

## [MS-ABS]:

### Address Book File Structure

---

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](http://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

**Preliminary Documentation.** This particular Open Specifications document provides documentation for past and current releases and/or for the pre-release version of this technology. This document provides final documentation for past and current releases and preliminary documentation, as applicable and specifically noted in this document, for the pre-release version. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. Because this documentation might change between the pre-release version and the final

version of this technology, there are risks in relying on this preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

Preliminary

## Revision Summary

Date	Revision History	Revision Class	Comments
4/4/2008	0.1	Major	Initial Availability
4/25/2008	0.2	Major	Revised and edited the technical content
6/27/2008	1.0	Major	Revised and edited the technical content
8/15/2008	1.01	Editorial	Edited the technical content

Preliminary

# 1 Introduction

The Address Book File Structure describes the format of the **address book files** that are produced daily by the **Address Book Server (ABS)** and accessed by clients to get information about users, **contacts** and **group objects** stored in **Active Directory**. Clients can use the contents of these address book files to provide an incremental search capability against the **users, contacts** and **groups** that were stored in Active Directory at the time the address book files were captured. Clients can also use this to provide reverse number lookup of incoming **Voice over IP (VoIP)** calls.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

## 1.1 Glossary

This document uses the following terms:

**Active Directory**: The Windows implementation of a general-purpose directory service, which uses LDAP as its primary access protocol. **Active Directory** stores information about a variety of objects in the network such as user accounts, computer accounts, groups, and all related credential information used by Kerberos [\[MS-KILE\]](#). **Active Directory** is either deployed as **Active Directory Domain Services (AD DS)** or Active Directory Lightweight Directory Services (AD LDS), which are both described in [\[MS-ADOD\]](#): Active Directory Protocols Overview.

**Active Directory Domain Services (AD DS)**: A directory service (DS) implemented by a domain controller (DC). The DS provides a data store for objects that is distributed across multiple DCs. The DCs interoperate as peers to ensure that a local change to an object replicates correctly across DCs. For more information, see [\[MS-AUTHSOD\]](#) section 1.1.1.5.2 and [\[MS-ADTS\]](#). For information about product versions, see [\[MS-ADTS\]](#) section 1. See also **Active Directory**.

**address book contact**: A user, contact, or group object that is obtained from Active Directory Domain Services (AD DS), including a subset of the AD DS attributes that are associated with the object, and is stored in an address book file.

**address book file**: A file that contains a set of **address book contact** records.

**Address Book Server (ABS)**: A component that produces **address book files** on a daily basis.

**American National Standards Institute (ANSI) character set**: A character set defined by a code page approved by the American National Standards Institute (ANSI). The term "ANSI" as used to signify Windows code pages is a historical reference and a misnomer that persists in the Windows community. The source of this misnomer stems from the fact that the Windows code page 1252 was originally based on an ANSI draft, which became International Organization for Standardization (ISO) Standard 8859-1 [\[ISO/IEC-8859-1\]](#). In Windows, the ANSI character set can be any of the following code pages: 1252, 1250, 1251, 1253, 1254, 1255, 1256, 1257, 1258, 874, 932, 936, 949, or 950. For example, "ANSI application" is usually a reference to a non-**Unicode** or code-page-based application. Therefore, "ANSI character set" is often misused to refer to one of the character sets defined by a Windows code page that can be used as an active system code page; for example, character sets defined by code page 1252 or character sets defined by code page 950. Windows is now based on **Unicode**, so the use of ANSI character sets is strongly discouraged unless they are used to interoperate with legacy applications or legacy data.

**attribute**: An identifier for a single or multivalued data element that is associated with a directory object. An object consists of its **attributes** and their values. For example, cn (common name), street (street address), and mail (email addresses) can all be **attributes** of a **user object**. An **attribute's** schema, including the syntax of its values, is defined in an attributeSchema object.

**big-endian:** Multiple-byte values that are byte-ordered with the most significant byte stored in the memory location with the lowest address.

**contact:** A person, company, or other entity that is stored in a directory and is associated with one or more unique identifiers and **attributes**, such as an Internet message address or login name.

**cryptographic hash function:** A function that maps an input of any length to a short output bit string of fixed length, such that finding an input that maps to a particular bit string of the correct output length, or even finding two inputs that map to the same output bit string, is computationally infeasible. For more information, see [\[SCHNEIER\]](#) chapters 2 and 18.

**cyclic redundancy check (CRC):** An algorithm used to produce a checksum (a small, fixed number of bits) against a block of data, such as a packet of network traffic or a block of a computer file. The CRC is a broad class of functions used to detect errors after transmission or storage. A CRC is designed to catch random errors, as opposed to intentional errors. If errors might be introduced by a motivated and intelligent adversary, a **cryptographic hash function** should be used instead.

**delta address book file:** An **address book file** that contains only the differences between two complete address book files. Differences can include changed values, added objects, and deleted objects.

**distinguished name (DN):** In the **Active Directory** directory service, the unique identifier of an object in **Active Directory**, as described in [\[MS-ADTS\]](#) and [\[RFC2251\]](#).

**full address book file:** An **address book file** that contains a complete set of the **address book contacts** that existed when the file was generated by the user, contact, and groups objects in AD DS.

**globally unique identifier (GUID):** A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [\[RFC4122\]](#) or [\[C706\]](#) must be used for generating the **GUID**. See also universally unique identifier (UUID).

**group object:** In **Active Directory**, a **group object** has an object class group. A group has a forward link attribute member; the values of this **attribute** either represent elements of the group (for example, objects of class user or computer) or subsets of the group (objects of class group). The representation of group subsets is called "nested group membership". The back link attribute memberOf enables navigation from group members to the groups containing them. Some groups represent groups of security principals and some do not and are, for instance, used to represent email distribution lists.

**hash:** A fixed-size result that is obtained by applying a one-way mathematical function, which is sometimes referred to as a hash algorithm, to an arbitrary amount of data. If the input data changes, the hash also changes. The hash can be used in many operations, including authentication and digital signing.

**hash code:** See **hash**.

**in-band provisioning:** A process in which a protocol client obtains configuration information from a protocol server.

**little-endian:** Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.

**Session Initiation Protocol (SIP):** An application-layer control (signaling) protocol for creating, modifying, and terminating sessions with one or more participants. **SIP** is defined in [\[RFC3261\]](#).

**Unicode:** A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The **Unicode** standard [\[UNICODE5.0.0/2007\]](#) provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).

**user object:** An object of class user. A user object is a security principal object; the principal is a person or service entity running on the computer. The shared secret allows the person or service entity to authenticate itself, as described in ([MS-AUTHSOD] section 1.1.1.1).

**UTF-8:** A byte-oriented standard for encoding Unicode characters, defined in the Unicode standard. Unless specified otherwise, this term refers to the UTF-8 encoding form specified in [UNICODE5.0.0/2007] section 3.9.

**Voice over IP (VoIP):** The use of the Internet Protocol (IP) for transmitting voice communications. VoIP delivers digitized audio in packet form and can be used to transmit over intranets, extranets, and the Internet.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the [Errata](#).

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com). We will assist you in finding the relevant information.

## 1.3 Structure Overview (Synopsis)

Address book files are produced daily by the Address Book Server. These files represent a daily snapshot of the **user object**, **contact** and **group object** in the **Active Directory Domain Services (AD DS)**, represented as a set of **address book contacts** in the address book files. The address book files are stored in a file system folder that contains the most recent N days of address book files,

where N is greater than 0. Client applications can schedule daily downloads of the address book file for local, incremental searching of users, contacts, and groups based on various fields in the file. Client applications can also use the data in the address book file to perform reverse number lookup for incoming calls from other clients.

Clients access the address book files by using the HTTP GET method. Clients construct the URL of the latest address book file by concatenating the base URL they receive as part of **in-band provisioning** with the address book file name constructed from the date. The file name is constructed as follows:

F-XXXX.Isabs

D-XXXX-YYYY.Isabs

C-XXXX-YYYY.Isabs<1>

F-XXXX.dabs

D-XXXX-YYYY.dabs

Where:

- XXXX and YYYY are 4-digit hexadecimal values that represent dates as the 0-based number of days after January 1, 2001, 00:00:00 UTC. For example, F-0A8C.Isabs would be the address book file for Saturday, May 24, 2008.
- File names that begin with F-XXXX are called full files and contain all user object, contact and group objects that exist on a given day.
- Files that begin with D-XXXX-YYYY are called delta files and represent the difference between two full files (F-XXXX.ext and F-YYYY.ext), where XXXX is less than YYYY. A delta file contains new and changed user object, contact and group objects, as well as deleted user objects, contact and group objects.
- Files that begin with C-XXXX-YYYY are called compact delta files and represent the difference between two full files (F-XXXX.Isabs and F-YYYY.Isabs), where XXXX is less than YYYY. A compact delta file contains new and deleted user objects, contacts (3), and group objects (2), as well as the specific attribute changes for changed user objects, contacts (3), and group objects (2).<2>
- Files with the .Isabs extension contain, for each user object, contacts, and group objects, all **attributes** that would be of interest to an end user.
- Files with the .dabs extension contain a minimal subset of attributes that would be useful to a physical device with limited memory, such as a **Session Initiation Protocol (SIP)** phone client. Also, group objects (2) are never included in device-specific address book files, so setting this flag on the **groupType** attribute will have no effect.

### 1.3.1 Address Book Server Configuration

The Address Book Server relies on a number of settings to control what goes into address book files. At a minimum, each address book file includes the following configuration settings:

**ABF\_ATTRIBUTES:** Controls which attributes for each **user**, **contact** and **group** are examined and how they are processed by the Address Book Server. A portion of this information is also used by client programs when interpreting downloaded address book files.

**ABF\_NORMALIZATION\_RULES:** Controls how the Address Book Server normalizes phone number **attribute** values. Normalization is the process of taking an arbitrarily formatted phone number and converting it into a dial string, as described in [\[E164\]](#). These normalization rules

are also stored in the address book files for use by clients when normalizing numbers outside of the address book, such as from personal contacts repository or a phone number entered manually through the client UI.

**UseNormalizationRules:** Controls whether the Address Book Server puts normalized phone numbers in the address book file or leaves phone numbers as they are and lets the client perform the normalization if needed.

How these configuration settings are stored and accessed is at the discretion of the system implementer and is outside the scope of this document.

### 1.3.2 Compressed File Format

Each address book file is compressed using the proprietary compression algorithm described in section 5. The file is stored on disk in compressed form and read over the wire using the HTTP GET method by client software. The client software then decompresses the file locally. The format of the compressed address book file is one or more COMPRESSED\_BLOCK records. Each COMPRESSED\_BLOCK record consists of a COMPRESSED\_BLOCK\_HEADER followed by the bytes for that COMPRESSED\_BLOCK. The decompression algorithm reads each block and decompresses it. The concatenation of all the decompressed blocks is the decompressed address book file.

### 1.3.3 Decompressed File Format

After an address book file is decompressed, it can be examined. For full files, the overall layout is as follows:

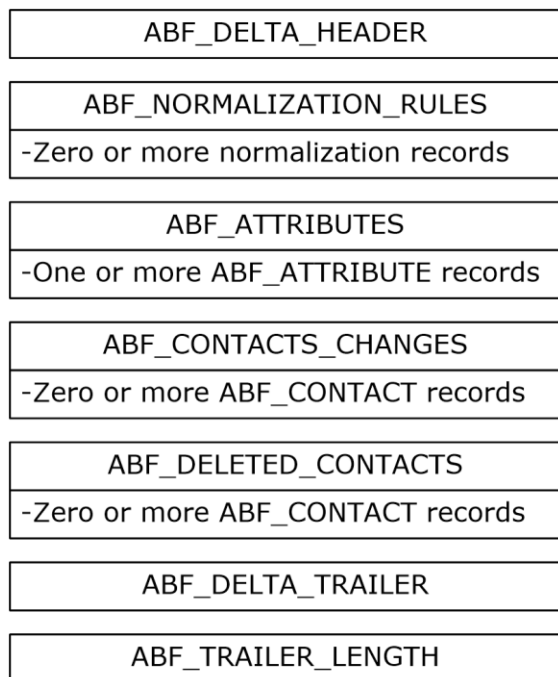

**Figure 1: Address book full file decompression layout**

For delta files, the overall layout is as follows:

**Figure 2: Address book full file decompression layout**

For compact delta files, the overall layout is as follows: [<3>](#)

**Figure 3: Address book compact delta file compression layout**

### 1.3.4 Byte Ordering

Data in **address book file** records are stored in **little-endian** format.

Some computer architectures number bytes in a binary word from left to right, which is referred to as **big-endian**. The bit diagram for this documentation is big-endian. Other architectures number the bytes in a binary word from right to left, which is referred to as little-endian. The underlying file format enumerations, objects and records are little-endian.

Using the big-endian and little-endian methods, the number 0x12345678 would be stored as shown in the following table.

Byte order	Byte 0	Byte 1	Byte 2	Byte 3
big-endian	0x12	0x34	0x56	0x78
little-endian	0x78	0x56	0x34	0x12

#### 1.4 Relationship to Protocols and Other Structures

None.

#### 1.5 Applicability Statement

Files that adhere to the **address book file** structure are suitable for use by clients listed in section [8](#).

#### 1.6 Versioning and Localization

This document covers versioning issues in the following areas:

- **Version:** This document specifies the first version of the **address book file** structure. The **ABF\_TRAILER\_LENGTH** structure provides support for adding more information in a way that does not affect older clients of the file structure.
- **Localization:** This structure defines no locale-specific processes or data. All strings are encoded in **Unicode UTF-8** [\[UNICODE\]](#) format.

#### 1.7 Vendor-Extensible Fields

None.

## 2 Structures

The following sections specify various types of address book file records and enumerations.

**Note:** All character strings specified in this section MUST be encoded in **Unicode UTF-8** format.

### 2.1 Address Book File Enumeration Tables

#### 2.1.1 ABF\_ATTRIBUTE\_FLAGS Enumeration

The **ABF\_ATTRIBUTE\_FLAGS** enumeration defines the bit values stored in the Flags field of the **ABF\_ATTRIBUTE** structure.

```
typedef enum
{
    ABF_ATTRIBUTE_FLAGS_TYPE_MASK           = 0x000000FF,
    ABF_ATTRIBUTE_FLAGS_RESERVED           = 0x00000100,
    ABF_ATTRIBUTE_FLAGS_EMAIL              = 0x00000400,
    ABF_ATTRIBUTE_FLAGS_REQUIRED           = 0x00000800,
    ABF_ATTRIBUTE_FLAGS_NC_MASK            = 0x00003000,
    ABF_ATTRIBUTE_FLAGS_EXCLUDE            = 0x00004000,
    ABF_ATTRIBUTE_FLAGS_INCLUDE            = 0x00008000,
    ABF_ATTRIBUTE_FLAGS_GROUPTYPE          = 0x00010000,
    ABF_ATTRIBUTE_FLAGS_DEVICE              = 0x00020000,
    ABF_ATTRIBUTE_FLAGS_UNUSED              = 0x00FC0200,
    ABF_ATTRIBUTE_FLAGS_CLIENT_MASK        = 0xFF000000,
} ABF_ATTRIBUTE_FLAGS;
```

**ABF\_ATTRIBUTE\_FLAGS\_TYPE\_MASK:** Used to mask out the value type of an Active Directory attribute. Doing a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** will yield a value in the **ABF\_ATTRIBUTE\_TYPE** enumeration.

**ABF\_ATTRIBUTE\_FLAGS\_RESERVED:** Reserved for future use. Value MUST be ignored.

**ABF\_ATTRIBUTE\_FLAGS\_EMAIL:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** structure yields a nonzero value, the associated attribute is an e-mail alias for an **address book contact**. If this bit is not set, the associated attribute does not represent an e-mail alias for an address book contact.

**ABF\_ATTRIBUTE\_FLAGS\_REQUIRED:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** structure yields a nonzero value, the associated attribute is required to be present on a user, contact or group object in order for the corresponding address book contact to be included in the address book file by the Address Book Server. If this bit is not set, the presence or absence of the associated attribute on a user, contact or group object does not affect whether the address book contact is included in the address book file. For information about how this attribute flag interacts with the other attribute flags, see section [7](#).

**ABF\_ATTRIBUTE\_FLAGS\_NC\_MASK:** This value can be used to mask out the phone number normalization control for an Active Directory **attribute**. Doing a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a value from the **ABF\_ATTRIBUTE\_NORMALIZATION\_CONTROL** enumeration.

**ABF\_ATTRIBUTE\_FLAGS\_EXCLUDE:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a nonzero value, any user, contact or group object that has the associated attribute will be excluded from the address book file by the Address Book Server. This bit setting overrides the setting of the **ABF\_ATTRIBUTE\_FLAGS\_INCLUDE** bit if both are specified for an attribute. If this bit is not set, the presence or absence of the associated attribute on a user, contact or group object does not affect whether the address book contact is

included in the address book file. For information about how this attribute flag interacts with the other attribute flags, see section 7.

**ABF\_ATTRIBUTE\_FLAGS\_INCLUDE:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a nonzero value, then any user, contact or group object that has the associated attribute is included as an address book contact in the address book file by the Address Book Server. If this bit is not set, the presence or absence of the associated attribute on a user, contact or group object does not affect whether the address book contact is included in the address book file. For information about how this attribute flag interacts with the other attribute flags, see section 7.

**ABF\_ATTRIBUTE\_FLAGS\_GROUPTYPE:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a nonzero value, the Boolean value of the associated attribute indicates whether the address book contact that has the associated attribute is a distribution list. If this bit is not set, the associated attribute is not used to determine if an address book contact is a distribution list.

**ABF\_ATTRIBUTE\_FLAGS\_DEVICE:** If a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a nonzero value, the associated attribute is included in the device-specific address book files (.dabs extension). If this bit is not set, the attribute is not included in the device-specific address book files. Group objects are never included in device specific address book files, so setting this flag on the groupType attribute has no effect.

**ABF\_ATTRIBUTE\_FLAGS\_UNUSED:** These bits in the **Flags** field are unused and MUST be ignored.

**ABF\_ATTRIBUTE\_FLAGS\_CLIENT\_MASK:** Used to mask out the client mapping of an Active Directory attribute. Doing a bitwise AND of this value with the **Flags** field of the **ABF\_ATTRIBUTE** yields a value from the **ABF\_ATTRIBUTE\_CLIENT\_FIELD** enumeration.

### 2.1.2 ABF\_ATTRIBUTE\_TYPE Enumeration

The **ABF\_ATTRIBUTE\_TYPE** enumeration defines values that specify how the Address Book Server and clients process Active Directory attributes associated with address book contacts. These values are found in the low-order byte of the **Flags** field of the **ABF\_ATTRIBUTE** structure.

```
typedef enum
{
    ABF_TYPE_STRING           = 0x00,
    ABF_TYPE_BINARY          = 0x01,
    ABF_TYPE_STRING_PROXYADDRESS = 0x02
} ABF_ATTRIBUTE_TYPE;
```

**ABF\_TYPE\_STRING:** An Active Directory attribute whose value is a **Unicode** string.

**ABF\_TYPE\_BINARY:** An Active Directory attribute whose value is a sequence of bytes.

**ABF\_TYPE\_STRING\_PROXYADDRESS:** An Active Directory **proxyAddresses** attribute whose value is a Unicode string that MUST begin with "TEL:" or "SMTP:". The case of "tel:" and "smtp:" is not important. A **proxyAddresses** attribute whose value starts with "SMTP:" MUST contain the '@' character in the value. A **proxyAddresses** attribute whose value starts with "TEL:" MUST have the format "tel:+nnnnnnnnnnnn;display-name=xxxxxxxxxx;ad-rdn=ttttt". **proxyAddresses** in Active Directory that begin with anything else (for example, "X500") are ignored and not stored in the Address Book Server output files. If **UseNormalizationRules** is set to "1", no **proxyAddresses** attribute values are included in the output files.

String "nnnnnnnnnnnn" is up to 15 digits and represents the E164 form of the phone number, "xxxxxxxxxx" is arbitrary text to use as the display string for the phone number and "ttttt"

gives the type of phone number and may be **telephoneNumber**, **homeNumber**, **mobile**, or **otherTelephone**.

### 2.1.3 ABF\_ATTRIBUTE\_NORMALIZATION\_CONTROL Enumeration

The **ABF\_ATTRIBUTE\_NORMALIZATION\_CONTROL** enumeration defines values that specify how an Address Book Server normalizes phone number attributes associated with user, contact and group objects. These values are found in bits 18 and 19 of the **Flags** field of the **ABF\_ATTRIBUTE** structure(base index is 0). If normalization is enabled for a particular attribute, and that attribute is present multiple times for a given user or contact, only the first value of that attribute is normalized.

```
typedef enum
{
    ABF_NORMALIZATION_CONTROL_NONE           = 0x0000,
    ABF_NORMALIZATION_CONTROL_ALWAYS        = 0x1000,
    ABF_NORMALIZATION_CONTROL_PROXYADDRESS = 0x2000,
    ABF_NORMALIZATION_CONTROL_UNDEFINED     = 0x3000
} ABF_ATTRIBUTE_NORMALIZATION_CONTROL;
```

**ABF\_NORMALIZATION\_CONTROL\_NONE:** Servers MUST NOT normalize the attribute value.

**ABF\_NORMALIZATION\_CONTROL\_ALWAYS:** Servers MUST normalize the attribute value if matching the phone number normalization rules in **Rules** field of **ABF\_NORMALIZATION\_RULES** Structure; otherwise, the attribute value is not normalized.

**ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS:** Servers MUST extract the normalized phone number from the **proxyAddress** value if the **UseNormalizationRules** field in **ABF\_FULL\_HEADER** or in **ABF\_DELTA\_HEADER** is zero. Otherwise, they MUST behave as if **ABF\_NORMALIZATION\_CONTROL\_ALWAYS** is set.

Normalized numbers are stored in the **proxyAddress** value using the following syntax:

```
tel:+nnnnnnnnnnnn;display-name=xxxxxxxxx;ad-rdn=ttttt
```

where nnnnnnnnnnnn is up to 15 digits and represents the E164 form of the phone number, xxxxxxxxxxxx is arbitrary text to use as the display string for the phone number and ttttt gives the type of phone number and may be **telephoneNumber**, **homeNumber**, **mobile**, or **otherTelephone**.

**ABF\_NORMALIZATION\_CONTROL\_UNDEFINED:** This value is not used and MUST be ignored.

### 2.1.4 ABF\_ATTRIBUTE\_CLIENT\_FIELD Enumeration

The **ABF\_ATTRIBUTE\_CLIENT\_FIELD** enumeration defines values that specify how clients map attributes associated with address book contacts to attributes in the client database. These values are found in the high order byte of the **Flags** field of the **ABF\_ATTRIBUTE** structure.

```
typedef enum
{
    ABF_CLIENT_FIELD_PROXYADDRESSES = 0x00000000,
    ABF_CLIENT_FIELD_GIVENNAME     = 0x01000000,
    ABF_CLIENT_FIELD_SN             = 0x02000000,
    ABF_CLIENT_FIELD_DISPLAYNAME    = 0x03000000,
    ABF_CLIENT_FIELD_TITLE          = 0x04000000,
    ABF_CLIENT_FIELD_MAILNICKNAME   = 0x05000000,
    ABF_CLIENT_FIELD_COMPANY        = 0x06000000,
    ABF_CLIENT_FIELD_PHYSICALDELIVERYOFFICENAME = 0x07000000,
    ABF_CLIENT_FIELD_MSRTCSIP_PRIMARYUSERADDRESS = 0x08000000,
    ABF_CLIENT_FIELD_TELEPHONENUMBER = 0x09000000,
    ABF_CLIENT_FIELD_HOMENUMBER    = 0x0A000000,
```

```
ABF_CLIENT_FIELD_MOBILE = 0x0B000000,  
ABF_CLIENT_FIELD_OTHERTELEPHONE = 0x0C000000,  
ABF_CLIENT_FIELD_IPPHONE = 0x0D000000,  
ABF_CLIENT_FIELD_MAIL = 0x0E000000,  
ABF_CLIENT_FIELD_GROUPTYPE = 0x0F000000,  
ABF_CLIENT_FIELD_MANAGER = 0x10000000,  
ABF_CLIENT_FIELD_IGNORE = 0xFF000000  
} ABF_ATTRIBUTE_CLIENT_FIELD;
```

**ABF\_CLIENT\_FIELD\_PROXYADDRESSES:** A **proxyAddresses** attribute of an address book contact.

**ABF\_CLIENT\_FIELD\_GIVENNAME:** The first name of an address book contact.

**ABF\_CLIENT\_FIELD\_SN:** The surname or last name of a user or contact.

**ABF\_CLIENT\_FIELD\_DISPLAYNAME:** The display name of an address book contact.

**ABF\_CLIENT\_FIELD\_TITLE:** The title of an address book contact.

**ABF\_CLIENT\_FIELD\_MAILNICKNAME:** The e-mail account name of an address book contact.

**ABF\_CLIENT\_FIELD\_COMPANY:** The company name of an address book contact.

**ABF\_CLIENT\_FIELD\_PHYSICALDELIVERYOFFICENAME:** The office name of an address book contact.

**ABF\_CLIENT\_FIELD\_MSRTCSIP\_PRIMARYUSERADDRESS:** The primary **SIP** address of an address book contact.

**ABF\_CLIENT\_FIELD\_TELEPHONENUMBER:** The work phone number of an address book contact.

**ABF\_CLIENT\_FIELD\_HOMENUMBER:** The home phone number of an address book contact.

**ABF\_CLIENT\_FIELD\_MOBILE:** The mobile phone number of an address book contact.

**ABF\_CLIENT\_FIELD\_OTHERTELEPHONE:** An alternate phone number of an address book contact.

**ABF\_CLIENT\_FIELD\_IPPHONE:** The IP phone number of an address book contact.

**ABF\_CLIENT\_FIELD\_MAIL:** The email address (user@host) for an address book contact.

**ABF\_CLIENT\_FIELD\_GROUPTYPE:** A Boolean indicator of whether an address book contact is a distribution list. If this attribute is present on an address book contact, the value **MUST** be 1, indicating that the address book contact is a distribution list.

**ABF\_CLIENT\_FIELD\_MANAGER:** The **distinguished name (DN)** of the manager of an address book contact. <4>

**ABF\_CLIENT\_FIELD\_IGNORE:** Ignored by the client and not mapped into any field in the client's database.

## 2.2 Address Book File Structures

### 2.2.1 COMPRESSED\_BLOCK Structure

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
Header																																		
...																																		
...																																		
Data (variable)																																		
...																																		

**Header (12 bytes):** A **COMPRESSED\_BLOCK\_HEADER** structure that gives the **cyclic redundancy check (CRC)** for the original, uncompressed **Data** bytes, the length of the **Data** bytes, and the length of the decompressed **Data** bytes.

**Data (variable):** 1 or more bytes of compressed data. Length is defined in the **Header** structure.

### 2.2.2 COMPRESSED\_BLOCK\_HEADER Structure

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
CRC																																		
CompressedSize																																		
DecompressedSize																																		

**CRC (4 bytes):** A 32-bit unsigned integer that gives the **CRC** for the original, uncompressed **Data** bytes. The value in this field **MUST** be calculated using the algorithm described in section 5.

**CompressedSize (4 bytes):** A 32-bit unsigned integer that gives the length of the **Data** bytes that follow the **Header** field. **CompressedSize** **MUST** be less than or equal to 64 kilobytes (0x10000).

**DecompressedSize (4 bytes):** A 32-bit unsigned integer that gives the length of the **Data** bytes after they are decompressed with the algorithm described in section 5. **DecompressedSize** **MUST** be greater than or equal to **CompressedSize**. If **CompressedSize** equals **DecompressedSize**, the block is not compressed, and the **Data** bytes represent the actual data. The block **MAY** be uncompressed.

### 2.2.3 ABF\_FULL\_HEADER Structure

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
FileType (16 bytes)																																		

...	
...	
NumberOfAttributes	CreationDate
UseNormalizationRules	MaximumAttributeId
SourceStream (128 bytes)	
...	
...	

**FileType (16 bytes):** A 16-byte **GUID** that MUST equal 0x76 0x6c 0xe1 0x44 0xfd 0x0a 0xa9 0x40 0x8b 0x63 0x5f 0xe9 0xb0 0x81 0x73 0x8f. This value indicates that the file is a full file.

**CreationDate (2 bytes):** A 16-bit unsigned number that is the XXXX portion of the F-XXXX file name.

**NumberOfAttributes (2 bytes):** A 16-bit unsigned number that is the number of **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure.

**MaximumAttributeId (2 bytes):** A 16-bit unsigned number that is the largest value of the **Id** field in all of the **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure. <5>

**UseNormalizationRules (2 bytes):** A 16-bit unsigned number that is 0 if the server did not use the phone normalization rules in the **ABF\_NORMALIZATION\_RULES** structure to normalize phone number strings. The value is nonzero if the Address Book Server did normalize phone numbers using the phone normalization rules.

**SourceStream (128 bytes):** A 128-byte field that SHOULD be set to all zeroes. The client does not validate this field.

### 2.2.4 ABF\_DELTA\_HEADER Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
FileType (16 bytes)																															
CreationDate																BaseCreationDate															
MaximumAttributeId																NumberOfAttributes															
SourceStream (128 bytes)																UseNormalizationRules															

**FileType (16 bytes):** A 16-byte GUID. For delta files, it MUST equal 0x16 0xc1 0x4b 0xb5 0x08 0x90 0xc7 0x47 0xb9 0xbd 0xf3 0xbb 0x1a 0x0a 0xb6 0xeb. This value indicates that the file is a delta file.

For compact files, it MUST equal 0x34 0x17 0x7d 0xf7 0x87 0xae 0x2b 0x4d 0x09 0xa0 0x8e 0xe9 0xba 0x89 0x4a 0x04. This value indicates that the file is a compact delta file. <6>

**BaseCreationDate (2 bytes):** A 16-bit unsigned number that is the XXXX portion of the D-XXXX-YYYY file name.

**CreationDate (2 bytes):** A 16-bit unsigned number that is the YYYY portion of the D-XXXX-YYYY file name.

**NumberOfAttributes (2 bytes):** A 16-bit unsigned number that is the number of **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure.

**MaximumAttributeId (2 bytes):** A 16-bit unsigned number that is the largest value of the **Id** field in all of the **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure. <7>

**UseNormalizationRules (2 bytes):** A 16-bit unsigned number that is 0 if the server did not use the phone normalization rules in the **ABF\_NORMALIZATION\_RULES** structure to normalize phone number strings. The value is nonzero if the Address Book Server did normalize phone numbers using the phone normalization rules.

**SourceStream (128 bytes):** A 128-byte field that SHOULD be set to all zeroes. The client does not validate this field.

### 2.2.5 ABF\_NORMALIZATION\_RULES Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Length																															
Rules (variable)																															
...																															

**Length (4 bytes):** A 32-bit unsigned number that is the number of bytes in the **Rules** field.

**Rules (variable):** A series of **UTF-8** characters that contains phone number normalization rules. The number of characters in the series is specified by the **Length** field. If **Length** is nonzero, the last byte of the **Rules** field MUST be a zero byte. Each rule consists of two lines, and each line MUST be terminated by a carriage return, linefeed sequence (0xD, 0xA). The first line is a regular expression to match against a phone number string, using standard [\[MC-RegEx\]](#) regular expression syntax. <8> The second line is a replacement string to convert the matching phone number into a valid [\[E164\]](#) number. When more than one rule is present, the rules MUST be processed in order, and the phone number is normalized using the first matching rule. If no rule matches a phone number, the phone number is not normalized.

There is a special built-in rule called E164. If the regular expression in the first line of one of the preceding pairs of lines is the string "E164," the second line is ignored and the rule matches any input that consists of 15 or fewer decimal digits, with any spaces, periods, hyphens, or parentheses ignored. If an input does match the built-in E164 rule, the result is "tel:+" followed by the digits that matched. The ignored characters are discarded.

## 2.2.6 ABF\_ATTRIBUTES Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Attributes (variable)																															
...																															

**Attributes (variable):** One or more **ABF\_ATTRIBUTE** structures.

## 2.2.7 ABF\_ATTRIBUTE Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id																Length															
Flags																															
Name (variable)																															

**Length (2 bytes):** A 16-bit unsigned integer that gives the length of the remaining bytes in the structure.

**Id (2 bytes):** A 16-bit unsigned integer that gives the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags (4 bytes):** A 32-bit unsigned integer that defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. The bits in this field are described by the **ABF\_ATTRIBUTE\_FLAGS** enumeration.

**Name (variable):** A zero-terminated UTF-8 string that is the name of the attribute in Active Directory. Name is not case-sensitive.

## 2.2.8 ABF\_CONTACTS Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Contacts (variable)																															
...																															

**Contacts (variable):** Zero or more **ABF\_CONTACT** structures.

## 2.2.9 ABF\_DELETED\_CONTACTS Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Contacts (variable)																															
...																															

**Contacts (variable):** Zero or more **ABF\_CONTACT** structures.

## 2.2.10 ABF\_CONTACT Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (16 bytes)																Length															
NumberOfAttributes																...															
Attributes (variable)																NumberOfDeletedAttributes (optional)															

**Length (2 bytes):** A 16-bit unsigned integer that gives the length of the remaining bytes in the structure.

**Id (16 bytes):** A 16 byte GUID that is the value of the **objectGUID** Active Directory attribute for this address book contact. If this field is all zeroes, this is a sentinel entry that marks the end of the **ABF\_CONTACTS** structure. The sentinel contact entry is not included in the count of **ABF\_CONTACTS** structures. The value of the **NumberOfAttributes** field in the sentinel contact entry **MUST** be 0, and the **Length** field **MUST** be 0x12.

**NumberOfAttributes (2 bytes):** A 16-bit unsigned integer that gives the number of **ABF\_CONTACT\_ATTRIBUTE** records in the **Attributes** field.

**NumberOfDeletedAttributes (2 bytes, optional):** If the **NumberOfAttributes** field is zero, this is a deleted Contact object, and the **NumberOfDeletedAttributes** field **MUST** be present if the **Length** field is greater than 20 (0x14).

**Attributes (variable):** Zero or more **ABF\_CONTACT\_ATTRIBUTE** structures that give the requested Active Directory attributes for this address book contact object.

## 2.2.11 ABF\_CONTACT\_ATTRIBUTE Structure

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Length (optional)																Id															

Data (variable)
-----------------

**Id (1 or 2 bytes):** An 8-bit or 16-bit unsigned integer that gives the identifier of the Active Directory attribute. This field corresponds to the **Id** field in the **ABF\_ATTRIBUTE** structure. This field is 1 byte if the value of the **MaximumAttributeId** field in the **ABF\_FULL\_HEADER** or **ABF\_DELTA\_HEADER** structure is less than 256; otherwise, this field is 2 bytes.

**Length (2 bytes, optional):** A 16-bit unsigned integer that gives the length of the **Data** field if the **Id** field specifies a binary attribute. If the **Id** field does not specify a binary attribute, this field is not present.

**Data (variable):** A variable field. The preceding **Id** field is used to index the **ABF\_ATTRIBUTES** array for the associated **ABF\_ATTRIBUTE** structure. The **Flags** field of that structure, masked with the **ABF\_ATTRIBUTE\_FLAGS\_TYPE\_MASK**, specifies the type of this field. If the type is **ABF\_TYPE\_BINARY**, this field contains the bytes for that attribute. If the type is not **ABF\_TYPE\_BINARY**, this field contains a zero-terminated UTF-8 string.

### 2.2.12 ABF\_FULL\_TRAILER Structure

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
NumberOfContacts																Hash																		
																NumberOfContacts (cont.)																		

**Hash (2 bytes):** A 16-bit unsigned number that is a **hash** of the contents of the file. The **cryptographic hash function** used can be anything, but it MUST be the same function for all files. For an example of a hash function, see section [6](#).

**NumberOfContacts (4 bytes):** A 32-bit unsigned number that is the number of **ABF\_CONTACT** structures in the file. Does not include the sentinel **ABF\_CONTACT** structure (**Id** and **NumberOfAttributes** fields all zeroes).

### 2.2.13 ABF\_DELTA\_TRAILER Structure

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
BaseFileHash																Hash																		
NumberOfContacts																																		
NumberOfDeletedContacts																																		

**Hash (2 bytes):** A 16-bit unsigned number that is a **hash** of the contents of the file. Any **cryptographic hash function** can be used, as long as it is the same function for all files. For an example of a hash function, see section [6](#).

**BaseFileHash (2 bytes):** A 16-bit unsigned number that is a hash of the contents of the base file that was used to calculate this delta file. Any hash function used can be used, but it **MUST** be the same function for all files. For an example of a hash function, see section 6.

**NumberOfContacts (4 bytes):** A 32-bit unsigned number that is the number of **ABF\_CONTACT** structures in the file. Does not include the sentinel **ABF\_CONTACT** structure (**Id** and **NumberOfAttributes** fields all zeroes).

**NumberOfDeletedContacts (4 bytes):** A 32-bit unsigned number that is the number of **ABF\_CONTACT** structures in the file that identify deleted contacts.

### 2.2.14 ABF\_TRAILER\_LENGTH Structure

**LengthOfTrailer (4 bytes):** A 32-bit unsigned number that is the length of either the **ABF\_FULL\_TRAILER** or **ABF\_DELTA\_TRAILER** structure that precedes this structure. Additional information **MAY** be added to the file format. If additional information is added, it **MUST** be placed after the **ABF\_FULL\_TRAILER** or **ABF\_DELTA\_TRAILER** structure and before the **ABF\_TRAILER\_LENGTH** structure. To access the trailer structure, readers of the file seek to the end of the file less the size of the **ABF\_TRAILER\_LENGTH** structure to read the length of the trailer structure. Once the **LengthOfTrailer** field has been read, readers of the file can seek from the end of the file less **LengthOfTrailer** less 4 (the size of the **ABF\_TRAILER\_LENGTH** structure) to get to the beginning of the trailer structure. This allows future versions of the file format to contain more information if necessary. If more information is added to the file, the **LengthOfTrailer** **MUST** include the length of the added information. Using this mechanism prevents breaking old clients using the existing file format.

### 2.2.15 ABF\_CONTACTS\_CHANGES Structure

The product behavior in this section replaces that in section [2.2.8.<9>](#)

**Changed Contacts (variable):** Zero or more **ABF\_CONTACT\_CHANGES** structures. Compact delta files uses **ABF\_CONTACTS\_CHANGES** structure instead of **ABF\_CONTACTS** structure.

### 2.2.16 ABF\_CONTACT\_CHANGES Structure

The product behavior in this section replaces that in section [2.2.10.<10>](#)

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1		
Id (16 bytes)																Length																	
NumberOfAttributes																...																	
Attributes (variable)																NumberOfDeletedAttributes (optional)																	

**Length (2 bytes):** A 16-bit unsigned integer that gives the length of the remaining bytes in the structure.

**Id (16 bytes):** A 16 byte GUID that is the value of the **objectGUID** Active Directory attribute for this **address book contact**. If this field is all zeroes, this is a sentinel entry that marks the end of the **ABF\_CONTACTS\_CHANGES** structure. The sentinel contact entry is not included in the count of **ABF\_CONTACTS\_CHANGES** structures. The value of the **NumberOfAttributes** field in the sentinel contact entry **MUST** be 0, and the **Length** field **MUST** be 0x12.

**NumberOfAttributes (2 bytes):** A 16-bit unsigned integer that gives the number of **ABF\_CONTACT\_ATTRIBUTE** records in the **Attributes** field.

**NumberOfDeletedAttributes (2 bytes, optional):** If the **NumberOfAttributes** field is zero, this is a deleted Contact object, and the **NumberOfDeletedAttributes** field **MUST** be present if the **Length** field is greater than 20 (0x14).

**Attributes (variable):** Zero or more **ABF\_CONTACT\_ATTRIBUTE** structures that give the requested Active Directory attributes for this **address book contact** object. These are only the attributes that have changed for the contact. If an attribute is deleted, it shows up here as empty. Missing attributes are unchanged.

## 3 Structure Examples

### 3.1 Address Book File

The primary function of the Address Book Server is to scan Active Directory for users, contacts and groups, and determine which objects to include in the Address Book Server files and, for each object included, which attributes to include. For pseudo-code that shows how users, contacts, and groups are chosen from Active Directory, see section [7](#).

This section describes an example of an address book output file. The scenario that produced this address book file is as follows:

- Monday, January 21, 2008, a **full address book file** is produced, F-0A10.lsabs.
- Later in the day, an administrator makes several edits to the Active Directory Domain Services. The **displayName** attribute of one user is changed, another user is deleted, and a new user is added.
- Tuesday, January 22, 2008, a full address book file is produced, F-0A11.lsabs, along with a **delta address book file**, D-0A10-0A11.lsabs, which is the delta between the two full files. and a compact delta address book file, C-0A10-0A11.lsabs, which is the delta of the contact attribute changes between the two full files. [<11>](#)
- The compact delta file is identical to the delta file with two exceptions. 1) only the attributes that changed for a contact are included, so unchanged attributes are ignored, and 2) attributes for the contact that no longer exist are marked as empty. [<12>](#)

The file that will be used in the example is the delta address book file, D-0A10-0A11.lsabs.

The relevant portion of Active Directory contents when F-0A10.lsabs is generated:

```

The contents of this delta address book file example follow, in hexadecimal bytes. The far-left column is the byte count; the far-right characters are the interpretation of the bytes in the **American National Standards Institute (ANSI) character set**. The sections that follow describe the structures that convey this series of bytes. This hexadecimal dump occurred after the actual D-0A10-0A11.lsabs file was decompressed. For a description of how the file is decompressed, see section [5](#).

FileType (0xB54BC116)																															
0x47C79008																															
0xBBF3BDB9																															
0xEBB60A1A																															
CreationDate (0x0A11)																BaseCreationDate (0x0A10)															
MaximumAttributeId (0x0014)																NumberOfAttributes (0x0014)															
SourceStream (0x0000)																UseNormalizationRules (0x0001)															
126 more bytes of 0x00																															

**FileType:** The GUID value {b54bc116-9008-47c7-b9bd-f3bb1a0ab6eb} indicates that this is a **delta address book file**.

**BaseCreationDate:** 0x0A10 specifies the base full file (F-0A10.lsabs) that was used to create this delta file.

**CreationDate:** 0x0A11 specifies the date that this delta file (D-0A10-0A11.lsabs) was created, as well as the full file (F-0A11.lsabs) that was compared against the base full file (F-0A10.lsabs) to produce this delta file.

**NumberOfAttributes:** 0x0014 specifies the number of **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure.

**MaximumAttributeId:** 0x0014 specifies the largest value of the **Id** field in all of the **ABF\_ATTRIBUTE** structures in the **ABF\_ATTRIBUTES** structure.

**UseNormalizationRules:** 0x0001 indicates that the Address Book Server did normalize phone numbers using the phone normalization rules in the **ABF\_NORMALIZATION\_RULES** structure.

SourceStream: 128 bytes of 0x00 are ignored by the client.

### 3.1.2 ABF\_NORMALIZATION\_RULES

This section provides an example of the address book file **ABF\_NORMALIZATION\_RULES** structure specified in section [2.2.5](#).

Length																															
Rules (variable)																															
...																															

**Length (4 bytes):** 0x0000085B specifies the length of the **Rules** field, in bytes.

**Rules (variable):** Normalization rules used by the Address Book Server to normalize the phone numbers in this file. This is a zero-terminated UTF-8 string, where the string contains one or more pairs of lines.

### 3.1.3 Attribute Structure

#### 3.1.3.1 ABF\_ATTRIBUTE manager

```

000008F0: 0E 00 14 00 00 00 00 .....

```

00000900: 10 6D 61 6E 61 67 65 72 00

.manager.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0014)																Length (0x000E)															
Flags (0x10000000)																															
Name ("manager")																															

**Length:** 0x000E specifies the length of the remaining bytes in this structure.

**Id:** 0x0014 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x10000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_MANAGER**.

**Name:** Specifies that this attribute corresponds to the **manager** attribute associated with Active Directory user and contact objects.

### 3.1.3.2 ABF\_ATTRIBUTE groupType

```

00000900: 10 00 13 00 01 08 01 .....
00000910: 0F 67 72 6F 75 70 54 79 70 65 00 .groupType.

```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0013)																Length (0x0010)															
Flags (0x0F010801)																															
Name ("groupType")																															

**Length:** 0x0010 specifies the length of the remaining bytes in this structure.

**Id:** 0x0013 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0F010801 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_BINARY OR ABF\_ATTRIBUTE\_FLAGS\_REQUIRED OR ABF\_ATTRIBUTE\_FLAGS\_GROUPTYPE OR ABF\_CLIENT\_FIELD\_GROUPTYPE**.

**Name:** Specifies that this attribute corresponds to the **groupType** attribute associated with Active Directory group objects.

### 3.1.3.3 ABF\_ATTRIBUTE proxyAddresses

```
00000910:                               15 00 12 00 02          .....
00000920: 01 00 00 70 72 6F 78 79 41 64 64 72 65 73 73 65 ...proxyAddresse
00000930: 73 00                                     s.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0012)																Length (0x0015)															
Flags (0x00000102)																															
Name ("proxyAddresses")																															

**Length:** 0x0015 specifies the length of the remaining bytes in this structure.

**Id:** 0x0012 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x00000102 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING\_PROXYADDRESS OR ABF\_ATTRIBUTE\_FLAGS\_RESERVED OR ABF\_CLIENT\_FIELD\_PROXYADDRESSES**.

**Name:** Specifies that this attribute corresponds to the **proxyAddresses** attribute associated with Active Directory user, contact and group objects.

### 3.1.3.4 ABF\_ATTRIBUTE mail

```
00000930:      0B 00 11 00 00 00 00 0E 6D 61 69 6C 00      .....mail.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0011)											Length (0x000B)																				
Flags (0x0E000000)																															
Name ("mail")																															

**Length:** 0x000B specifies the length of the remaining bytes in this structure.

**Id:** 0x0011 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0E000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_MAIL**.

**Name:** Specifies that this attribute corresponds to the **mail** attribute associated with Active Directory user and contact objects.

### 3.1.3.5 ABF\_ATTRIBUTE ipPhone

```
00000930:                                     0E .
00000940: 00 10 00 00 20 00 0D 69 70 50 68 6F 6E 65 00 .....ipPhone.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0010)																Length (0x000E)															
Flags (0x0D002000)																															
Name ("ipPhone")																															

**Length:** 0x000E specifies the length of the remaining bytes in this structure.

**Id:** 0x0010 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0D002000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS OR ABF\_CLIENT\_FIELD\_IPPHONE**.

**Name:** Specifies that this attribute corresponds to the **ipPhone** attribute associated with Active Directory user and contact objects.

### 3.1.3.6 ABF\_ATTRIBUTE otherTelephone

```
00000940:                                     15 .
00000950: 00 0F 00 00 20 00 0C 6F 74 68 65 72 54 65 6C 65 .....otherTele
00000960: 70 68 6F 6E 65 00                               phone.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x000F)																Length (0x0015)															
Flags (0x0C002000)																															
Name ("otherTelephone")																															

**Length:** 0x0015 specifies the length of the remaining bytes in this structure.

**Id:** 0x000F specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0C002000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS OR ABF\_CLIENT\_FIELD\_OTHERTELEPHONE

**Name:** Specifies that this attribute corresponds to the **otherTelephone** attribute associated with Active Directory user and contact objects.

### 3.1.3.7 ABF\_ATTRIBUTE otherMobile

```
00000960:                12 00 0E 00 00 20 00 0B 6F 74          .....ot
00000970: 68 65 72 4D 6F 62 69 6C 65 00          herMobile.
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1		
Id (0x000E)										Length (0x0012)																							
Flags (0x0B002000)																																	
Name ("otherMobile")																																	

**Length:** 0x0012 specifies the length of the remaining bytes in this structure.

**Id:** 0x000E specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0B002000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS OR ABF\_CLIENT\_FIELD\_MOBILE.

**Name:** Specifies that this attribute corresponds to the **otherMobile** attribute associated with Active Directory user and contact objects.

### 3.1.3.8 ABF\_ATTRIBUTE mobile

```
00000970:                0D 00 0D 00 00 28          .....(
00000980: 02 0B 6D 6F 62 69 6C 65 00          ..mobile.
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1		
Id (0x000D)										Length (0x000D)																							
Flags (0x0B022800)																																	
Name ("mobile")																																	

**Length:** 0x000D specifies the length of the remaining bytes in this structure.

**Id:** 0x000D specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0B022800 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING** OR **ABF\_ATTRIBUTE\_FLAGS\_REQUIRED** OR **ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS** OR **ABF\_ATTRIBUTE\_FLAGS\_DEVICE** OR **ABF\_CLIENT\_FIELD\_MOBILE**.

**Name:** Specifies that this attribute corresponds to the **mobile** attribute associated with Active Directory user and contact objects.

### 3.1.3.9 ABF\_ATTRIBUTE otherHomePhone

```
00000980:          15 00 0C 00 00 20 00          .....
00000990: 0A 6F 74 68 65 72 48 6F 6D 65 50 68 6F 6E 65 00 .otherHomePhone.
000009A0:
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x000C)																Length (0x0015)															
Flags (0x0A002000)																															
Name ("otherHomePhone")																															

**Length:** 0x0015 specifies the length of the remaining bytes in this structure.

**Id:** 0x000C specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0A002000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING** OR **ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS** OR **ABF\_CLIENT\_FIELD\_HOMENUMBER**.

**Name:** Specifies that this attribute corresponds to the **otherHomePhone** attribute associated with Active Directory user and contact objects.

### 3.1.3.10 ABF\_ATTRIBUTE homePhone

```
000009a0: 10 00 0b 00 00 28 00 0a 68 6f 6d 65 50 68 6f 6e .....(..homePhon
000009b0: 65 00                                     e.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x000B)																Length (0x0010)															
Flags (0x0A002800)																															

Name ("homePhone")
--------------------

**Length:** 0x0010 specifies the length of the remaining bytes in this structure.

**Id:** 0x000B specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x0A002800 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_ATTRIBUTE\_FLAGS\_REQUIRED OR ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS OR ABF\_CLIENT\_FIELD\_HOMENUMBER**.

**Name:** Specifies that this attribute corresponds to the **homePhone** attribute associated with Active Directory user and contact objects.

**3.1.3.11 ABF\_ATTRIBUTE telephoneNumber**

```
000009B0: 16 00 0A 00 00 28 02 09 74 65 6C 65 70 68 .....(..teleph
000009C0: 6F 6E 65 4E 75 6D 62 65 72 00 oneNumber.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x000A)																Length (0x0016)															
Flags (0x09022800)																															
Name ("telephoneNumber")																															

**Length:** 0x0016 specifies the length of the remaining bytes in this structure.

**Id:** 0x000A specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x09022800 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_ATTRIBUTE\_FLAGS\_REQUIRED OR ABF\_NORMALIZATION\_CONTROL\_PROXYADDRESS OR ABF\_ATTRIBUTE\_FLAGS\_DEVICE OR ABF\_CLIENT\_FIELD\_TELEPHONENUMBER**.

**Name:** Specifies that this attribute corresponds to the **telephoneNumber** attribute associated with Active Directory user and contact objects.

**3.1.3.12 ABF\_ATTRIBUTE msRTCSIP-PrimaryUserAddress**

```
000009C0: 22 00 09 00 00 08 ".....
000009D0: 02 08 6D 73 52 54 43 53 49 50 2D 50 72 69 6D 61 ..msRTCSIP-Prima
000009E0: 72 79 55 73 65 72 41 64 64 72 65 73 73 00 ryUserAddress.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0009)																Length (0x0022)															
Flags (0x08020800)																															
Name ("msRTCSIP-PrimaryUserAddress")																															

**Length:** 0x0022 specifies the length of the remaining bytes in this structure.

**Id:** 0x0009 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x08020800 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_ATTRIBUTE\_FLAGS\_REQUIRED OR ABF\_ATTRIBUTE\_FLAGS\_DEVICE OR ABF\_CLIENT\_FIELD\_MSRTCSIP\_PRIMARYUSERADDRESS.

**Name:** Specifies that this attribute corresponds to the **msRTCSIP-PrimaryUserAddress** attribute associated with Active Directory user and contact objects.

### 3.1.3.13 ABF\_ATTRIBUTE physicalDeliveryOfficeName

```

000009E0:                21 00                !.
000009F0: 08 00 00 00 00 07 70 68 79 73 69 63 61 6C 44 65 .....physicalDe
00000A00: 6C 69 76 65 72 79 4F 66 66 69 63 65 4E 61 6D 65 liveryOfficeName
00000A10: 00

```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0008)																Length (0x0021)															
Flags (0x07000000)																															
Name ("physicalDeliveryOfficeName")																															

**Length:** 0x0021 specifies the length of the remaining bytes in this structure.

**Id:** 0x0008 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x07000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_PHYSICALDELIVERYOFFICENAME.

**Name:** Specifies that this attribute corresponds to the **physicalDeliveryOfficeName** attribute associated with Active Directory user and contact objects.

### 3.1.3.14 ABF\_ATTRIBUTE company

```
00000A10: 0E 00 07 00 00 00 00 06 63 6F 6D 70 61 6E 79 .....company
00000A20: 00
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0007)											Length (0x000E)																				
Flags (0x06000000)																															
Name ("company")																															

**Length:** 0x000E specifies the length of the remaining bytes in this structure.

**Id:** 0x0007 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x06000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_COMPANY**.

**Name:** Specifies that this attribute corresponds to the **company** attribute associated with Active Directory user and contact objects.

### 3.1.3.15 ABF\_ATTRIBUTE mailNickname

```
00000A20: 13 00 06 00 00 04 00 05 6D 61 69 6C 4E 69 63 .....mailNic
00000A30: 6B 6E 61 6D 65 00 kname.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0006)											Length (0x0013)																				
Flags (0x05000400)																															
Name ("mailNickname")																															

**Length:** 0x0013 specifies the length of the remaining bytes in this structure.

**Id:** 0x0006 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x05000400 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_ATTRIBUTE\_FLAGS\_EMAIL OR ABF\_CLIENT\_FIELD\_MAILNICKNAME**.

**Name:** Specifies that this attribute corresponds to the **mailNickname** attribute associated with Active Directory user, contact and group objects.

### 3.1.3.16 ABF\_ATTRIBUTE title

```
00000A30:          0C 00 05 00 00 00 00 04 74 69          .....ti
00000A40: 74 6C 65 00                                     tle.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0005)																Length (0x000C)															
Flags (0x04000000)																															
Name ("title")																															

**Length:** 0x000C specifies the length of the remaining bytes in this structure.

**Id:** 0x0005 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x04000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_TITLE**.

**Name:** Specifies that this attribute corresponds to the **title** attribute associated with Active Directory user and contact objects.

### 3.1.3.17 ABF\_ATTRIBUTE displayName

```
00000A40:          12 00 04 00 00 00 02 03 64 69 73 70          .....disp
00000A50: 6C 61 79 4E 61 6D 65 00                       layName.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0004)																Length (0x0012)															
Flags (0x03020000)																															
Name ("displayName")																															

**Length:** 0x0012 specifies the length of the remaining bytes in this structure.

**Id:** 0x0004 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x03020000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_ATTRIBUTE\_FLAGS\_DEVICE OR ABF\_CLIENT\_FIELD\_DISPLAYNAME

**Name:** Specifies that this attribute corresponds to the **displayName** attribute associated with Active Directory user, contact and group objects.

### 3.1.3.18 ABF\_ATTRIBUTE sn

```
00000A50:          09 00 03 00 00 00 00 02  .....
00000A60: 73 6E 00                               sn.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0003)											Length (0x0009)																				
Flags (0x02000000)																															
Name ("sn")																															

**Length:** 0x0009 specifies the length of the remaining bytes in this structure.

**Id:** 0x0003 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x02000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_SN.

**Name:** Specifies that this attribute corresponds to the **sn** attribute associated with Active Directory user and contact objects.

### 3.1.3.19 ABF\_ATTRIBUTE givenName

```
00000A60:          10 00 02 00 00 00 00 01 67 69 76 65 6E  .....given
00000A70: 4E 61 6D 65 00                          Name.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x0002)											Length (0x0010)																				
Flags (0x01000000)																															
Name ("givenName")																															

**Length:** 0x0010 specifies the length of the remaining bytes in this structure.

**Id:** 0x0002 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0x01000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_GIVENNAME**.

**Name:** Specifies that this attribute corresponds to the **givenName** attribute associated with Active Directory user and contact objects.

### 3.1.3.20 ABF\_ATTRIBUTE msExchHideFromAddressLists

```
00000A70:          21 00 01 00 00 00 00 FF 6D 73 45      !.....msE
00000A80: 78 63 68 48 69 64 65 46 72 6F 6D 41 64 64 72 65 xchHideFromAddre
00000A90: 73 73 4C 69 73 74 73 00                          ssLists.
```

Id (0x0001)																	Length (0x0021)																
Flags (0xFF000000)																																	
Name ("msExchHideFromAddressLists")																																	

**Length:** 0x0021 specifies the length of the remaining bytes in this structure.

**Id:** 0x0001 specifies the identifier of this attribute as referenced by **ABF\_CONTACT** structures and the **MaximumAttributeId** field of the **ABF\_FULL\_HEADER** and **ABF\_DELTA\_HEADER** structures.

**Flags:** 0xFF000000 defines the type of attribute, how it is mapped by the client, and how it is processed by the Address Book Server. These flag settings correspond to the Boolean expression **ABF\_TYPE\_STRING OR ABF\_CLIENT\_FIELD\_IGNORE**.

**Name:** Specifies that this attribute corresponds to the **msExchHideFromAddressLists** attribute associated with Active Directory user, contact and group objects.

### 3.1.4 ABSUser1 Contact

#### 3.1.4.1 ABF\_CONTACT

```
00000A90:          66 01 0A AD 36 8C 97 5E      f...6..^
00000AA0: DD 46 8D 5B 25 51 40 C5 2B 00 12 00      .F.[%Q@.+...
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31		
Id (0xAD0A)																	Length (0x0166)																

0x5E978C36	
0x5B8D46DD	
0xC5405125	
NumberOfAttributes (0x0012)	0x002B

**Length:** 0x0166 specifies the length of the remaining bytes in the structure.

**Id:** {8c36ad0a-5e97-46dd-8d5b-255140c52b00} is the **objectGUID** value associated with ABSUser1 in the sample Active Directory data.

**NumberOfAttributes:** 0x0012 specifies the number of **ABF\_CONTACT\_ATTRIBUTE** structures that follow this structure.

### 3.1.4.2 ABF\_CONTACT\_ATTRIBUTE mail

```
00000AA0:                11 41 42 53                .ABS
00000AB0: 55 73 65 72 31 40 75 72 74 65 73 74 2E 63 6F 6D User1@urtest.com
00000AC0: 00
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
"ABSUser1@urtest.com"																Id (0x11)															

**Id:** 0x11 corresponds to the **mail ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser1@urtest.com" is a null-terminated string that is the value of the **mail** attribute for this contact.

### 3.1.4.3 ABF\_CONTACT\_ATTRIBUTE otherTelephone

```
00000AC0: 0F 35 35 35 2D 35 33 33 2D 34 33 31 32 00 .555-533-4312.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
"555-533-4312"																Id (0x0F)															

**Id:** 0x0F corresponds to the **otherTelephone ABF\_ATTRIBUTE** structure.

**Data:** "555-533-4312" is a null-terminated string that is the value of the **otherTelephone** attribute for this contact.

### 3.1.4.4 ABF\_CONTACT\_ATTRIBUTE otherTelephone, normalized

```
00000AC0:                                0F .
00000AD0: 74 65 6C 3A 2B 35 35 35 35 33 33 34 33 31 32 00 tel:+5555334312.
00000AE0:
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
" tel:+5555334312"																	Id (0x0F)														

**Id:** 0x0F corresponds to the **otherTelephone ABF\_ATTRIBUTE** structure.

**Data:** "tel:+5555334312" is a null-terminated string that is the value of the **otherTelephone** attribute for this contact. This attribute value is not present in Active Directory, because this is the normalized version of the actual value of the **otherTelephone** attribute stored in Active Directory that was reported in the previous **ABF\_CONTACT\_ATTRIBUTE** structure.

### 3.1.4.5 ABF\_CONTACT\_ATTRIBUTE mobile

```
00000AE0: 0D 35 35 35 2D 35 33 33 2D 34 33 31 33 00 .555-533-4313.

"sip:ABSUser5@urtest.rtmp.selfhost.corp.proseware.com"																	Id (0x09)														

**Id:** 0x09 corresponds to the **msRTCSIP-PrimaryUserAddress ABF\_ATTRIBUTE** structure.

**Data:** "sip:ABSUser5@urtest.rtmp.selfhost.corp.proseware.com" is a null-terminated string that is the value of the **msRTCSIP-PrimaryUserAddress** attribute for this contact.

### 3.1.5.5 ABF\_CONTACT\_ATTRIBUTE displayName

```

00000C60:          04 41 42 53 55 73 65          .ABSUse
00000C70: 72 35 5F 64 69 73 70 6C 61 79 6E 61 6D 65 00    r5_displayname.

```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
"ABSUser5_displayname"																	Id (0x04)														

**Id:** 0x04 corresponds to the **displayName ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser5\_displayname" is a null-terminated string that is the value of the **displayName** attribute for this contact.

### 3.1.5.6 ABF\_CONTACT\_ATTRIBUTE sn

```

00000C70:          03          .
00000C80: 41 42 53 55 73 65 72 35 5F 6C 61 73 74 6E 61 6D ABSUser5_lastnam
00000C90: 65 00          e.

```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
"ABSUser5_lastname"																Id (0x03)															

**Id:** 0x03 corresponds to the **sn ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser5\_lastname" is a null-terminated string that is the value of the **sn** attribute for this contact.

### 3.1.5.7 ABF\_CONTACT\_ATTRIBUTE givenName

```
00000C90:      02 41 42 53 55 73 65 72 35 5F 66 69 72 73      .ABSUser5_firs
00000CA0: 74 6E 61 6D 65 00                                tname.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
"ABSUser5_firstname"																Id (0x02)															

**Id:** 0x02 corresponds to the **givenName ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser5\_firstname" is a null-terminated string that is the value of the **givenName** attribute for this contact.

### 3.1.6 ABSUser2 Contact

#### 3.1.6.1 ABF\_CONTACT

```
00000CA0:      A6 00 1B 25 7C 47 42 DB F6 4E      ...%|GB..N
00000CB0: 9C 69 FA BB EC C6 7F 31 00 00 06 00      .i.....1....
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Id (0x251B)																Length (0x00A6)															
0xDB42477C																															
0x699C4EF6																															
0xC6ECBBFA																															
NumberOfAttributes (0x0000)																0x317F															
NumberOfDeletedAttributes (0x0006)																															

**Length:** 0x00A6 specifies the length of the remaining bytes in the structure.

**Id:** {477c251b-db42-4ef6-9c69-fabbecc67f31} is the **objectGUID** value associated with ABSUser2 in the sample Active Directory data.

**NumberOfAttributes:** 0x0000 specifies that this contact was deleted. Because the **Length** field specifies a length greater than 18, the next field is also present.

**NumberOfDeletedAttributes:** 0x0006 specifies the number of **ABF\_CONTACT\_ATTRIBUTE** structures that follow this structure.

### 3.1.6.2 ABF\_CONTACT\_ATTRIBUTE telephoneNumber

```
00000CB0:                                0A 35 35 35                                .555
00000CC0: 2D 37 38 33 2D 34 37 35 36 00          -783-4756.
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31				
"555-783-4756"																		Id (0x0A)																	

**Id:** 0x0A corresponds to the **telephoneNumber ABF\_ATTRIBUTE** structure.

**Data:** "555-783-4756" is a null-terminated string that is the value of the **telephoneNumber** attribute for this contact.

### 3.1.6.3 ABF\_CONTACT\_ATTRIBUTE telephoneNumber, normalized

```
00000CC0:                                0A 74 65 6C 3A 2B                                .tel:+
00000CD0: 35 35 35 37 38 33 34 37 35 36 00          5557834756 .
```

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31				
"tel:+5557834756 "																		Id (0x0A)																	

**Id:** 0x0A corresponds to the **telephoneNumber ABF\_ATTRIBUTE** structure.

**Data:** "tel:+5557834756 " is a null-terminated string that is the value of the "telephoneNumber" attribute for this contact.

### 3.1.6.4 ABF\_CONTACT\_ATTRIBUTE msRTCSIP-PrimaryUserAddress

```
00000CD0:                                09 73 69 70 3A                                .sip:
00000CE0: 41 42 53 55 73 65 72 32 40 75 72 74 65 73 74 2E ABSUser2@urtest.
00000CF0: 72 74 6D 70 2E 73 65 6C 66 68 6F 73 74 2E 63 6F rtmp.selfhost.co
00000D00: 72 70 2E 70 72 6F 73 65 77 61 72 65 2E 63 6F 6D rp.proseware.com
00000D10: 00 .
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
"sip:ABSUser2@urtest.rtmp.selfhost.corp.proseware.com"																	Id (0x09)														

**Id:** 0x09 corresponds to the **msRTCSIP-PrimaryUserAddress ABF\_ATTRIBUTE** structure.

**Data:** "sip:ABSUser2@urtest.rtmp.selfhost.corp.proseware.com" is a null-terminated string that is the value of the **msRTCSIP-PrimaryUserAddress** attribute for this contact.

### 3.1.6.5 ABF\_CONTACT\_ATTRIBUTE displayName

```
00000D10: 04 41 42 53 55 73 65 72 32 5F 64 69 73 70 6C .ABSUser2_displ
00000D20: 61 79 6E 61 6D 65 00                             ayname.
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
"ABSUser2_displayname"																	Id (0x04)														

**Id:** 0x04 corresponds to the **displayName ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser2\_displayname" is a null-terminated string that is the value of the **displayName** attribute for this contact.

### 3.1.6.6 ABF\_CONTACT\_ATTRIBUTE sn

```
00000D20: 03 41 42 53 55 73 65 72 32 .ABSUser2
00000D30: 5F 6C 61 73 74 6E 61 6D 65 00 lastname.
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
"ABSUser2_lastname"																	Id (0x03)														

**Id:** 0x03 corresponds to the **sn ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser2\_lastname" is a null-terminated string that is the value of the **sn** attribute for this contact.

### 3.1.6.7 ABF\_CONTACT\_ATTRIBUTE givenName

```
00000D30: 02 41 42 53 55 73 .ABSUs
00000D40: 65 72 32 5F 66 69 72 73 74 6E 61 6D 65 00 er2 firstname.
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
"ABSUser2_firstname"																Id (0x02)															

**Id:** 0x02 corresponds to the **givenName ABF\_ATTRIBUTE** structure.

**Data:** "ABSUser2\_firstname" is a null-terminated string that is the value of the **givenName** attribute for this contact.

### 3.1.7 ABF\_CONTACT

This section provides an example of the address book file **ABF\_CONTACT** structure specified in section [2.2.10](#).

```
00000D40:                                     12 00 ..
00000D50: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 ..
00000D60: 00 00 ..
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Id (0x0000)												Length (0x0012)																			
												0x00000000																			
												0x00000000																			
												0x00000000																			
NumberOfAttributes (0x0000)												0x0000																			

**Length:** 0x0012 specifies the length of the remaining bytes in the structure.

**Id:** {00000000-0000-0000-0000-000000000000} is a GUID with a value of 0, which indicates the end of the **ABF\_CONTACT** array.

**NumberOfAttributes:** 0x0000 specifies that this contact was deleted, unless the GUID in the **Id** field has a value of 0, in which case this structure indicates the end of the **ABF\_CONTACT** array.

### 3.1.8 ABF\_DELTA\_TRAILER

This section provides an example of the address book file **ABF\_DELTA\_TRAILER** structure specified in section [2.2.13](#).

```
00000D60: DB DF D2 DD 02 00 00 00 01 00 00 00 ..
```

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
BaseFileHash (0xDDD2)										Hash (0xDFDB)																								
NumberOfContacts (0x00000002)																																		
NumberOfDeletedContacts (0x00000001)																																		

**Hash:** 0xDFDB is the **hash** of the contents of the file. The **cryptographic hash function** that is used can be anything, as long as it is the same function for all files.

**BaseFileHash:** 0xDDD2 is the hash of the contents of the base file that was used to calculate this delta file. The hash function that is used can be anything, as long as it is the same function for all files.

**NumberOfContacts:** 0x00000002 specifies the number of **ABF\_CONTACT** structures in the file that have a nonzero value in the **NumberOfAttributes** field.

**NumberOfDeletedContacts:** 0x00000001 specifies the number of **ABF\_CONTACT** structures in the file that have a zero value in the **NumberOfAttributes** field.

### 3.1.9 ABF\_TRAILER\_LENGTH

This section provides an example of the address book file **ABF\_TRAILER\_LENGTH** structure specified in section [2.2.14](#).

```
00000D60:                                0C 00      ..
00000D70: 00 00      ..
```

0	1	2	3	4	5	6	7	8	9	1	0	1	2	3	4	5	6	7	8	9	2	0	1	2	3	4	5	6	7	8	9	3	0	1
LengthOfTrailer (0x0000000C)																																		

**LengthOfTrailer:** 0x0000000C length of the **ABF\_DELTA\_TRAILER** structure in this file. This allows additional information to be placed in the file after the **ABF\_DELTA\_TRAILER** structure and before the **ABF\_TRAILER\_LENGTH** structure without affecting older clients.

### 3.2 Compressed Address Book File

Using the compressed form of the D-0A10-0A11.lsabs file seen in [Address Book File Example](#), the hexadecimal dump of the compressed file is as follows:

```
00000000: 6e 65 5c a2 83 04 00 00 72 0d 00 00 20 00 00 00 ne\.....r... ..

### 3.3 COMPRESSED\_BLOCK\_HEADER

Each **COMPRESSED\_BLOCK** structure in a compressed address book file begins with a **COMPRESSED\_BLOCK\_HEADER** structure that gives the size of the remaining bytes in the **COMPRESS\_BLOCK** structure.

```
00000000: 6e 65 5c a2 83 04 00 00 72 0d 00 00          ne\.....r...
```

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
CRC (0xA25C656E)																															
CompressedSize (0x00000483)																															
DecompressedSize (0x00000D72)																															

**CRC:** 0xA25C656E is the **CRC** of the decompressed **Data** bytes in the block. The algorithm that is used to compute this value is described in the next section.

**CompressedSize:** 0x00000483 is the length, in bytes, of the **Data** field that follows the **COMPRESSED\_BLOCK\_HEADER**.

**DecompressedSize:** 0x00000D72 is the expected length, in bytes, of the decompressed data.

## 5 Appendix A: Compression Format

The information in this section describes the format of compressed Address Book Files with examples and pseudo code to decompress a compressed file.

### 5.1 32-Bit CRC Algorithm

This section uses pseudo code to explain how to generate the 32-bit **CRC** value stored in the **CRC** field of the **COMPRESSED\_BLOCK\_HEADER** structure.

```
Define CalculateCRC32 as Function With Parameters (
  buffer as unsigned char []
  length as unsigned integer
)
Begin
  Define crc as unsigned integer
  Define index as integer

  crc = 0xFFFFFFFF
  index := 0
  While (index < length)
  Begin
    crc := crc32_table [(crc AND 0xFF) XOR buffer [index]] ^ (crc / 256)
    index := index + 1
  End
  return crc XOR 0xFFFFFFFF
End

Define crc32_table as unsigned integer [256] =
Begin

## 5.2 Compressed Data Format

The compression technique used to compress the output files belongs to the LZ77 family, as described in [\[UASDC\]](#), and is based on a simple idea: compression is achieved by substitution of substrings with pointers to previous occurrence of exactly the same substring in form of (**offset, length**) where **offset** is offset to the beginning of matching substring and **length** is its length

At the highest level, each block of compressed data consists of one or more token groups. All but the last token group has 32 tokens. Each token group starts out with a 32-bit unsigned integer, where each bit indicates the type of one token. Bit 0 gives the type of the first token, Bit 1 the type of the second token, and so on. The data for each token is serialized after the 32-bit unsigned integer. If a bit in the unsigned integer is 0, then the corresponding token is a literal byte, which is copied directly from the input buffer to the output buffer. If the bit is 1, then the corresponding token is a reference to a sequence of 3 or more bytes from a previous position in the output buffer. The length and offset of the data to be copied are encoded in the data for the token. This encoding occupies a minimum of 2 bytes and a maximum of 6 bytes, depending on the length of the data being copied.

## 5.3 Run Encoding

As described in the previous section, when a run of characters is encoded, a length and offset are stored in a minimum of 2 bytes and a maximum of 6. This encoding works by storing the offset in the high 13 bits of the first two bytes and the length in the low 3 bits. Because the compression algorithm does not generate runs shorter than 3 bytes, the length is biased by -3.

The first 2 bytes are treated as an unsigned 16-bit integer, with the high 13 bits being the offset and the low 3 bits being the length. The offset has been biased by -1, so in order for the number to be useful, 1 must be added back to it. The offset is a backwards offset from the current position in the output buffer. So after adjusting for the -1 bias, an offset of zero in the high 13 bits would be 1, and that value (1) would then be subtracted from the current position in the output buffer to get the location of the previous character in the buffer that starts the run.

The length field is biased by -3, because no runs of length less than 3 can be emitted by the compression algorithm. So a value of 0 in the low 3 bits is really a length of 3. This bias makes it possible to encode lengths of 3 to 10 (0 through 7) in 3 bits. Because the length will often be greater than 10 bits, there is an additional mechanism: If all 3 bits are set (0x7), then the next byte is examined. The first time, the low 4 bits of that byte are extracted as the length, and the location of the byte is stored. This 4-bit length is biased by -10 ( $-(3+7)$ ), so it is now possible to represent lengths of 10 through 25 using the three-byte notation. In fact, only two and a half bytes are available, because each run of length 10 to 25 uses either the low or high four bits of the byte. Again, to accommodate lengths greater than 25, there is another escape mechanism: If all 4 bits are 1 (0xF), then the next byte is also examined. If the next byte is not equal to 255 (0xFF), then that is the length, biased by -25 ( $-(3+7+15)$ ), so it is possible to encode lengths of 25 through 279. Finally, if the fourth byte is 255 (0xFF), then the next two bytes contain the length, biased by -3. The following section contains pseudo code to demonstrate this encoding algorithm. The decompression pseudo code in the section after that shows how to decode the encoded offset and length.

#### 5.4 Pseudo Code to Encode Offset and Length into a Token

While this code is necessary to generate a well formed compressed file, the bulk of the complexity in any LZ77 compression algorithm is the logic to find duplicate runs of bytes in the input. That logic is beyond the scope of this specification.

```

Define NibbleIndex as integer := -1

Define EncodeOffsetLength as Function With Parameters (
  offset as unsigned integer
  length as unsigned integer
  outputBuffer as unsigned char array
  outputIndex as unsigned integer
)
Begin
  Define nibbleValue as unsigned integer

  offset := offset - 1
  length := length - 3

  offset := offset times 8
  If (length < 7)
  Begin
    offset := offset OR length
    outputBuffer [outputIndex] = offset
    outputBuffer [outputIndex+1] = offset / 256
    return outputIndex + 2
  End

  offset := offset OR 0x7
  length -= 7;

  outputBuffer [outputIndex] = offset
  outputBuffer [outputIndex+1] = offset / 256
  outputIndex := outputIndex + 2

  nibbleValue = length
  If (nibbleValue >= 15)
  Begin
    nibbleValue = 15
  End

  If (NibbleIndex equals -1)
  Begin
    NibbleIndex := outputIndex
    outputBuffer [NibbleIndex] := nibbleValue
    outputIndex := outputIndex + 1
  End
End
Else

```

```

Begin
    outputBuffer [NibbleIndex] := outputBuffer [NibbleIndex] OR (nibbleValue times 16)
    NibbleIndex := -1
End
If (nibbleValue equals 15)
Begin
    length := length - 15
    If (length >= 255)
    Begin
        length := length + 7 + 15
        outputBuffer [outputIndex] := 255
        outputBuffer [outputIndex + 1] := length
        outputBuffer [outputIndex + 2] := length / 256
        outputIndex := outputIndex + 3
    End
    Else
    Begin
        outputBuffer [outputIndex] := length
        outputIndex := outputIndex + 1
    End
End
return outputIndex
End

```

## 5.5 Pseudo Code to Decompress an Address Book File

Decompressing a compressed file consists of the following steps:

1. Looping over the input file.
2. Reading a **COMPRESSED\_BLOCK\_HEADER**.
3. Reading from that header the **Data** portion of the **COMPRESSED\_BLOCK** based on the **CompressedSize** field in the **COMPRESSED\_BLOCK\_HEADER** structure.
4. Allocating an output buffer based on the **DecompressedSize** field in the **COMPRESSED\_BLOCK\_HEADER** structure and decompressing the input buffer into the output buffer according to the algorithm described in earlier in this section.

The following pseudo code implements this procedure. The pseudo code assumes that file handles of some sort have been opened to the input file to be decompressed and to the decompressed file that is being created. It also assumes the existences of **ReadFile** and **WriteFile** primitives to read and write bytes to and from those files handles. In the interest of brevity, there is no error checking logic in the following pseudo code, and the pseudo code assumes a well-formed input file.

### 5.5.1 Function to Decompress a File

```

Define DecompressFile as Function With Parameters (
    inputFile as FileHandle,
    outputFile as FileHandle
)
Begin
    Define blockHeader as structure
    Begin
        Define crc32 as unsigned integer
        Define compressedSize as unsigned integer
        Define decompressedSize as unsigned integer
    End
    Define bufferSize as unsigned integer := 65536
    Define inputBuffer as unsigned char [bufferSize]
    Define outputBuffer as unsigned char [bufferSize]

```

```

Define bytesRead as unsigned integer

While (ReadFile (inputFile, blockHeader, sizeof (blockHeader)) not equal 0)
Begin
  ReadFile (inputFile, inputBuffer, blockHeader.compressedSize);
  If (blockHeader.compressedSize < blockHeader.decompressedSize)
  Begin
    DecompressBuffer (inputBuffer, outputBuffer, blockHeader.decompressedSize);
    WriteFile (outputFile, outputBuffer, blockHeader.decompressedSize);
  End
  Else
  Begin
    // Block is not compressed, just write to output file
    WriteFile (outputFile, inputBuffer, blockHeader.compressedSize);
  End
End
End

```

## 5.5.2 Function to Decompress the Bytes in a Block

The following pseudo code shows how to decompress the bytes in the **Data** field of a **COMPRESSED\_BLOCK** structure. The Print statements are for debugging purposes and are not necessary, nor are the tokenGroup and tokenIndex variables, which are there to support the Print statements.

```

Define DecompressBuffer as Function With Parameters (
  inputBuffer as unsigned char []
  outputBuffer as unsigned char []
  outputSize as unsigned integer
)
Begin
  Define inputIndex as unsigned integer
  Define outputIndex as unsigned integer
  Define tokenType as unsigned integer
  Define tokenTypeMask as unsigned integer
  Define nibbleIndex as integer
  Define offset as integer
  Define length as unsigned integer
  Define tokenGroup as unsigned integer
  Define tokenIndex as unsigned integer

  inputIndex := 0
  outputIndex := 0
  tokenTypeMask := 0
  nibbleIndex := -1
  tokenGroup := 1

  While (outputIndex < outputSize)
  Begin
    If (tokenTypeMask < 2)
    Begin
      tokenType := inputBuffer [inputIndex] |
        inputBuffer [inputIndex + 1] times 256 |
        inputBuffer [inputIndex + 2] times 256 times 256 |
        inputBuffer [inputIndex + 3] times 256 times 256 times 256
      inputIndex := inputIndex + 4
      tokenTypeMask := 0x80000000
      Print "Token Group [" + tokenGroup + "]: tokenType: " + tokenType + NewLine
      tokenGroup := tokenGroup + 1
    End
    Else
    Begin
      tokenTypeMask := tokenTypeMask / 2
    End
  End
End

```

```

Print " Token [" + tokenIndex + "]: "
tokenIndex := tokenIndex + 1
If ((tokenType & tokenTypeMask) equal 0)
Begin
    Print " LITERAL: " + inputBuffer [inputIndex] +

Preliminary

## 6 Appendix B: Hash Function

The ABF\_FULL\_TRAILER and ABF\_DELTA\_TRAILER structures contain **hash** fields. The **cryptographic hash function** used to compute these fields is implementation-specific, with the requirement that the same function be used in computing each **hash code** for each Address Book Server file in a deployment and that the hash value have a high probability of being unique for each file [<13>](#). The following pseudo code is an example of a cryptographic hash function.

```
Define HashContacts as Function With Parameters (
    contacts as ABF_CONTACT []
    numberOfContacts as unsigned integer
)
Begin
    Define contactIndex as unsigned integer
    Define hashValue as unsigned integer

    hashValue = 0
    For (contactIndex=0; contactIndex<numberOfContacts; contactIndex++)
        Begin
            hashValue = hashValue + HashContact (contacts [contactIndex])
        End

        //
        // Return 16 bit hash value
        //
        Return (hashValue & 0xFFFF) XOR (hashValue >> 16)
    End

Define HashContact as Function With Parameters (
    contact as ABF_CONTACT
)
Begin
    Define hashValue as unsigned integer
    Define attributeIndex as unsigned integer

    hashValue = HashBytes (contact.Id, SizeOf (contact.Id))
    For (attributeIndex=0; attributeIndex<contact.NumberOfAttributes; attributeIndex++)
        Begin
            hashValue = hashValue + HashContactAttribute (contact.Attributes [attributeIndex])
        End

    Return hashValue
End

Define HashContactAttribute as Function With Parameters (
    contactAttribute as ABF_CONTACT_ATTRIBUTE
)
Begin
    // contactAttribute.Length may or may not be a computed field
    // depending upon the type of attribute.
    Return HashBytes (contactAttribute.Data, contactAttribute.Length)
End

Define HashBytes as Function With Parameters (
    buffer as unsigned char []
    bufferLength as unsigned integer
)
Begin
    Define hashValue as unsigned integer
    Define bufferIndex as unsigned integer
    Define c as unsigned char

    hashValue = 0
    For (bufferIndex=0; bufferIndex<bufferLength; bufferIndex++)
        Begin
            c = buffer [bufferIndex]
            hashValue = hashValue + (c << 1) + (c >> 1) + c
        End
    End
```

```
Return hashValue  
End
```

Preliminary

## 7 Appendix C: Active Directory Scanning Algorithm

The primary function of the Address Book Server is to scan Active Directory for users, contacts, and groups and determine which objects to include in the Address Book Server files and, for each object included, which attributes to include. The following pseudo-code example illustrates how a scanning process works.

```
// This is a representation of the ABF ATTRIBUTES Structure
//
extern Dictionary<String, ABF_ATTRIBUTE> attributeTable;
adObjects = select from Active Directory where ObjectType == Group Or
           ObjectType == User Or
           ObjectType == Contact

foreach (adObject in adObjects)
{
    hideObject = false;
    includeAttributeSeen = false;
    requiredAttributeSeen = false;
    foreach (adAttribute in adObject.Attributes)
    {
        if (attributeTable [adAttribute.Name].Flags &
            ABF_ATTRIBUTE_FLAGS_EXCLUDE)
        {
            // Exclude attribute seen, so bail now.
            // Not going to take this adObject.
            hideObject = true;
            break;
        }
        if (attributeTable [adAttribute.Name].Flags &
            ABF_ATTRIBUTE_FLAGS_INCLUDE)
        {
            // Include attribute seen, so assume
            // this adObject will be taken
            includeAttributeSeen = true;
        }
        if (attributeTable [adAttribute.Name].Flags &
            ABF_ATTRIBUTE_FLAGS_REQUIRED)
        {
            // Required attribute seen, so assume
            // this adObject will not be taken
            requiredAttributeSeen = true;
        }
    }

    If (attributeTable.HasRequiredAttributes && !requiredAttributeSeen)
    {
        // There was at least one ABF_ATTRIBUTE_FLAGS_REQUIRED attribute
        // defined in the attributeTable, but no required
        // attributes on this adObject, so hide it.
        hideObject = true;
    }
    else
    If (attributeTable.HasIncludeAttributes && !includeAttributeSeen)
    {
        // There was at least one ABF_ATTRIBUTE_FLAGS_INCLUDE attribute
        // defined in the attributeTable, but no include
        // attributes on this adObject, so hide it.
        hideObject = true;
    }

    if (hideObject)
    {
        // Not interested in this adObject so on to the next one.
        continue;
    }
}

//
```

```
// This adObject should be in address book files so process it
//
}
```

Preliminary

## 8 Appendix D: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Office Communications Server 2007
- Microsoft Office Communications Server 2007 R2
- Microsoft Office Communicator 2007
- Microsoft Office Communicator 2007 R2
- Microsoft Lync Server 2010
- Microsoft Lync 2010
- Microsoft Lync Server 2013
- Microsoft Lync Client 2013/Skype for Business
  
- Microsoft Skype for Business 2016
  
- Microsoft Skype for Business Server 2015
  
- Microsoft Skype for Business 2019 Preview

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

[<1> Section 1.3](#): Office Communications Server 2007, Office Communicator 2007: Product behavior not supported. Product behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2 and Office Communicator 2007 R2.

[<2> Section 1.3](#): Office Communications Server 2007, Office Communicator 2007: Product behavior not supported. Product behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2 and Office Communicator 2007 R2.

[<3> Section 1.3.3](#): Office Communications Server 2007, Office Communicator 2007: This behavior is not supported. This behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2 and Office Communicator 2007 R2.

[<4> Section 2.1.4](#): This value is not used by Communicator clients.

[<5> Section 2.2.3](#): Office Communicator 2007 and Office Communicator 2007 R2 uses `MaximumAttributeId+1` as the value of `NumberOfAttributes` if `MaximumAttributeId` is less than 256. Otherwise, it uses the `NumberOfAttributes` field. To work with the clients in Appendix B, values in the `Id` field of `ABF_ATTRIBUTE` structure must start at 1 and be contiguous.

[<6> Section 2.2.4](#): Office Communications Server 2007, Office Communicator 2007: Product behavior not supported. Product behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2, Office Communicator 2007 R2.

[<7> Section 2.2.4](#): Office Communicator 2007 and Office Communicator 2007 R2 uses `MaximumAttributeId+1` as the value of `NumberOfAttributes` if `MaximumAttributeId` is less than 256. Otherwise, it uses the `NumberOfAttributes` field. To work with the clients in Appendix B, values in the `Id` field of `ABF_ATTRIBUTE` structure must start at 1 and be contiguous.

<8> [Section 2.2.5](#): Office Communicator 2007, Office Communications Server 2007: The Microsoft .NET Framework 2.0 Regular Expression library is used. For all other products, Microsoft .NET Framework 3.5 Regular Expression library is used.

<9> [Section 2.2.15](#): Office Communications Server 2007, Office Communicator 2007: This behavior is not supported. This behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2 and Office Communicator 2007 R2.

<10> [Section 2.2.16](#): Office Communications Server 2007, Office Communicator 2007: This behavior is not supported. This behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix applies to Office Communications Server 2007 R2 and Office Communicator 2007 R2.

<11> [Section 3.1](#): Office Communications Server 2007, Office Communicator 2007: Product behavior not supported. Product behavior added in relation to Knowledge Base Article 972403, July 2009; starting with the phrase "and a compact delta book file". This hotfix applies to Office Communications Server 2007 R2, Office Communicator 2007 R2.

<12> [Section 3.1](#): Office Communications Server 2007, Office Communicator 2007: Product behavior not supported. Product behavior added in relation to Knowledge Base Article 972403, July 2009. This hotfix release applies to Office Communications Server 2007 R2, Office Communicator 2007 R2.

<13> [Section 6](#): Office Communications Server 2007 calls the Microsoft .NET Framework GetHashCode method on the individual objects to compute the hash code. The other supported products call .NET Framework 3.5 GetHashCode method on the individual objects to compute the hash code.

## 9 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).
