Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.

- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Preliminary Documentation. This Open Specification provides documentation for past and current releases and/or for the pre-release (beta) version of this technology. This Open Specification is final

documentation for past or current releases as specifically noted in the document, as applicable; it is preliminary documentation for the pre-release (beta) versions. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. As the documentation may change between this preliminary version and the final version of this technology, there are risks in relying on preliminary documentation. 1.3 Overview

This protocol is used for managing data maintained by a protocol server, which provides access to a protocol client that renders the data provided by the protocol server. The communication is always initiated by the protocol client using different operations, the functionality of which is outlined in section [1.3.2](#). A typical scenario for this protocol is opening a **result set** and updating data.

1.3.1 Session-based Protocol

The protocol is **session (2)** based and uses a unique **session identifier (2)**. This session identifier (2) is generated when a new session (2) is created and is used thereafter to refer to that particular session (2).

- Multiple sessions (2) can exist at the same time.
- Result sets are not shared across sessions (2).

Sessions (2) can be created and closed independently.

1.3.2 Protocol Operations

The protocol provides the following sets of functionality:

- Creation, modification, and deletion of objects in a database application.
- Querying a protocol server for information about a database application or the objects in it.
- Setting some behaviors for a database application.
- Creation of packages that describe a database application
- Creating and enabling logins on the database application, which enable connecting to the database application directly.
- Creating and managing databases that are used to store data in database applications.
- Creating, reading, updating and deleting data from the database application.
- Getting information about the protocol server.

1.4 Relationship to Other Protocols

The Access Services Data Run Time Protocol uses **SOAP** over **HTTP**, as described in [\[RFC2616\]](#), and SOAP over **HTTPS**, as described in [\[RFC2818\]](#), as shown in the following layering diagram:

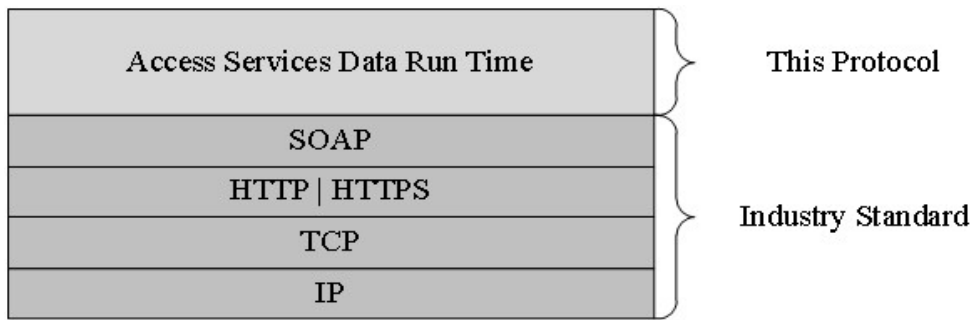

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol operates against a protocol server that exposes one or more **endpoint (4) URIs** that are known by protocol clients. The endpoint (4) URI of the protocol server and the transport that is used by the protocol server are either known by the protocol client or obtained by using the discovery mechanism that is described in [\[MS-SPTWS\]](#).

The protocol client obtains the requisite ApplicationClassId and ApplicationVersion values and the endpoint (4) URI of the protocol server that provides the discovery mechanism, as described in [\[MS-SPTWS\]](#), by means that are independent of either protocol.

This protocol requires the protocol client to have appropriate permission to call the methods on the protocol server.

The protocol client implements the token-based security mechanisms that are required by the protocol server and related security protocols, as described in [\[MS-SPSTWS\]](#).

1.6 Applicability Statement

This protocol is applicable for the following scenarios:

- Creation, modification, and deletion of objects in a database application.
- Querying a protocol server for information about a database application or the objects in it.
- Setting some behaviors for a database application.
- Creation of packages that describe a database application
- Creating and enabling logins on the database application, which enable connecting to the database application directly.
- Creating and managing databases that are used to store data in database applications.
- Managing sessions (2) between protocol client and protocol server.
- Creating, reading, updating, or deleting data on the protocol server.
- Monitoring the health of the protocol server.

1.7 Versioning and Capability Negotiation

This protocol can be implemented by using transports that support sending Simple Object Access Protocol (SOAP) messages, as described in section [2.1](#).

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

Preliminary

2 Messages

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The **WSDL** in this specification matches the **WSDL** that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **not null** and **present**.

2.1 Transport

Protocol servers **MUST** support SOAP over HTTP or HTTPS.

All protocol messages **MUST** be transported by using HTTP or HTTPS bindings at the transport level.

Protocol messages **MUST** be formatted as specified by [\[SOAP1.2/1\]](#) section 5. Protocol server faults **MUST** be returned by using either an HTTP **Status-Code**, as specified by [\[RFC2616\]](#) section 10, or **SOAP faults**, as specified by [\[SOAP1.2/1\]](#) section 5.4.

If the **HTTPS** transport is used, a server certificate **MUST** be deployed.

This protocol **MAY** transmit an additional SOAP header, the **ServiceContext** header, as specified by [\[MS-SPSTWS\]](#) section 2.2.4.1.

This protocol does not define any means for activating a protocol server or protocol client. The protocol server **MUST** be configured and begin listening in an implementation-specific way. In addition, the protocol client **MUST** know the format and transport that is used by the protocol server, for example, the SOAP format over the HTTP transport.

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses an **XML schema** as defined by [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and the **WSDL** as defined by [\[WSDL\]](#).

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

2.2.2 Messages

This specification does not define any common **WSDL** message definitions.

2.2.3 Elements

This specification does not define any common XML schema element definitions.

- The SOAP fault **Detail** element ([\[SOAP1.2/1\]](#) section 5.4.5) MUST contain the protocol server alert specified by section [2.2.4.1](#).

When returning a SOAP fault ([\[SOAP1.2/1\]](#) section 5.4) or a **ServiceError** ([\[MS-AADT\]](#) section 2.2.4.7) as a response, the protocol server MUST return a **fault identifier** (section [2.2.5.2](#)) in the response either as the **Value** element ([\[SOAP1.2/1\]](#) section 5.4.1.3) inside a **Subcode** element ([\[SOAP1.2/1\]](#) section 5.4.1.2) of the SOAP fault ([\[SOAP1.2/1\]](#) section 5.4), or as the **Code** attribute in a **ServiceError** ([\[MS-AADT\]](#) section 2.2.4.7).

Preliminary

3 Protocol Details

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The WSDL in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions differences that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **not null**, and **present**.

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls that are made by the higher-layer protocol or application are passed directly to the transport, and the results that are returned by the transport are passed directly to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret Hypertext Transfer Protocol (HTTP) status codes that are returned by the protocol server as specified in [\[RFC2616\]](#), section 10.

This protocol allows protocol servers to notify protocol clients of application-level faults by using SOAP faults. Except where otherwise specified, these SOAP faults are not significant for interoperability and protocol clients can interpret them in an implementation-specific manner.

This protocol allows protocol servers to perform implementation-specific authorization checks and to notify protocol clients of authorization faults by using either HTTP status codes or SOAP faults, as specified previously in this section.

3.1 Client Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls that are made by the higher-layer protocol or application are passed directly to the transport, and the results that are returned by the transport are passed directly to the higher-layer protocol or application.

For any of the **Runtime protocol operations** (section [3.2.1](#)) however, the client side of this protocol needs to call the **OpenSession** operation (section [3.2.4.11](#)) and **GetObjectSchema** operation (section [3.2.4.7](#)) before calling any other runtime protocol operation. The **OpenSession** operation creates a new session (2) on the protocol server and assigns a **sessionId** (section [3.2.4.11.2.2](#)) to the newly created session (2). The **GetObjectSchema** operation creates a new result set on the current session (2) and assigns a unique **moniker** (section [3.2.4.7.2.2](#)) for the result set. The protocol client can then call any other runtime operation using the **moniker** and the **sessionId** elements to ensure that actions are performed on the same result set. If the protocol client wants to query data from any other **Source** (section [3.2.1.1](#)) in the database application, it does not need to call **OpenSession** operation again. However, it MUST call **GetObjectSchema** operation with the object name passed in the **source** input element. This operation will create another result set in the same session (2) and assign a new **moniker** to it.

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations

adhere to this model as long as their external behavior is consistent with that described in this document.

The protocol operations are divided into two major categories:

- Design time protocol operations.
- Runtime protocol operations.

Design time protocol operations: The design time protocol operations enable creation and modification of database application. Once the database application has been created, the design time protocol operations enable creation, modification, and deletion of objects in the database application. Some design time operations can be used to query information about the database application or objects in it. Some operations can be used to create and enable logins which can connect directly to the database application.

All the design time protocol operations are listed following.

AddFirewallRule operation (section [3.2.4.13](#)), **CreateAccessObject** operation (section [3.2.4.14](#)), **CreateApplication** operation (section [3.2.4.15](#)), **CreatePackage** operation (section [3.2.4.16](#)), **DeleteAccessObject** operation (section [3.2.4.17](#)), **DeleteApplication** operation (section [3.2.4.18](#)), **DeleteFirewallRules** operation (section [3.2.4.19](#)), **GetAccessObject** operation (section [3.2.4.20](#)), **GetApplicationInformation** operation (section [3.2.4.21](#)), **GetDataConnectivity** operation (section [3.2.4.23](#)), **GetApplicationProperties** operation (section [3.2.4.22](#)), **GetDataConnectivityStatus** operation (section [3.2.4.24](#)), **GetFirewallRules** operation (section [3.2.4.25](#)), **GetLinkedTableInformation** operation (section [3.2.4.26](#)), **GetThemeList** operation (section [3.2.4.27](#)), **ImportData** operation (section [3.2.4.28](#)), **RefreshLinkedTableInformation** operation (section [3.2.4.29](#)), **RenameAccessObject** operation (section [3.2.4.30](#)), **SetApplicationProperties** operation (section [3.2.4.31](#)), **SetDataConnectivityStatus** operation (section [3.2.4.32](#)), **SetDataMacroTracing** operation (section [3.2.4.33](#)), **UpdateAccessObject** operation (section [3.2.4.34](#)), **CheckCopyStatus** operation (section [3.2.4.35](#)), **CopyDatabase** operation (section [3.2.4.36](#)), **DatabaseExists** operation (section [3.2.4.37](#)), **ExecuteDacIncrementalUpgrade** operation (section [3.2.4.38](#)), **GetAvailableServer** operation (section [3.2.4.39](#)), **GetPackage** operation (section [3.2.4.40](#)), **GetServerName** operation (section [3.2.4.41](#)), **ProvisionDatabase** operation (section [3.2.4.42](#)), **RenameDatabase** operation (section [3.2.4.43](#)), **SetReadWrite** operation (section [3.2.4.44](#)), and **UnprovisionDatabase** operation (section [3.2.4.45](#)).

Run time protocol operations: The run time protocol operations enable querying, inserting, updating and deleting of data in the database application. Once the database application and objects in it have been created, the run time operations can be called by the protocol client. To enable a collaborative environment, the protocol client MUST call **OpenSession** operation (section [3.2.4.11](#)) and **GetObjectSchema** operation (section [3.2.4.7](#)) before any runtime operation. The **OpenSession** operation creates a new session (2) and the **GetObjectSchema** operation creates a result set in the current session (2) and assigns a **moniker** (section [3.2.4.7.2.1](#)) for it. All the subsequent run time operations use this **moniker**, to perform actions on the same result set. If the protocol client wants to query data from any other object in the database application, it MUST call **GetObjectSchema** operation with the object name passed in the **source** input element. This operation will create another result set in the current session (2) and assign a new **moniker** to it.

All the run time protocol operations are listed following.

CloseSession operation (section [3.2.4.1](#)), **DeleteData** operation (section [3.2.4.2](#)), **FixupRow** operation (section [3.2.4.3](#)), **GetData** operation (section [3.2.4.4](#)), **GetDistinctValues** operation (section [3.2.4.5](#)), **GetObjectSchema** operation (section [3.2.4.7](#)), **InsertData** operation (section

[3.2.4.8](#)), **KeepAlive** operation (section [3.2.4.9](#)), **OpenResultSet** operation (section [3.2.4.10](#)), **OpenSession** operation (section [3.2.4.11](#)), **UpdateData** operation (section [3.2.4.12](#)).

3.2.1.1 Common Terms

The following terms are common amongst all protocol operations.

Session: An entity that gives context to operations working against application data. A session (2) is associated with one or more result sets, which can be modified by **state changing** operations.

Request: An entity that represents a running request on the protocol server.

Named Query: An entity stored in the database application representing a **CT_Query** element, as specified in [\[MS-AXL2\]](#) section 2.2.3.18. The **Name** attribute of the element **MUST** be specified.

Source: A **table** or a **Named Query** in the database application. One or more **Sources** **MUST** be referenced in a **CT_Query** element.

Updatable Source: The **Source** in a database application against which insert, update, and delete data operations are applied.

- If a **Source** is a table, it is an **Updatable Source**.
- For a **Named Query** based on a single **Source**, that query is updatable, as long as it the **Source** is updatable, and the query includes the primary key of the **Source**.
- For queries with more than one **Source** to be updatable, the **Sources** in the query **MUST** be connected by joins. Each join is specified by a **CT_Join** element, as specified in [\[MS-AXL2\]](#) section 2.2.3.10. For the join, call the **Source** specified in the **Left** attribute S_L , the **Source** specified in the **Right** attribute S_R , the property specified in the **LeftProperty** attribute P_L , the property specified in the **RightProperty** attribute P_R , and the join type specified in the **Type** attribute T . For the query to be updatable, a property **MUST** be part of exactly one **CT_Join** element.

If a graph is defined by considering each **Source** as a node, and each **CT_Join** as an edge between its **Sources** S_L and S_R , then the graph:

- **MUST** be fully connected.
- **MUST** be acyclic.
- **MUST NOT** have more than one edge between two given nodes.

For each **CT_Join**, S_L is updatable in relation to S_R if all of the following conditions hold:

- T is "Inner" or "Left Outer."
- P_R is a primary key field.
- P_L is not a primary key field.

S_R is updatable in relation to S_L if all of the following conditions hold:

- T is "Inner" or "Right Outer."
- P_L is a primary key field.
- P_R is not a primary key field.

Otherwise, S_R is not updatable in relation to S_L and S_L is not updatable in relation to S_R .

The query is updatable, if there exists a **Source** that is updatable in relation to all of the **Sources** that it is connected to in the graph for the query. Because the graph is fully connected and acyclic, there is exactly one of these **Sources**. Only the fields (3) from this **Source** are updatable.

Result Set: A set of rows that results from running a query specified by a **Source**. Rows SHOULD satisfy the **filter** and **restriction** criteria which are input elements in **OpenResultSet** (section [3.2.4.10.2.1](#)), and SHOULD be sorted according to the **sortExpression** which is an input element in **OpenResultSet** (section [3.2.4.10.2.1](#)).

A protocol client requests a subset of the rows in a result set by specifying a starting index and a maximum row count to return. The row indices are consecutive integer values starting at zero and ending at one less than the total number of rows, or maximum row count, whichever is smaller

3.2.1.2 SessionIdentifier

A **string** ([\[XMLSCHEMA2\]](#) section 3.2.1) that uniquely identifies a session (2) on the protocol server and also contains information about the session (2).

The **SessionIdentifier** MUST have the following layout:

(Numeric values in parts 1, 3, 5, 6, 8, 10, 12, and 14 MUST follow the **int** ([\[XMLSCHEMA2\]](#) section 3.3.17) type representation)

Part 1: MUST be the value "1", followed by a period (".").

Part 2: MUST be "V".

Part 3: The number of characters in part 4, followed by a period (".").

Part 4: A unique **string** ([\[XMLSCHEMA2\]](#) section 3.2.1). MUST be greater than or equal to 20 and less than or equal to 32647 characters long.

Part 5: The sum of the number of characters in parts 6-11, followed by a period (".").

Part 6: The number of characters in part 7, followed by a period (".").

Part 7: The **UI culture** of the session (2). A language tag, as specified in [\[RFC1766\]](#) Section 2.

Part 8: The number of characters in part 9, followed by a period (".").

Part 9: The data culture of the session (2). A language tag, as specified in [\[RFC1766\]](#) Section 2.

Part 10: The number of characters in part 11, followed by a period (".").

Part 11: The **time zone** of the session (2), as specified in **CultureCommandParameter** complex type (section [3.2.4.11.3.1](#)).

Part 12: The number of characters in part 13, followed by a period (".").

Part 13: MUST be equal to the value of **RequestSiteId** passed in *parameter*, in the **OpenSession** operation (section [3.2.4.11.2.1](#)).

Part 14: MUST be the value "1", followed by a period (".").

Part 15: MUST be "U".

3.2.2 Timers

The **Session Timeout** timer measures the time it takes for a session (2) to time out. The default session timeout is 1,800 seconds.

3.2.3 Initialization

None.

```

The protocol client sends an **IAccessServiceSoap_GetData_InputMessage** (section [3.2.4.4.1.1](#)) request message and the protocol server responds with an **IAccessServiceSoap_GetData_OutputMessage** (section [3.2.4.4.1.2](#)) response message as follows:

- The protocol server first executes any actions specified by the **cacheCommands** input element (section [3.2.4.4.2.1](#)), and refreshes the result set according to the **cacheCommands** values specified in section [3.2.4.4.4.1](#). Next, the protocol server returns a subset of the rows in the result set, as specified by the **startRowIndex** and **maximumRows** input elements (section [3.2.4.4.2.1](#)).
- The subset of rows returned is specified by **startRowIndex** and **maximumRows** as follows:
 - **maximumRows** MUST be greater than zero . If it is less than or equal to zero, a SOAP fault is returned, as specified in section [2.2.9](#).
 - If the **RetrieveImage** value is specified for **cacheCommands**, then the protocol server returns a single row specified by the **startRowIndex** from the result set. The row MUST have only fields (3) from the result set that contain image data.
 - If the **maximumRows** element is greater than zero and **startRowIndex** + **maximumRows** exceeds the number of rows in the result set, the protocol server returns all rows in the result set with indices greater than or equal to **startRowIndex**.

- Otherwise, the protocol server returns all rows in the result set with indices starting at **startRowIndex** and ending at **startRowIndex + maximumRows - 1**.

The protocol client sends an **IAccessServiceSoap_GetObjectSchema_InputMessage** (section [3.2.4.7.1.1](#)) request message and the protocol server responds with an **IAccessServiceSoap_GetObjectSchema_OutputMessage** (section [3.2.4.7.1.2](#)) response message as follows:

- The protocol server retrieves information about all fields (3) of the **Source** in the database application. The information is returned in **FieldSchema** elements, as specified by section [3.2.4.7.3.2](#)
- This operation will create a new result set for a session (2), which was created during the operation **OpenSession** (section [3.2.4.11](#)).
- In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.9](#). The **Id** element of the **AccessServerMessage** MUST be one of the values specified in section [2.2.9.1](#), or section [2.2.9.3](#).

```

The protocol client sends an **IAccessServiceSoap_InsertData_InputMessage** (section [3.2.4.8.1.1](#)) request message and the protocol server responds with an **IAccessServiceSoap_InsertData_OutputMessage** (section [3.2.4.8.1.2](#)) response message as follows:

- The protocol server adds a new record into the **Updatable Source** of the database application (section [3.2.1](#)) with the fields (3) of the record filled in as specified by the **values** element in the **InsertData** element (section [3.2.4.8.2.1](#)).
- If the record was successfully inserted, the protocol server retrieves the inserted record from the database application and adds a row to the result set with a primary key equal to the primary key of the record, and with its columns filled in as specified by the corresponding columns of the retrieved record. The protocol server then returns the newly added row to the protocol client.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified by section [2.2.9](#). The **Id** element of the **AccessServerMessage** MUST be one of the values specified by section [2.2.9.1](#), one of the values specified by section [2.2.9.3](#), or one of the values specified in the following table.

3.2.4.12 UpdateData

This operation updates a record in an **Updatable Source** (section [3.2.1.1](#)) in the database application and also updates the row in the result set.

```
<wsdl:operation name="UpdateData" xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:input
    wsaw:Action="http://schemas.microsoft.com/office/Access/2010/11/Server/WebServices/AccessServ

    xmlns:wsaw="http://www.w3.org/2006/05/addressing/wsdl"/>
</wsdl:operation>
```

<wsdl:fault
wsaw:Action="http://schemas.microsoft.com/office/Access/2010/11/Server/Webservices/AccessServ

message="tnsl:IAccessServiceSoap_UpdateData_AccessServerMessageFault_FaultMessage"
xmlns:wsaw="http://www.w3.org/2006/05/addressing/wsdl"/>
</wsdl:operation>

```

The protocol client sends an **IAccessServiceSoap_UpdateData_InputMessage** (section [3.2.4.12.1.1](#)) request message and the protocol server responds with an **IAccessServiceSoap_UpdateData_OutputMessage** (section [3.2.4.12.1.2](#)) response message as follows:

- The protocol server attempts to update the record in the **Updatable Source**, as specified in section [3.2.1.1](#), which has a primary key equal to the **Key** element of the first **KeyValuePair** (section [2.2.4.5](#)) of the **keys** input element (section [3.2.4.12.2.1](#)).
- If the columns in the result set specified by the **Key** elements of the **KeyValuePair** elements of the **oldValues** element (section [3.2.4.12.2.1](#)) contain data different from what is specified by the respective **Value** elements of the **KeyValuePair** elements of the **oldValues**, a SOAP fault MUST be returned.
- If the record was successfully updated, the protocol server retrieves the updated record from the database application and updates the row in result set with a primary key equal to the primary key of the updated record with its columns filled in as specified by the corresponding columns of the retrieved record. The protocol server then returns the updated row to the protocol client.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.9](#). The **Id** element of the **AccessServerMessage** (section [2.2.4.1](#)) MUST be one of the values specified in section [2.2.9.1](#), or one of the values specified in section [2.2.9.2](#), or one of the values specified in section [2.2.9.3](#), or one of the values specified in the following table.

5 Security

5.1 Security Considerations for Implementers

In addition to the security considerations applicable to the underlying protocols, there are security risks associated with exposing session identifiers (2). If the session identifier (2) is exposed, it is possible for an attacker to read information from, or modify data in, a session (2) on the protocol server. An implementer of this protocol needs to consider keeping session identifiers (2) protected. There could be some cases where it is desirable to expose the session identifier (2), however, an implementer is to use caution in how they expose session identifiers (2) and consider the security risks.

Preliminary

8 Appendix C: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® Access® 15 Technical Preview
- Microsoft® SharePoint® Server 15 Technical Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 3.2.4.7.4.1:](#) Access Services assumes that a localized version of the string will be displayed to a user.

[<2> Section 3.2.4.11.3.1:](#) SharePoint Server 2010 will attempt to fall back to a **fallback UI culture** when an unsupported UI culture is requested.
