1 Introduction

This document specifies a protocol for the **Wireless Application Protocol (WAP) binary XML (WBXML)** features utilized by the ActiveSync protocols. This document specifies which WBXML functionality is used by the protocol and which is not. It also specifies the **token** codes and **code pages** used by the ActiveSync protocols.

1.1 Glossary

The following terms are defined in [MS-OXGLOS]:

protocol
server
WAP
WAP binary XML (WBXML)
XML

code page: A numeric encoding specifier used to tokenize XML tags.

token: A single-byte code that represents a specific XML tag.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Protocol Overview

This document specifies how **WBXML** functionality is utilized by the ActiveSync protocols. This document also specifies the **tokens** and **code pages** used to perform the WBXML encoding.

1.4 Relationship to Other Protocols

The **WBXML tokens** and **code pages** specified in this protocol are used to compress the **XML** tags in request and response messages. The following table defines the ActiveSync protocol that specifies the XML namespace that corresponds to each of the code pages. Code pages are hard-coded on the server, but cannot be changed by the client.

Code page 1: Contacts	MS-ASCNTC
Code page 2: Email	MS-AEMAIL
Code page 3: Air Notify	MS-ASCMD section 2.2.2.13

1.5 Prerequisites/Preconditions

None.

1.6 Applicability Statement

WBXML encoding of **XML** tags is appropriate for all messages sent and received by the ActiveSync protocol. This specification assumes that the reader is familiar with the WBXML standard. For more information about WBXML, see [WBXML].

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

None.

2 Messages

2.1 Transport

ActiveSync messages are transported as HTTP POST messages, where the body of the message contains **WBXML** formatted data. The HTTP POST message header is specified in [MS-ASHTTP]. The body of the HTTP message contains the **XML** required by the command being communicated in the message. The ActiveSync commands are specified in [MS-ASCMD].

2.2 Message Syntax

2.2.1 WBXML

The **XML** tags in both request and response messages are encoded by using **WBXML** tokenization. WBXML is a standard for compressing an XML data stream for efficient transmission over a low bandwidth connection, such as wireless. The format used by the ActiveSync protocol is a subset of the WBXML standard.

2.2.1.1 WBXML Features Used in the Protocol

The **XML** format that is used by the ActiveSync protocol is a subset of the **WBXML** standard, as specified in [WBXML]. However, not all of the WBXML features specified in [WBXML] are used by this specification.

The ActiveSync protocol uses the following [WBXML] features:

- **Tokens** to encode XML tags
- **Code pages** to support multiple XML namespaces
- Inline strings

The ActiveSync protocol notifications use the following [WBXML] features:

- Attribute encoding
- Opaque data

The ActiveSync protocols do not use the following [WBXML] features:

- String tables
- Entities
- Processing instructions

2.2.1.2 Code Pages

The ActiveSync protocol supports the following **code pages**.

Code Page	XML Namespace
0x0	AirSync
0x1	Contacts
0x2	Email

Code Page	XML Namespace
0x3	AirNotify
0x4	Cal

3 Protocol Details

3.1 Common Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The abstract data model follows what is specified in [WBXML].

3.1.2 Timers

None.

3.1.3 Initialization

None.

3.1.4 Higher-Layer Triggered Events

None.

3.1.5 Message Processing Events and Sequencing Rules

Message processing is specified in [WBXML], in the Document Tokenisation section.

3.1.6 Timer Events

None.

3.1.7 Other Local Events

None.

4 Protocol Examples

The following examples show the **WBXML** encoding of the messages, and provide a byte-by-byte description of the encoding.

4.1 Example 1

The following example shows the **WBXML** encoding of a server response that contains a new contact.

4.1.1 XML Message

```
<?xml version="1.0" encoding="utf-8"?>
<Sync xmlns="AirSync:" xmlns:A="AirSyncBase:" xmlns:B="POOMCONTACTS:">
  <Collections>
    <Collection>
      <Class>Contacts</Class>
      <SyncKey>2</SyncKey>
      <CollectionId>2</CollectionId>
      <Status>1</Status>
      <Commands>
        <Add>
```

```

<ServerId>2:1</ServerId>
<ApplicationData>
  <A:Body>
    <A:Type>1</A:Type>
    <A:EstimatedDataSize>0</A:EstimatedDataSize>
    <A:Truncated>1</A:Truncated>
  </A:Body>
  <B:FileAs>Hall, Don</B:FileAs>
  <B:FirstName>Don</B:FirstName>
  <B:LastName>Hall</B:LastName>
  <A:NativeBodyType>1</A:NativeBodyType>
</ApplicationData>
</Add>
</Commands>
</Collection>
</Collections>
</Sync>

4.2 Example 2

The following example shows a notification sent from the server to the device. Two things that are unique about this example are its use of an encoded attribute and its use of opaque binary data.

```
<?xml version="1.0" encoding="utf-8"?>
<Notification xmlns="AirNotify:" version="1.1">
    FF68022058BD485996BE15F6F6D993AF
</Notification>
```

Note: Be aware that the previous transcription is not completely accurate. The globally unique identifier (GUID) is binary data and should correctly be written as escaped characters. For clarity, however, GUID is written as if it were text.

So, for the previous example (GUID in bold):

```
03 01 6A 00 00 03 C6 00 03 05 01 C3 10
FF 68 02 20 58 BD 48 59 96 BE 15 F6 F6 D9 93 AF
01
```

The following table shows the **WBXML** representation of the **XML**.

Token Stream	Description	Bytes
03	Version number—WBXML version 1.3	1
01	Unknown public identifier	1
6A	Charset = UTF-8	1
00	String table length	1
00 03	Select code page 3 (AirNotify) for tags	2
C6	<Notification> tag, with content and attributes	1
00 03	Select code page 3 (AirNotify) for attributes	2
05	Attribute: “Version=1.1”	1
01	End of attribute list	1
C3	Opaque data follows	1
10	Length of opaque data (16 bytes)	1
FF, 68, ...	GUID data (byte #1 – byte #16)	16
01	End of </Notification>	1
Total		30 bytes

5 Security

5.1 Security Considerations for Implementers

In most cases, all communication between the **client** and **server** happens across a HTTP connection secured by the Secure Sockets Layer (SSL) protocol as specified in [RFC2068]. The SSL connection is assumed to be secure enough to transmit confidential data, such as user credentials and sensitive e-mail. The SSL certificate on the server must be trusted by the client application.

5.2 Index of Security Parameters

None.

6 Appendix A: Office/Exchange Behavior

The information in this specification is applicable to the following versions of Office/Exchange:

- Office 2003 with Service Pack 3 applied
- Exchange 2003 with Service Pack 2 applied
- Office 2007 with Service Pack 1 applied
- Exchange 2007 with Service Pack 1 applied

Exceptions, if any, are noted below. Unless otherwise specified, any statement of optional behavior in this specification prescribed using the terms SHOULD or SHOULD NOT implies Office/Exchange behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies Office/Exchange does not follow the prescription.
