

# [MS-CONFAV]: Centralized Conference Control Protocol: Audio-Video Extensions

---

## Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

**Preliminary Documentation.** This Open Specification provides documentation for past and current releases and/or for the pre-release (beta) version of this technology. This Open Specification is final documentation for past or current releases as specifically noted in the document, as applicable; it is preliminary documentation for the pre-release (beta) versions. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. As the documentation may change between this preliminary version and the final version of this technology, there are risks in relying on preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

## Revision Summary

Date	Revision History	Revision Class	Comments
04/04/2008	0.1		Initial version
04/25/2008	0.2		Revised and edited the technical content
06/27/2008	1.0		Revised and edited the technical content
08/15/2008	1.01		Revised and edited the technical content
12/12/2008	2.0	Major	Revised and edited the technical content
02/13/2009	2.01		Edited the technical content
03/13/2009	2.02		Edited the technical content
07/13/2009	2.03	Major	Revised and edited the technical content
08/28/2009	2.04	Editorial	Revised and edited the technical content
11/06/2009	2.05	Editorial	Revised and edited the technical content
02/19/2010	2.06	Editorial	Revised and edited the technical content
03/31/2010	2.07	Major	Updated and revised the technical content
04/30/2010	2.08	Editorial	Revised and edited the technical content
06/07/2010	2.09	Editorial	Revised and edited the technical content
06/29/2010	2.10	Editorial	Changed language and formatting in the technical content.
07/23/2010	2.10	No change	No changes to the meaning, language, or formatting of the technical content.
09/27/2010	3.0	Major	Significantly changed the technical content.
11/15/2010	3.0	No change	No changes to the meaning, language, or formatting of the technical content.
12/17/2010	3.0	No change	No changes to the meaning, language, or formatting of the technical content.

<b>Date</b>	<b>Revision History</b>	<b>Revision Class</b>	<b>Comments</b>
03/18/2011	3.0	No change	No changes to the meaning, language, or formatting of the technical content.
06/10/2011	3.0	No change	No changes to the meaning, language, or formatting of the technical content.
01/20/2012	4.0	Major	Significantly changed the technical content.

# 1 Introduction

This document specifies proprietary extensions to the Centralized Conference Control Protocol that can be used to integrate audio and video conference modes within the framework described in [\[MS-CONFAS\]](#).

Sections 1.8, 2, and 3 of this specification are normative and contain RFC 2119 language. Sections 1.5 and 1.9 are also normative but cannot contain RFC 2119 language. All other sections and examples in this specification are informative.

## 1.1 Glossary

The following terms are defined in [\[MS-GLOS\]](#):

**server**

The following terms are defined in [\[MS-OFCGLOS\]](#):

**200 OK**  
**Audio/Video Multipoint Control Unit (AVMCU)**  
**codec**  
**conference**  
**data type**  
**dialog**  
**endpoint**  
**endpoint identifier (EPID)**  
**focus**  
**Interactive Connectivity Establishment (ICE)**  
**Internet message**  
**INVITE**  
**MCU-Conference-URI**  
**Media Source ID (MSI)**  
**mixer**  
**Multipoint Control Unit (MCU)**  
**notification**  
**participant**  
**Real-Time Transport Protocol (RTP)**  
**remote endpoint**  
**request message**  
**SDP answer**  
**SDP offer**  
**Session Description Protocol (SDP)**  
**Session Initiation Protocol (SIP)**  
**SIP message**  
**Synchronization Source (SSRC)**  
**Uniform Resource Identifier (URI)**  
**user agent client (UAC)**

The following terms are specific to this document:

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

References to Microsoft Open Specification documents do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com). We will assist you in finding the relevant information. Please check the archive site, <http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624>, as an additional source.

### 1.3 Protocol Overview (Synopsis)

The Centralized Conference Control Protocol (C3P) is described in [MS-CONFBAS], which in turn extends [RFC4575] and [RFC4353]. [RFC4575] describes a **Session Initiation Protocol (SIP)** Event Package for conference state. [RFC4353] provides a conceptual description of a framework for conferencing with SIP. [MS-CONFBAS] describes a framework for aggregating multiple instances of a **Multipoint Control Unit (MCU)** in the context of what [RFC4575] section 4 describes as a single logical conference. [MS-CONFBAS] describes concrete extensions to [RFC4575] that are built on the concepts in [RFC4353].

Within [MS-CONFBAS] section 2.2.2.4, centralized processing of conference media content is delegated to specialized media-type-specific MCUs. For example, a multiparty conference that simultaneously encompasses sending **Internet messages**, data and application sharing, and audio-video media types is processed by three separate logical MCU entities: one for Internet messages, one for data and application sharing, and one for audio and video.

This document specifies extensions to [MS-CONFBAS] that relate to audio and video media content that is transferred using the **Real-Time Transport Protocol (RTP)** and **Interactive Connectivity Establishment (ICE)**.

To put the scope of the extensions specified in this document in perspective, it is helpful to start with a conceptual view of how the extensions described in [MS-CONFBAS] define the effective scope of the separate logical MCU entities with respect to the contents of the Conference Document.

#### 1.3.1 Overview of Conceptual Conference Document Structure

[MS-CONFBAS] describes extensions to the XML schema of the Conference Document that were originally described in [RFC4575]. Central to those extensions is the representation of separate logical **focus**, or MCU, entities in the structure of the Conference Document.

In general:

- Each MCU independently maintains a list of users, with exactly one **endpoint (5)** for each user. Each endpoint (5) represents a media-specific communication session between the MCU and one user.
- Separate containers represented by **entity-view** elements exist for each logical MCU entity as described in [MS-CONFBAS] section 2.2.2.7. The conference information that falls within the scope of a single logical MCU entity generally resides in this container. MCU-specific endpoints (5) are the main exception, as noted in the preceding paragraph).

[MS-CONFBAS] redefines how conference media is represented relative to [RFC4575]. [MS-CONFBAS] and [RFC4575] use essentially the same underlying XML **data types** for conference and user media instances.

The Conference Document structure described in [MS-CONFBAS] does not place the conference media elements in the same location in the Conference Document as described by [RFC4575]. As a result, the definitions of the media-related data elements in [RFC4575] sections 5.3.4 and 5.8 are interpreted in the context of [MS-CONFBAS].

This interpretation can be summarized as follows:

- Where [\[RFC4575\]](#) describes one container for all conference-wide media, [MS-CONFBAS] describes separate MCU-specific containers. Each [MS-CONFBAS]-defined container is limited in scope to only the conference media instances processed by the designated MCU.
- [\[RFC4575\]](#) section 5.3.4 defines the **available-media** element as the container for conference media. Definitions of endpoint (5) media instances, as described in [\[RFC4575\]](#) section 5.8, refer back to the **available-media** element.
- [MS-CONFBAS] deprecates use of the **available-media** element in all messages.
- [MS-CONFBAS] defines **media** elements under the MCU-specific **entity-view** container hierarchy. Each **media** element is a container for one MCU's conference media instances.
- The general form of the underlying XML data types used to represent conference media is the same in [MS-CONFBAS] as it is in [\[RFC4575\]](#). The XML type **conference-medium-type**, described in [\[RFC4575\]](#), is the basis for describing a single Conference Media instance.
- The semantics of the elements and attributes of **conference-medium-type** are described in [\[RFC4575\]](#).
- The XML schema introduced in [MS-CONFBAS] describes XML schema extensions to **conference-medium-type**. This protocol defines semantics of the extension elements that are specific to audio/video (A/V) media types.
- The collection of all MCU-specific **media** elements, when taken as a whole, replaces the **available-media** element described in [\[RFC4575\]](#).
- Where [\[RFC4575\]](#) refers to the **available-media** element in the semantic definition of any element, the reference is to the MCU-specific **media** element instead.

### 1.3.2 Scope

This protocol defines extensions to [\[MS-CONFBAS\]](#) that enable SIP/**Session Description Protocol (SDP)**/RTP-based audio and video conference modalities and features within the multiple-MCU architecture that is described in [MS-CONFBAS].

The framework described in [MS-CONFBAS] calls for MCU entities to maintain separate, media type-specific communication sessions with each client. This protocol assumes that the communication protocol for signaling and media handshakes between clients and the logical **AVMCU** entity is the suite of protocols specified by the following:

Protocol	Description
<a href="#">[MS-SIPRE]</a>	Extensions to SIP
<a href="#">[MS-SDPEXT]</a>	Extensions to SDP
<a href="#">[RFC3264]</a>	An offer/answer Model with SDP

This protocol defines the necessary interactions between the preceding protocols and the Centralized Conference Control Protocol (C3P), as described in [MS-CONFBAS]. For example, some of the interactions specified in this protocol are as follows:

- Correlation of the C3P conference state and message element and attribute values with SIP URIs and SIP header values.

- Correlation of the C3P conference state and message element and attribute values with the values of standard SDP attributes, as described in [\[RFC4566\]](#) and [\[RFC3264\]](#).
- Processing of C3P commands that result in an action on one or more SIP dialogs between the server, or MCU, and the client or clients.
- Changes in SIP dialog states between the MCU and the client that result in conference state changes and C3P notifications.
- Logic rules based on C3P conference state that are factored into media-negotiation behavior whenever a client or MCU formulates an **SDP offer** or responds with an **SDP answer**.

This protocol does not specify any XML schema extensions beyond that of [MS-CONFBAS]. It does define semantics of some parts of the XML schema and C3P message constructs in more detail than those described in [MS-CONFBAS], particularly where [MS-CONFBAS] obsoletes, replaces, or deprecates parts of [\[RFC4575\]](#).

Therefore, this protocol does the following:

- Defines semantics for the XML schema extensions to **conference-medium-type** that are described in [MS-CONFBAS].
- Extends the semantics of **conference-medium-type** relative to [\[RFC4575\]](#).

#### 1.4 Relationship to Other Protocols

In addition to the dependencies described in [\[MS-CONFBAS\]](#) section 1.4, the following protocols are required components of a complete implementation:

- [\[MS-SDPEXT\]](#)
- [\[MS-SIPRE\]](#)
- [\[MS-ICE\]](#)
- [\[MS-RTP\]](#)
- [\[MS-RTPRADEX\]](#)
- [\[MS-ICE2\]](#)

Note that each of these protocols can be extended independently.

#### 1.5 Prerequisites/Preconditions

In addition to the prerequisites and preconditions described in [\[MS-CONFBAS\]](#) section 1.5 and the protocol dependencies specified in section [1.4](#), this protocol assumes that the client and the server:

- Support mutually-interoperable implementations of all of the protocols listed in section [1.4](#).
- Support at least one RTP audio or video payload format in common.

When the client and server meet these requirements, they are able to negotiate a viable, bidirectional RTP channel between them using the standard protocols listed in section [1.4](#).

#### 1.6 Applicability Statement

The extensions specified in this protocol apply when both of the following are true:

- The client and server both meet the prerequisites and preconditions in section [1.5](#).
- The client and server both intend to implement audio or video, or both types, of conference communication modes within the framework and architecture described in [\[MS-CONFBAS\]](#).

### **1.7 Versioning and Capability Negotiation**

This protocol does not have any additional versioning and capability negotiation constraints beyond those described in [\[MS-CONFBAS\]](#).

### **1.8 Vendor-Extensible Fields**

None.

### **1.9 Standards Assignments**

None.

## 2 Messages

### 2.1 Transport

This protocol does not introduce a new transport to exchange messages. The constraints and conditions for exchanging messages are specified in [\[MS-CONFAS\]](#).

### 2.2 Message Syntax

This protocol does not introduce new message formats outside of the encapsulating message structures and envelopes specified in [\[MS-CONFAS\]](#). All messages within this section conform to the message syntax specification in [\[MS-CONFAS\]](#) section 2.2.

Extensions to message content and the associated syntax are discussed in this and subsequent sections.

#### 2.2.1 Extension Semantics of application/conference-info+xml Document Format

The application/conference-info+xml document format details the data model for a conference specified in [\[RFC4575\]](#). Extensions to [\[RFC4575\]](#) are also specified in [\[MS-CONFAS\]](#). This protocol does not introduce any new extensions to the underlying XML schema that is defined in [\[MS-CONFAS\]](#). This protocol further extends the conference data model by specifying the semantics of XML elements and attributes that are relevant to the message syntaxes defined in this protocol.

Extensions to this protocol MAY define the semantics of other elements and attributes that they depend upon. They MAY also introduce new extensions to this data model.

Note that not all of the extension element semantics defined by this protocol are exclusively limited to audio and video conference modalities. Unless otherwise specified, extensions to this protocol or other extensions to [\[RFC4575\]](#) and to [\[MS-CONFAS\]](#) MAY define media type-specific semantics, MCU-specific semantics, or generic media-type-agnostic semantics that are broader and more general in scope than those defined in this protocol.

The cardinality of each extension element is specified in the XML schema using standard **minOccurs** and **maxOccurs** XML schema conventions. Similarly, the cardinality of each extension attribute is specified in the XML schema using standard **required** or **optional** attributes. Similarly, the namespace of each extension attribute or element is specified in the XML schema using standard conventions and is omitted here for brevity.

This section defines only the general semantics of extension XML data types out of the context of any C3P message. C3P requests, responses, and notifications MAY further define or restrict this data model. Any such restrictions are specified by their message syntaxes as needed.

##### 2.2.1.1 XML Schema Types used in A/V Conference Modalities

Message elements and attributes that have specific semantics with respect to A/V media are specified here. However, it is important to note that not all of the schema extension semantics specified in this protocol are exclusive to A/V media. They are emphasized in this protocol to define them as they apply to RTP audio and RTP video media types. This emphasis also defines the minimal common C3P profile for control of multiparty RTP audio and RTP video conferences.

This section of this protocol defines only the XML constructs and the generic semantics of the XML schema types that this protocol introduces, unless otherwise specified. The data types in this protocol that are intended exclusively for A/V conference modalities are indicated by an asterisk (\*) immediately following the element or data type name in each document sub-heading. Those not

indicated by (\*) can be used in other conferencing modalities. However, such usage is beyond the scope of this protocol.

### 2.2.1.1.1 Media Filter Types

The following XML types are used to construct rules for allowing or preventing media flow to or from remote endpoints (5), or clients.

#### 2.2.1.1.1.1 Media-Filter-Type

The type **media-filter-type** is a simple enumeration type with two possible values, "block", and "unblock". Elements of this type appear in several other types in the C3P message schema. The schema of the **media-filter-type** is as follows:

```
<xs:simpleType name="media-filter-type">
  <xs:restriction base="xs:string">
    <xs:enumeration value="block" />
    <xs:enumeration value="unblock" />
  </xs:restriction>
</xs:simpleType>
```

The general semantics of the enumeration values are as follows:

- "block": Media MUST NOT be propagated. This value takes precedence over all other protocol state and behavior specifications.
- "unblock": Allow propagation of media data within any other constraints that are specified by the suite of protocols used in the implementation.

#### 2.2.1.1.2 video-parameters-type\*

The XML type **video-parameters-type** is intended specifically for video media types. It is defined in the avconfinfoextensions namespace:

<http://schemas.microsoft.com/rtc/2005/08/avconfinfoextensions>.

The schema of **video-parameters-type** is as follows:

```
<xs:element name="video-parameters" type="tns:video-parameters-type" ms:ignore="true"/>
<xs:complexType name="video-parameters-type">
  <xs:sequence>
    <xs:element name="video-mode" type="xs:string" minOccurs="0" />
    <xs:element name="intended-primary-presenter-source" type="tns:contributing-sources-type"
minOccurs="0"/>
    <xs:any namespace="##other" processContents="lax" minOccurs="0" maxOccurs="unbounded"
/>
  </xs:sequence>
</xs:complexType>
```

The child elements of the **video-parameters-type** are as follows:

**video-mode:** (\*) This element specifies the video processing mode of the MCU. The XML type of this element is **xs:string**. The schema does not constrain the value to an enumeration. The base profile defines 2 literal strings values: "dominant-speaker-switched" and "manual-switched". The "dominant-speaker-switched" value specifies that the video source has not been restricted to a specific source in the conference. The "manual-switched" value specifies that the video source is

restricted to either no sources or one source for the **conference**. These are the default modes that implementations SHOULD [1](#) support.

The **video-mode** element is optional. If this element is not present, it is assumed to have a value of "dominant-speaker-switched".

The **intended-primary-presenter-source** is optional. It SHOULD only be present if the **video-mode** is present and has a value of "manual-switched".

If the client supports Video Source Requests as defined in [\[MS-RTP\]](#) section 2.2.12.2, the MCU SHOULD NOT [2](#) select the video source for that client.

If the client does not support Video Source Requests as defined in [\[MS-RTP\]](#) section 2.2.12.2, the MCU SHOULD dynamically select the video source based on the contents of the audio streams received by the MCU when in "dominant-speaker-switched" mode or select the source specified by **intended-primary-presenter-source** when in "manual-switched" mode.

#### 2.2.1.1.2.1 contributing-sources-type

The XML type **contributing-sources-type** is intended specifically for video media types when **video-mode** is "manual-switched". It is defined in the avconfinfoextensions namespace:

<http://schemas.microsoft.com/rtc/2005/08/avconfinfoextensions>

The schema **contributing-sources-type** is as follows:

```
<xs:complexType name="contributing-sources-type">
  <xs:sequence>
    <xs:element name="entry" type="xs:anyURI" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:attribute name="empty" type="xs:boolean" use="optional"/>
</xs:complexType>
```

The **entry** element is optional and is of xml type **xs:anyURI**. If present, it identifies the user in the conference that will be the only video source available for the conference.

The **empty** attribute is optional and is of xml type **xs:Boolean**. If present and has a value of "true", it identifies that there is no video source available for the conference. In the context of C3P request messages, this attribute is ignored.

#### 2.2.1.1.3 capabilities-type\*

The XML type **capabilities-type** is intended specifically for A/V conference modalities. It is defined in the avconfinfoextensions namespace:

<http://schemas.microsoft.com/rtc/2005/08/avconfinfoextensions>.

The schema for **capabilities-type** is as follows:

```
<xs:complexType name="capabilities-type">
  <xs:sequence>
    <xs:element name="supports-audio" type="xs:boolean" />
    <xs:element name="supports-video" type="xs:boolean" />
  </xs:sequence>
</xs:complexType>
```

The child elements of the **capabilities-type** are as follows:

**supports-audio**: A boolean value that specifies whether or not audio is supported.

**supports-video**: A boolean value that specifies whether or not video is supported.

#### 2.2.1.1.4 entry-exit-announcements type

The XML type **entry-exit-announcements-type** is intended for the **entity-state-type**. The description of **entity-state-type** is in [MS-CONFAS] section 2.2.2.7. The **entry-exit-announcements-type** is defined in the commonmcuextensions namespace:

<http://schemas.microsoft.com/rtc/2009/03/commonmcuextensions>.

The schema for **entry-exit-announcements-type** is as follows:

```
<xs:complexType name="entry-exit-announcements-type">
  <xs:sequence>
    <xs:element name="modifiable" type="xs:boolean" minOccurs="0"/>
    <xs:element name="enabled" type="xs:boolean"/>
    <xs:any namespace="##other" processContents="lax" minOccurs="0"
maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>
```

The child elements of the **entry-exit-announcement-type** are as follows:

**Enabled** (xs:boolean): A boolean value that specifies whether entry and exit announcements in the conference will be played or not.

**Modifiable** (xs:boolean): A boolean value that specifies whether the **Enabled** element of the **entry-exit-announcements-type** can be changed during the conference or not. If the value is "true", the value of the element **Enabled** can be changed.

#### 2.2.1.1.5 media-filters-rules-type

The XML type **media-filters-rules-type** is intended for the **entity-state-type**. The description of **entity-state-type** is in [MS-CONFAS] section 2.2.2.7. The **media-filters-rules-type** is defined in the confinfoextensions namespace:

<http://schemas.microsoft.com/rtc/2005/08/confinfoextensions>.

The schema for **media-filters-rules-type** is as follows:

```
<xs:complexType name="media-filters-rules-type">
  <xs:sequence>
    <xs:element name="mayModifyOwnFilters" type="tns:boolean-role-rule-type"
minOccurs="0" maxOccurs="unbounded"/>
    <xs:element name="initialFilters" type="tns:media-filters-role-rule-type"
minOccurs="0" maxOccurs="unbounded"/>
    <xs:element ref="msav:type" minOccurs="0" />
    <xs:sequence minOccurs="0">
      <xs:element ref="cis:separator"/>
      <xs:any namespace="##other" processContents="lax" minOccurs="0"
maxOccurs="unbounded"/>
    </xs:sequence>
  </xs:sequence>
```

```

    </xs:sequence>
    <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>

```

The following XML types are used to construct and express rules for allowing and preventing the flow of media in the conference by manipulating the media filter types described in section [2.2.1.1.1](#).

#### 2.2.1.1.5.1 mayModifyOwnFilters

The `mayModifyOwnFilters` element specifies rules for each user role in a conference with regard to permission to modify the ingress filters for the **media** element specified by the **type** element defined in section [2.2.1.1.5.3](#).

The XML type for `mayModifyOwnFilters` is **boolean-role-rule-type**, which is comprised of an element role of XML type **xs:string**, paired with an element value of XML type **xs:boolean**.

The XML type **boolean-role-rule-type** is defined in the `confinfoextensions` namespace:

<http://schemas.microsoft.com/rtc/2005/08/confinfoextensions>.

The schema for **boolean-role-rule-type** is as follows:

```

<xs:complexType name="boolean-role-rule-type">
  <xs:sequence>
    <xs:element name="role" type="xs:string"/>
    <xs:element name="value" type="xs:boolean"/>
    <xs:any namespace="##other" processContents="lax" minOccurs="0"
maxOccurs="unbounded"/>
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>

```

#### 2.2.1.1.5.2 initialFilters

The `initialFilters` element specifies the default values that are applied to each **participant's (2)** with the **media** element specified by the **type** element defined in section [2.2.1.1.5.3](#), to be applied to different roles in the conference.

The XML type for `initialFilters` is **media-filters-role-rule-type**, which is comprised of an element **role** of XML type **xs:string**, and elements **ingressfilter**, and **egressfilter** of XML type **media-filter-type**, which is defined in section [2.2.1.1.1](#).

The XML type **media-filters-role-rule-type** is defined in the `confinfoextensions` namespace:

<http://schemas.microsoft.com/rtc/2005/08/confinfoextensions>.

The schema for **media-filters-role-rule-type** is as follows:

```

<xs:complexType name="media-filters-role-rule-type">
  <xs:sequence>
    <xs:element name="role" type="xs:string"/>
    <xs:element name="ingressFilter" type="tns:media-filter-type" minOccurs="0"/>
    <xs:element name="egressFilter" type="tns:media-filter-type" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>

```

```
        <xs:any namespace="##other" processContents="lax" minOccurs="0"
maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:complexType>
```

### 2.2.1.1.5.3 type

The **type** element specifies the **conference-media-type** as defined in [\[RFC4575\]](#) section 5.8.2 that the **mayModifyOwnFilters** and **initialFilters** are applied to. The XML type is defined in the `avconfinfoextensions` namespace:

<http://schemas.microsoft.com/rtc/2005/08/avconfinfoextensions>.

The schema for **type** is as follows:

```
<xs:element name="type" type="xs:string" ms:ignore="true" />
```

The schema does not constrain the value to an enumeration. The base profile defines 2 literal strings values: "audio" and "video".

The **type** element is optional [<3>](#). If this element is not present, it is assumed to have a value of "audio".

## 2.2.2 MCU Conference Roster Document Format

This section specifies extensions to the MCU Conference Roster Document Format specified in [\[MS-CONFAS\]](#) section 2.2.5.

### 2.2.2.1 MCU endpoint Element Syntax

The model defined in [\[MS-CONFAS\]](#) section 2.2.2.6 specifies the role of MCU entities in generating and maintaining MCU-specific **endpoint** elements. This section specifies extended message syntax and semantics for A/V-specific **endpoint** elements.

The XML schema for the type **endpoint-type** and the semantics of the elements it contains were originally specified in [\[RFC4575\]](#) in section 5.7. Extensions to [\[RFC4575\]](#) are specified in [\[MS-CONFAS\]](#) section 2.2.2.6. This protocol further extends the semantics of the elements within **endpoint-type** relative to [\[RFC4575\]](#), and defines additional extension elements.

#### 2.2.2.1.1 endpoint Element Semantic Extensions

The following extension semantics are defined relative to [\[RFC4575\]](#) section 5.7. Unless extension semantics are explicitly defined in this section or in [\[MS-CONFAS\]](#), the semantics specified in [\[RFC4575\]](#) remain intact.

##### 2.2.2.1.1.1 media Element Instances

The **media** element is semantically extended as follows:

**label:** The **label** element has message-specific semantics. This element **MUST** be present in MCU Conference Roster Documents sent by an MCU. In the context of C3P request messages, this element is optional. If present, the value of this element **MUST** be equal to the value of the **label** attribute of

the corresponding media stream **entry** element in the MCU-specific **media** container element in the MCU-specific **entity-state** container element.

Matching **label** elements tie an endpoint's media stream instance with a specific conference media instance.

The schema for **label** element is as follows:

```
<xs:element name="label" type="xs:string" minOccurs="0"/>
```

**src-id**: The **src-id** element carries the identifier of the actual source of RTP-based media. This element is optional. If present, the value MUST contain the RTP **Synchronization Source (SSRC)** identifier value generated by the endpoint (5) for the stream it sends. This value is available in the SDP offer and SDP answer used to negotiate media, as specified in [\[RFC3264\]](#).

The schema for **src-id** element is as follows:

```
<xs:element name="src-id" type="xs:string" minOccurs="0"/>
```

### 2.2.2.1.2 endpoint Element Extension Elements

This protocol defines the following extension elements of the **media** element within the **endpoint** element.

#### 2.2.2.1.2.1 media-ingress-filter Element

The **media-ingress-filter** element is of the XML type **media-filter-type**, following the semantic definition specified in section [2.2.1.1.1.1](#).

The **media-ingress-filter** element specifies the filter value for media in the direction of a client endpoint (5) to the MCU.

The **media-ingress-filter** element is optional. This element has message-specific semantics that are specified in the context of containing message semantics detailed in subsequent sections.

#### 2.2.2.1.2.2 media-egress-filter Element

The **media-egress-filter** element is of the XML type **media-filter-type**, following the semantic definition specified in section [2.2.1.1.1.1](#).

The **media-egress-filter** element specifies the filter value for media in the direction of the MCU to a client endpoint (5).

The **media-egress-filter** element is optional. This element has message-specific semantics that are specified in the context of containing message semantics detailed in subsequent sections.

#### 2.2.2.1.2.3 media-source-id Element

The **media-source-id** element SHOULD [<4>](#) be present in the MCU Conference Roster Document sent by an MCU. The value represents the **Media Source ID (MSI)** as defined in [\[MS-SDPEXT\]](#) section 3.1.5.32. In the context of C3P **request messages**, this element is ignored.

The schema for **media-source-id** element is as follows:

```
<xs:element name="media-source-id" type="xs:unsignedInt" ms:ignore="true" />
```

#### 2.2.2.1.2.4 source-name Element

The **source-name** element SHOULD [<5>](#) be present in the MCU Conference Roster Document sent by an MCU. This value might be available in the SDP Offer or SDP answer as **a=x-source-streamid** attribute as defined in [\[MS-SDPEXT\]](#) section 3.1.5.33. If the value is not present in the SDP Offer or SDP answer, then the **label** SHOULD be used. In the context of C3P **request messages**, this element is ignored.

The schema for **source-name** element is as follows:

```
<xs:element name="source-name" type="xs:string" ms:ignore="true"/>
```

### 2.2.2.2 MCU conference-view Element Syntax

This section specifies semantics for the notification message elements that reside within the MCU-specific **entity-view** element within the **conference-view** element defined in [\[MS-CONFBAS\]](#) section 2.2.2.7.

#### 2.2.2.2.1 entity-state Extension Elements

This protocol defines the following extension elements of the **entity-state** element.

##### 2.2.2.2.1.1 media Element Extensions

The Conference Document format defined in [\[MS-CONFBAS\]](#) specifies the role of MCU entities in generating and maintaining MCU-specific **entity-view** elements and subelements. This section specifies extended message syntax and semantics for MCU-specific **entry** elements within the **media** element within the **entity-state** element of the MCU-specific **entity-view** element.

The XML schema for the type **conference-media-type** and the semantics of the elements it contains are originally established in [\[RFC4575\]](#). Extensions to [\[RFC4575\]](#) are specified in [\[MS-CONFBAS\]](#). This protocol further extends the semantics of the elements within **conference-media-type** relative to [\[RFC4575\]](#) and defines additional extension elements.

The following extension semantics are defined relative to [\[RFC4575\]](#) section 5.3.4. Unless extension semantics are explicitly defined in this section or in [\[MS-CONFBAS\]](#), the semantics specified in [\[RFC4575\]](#) section 5.3.4 remain intact.

##### 2.2.2.2.1.1.1 media entry Element Semantic Extensions

The media entry element semantic extensions are specified as follows:

**label:** The **label** attribute is the identifier for the MCU-centric view of an instance of conference media. For example, this attribute can identify an instance of an audio **mixer** within the MCU. This identification is made by finding the **label** attribute of the conference media instance that equals the **label** element of the media instances of the user within the **endpoint** element's **media** element.

The **label** attribute is assigned by the MCU and MUST be unique within the containing **entity-state/media** element container.

The value of this attribute is the same as the SDP **label** media attribute defined in [\[RFC4574\]](#) section 1.

#### 2.2.2.2.1.1.2 media entry Element Extension Elements

This protocol defines the following extension elements of the **entry** element child of the **media** element.

**modal-parameters**: The **modal-parameters** element can be present within the **entry** element when the **entry** element describes a video type. This is true when the **type** element contains the value "video".

The **modal-parameters** element can be present within the **entry** element when the **entry** element describes a media type other than video. This protocol defines no semantics or behavior associated with the **modal-parameters** element for types other than video. A message containing this element is considered to be syntactically valid; however, the contents of the **modal-parameters** element are ignored for media types other than video.

**audio-parameters**\*: This protocol defines no schema extensions, semantics, or content for **audio-parameters**. Extensions to this protocol can define schema extensions and related semantics and message processing rules.

**video-parameters**\*: The **video-parameters** element is of the XML type **video-parameters-type**, following the semantic definition specified in section [2.2.1.1.2](#).

#### 2.2.2.2.1.2 entry-exit-announcements

**Entry-exit-announcements** \*: The **entry-exit-announcements** element is of the XML type **entry-exit-announcements-type**, following the semantic definition in section [2.2.1.1.4](#).

#### 2.2.2.2.1.3 presentation-mode-capable

**Presentation-mode-capable** \*: The **presentation-mode-capable** element is of the XML type **xs:boolean** following the semantic definition in section [3.2.3.1.1.2.3](#). The schema for **presentation-mode-capable** element is as follows:

```
<xs:element name="presentation-mode-capable" type="xs:boolean" ms:ignore="true"/>
```

#### 2.2.2.2.1.4 mediaFiltersRules

**mediaFiltersRules** \*: The **mediaFiltersRules** element is of the XML type **media-filters-rules-type**, following the semantic definition in section [2.2.1.1.5](#).

#### 2.2.2.2.1.5 multi-view-capable Element

The **multi-view-capable** element SHOULD [<6>](#) be present in the MCU Conference Roster Document sent by an MCU. The value represents whether the conference supports sending multiple streams for the **conference-media-type** with a **label** value equal to "main-video" for each client. In the context of C3P **request messages**, this element is ignored.

It is defined in the commonmcuextensions namespace found here:

<http://schemas.microsoft.com/rtc/2009/03/commonmcuextensions>.

The schema for **multi-view-capable-type** is as follows:

```
<xs:element name="multi-view-capable" type="xs:boolean" ms:ignore="true"/>
```

#### 2.2.2.2.1.6 video-presentation-mode-capable Element

The **video-presentation-mode-capable** element SHOULD<7> be present in the MCU Conference Roster Document sent by an MCU. The value represents whether the conference supports role-based restrictions specified by **media-filters-rules-type** in section 2.2.1.1.5, with **type** value equal to "video". In the context of C3P request messages, this element is ignored.

It is defined in the commonmcuextensions namespace found here:

<http://schemas.microsoft.com/rtc/2009/03/commonmcuextensions>.

The schema for **video-presentation-mode-capable** is as follows:

```
<xs:element name="video-presentation-mode-capable" type="xs:boolean" ms:ignore="true"/>
```

#### 2.2.2.2.1.7 confMediaFiltersRules Element

The **confMediaFiltersRules** element SHOULD<8> be present in the MCU Conference Roster Document sent by an MCU. The **confMediaFiltersRules** element is of the XML type **media-filters-rules-type**, following the semantic definition in section 2.2.1.1.5. The value represents the **media-filters-rules-type** that is applied to the conference.

It is defined in the commonmcuextensions namespace found here:

<http://schemas.microsoft.com/rtc/2009/03/commonmcuextensions>.

The schema for **confMediaFiltersRules** is as follows:

```
<xs:element name="conf-media-filters-rules" type="msci:media-filters-rules-type" ms:ignore="true" />
```

### 2.2.3 C3P request/response Document Content

#### 2.2.3.1 addUser Dial-out Request Document Syntax

In addition to the syntax rules given in [MS-CONFBAS] section 2.2.3.15 for **addUser** dial-out requests, additional rules apply to the elements specified in the following subsections.

##### 2.2.3.1.1 endpoint Element

The following rules apply to the **endpoint** element.

- One single **endpoint** element MUST be present inside the **user** element. The **user** element MUST NOT contain more than one **endpoint** element.
- The **epid** attribute can be specified. If specified, it MUST be a valid **endpoint identifier (EPID)**, as specified in [MS-SIPRE] section 3.3.
- The attributes **epid**, **endpoint-uri**, and **sip-instance** are mutually exclusive. While any one of them can be specified, entities MUST NOT specify more than one in an **addUser** dial-out request document.

- If the **languages** element is present it MUST NOT contain more than one language. The language specified will be used, if supported, to play the entry and exit announcements to this particular **endpoint**.

### 2.2.3.1.2 media Element

Instances of the **media** element of the **endpoint** element can be present. If present, instances MUST conform to the syntax specified in section [2.2.2.1.1.1](#). If instances of the **media** element are present in an **addUser** dial-out request, the contents are interpreted as a constraint on the default SDP offer that the MCU sends the called party in the SIP **INVITE**.

The specific rules for processing the **addUser** dial-out request are specified in section [3.2.5.2](#).

### 2.2.3.2 addUser Dial-in Request Document Syntax

In addition to the syntax rules given in [\[MS-CONFAS\]](#) section 2.2.3.17 for **addUser** dial-in requests, the additional rules in the following subsections apply.

#### 2.2.3.2.1 endpoint Element

- Exactly one **endpoint** element MUST be present inside the **user** element. The **user** element MUST NOT contain more than one **endpoint** element.
- The **epid** attribute can be specified. If specified, it MUST be a valid EPID, as specified in [\[MS-SIPRE\]](#) section 3.3.
- One and only one of the attributes **epid**, **endpoint-uri**, and **sip-instance** MUST be specified.
- If the **languages** element is present it MUST contain exactly one language. The language specified will be used, if supported, to play the entry and exit announcements to this particular **endpoint**.

#### 2.2.3.2.2 media Element

Instances of the **media** element of the **endpoint** element can be present inside the **endpoint** element. If present, instances MUST conform to the **media** element syntax specified in section [2.2.2.1.1.1](#).

This protocol does not define any processing rules or behavior related to **endpoint media** elements in **addUser** dial-in request messages. If instances of the **media** element are present in an **addUser** dial-in request, they are ignored.

### 2.2.3.3 modifyEndpointMedia Request Syntax

This section defines A/V-specific semantics for the **modifyEndpointMedia** request message.

In addition to the syntax rules for C3P request document formats specified in [\[MS-CONFAS\]](#) section 2.2.3, the following additional syntax rules apply.

The **mediaKeys** element MUST be present, and it MUST contain the following attributes:

- **userEntity**: Specifies the user to which the request applies.
- **endpointEntity**: Specifies the user's endpoint (5) to which the request applies.
- **mediaId**: Specifies the user media instance to which the request applies.

The previous attributes SHOULD contain values that reference current MCU Conference Roster Document contents. In other words, these attributes SHOULD correlate with values that were reflected in the most recent notification that contains the MCU Conference Roster Document..

The schema for **media-keys-type** element is as follows:

```
<xs:complexType name="media-keys-type" ms:className="CC3PMediaKeysType">
  <xs:attribute name="confEntity" type="xs:anyURI" ms:propertyName="ConfUri"/>
  <xs:attribute name="userEntity" type="xs:anyURI" ms:propertyName="UserUri"/>
  <xs:attribute name="endpointEntity" type="xs:string" ms:propertyName="EndpointUri"/>
  <xs:attribute name="mediaId" type="xs:string" />
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

The **label** element can be present. If present, it MUST contain the pre-existing value. This element is assigned by an MCU and cannot be modified.

The **media-ingress-filter** element is optional. If present, it specifies a new media filter direction of client-endpoint-to-MCU. If it is not present, the existing value of the filter is unaffected by the request.

The **media-egress-filter** element is optional. If present, it specifies a new media filter direction of MCU-to-client-endpoint. If it is not present, the existing value of the filter is unaffected by the request.

The **status** element can be present. Extensions to this protocol can specify additional syntax and processing rules for modifying the value of the **status** element.

The **src-id** element SHOULD NOT be present. This element is assigned by an MCU and cannot be modified. If this element is present in a **modifyEndpointMedia** request, its value is ignored.

The **type** element can be present. This element is assigned by an MCU and cannot be modified. If this element is present in a **modifyEndpointMedia** request, its value is ignored.

#### 2.2.3.4 modifyConferenceAnnouncements Request Syntax

This section defines A/V-specific semantics for the **modifyConferenceAnnouncements** request message.

In addition to the syntax rules for C3P request document formats specified in [\[MS-CONFBAS\]](#) section 2.2.3.25, the following rules apply.

The boolean type element **enabled** MUST be present.

The schema for **modify-conference-announcements-type** is as follows:

```
<xs:complexType name="modify-conference-announcements-type"
ms:className="CC3PModifyConfAnnouncementsRequestType">
  <xs:sequence>
    <xs:element name="conferenceKeys" type="tns:conference-keys-type"
ms:propertyName="ConferenceKeys"/>
    <xs:element name="enabled" type="xs:boolean"/>
    <xs:any namespace="##other" processContents="lax" minOccurs="0" maxOccurs="unbounded"
/>
  </xs:sequence>
  <xs:attribute ref="mscp:mcuUri" use="optional" ms:propertyName="McuUri"/>
  <xs:anyAttribute namespace="##other" processContents="lax" />
```

</xs:complexType>

Preliminary

## 3 Protocol Details

### 3.1 Client Details

#### 3.1.1 Abstract Data Model

None.

#### 3.1.5 Message Processing Events and Sequencing Rules

##### 3.1.5.1 Constructing the Outgoing addUser Dial-in Request

As specified in [\[MS-CONFBAS\]](#) section 3.11, the dial-in request can be sent by the client or by the focus itself to the MCU. Clients do not typically need to explicitly send an **addUser** dial-in request to join MCU-specific conference modes. This assumes that they have followed the conference subscription rules specified in [\[MS-CONFBAS\]](#). Specifically, the clients have extracted the **MCU-Conference-URI** of the desired MCU from the received conference notifications. A SIP INVITE message sent to the **MCU-Conference-URI** of a specific MCU results in an implicit **addUser** dial-in message being sent from the focus to the MCU.

In addition to the rules specified in [\[MS-CONFBAS\]](#) section 3.11.4.1,

an A/V specific **addUser** dial-in request MUST conform to the syntax rules specified in section [2.2.3.2](#).

##### 3.1.5.2 Constructing the Outgoing SIP INVITE Dial-in Request

This section specifies A/V media specific SDP content rules for SIP INVITE messages associated with an **addUser** dial-in. In addition to the rules specified in [\[MS-CONFBAS\]](#) section 3.11 for outgoing SIP INVITE requests, the following rules apply to SIP INVITE messages that follow A/V-specific **addUser** dial-in requests.

If the client specifies an **Accept-Language** header, as specified in [\[RFC3261\]](#) section 20.3, the conference MUST use the specified language to play all entry and exit announcements if the language is available. The behavior SHOULD be the same as if the **languages** element were specified in the **addUser** dial-in request, as explained in section [2.2.3.2.1](#). If present, the header MUST contain exactly one language and MUST NOT contain any **accept-param** header parameters.

It is assumed that clients have subscribed to conference notifications and have followed all of the rules and recommendations specified in [\[MS-CONFBAS\]](#). Therefore, the client is aware of the

following information before constructing the SIP INVITE message and the SDP offer content contained within it.

- The **MCU-Conference-URI** of the **Audio/Video Multipoint Control Unit (AVMCU)** that is extracted from the **conf-uris** element of the Conference Document, whose child **purpose** element contains the value "audio-video", as specified in [\[MS-CONFBAS\]](#) section 2.2.2.4.
- The contents of the AVMCU-specific **entity-view** element, and its subelements, within the **conference-view** element. The **conference-view** element can contain zero or more MCU-specific **entity-view** elements. Each **entity-view** element contains an **entity-state** element, which contains a **media** element. The **media** element can contain zero or more **entry** elements, each representing one conference media instance. Therefore, the client has a list of the A/V-specific conference media instances.

### 3.1.5.2.1 Constructing the SDP Offer in the Outgoing SIP INVITE Message

When constructing the SDP offer, the offered media instances are expected to correlate with the conference media instances that are reflected in conference state **notifications**. Therefore, the following rules apply:

- If the conference notification sent by the MCU does not contain a **multi-view-capable** element with a value of "true", the client SHOULD NOT offer a greater number of SDP media instances of a given media type than are reflected in conference media instances. For example, if there is one conference media instance of type "audio" and one conference media instance of type "video", the client's SDP offer SHOULD NOT contain more than one **m=audio** and one **m=video** instance.

Note that if the client SDP offer contains more SDP media instances than are reflected in conference media instances, the MCU will reject those media instances using the conventional "port=0" semantics specified in [\[RFC3264\]](#) section 8.2 for removing a media stream.

- If the conference notification sent by the MCU contains a **multi-view-capable** element with a value of "true", the client can offer multiple SDP media instances of type "video" for one instance of conference media instance of type "video". For the other media instance types, the client SHOULD behave as described above, wherein the client SHOULD NOT offer a greater number of SDP media instances of a given media type than are reflected in conference media instances. When offering such media instances, the client SHOULD follow the descriptions specified in [\[MS-SDPEXT\]](#) section 3.1.5.34 and [\[MS-SDPEXT\]](#) section 3.1.5.35 to construct the SDP and construct a MIME structure as defined in [\[MS-SIPRE\]](#) section 3.15.4.1.
- The client can supplement each SDP **m=** line with the **label** attribute where the value of the **label** attribute is equal to the value of the **label** element that is reflected in conference state notifications.

### 3.1.5.3 Constructing the Outgoing addUser Dial-out Request

In addition to the rules specified in [\[MS-CONFBAS\]](#) section 3.10, A/V-specific **addUser** dial-out requests

MUST conform to the syntax rules specified in section [2.2.3.2](#).

## 3.2 Server Details

### 3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

Because external messages always relate in some way to the Conference Document structure that is described in section 1.3, it is convenient to use that as the conceptual data model. In other words, the abstract data model is represented by the structure defined by the XML schema for the **conference-info** element and its entire hierarchy of subelements.

Using the Conference Document structure as the basis for representing abstract state allows interim processing steps to be described in terms of data-modification operations made directly on a copy of the Conference Document. Where externally-visible C3P messages contain parts and fragments of the conference document, descriptions of the interim steps are used in subsequent sections to illustrate how the externally-visible state changes are realized.

Note that the actual data model can be implemented using a variety of techniques. An implementation is at liberty to represent such data in any way convenient.

#### 3.2.1.1 Correlation of Media Parameters

The message processing and sequencing rules specified for the server role have common requirements for correlating media information across Conference Media instances, user **endpoint** element media instances, and SDP, [RFC4566], and [MS-SDPEXT] media descriptions contained in the **application/SDP** section of SIP messages.

The message processing and sequencing rules for the server role are as follows:

- A conference media instance is described using the XML type **conference-medium-type** in an instance of an **entry** element within the **media** element within the MCU-specific **entity-state** element.
- A user media instance is described using the XML type **media-type** in an instance of a **media** element within the **endpoint** element.
- Media instances are represented in SDP by the **m=** line.

The following table specifies the extent of possible correlation relationships across the three separate constructs.

Conference Media(XML type "conference-medium-type")	User Media(XML type "media-type")	SDP Media Description("m" line)
<b>label</b> attribute	<b>label</b> element	<b>label</b> attribute [RFC4574]
<b>type</b> element	<b>type</b> element	<b>m=</b> field value. For example,

Conference Media(XML type "conference-medium-type")	User Media(XML type "media-type")	SDP Media Description("m" line)
		m=audio
<b>status</b> element	<b>status</b> element	multiple <b>a=</b> attribute values: a=sendrecv a=sendonly a=recvonly a=inactive

The **type** element can have the value of "audio" or "video". Other values MUST be ignored.

### 3.2.1.2 Correlation of Media Instances

A relationship exists between user media instances and SDP media instances. When correlated, user media instances and SDP media instances are paired together.

Note that there are cases where correlation is not possible. For example:

- There are more SDP media instances than user media instances.
- There are more user media instances than SDP media instances.
- An SDP media instance exists for which there is no matching user media instance that has not already been paired with a different SDP media instance.

The following abstract data model can be used to maintain the correlated relationships and state that is referenced when processing messages.

Note that an implementation is at liberty to represent the media instance relationships in any way that is convenient.

The conceptual model is a two-dimensional table containing all user media instances and all SDP media instances, whether correlated or not. For each user media instance in the table, there is also a corresponding state variable that controls message processing behavior. The user media instances in the correlation table are uniquely identified by the **id** attribute value. SDP media instances in the table are uniquely identified by their positional order within the body of the "application/SDP" content specified in [\[RFC3264\]](#).

For example:

User media instances	SDPState	SDP media instances
<media id="1">	"Active" or "Rejected"	"m=" line 2
<media id="2">	"Active" or "Rejected"	"m=" line 1
<media id="3">	"NotInstantiated"	(None)
(None)	"Rejected"	"m=" line 3

In the example shown in the preceding table:

- The user media instance <media id="1"> is correlated with the SDP media instance that appears second in the "application/SDP" content.
- The user media instance <media id="2"> is correlated with the SDP media instance that appears first in the "application/SDP" content.
- The user media instance <media id="3"> is not correlated with any SDP media instance.
- The third SDP media instance is not correlated with a user media instance.

The **SDPState** variable has the following state values and behaviors associated with each state:

- "NotInstantiated": Indicates that the user media instance has not been correlated with an SDP media instance. User media instances in this state are not included in MCU Roster (user) notifications.
- "Active": Indicates that the SDP media instance refers to a negotiated RTP stream. User media instances in this state are included in MCU Roster notifications for the user.
- "Rejected": Indicates that the SDP media instance has been rejected using the "port=0" semantics specified in [\[RFC3264\]](#). User media instances in this state are included in MCU Roster notifications for the user.

### 3.2.2 Timers

None.

### 3.2.3 Initialization

#### 3.2.3.1 Conference Activation (MCU Bootstrap)

This section defines the message content and semantics for bootstrapping an **AVMCU** and initializing its conference state.

In addition to the requirements specified in [\[MS-CONFBAS\]](#) section 3.4.4.3, the following semantics and content apply to bootstrapping an AVMCU.

##### 3.2.3.1.1 Initial Full Conference Notification

The contents of the initial full conference notification sent by an AVMCU are specified in the content rules contained in the following subsections.

###### 3.2.3.1.1.1 entity-capabilities Element

The **entity-capabilities** element SHOULD be present. The contents of the **entity-capabilities** element SHOULD be fully populated and initialized as follows.

The **msav:capabilities** element SHOULD be present. If present, its child elements, **supports-audio** and **supports-video**, MUST be valid XML according to the defined schema. In other words, both elements MUST be present and MUST contain either "true" or "false".

###### 3.2.3.1.1.2 Child Elements of the entity-state Element

###### 3.2.3.1.1.2.1 entry-exit-announcements element

This section follows the product behavior described in endnote. [<9>](#)

The **entry-exit-announcements** element MUST be present and MUST be fully populated.

The following rules apply:

- If the **entry-exit-announcements** is included in the **entity-settings** upon conference activation the AVMCU MUST copy the received value of **entry-exit-announcements** to the corresponding instance in **entity-state** element.
- Otherwise, the AVMCU MUST populate the following default value for the **entry-exit-announcements** in the **entity-state** element.

```
<msmcu:entry-exit-announcements>
  <msmcu:modifiable>true</msmcu:modifiable>
  <msmcu:enabled>false</msmcu:enabled>
</msmcu:entry-exit-announcements>
```

### 3.2.3.1.1.2.2 mediaFiltersRules element

This section follows the product behavior described in endnote. [<10>](#)

The **mediaFiltersRules** element MUST be present and MUST be fully populated in the initial full conference notification.

The following rules apply:

- If the AVMCU receives a **mediaFiltersRules** element in the **entity-settings** section of the initial **addConference** request during conference bootstrap, the AVMCU MUST copy the received value of **mediaFiltersRules** to the corresponding instance in the **entity-state** element.
- Otherwise, the AVMCU MUST populate the following default values for the **mediaFiltersRules** element with **type** value equal to "audio" in the **entity-state** element:

```
<msci:mediaFiltersRules>
  <msci:mayModifyOwnFilters>
    <msci:role>default</msci:role>
    <msci:value>true</msci:value>
  </msci:mayModifyOwnFilters>
  <msci:initialFilters>
    <msci:role>default</msci:role>
    <msci:ingressFilter>unblock</msci:ingressFilter>
  </msci:initialFilters>
  <msav:type>audio</msav:type>
```

```
</msci:mediaFiltersRules>
```

### 3.2.3.1.1.2.3 presentation-mode-capable element

This section follows the product behavior described in endnote. [<11>](#)

The **presentation-mode-capable** element can be present and, if present, MUST adhere to the syntax rules specified in section [2.2.2.1.3](#). The value of this element MUST be "true".

If the **presentation-mode capable** element is present, then the AVMCU MUST support modification of the **mediaFiltersRules** or **confMediaFiltersRules** elements with a **type** of value equal to "audio" as discussed in section [3.2.3.1.1.2.2](#) using the ModifyConference request shown in section [4.5](#)

#### 3.2.3.1.1.2.4 media Element

The **media** element MUST be present and MUST be fully populated to contain the descriptions of the AVMCU's full complement of conference media instances, following the semantic rules specified in section [2.2.2.2.1.1](#) for each **entry** element within the **media** element.

The following rules also apply:

- If the **capabilities** element of the **entity-capabilities** element is also present, and the value of its **supports-video** element is "false", the **media** elements MUST NOT contain any instances that have a **type** element value of "video".
- If the **capabilities** element of **entity-capabilities** is also present, and the value of its **supports-audio** element is "false", the **media** elements MUST NOT contain any instances that have a **type** element value of "audio".

#### 3.2.3.1.1.2.5 multi-view-capable Element

The **multi-view-capable** element SHOULD [<12>](#) be present and be fully populated. If the **multi-view-capable** element is set to "true", then the MCU MUST support negotiating multiple video streams with label "main-video" as defined in [\[MS-SDPEXT\]](#) section 3.1.5.35.

#### 3.2.3.1.1.2.6 video-presentation-mode-capable Element

The **video-presentation-mode-capable** element SHOULD [<13>](#) be present and, if present, MUST adhere to the syntax rules specified in section [2.2.2.2.1.3](#).

If the **video-presentation-mode-capable** element is set to "true", then the MCU MUST support modification of the **mediaFiltersRules** or **confMediaFiltersRules** elements with a **type** (section [2.2.1.1.5.3](#)) of value equal to "video" as discussed in section [3.2.3.1.1.2.2](#) using the ModifyConference request shown in section [4.5](#)

#### 3.2.3.1.1.2.7 confMediaFiltersRules Element

The **confMediaFiltersRules** element SHOULD [<14>](#) be present and if present, MUST be fully populated in the initial full conference notification.

The following rules apply:

- If the AVMCU receives a **confMediaFiltersRules** element in the **entity-settings** section of the initial **addConference** request during conference bootstrap, the AVMCU SHOULD reflect the received value of **confMediaFiltersRules** to the corresponding instance in the **entity-state** element.
- Otherwise, the AVMCU SHOULD populate the following default values for the **confMediaFiltersRules** element with **type** value equal to "video" in the **entity-state** element:

```
<msmcu:confMediaFiltersRules>
```

```
<msci:mayModifyOwnFilters>
```

```

    <msci:role>default</msci:role>
    <msci:value>>true</msci:value>
  </msci:mayModifyOwnFilters>
  <msci:initialFilters>
    <msci:role>default</msci:role>
    <msci:ingressFilter>unblock</msci:ingressFilter>
  </msci:initialFilters>
  <msav:type>video</msav:type>

```

```
</msmcu:confMediaFiltersRules >
```

The **conference-view** element package described in [\[MS-CONFBAS\]](#) section 2.2.4.3 is used for conference notifications. When a first notification returned by the **server (2)** has **state** equal to "full", it is called the initial full conference notification. An example of a **conference-view** element package containing the initial full conference notification for an AVMCU is as follows:

```

<msci:conference-view ci:state="full">
  <msci:entity-view ci:state="full" entity="sip:alice@fabrikam.com;
    gru;opaque=app:conf:focus:id:34D7F8255152F345817A2A6037C579BD">
    <msci:entity-state>
      <msci:locked>false</msci:locked>
    </msci:entity-state>
  </msci:entity-view>
  <msci:entity-view ci:state="full" entity="sip:alice@fabrikam.com;
    gru;opaque=app:conf:audio-video:id:34D7F8255152F345817A2A6037C579BD">
    <msci:entity-capabilities>
      <msav:capabilities>
        <msav:supports-audio>true</msav:supports-audio>
        <msav:supports-video>true</msav:supports-video>
      </msav:capabilities>
    </msci:entity-capabilities>
    <msci:entity-state>
      <msci:mediaFiltersRules>
        <msci:mayModifyOwnFilters>
          <msci:role>default</msci:role>
          <msci:value>true</msci:value>
        </msci:mayModifyOwnFilters>
        <msci:initialFilters>
          <msci:role>default</msci:role>
          <msci:ingressFilter>unblock</msci:ingressFilter>
        </msci:initialFilters>
        <msav:type>audio</msav:type>
      </msci:mediaFiltersRules>
      <msci:media>
        <entry label="main-audio">
          <type>audio</type>
          <status>sendrecv</status>
        </entry>
        <entry label="main-video">
          <type>video</type>
          <status>sendrecv</status>
          <msci:modal-parameters>
            <msci:video-parameters>
              <msav:video-mode>dominant-speaker-switched</msav:video-mode>
            </msci:video-parameters>
          </msci:modal-parameters>
        </entry>
      </msci:media>
    </msci:entity-state>
  </msci:entity-view>

```

```

        </msci:video-parameters>
    </msci:modal-parameters>
</entry>
<entry label="panoramic-video">
    <type>panoramic-video</type>
    <status>sendrecv</status>
</entry>
</msci:media>
<cis:separator/>
<cis:separator/>
<msmcu:presentation-mode-capable>true</msmcu:presentation-mode-capable>
<msmcu:entry-exit-announcements>
    <msmcu:modifiable>true</msmcu:modifiable>
    <msmcu:enabled>false</msmcu:enabled>
</msmcu:entry-exit-announcements>
<cis:separator/>
<msmcu:multi-view-capable>true</msmcu:multi-view-capable>
<msmcu:video-presentation-mode-capable>true</msmcu:video-presentation-mode-capable>
<msmcu:conf-media-filters-rules>
    <msci:mayModifyOwnFilters>
        <msci:role>default</msci:role>
        <msci:value>true</msci:value>
    </msci:mayModifyOwnFilters>
    <msci:initialFilters>
        <msci:role>default</msci:role>
        <msci:ingressFilter>unblock</msci:ingressFilter>
    </msci:initialFilters>
    <msav:type>video</msav:type>
</msmcu:conf-media-filters-rules>
</msci:entity-state>
</msci:entity-view>
</msci:conference-view>

```

### 3.2.4 Higher-Layer Triggered Events

None.

### 3.2.5 Message Processing Events and Sequencing Rules

Unless otherwise specified, the message processing rules defined in this protocol assume that the commands documented herein are executed without error. Implementations of AVMCU services can have operating modes and application logic that prohibit certain commands from being carried out to their normal conclusion. For example, an implementation's configuration or policy could result in certain commands being deliberately denied or rejected with error responses. Such implementation decisions are beyond the scope of this protocol, and not necessary for illustrating the protocol extensions.

#### 3.2.5.1 Common Rules for Processing SDP Offers and Answers

This section specifies common rules that apply to any handling of audio/video-specific SDP offers or answers within the MCU entity. These rules are referred to by the message processing rules defined in this section.

The rules specified in this section assume that the following conditions exist:

- The MCU entity has an internal representation of the current state of conference media, so it could generate a full conference notification. That is, bootstrap has occurred.
- The MCU entity has an internal representation of user media instances, so it could construct at least the contents of the **media** element, the **media-ingress-filter** element, and the **media-egress-filter** elements within the **endpoint** element as it would appear in the MCU Conference Roster Document Format specified in section [2.2.2.1](#).

Note that the previous condition can be met by generating a temporary working copy of user media instances on demand.

If the MCU has set the **multi-view-capable** attribute to "true" as described in section [2.2.2.2.1.5](#), then the MCU SHOULD have multiple instances of user media instances with label "main-video" for its internal representation, but SHOULD NOT include

- more than one media instance in the full conference notification. The single instance of the user media instance with label "main-video" SHOULD be the instance which the client might contribute its video source.

### 3.2.5.1.1 Generating an Initial SDP Offer

This section specifies the processing rules and behavior for generating an initial SDP offer, as is typical when preparing to send a SIP INVITE as part of **addUser** dial-out processing. It is assumed that an implementation is independently capable of SDP negotiation using [\[MS-SDPEXT\]](#) before considering the extensions specified in this protocol.

The following conceptual steps specify the requirements for generating an initial SDP offer. The steps can be performed in another order from the one given here, as long as the same end results are achieved.

For each instance of the **media** element within the **endpoint** element:

- If the **media-ingress-filter** element or the **media-egress-filter** elements are present within the **media** element, apply them to the initial value of the **status** element.
  - Note that the semantics of the **media-ingress-filter** element and **media-egress-filter** element are referenced from the point of view of the MCU. The **status** element is referenced from the point of view of the user.
 

For example, if the initial value of the **status** element is "sendrecv" and the value of **media-ingress-filter** element is "block", the resulting value of the **status** element is "recvonly".
- Generate a valid and fully-formed SDP **m=** line of the media type specified in the **type** element of the user media instance. Referring to the table and the special case specified in section [3.2.1.1](#):
  - If the value of the **type** element is **audio**, the **m=** line begins with "m=audio".
  - If the value of the **type** element is **video**, the **m=** line begins with "m=video".
  - If the value of the **type** element is another value, the media instance MUST be ignored; they are not used by a **user agent client (UAC)** and are reserved.
- The directional attribute, such as "a=sendrecv", MUST be set to reflect the directionality of the MCU's point of view based on the value specified in the **status** element of the user media instance, with the following exception. When the direction is "sendrecv", the MCU SHOULD exclude the direction attribute in the SDP offer, because a default of "a=sendrecv" SHOULD be

assumed in cases where a direction attribute is not explicitly specified, as specified in [\[RFC3264\]](#). The **status** element reflects the user's point of view and, following the conventions established in [\[RFC3264\]](#), the offered directional attribute is the opposite of the directional attribute of the **remote endpoint**. For example, if the user media instance directional attribute is "recvonly", the MCU's offered directional attribute is "sendonly".

- An MCU SHOULD supplement the SDP media description with the **label** attribute, setting the value of the **label** attribute to the value contained in the media instance's **label** element.
- This protocol specifies only the media type, either "audio" or "video", the **label** element value, and the **status** element value. The remainder of the SDP media description (**m** line) is implementation-specific and beyond the scope of this protocol. This protocol assumes that an implementation is first capable of operating independently of the protocol extensions specified in this protocol before the extensions are applied. For more information, see section [1.5](#).
- Using the conceptual data model described in section [3.2.1.2](#), create and initialize a table of correlated media instances for reference when processing subsequent messages.

If the MCU internally has multiple instances of a **media** element of type "video" with label "main-video", the video streams SHOULD be multiplexed as defined in [\[MS-SDPEXT\]](#) section 3.1.5.35.

### 3.2.5.1.2 Correlation of Offered SDP Media Instances

This section specifies processing rules for establishing the initial correlation between user media instances and newly-offered SDP media instances. This typically occurs when the first SIP INVITE is received, such as in the case of an **addUser** dial-in. It can also occur in subsequent re-INVITE messages, regardless of the direction of the original SDP offer.

The following rules assume use of the conceptual data model described in section [3.2.1.2](#) and the media parameter correlations specified in section [3.2.1.1](#):

- A user media instance and an SDP media instance can be considered to correlate only if the following conditions are met:
  - If the SDP media instance specifies "m=audio", the value of the **type** element of the user media instance MUST be "audio".
  - If the SDP media instance specifies "m=video", the value of the **type** element of the user media instance MUST be "video".
- Once correlation between a user media instance and an SDP media instance has been established, that correlation relationship MUST NOT change. Thus, only the user media instances having an **SDPState** of "NotInstantiated" are eligible for correlation with a new SDP media instance.

Other than the previously mentioned rules, this protocol does not mandate use of any specific algorithm to correlate media instances. An implementation can use any convenient mechanism. In typical cases, all that is necessary is to apply the previously mentioned rules in a simple search loop.

The following pseudocode illustrates correlating media instances:

```
for each new SDP media instance that does not already exist in the table
{
    for each row in the table that contains a user media instance
    {
        If the preceding correlating conditions are met
        {
```

```
add the correlating SDP media instance to the row
change the SDPState value of the row from "NotInstantiated" to "Active"
continue on to the next new SDP media instance
}
}
if no correlating user media instance was found
append the table with a new row containing only the SDP media instance
}
```

If the **label** attribute is present in the SDP-offered media instances, the MCU can implement correlation logic that considers the **label** attribute value of the SDP media instance and the **label** element value of the user media instance, particularly when multiple media instances of the same media type are present.

### 3.2.5.1.3 Processing a Received SDP Offer

This section specifies processing rules for processing an SDP offer. The rules specified in this section assume that the correlation relationships between SDP media instances and user media instances have been established. In other words, the conceptual correlation table described in section [3.2.1.2](#) has been initialized using the rules specified in section [3.2.5.1.2](#).

The following conceptual steps specify the requirements for processing a received SDP offer. The steps can be performed in other sequences, as long as the same end results are achieved.

For each SDP media instance that is correlated with a user media instance:

1. If the SDP offer specifies that a previously negotiated media stream has been removed, as specified in [\[RFC3264\]](#) section 8.2, the MCU MUST omit the user media instance from subsequent MCU Roster notifications for the user and continue on to the next media instance. Using the conceptual correlation table described in section [3.2.1.2](#), this is accomplished by changing the **SDPState** value from "Active" to "Rejected".
2. If the SDP offer specifies that a previously rejected or removed media stream has been re-instantiated using the same SDP media "slot", as specified in [\[RFC3264\]](#) section 8.1, the MCU MUST include the user media instance in subsequent MCU Roster notifications for the user and continue on to the next step. Using the conceptual correlation table described in section [3.2.1.2](#), this is accomplished by changing the **SDPState** value from "Rejected" to "Active".
3. The MCU MUST intersect the values of the **status** element and the offered SDP directional attribute contained in an **a=** line to determine the effective directionality, and apply the resulting value to the **status** element. For example, if the original **status** element value is "sendrecv" and the SDP offer specifies "a=recvonly", the resulting value of the **status** element is "recvonly".
4. If the media capabilities of the implementation do not support the parameters of the offered media instance, such as when the offered **codec** is not supported, the MCU MUST reject the media instance using the conventional "port=0" semantics specified in [\[RFC3264\]](#). In addition, the MCU MUST omit the user media instance from subsequent MCU Roster notifications for the user and continue on to the next media instance. Using the conceptual correlation table described in section [3.2.1.2](#), this is accomplished by changing the **SDPState** value from "Active" to "Rejected".
5. When constructing the SDP answer for this media instance, the MCU MUST specify the intersected directionality using the standard conventions specified in [\[RFC3264\]](#). This is a "reverse" direction.

6. The remainder of the SDP media description, or **m** line, is implementation-specific, and beyond the scope of this protocol. This protocol assumes that an implementation is first capable of operating independently of the protocol extensions specified in this protocol before the extensions are applied. For more information, see section [1.5](#).
7. For each SDP media instance that is not correlated with a user media instance, the MCU MUST reject the media instance using the conventional "port=0" semantics specified in [\[RFC3264\]](#).

#### 3.2.5.1.4 Processing a Received SDP Answer

This section specifies processing rules for processing an SDP answer. The rules specified in this section assume that the correlation relationships between SDP media instances and user media instances have been established. In other words, the conceptual correlation table described in section [3.2.1.2](#) has been initialized using the rules specified in section [3.2.5.1.2](#).

In addition, the full contents of the SDP answer are assumed to conform to the requirements and recommendations specified in [\[RFC3264\]](#) and, therefore, any uncorrelated SDP media instances have been previously removed or rejected using the conventions specified in [\[RFC3264\]](#).

The following conceptual steps specify the requirements for processing a received SDP answer to a previously sent offer. The steps can be performed in a different sequence, as long as the same end results are achieved.

For each SDP media instance that is correlated with a user media instance:

1. If the SDP answer specifies that a media instance has been rejected, as specified in [\[RFC3264\]](#) section 6, the MCU MUST omit the user media instance from subsequent MCU Roster notifications for the user and continue on to the next media instance. Using the conceptual correlation table described in section [3.2.1.2](#) this is accomplished by changing the **SDPState** value from "Active" to "Rejected".
2. The MCU MUST intersect the values of the **status** element and the SDP **a=** element to determine the effective directionality, and apply the resulting value to the **status** element. For example, if the original **status** element value is "sendrecv" and the SDP answer specifies "a=recvonly", the resulting value of the **status** element is "recvonly".
3. The remainder of the SDP media description, which is contained in an **m=** line, is implementation-specific, and beyond the scope of this protocol. This protocol assumes that an implementation is first capable of operating independently of the protocol extensions specified in this protocol before the extensions are applied. For more information, see section [1.5](#).

#### 3.2.5.2 addUser Dial-out Request

The **addUser** dial-out request is used to initiate connecting a participant to an MCU. [\[MS-CONFAS\]](#) section 3.10 specifies **addUser** dial-out behavior and message processing rules that are common to all MCUs. This section specifies the **addUser** dial-out behavior that is specific to the **AVMCU** role.

Unless otherwise specified, all of the message processing and sequencing rules specified in [\[MS-CONFAS\]](#) section 3.10 for the MCU's role in processing **addUser** dial-out commands apply.

Upon receiving an **addUser** dial-out command, assuming that the prerequisite conditions specified in [\[MS-CONFAS\]](#) section 3.10 are met, the following additional rules apply.

- The MCU MUST validate the contents of the **addUser** dial-out request for conformance to the syntax rules specified in section [2.2.3.1](#). If the syntax is not valid, the MCU MUST respond to the **addUser** dial-out request with an **addUser** "error" response. The "error" response contains the

response code "Request Malformed", and the body of the **addUser** contains the **reason** attribute with the value "OtherFailure".

Construction of the SIP INVITE message consists of two steps:

- Determining the SIP **URI** to send the message to and construction of the **SIP message** envelope including all headers.
- Construction of the media-specific, application/SDP, content.

### 3.2.5.2.1 Constructing the Outgoing SIP INVITE Request

The SIP INVITE request that is used to carry the SDP content is constructed as specified in [\[MS-CONFAS\]](#) section 3.10.4.1.1. This protocol defines only SDP-specific extension rules to the **addUser** dial-out request.

The target SIP URI is obtained using the rules specified in [\[MS-CONFAS\]](#) section 3.10.4.1.1.

### 3.2.5.2.2 Construction of SDP Contents

The following conceptual interim steps facilitate construction of SDP content and subsequent C3P messages related to the added user.

- If the **media** element contained in the **endpoint** element of the **addUser** message is present and populated with media instances, given the contents of initialized user media instances, the SDP offer content is constructed using the rules defined in section [3.2.5.1.1](#).
- If the **media** element contained in the **endpoint** element of the **addUser** message is not present or is empty, user media instances MUST be constructed and initialized with a one-to-one relationship to conference media instances.

After completion of the previous step, the MCU MUST send a SIP INVITE message containing the constructed SDP offer to the specified target URI.

The MCU SHOULD send an **addUser** "Pending" response at this point.

### 3.2.5.3 addUser Dial-in Request

Processing the **addUser** dial-in message consists of three steps:

- Validating the message syntax and contents.
- Saving a record of the message contents for later reference when processing SIP INVITE messages.
- Constructing and sending the **addUser** dial-in response message.

On receipt of the **addUser** dial-in message, the MCU first validates the message syntax.

In addition to the message processing and sequencing rules specified in [\[MS-CONFAS\]](#) for the MCU's role in processing the **addUser** dial-in, the MCU MUST validate the contents of the **addUser** dial-in request for conformance to the syntax rules specified in section [2.2.3.2](#). If the syntax is not valid, the MCU MUST respond to the **addUser** dial-in request with an **addUser** "error" response. The "error" response contains the response code "Request Malformed", and the body of the **addUser** contains the **reason** attribute with the value "OtherFailure".

Once the request is deemed valid, the MCU saves the contents of the message for later reference when processing the received SIP INVITE message for this user. Because there can be several **addUser** dial-in operations in progress at any given time, the MCU SHOULD implement and maintain a per-conference list of pending **addUser** dial-in request contents.

The data elements of the **addUser** dial-in request that are used later for search comparisons when processing received SIP INVITE messages are as follows:

- The **entity** attribute of the **user** element.
- The **epid** attribute of the **endpoint** element within the **user** element.
- The **sip-instance** attribute of the **endpoint** element within the **user** element.
- The **endpoint-uri** attribute of the **endpoint** element within the **user** element.

### 3.2.5.3.1 Constructing the addUser Dial-in Response

When constructing and sending the **addUser** dial-in response, the rules specified in [\[MS-CONFAS\]](#) section 3.11.5.2.1 apply.

In addition, the MCU SHOULD populate the connection-info element with key-value pairs using the key values for mcu-server-uri and "mcu-conference-uri", as specified in [\[MS-CONFAS\]](#) section 3.11.5.2.1.

### 3.2.5.4 modifyEndpointMedia Request

This section specifies processing rules for the **modifyEndpointMedia** request. Processing the **modifyEndpointMedia** request consists of two steps:

1. Identifying the targeted user and user media instance that the request applies to.
2. Processing the media-instance-specific modification specified by the body of the request. In other words, this modification is specified by the subelements of the **media** element.

The rules for identifying the targeted user and user media instance are specified as follows:

- If the user specified by the **userEntity** attribute of the C3P request message does not exist in the current MCU Conference Roster Document, the MCU MUST send a **modifyEndpointMedia** error response with the reason "UserDoesntExist".
- If the MCU-specific endpoint (5) specified by the **endpointEntity** attribute of the C3P request message does not exist in the current MCU Conference Roster, the MCU MUST send a **modifyEndpointMedia** error response with the reason "EndpointDoesntExist".
- If the user media instance specified by the **mediaId** attribute of the C3P request message does not exist under the specified user and the endpoint (5) in the current MCU Conference Roster, the MCU MUST send a **modifyEndpointMedia** error response with the reason "OtherFailure".
- If the media element in the **modifyEndpointmedia** request contains a value of "unblock" for the **media-ingress-filter** element, the following additional rules apply:
  - The AVMCU MUST retrieve the **mayModifyOwnFilters** rule for the role of the user originating the request specified by the **Ref originator uri**. If the originator uri is not present in the AV portion of the conference, the **mayModifyFilterRules** for the "presenter" role are applied. If the value of the **mayModifyOwnFilters** rule is "true", the AVMCU can process the request further. If the value of the **mayModifyOwnFilters** rule is "false", the AVMCU MUST respond

to the request with a **modifyEndpointMedia** error response with the **CCCP** response code "**unauthorized**" and **addEndpointMedia reason** equal to "otherFailure".

SDP media renegotiation occurs when the MCU sends a SIP re-INVITE containing a modified SDP offer on its pre-established SIP session between itself and the client. The modification of a user media instance can result in SDP media renegotiation. An MCU SHOULD take the current state of that session into account before proceeding.

The following recommendations apply:

- If the SIP session is not in a connected state, for example when the MCU has just received a SIP BYE but has not yet reflected the pending state change in the MCU conference roster, the MCU SHOULD send a **modifyEndpointMedia** error response with the reason "OtherFailure".
- If SDP media renegotiation is in-progress, for example when the MCU has previously sent a SIP INVITE containing a modified SDP offer but has not yet received an SDP answer in response, an implementation SHOULD consider one of the following options:
  - The MCU can send a **modifyEndpointMedia** error response with the reason "OtherFailure". [<15>](#)
  - The MCU can delay processing of the **modifyEndpointMedia** request until the prior SDP media renegotiation is complete. However, delaying processing does not guarantee that the client will not send a SIP BYE in the next message it sends to the MCU. During this delay, the MCU SHOULD send a **modifyEndpointMedia** "pending" response, as described in [\[MS-CONFAS\]](#) section 2.2.3.2.1.
  - The MCU can send a **modifyEndpointMedia** "failure" response if the INVITE from the MCU containing the modified SDP offer receives a SIP Failure response (4xx,5xx, or 6xx).
  - The MCU can process the **modifyEndpointMedia** request before the prior SDP media renegotiation is complete. However, upon completion of the prior renegotiations, the MCU SHOULD determine if another renegotiation is necessary based on the steps below. [<16>](#)

The following steps complete the processing of the **modifyEndpointMedia** request.

1. If the **media-ingress-filter** or **media-egress-filter** elements are present within the **media** element of the **modifyEndpointMedia** request, apply, or copy, their values to the **media-ingress-filter** and **media-egress-filter** elements within the targeted user media instance.
2. Save a temporary copy of the value of the **status** element of the targeted user media instance. In other words, remember the currently-negotiated SDP directional attribute for this media instance.
3. Apply the new values of the **media-ingress-filter** and **media-egress-filter** elements of the targeted media instance to the current value of the **status** element.
  - Note that the semantics of the **media-ingress-filter** and **media-egress-filter** elements are from the perspective of the MCU, and the **status** element is from the perspective of the user.
4. If the new value of the **status** element is different from the previous value, SDP media renegotiation is required.
5. If SDP media renegotiation is required, the MCU SHOULD initiate SDP renegotiation by sending a SIP INVITE message to the client, specifying the full complement of previously-negotiated SDP media instances, following the model specified in [\[RFC3264\]](#) section 1.

Upon completion of the previous procedure, the MCU MUST send a **modifyEndpointMedia** "success" response, which is characterized by a "success" response code for the **modifyEndpointMedia** request. If the new values of the **media-ingress-filter** and **media-egress-filter** elements are different from their previous values, the MCU MUST send a MCU conference roster notification containing the updated **user** element state to the focus.

Note that sending a SIP INVITE message with a new SDP offer to renegotiate media results in subsequent receipt of a **200 OK** message containing the SDP answer. The rules specified in section [3.2.7.1.3](#) apply at that time.

### 3.2.5.5 modifyConferenceAnnouncements Request

This section specifies processing rules for the **modifyConferenceAnnouncements** request. Processing the **modifyConferenceAnnouncements** request consists of two steps:

1. Validating whether the changes contained in the request are permitted within the context of the conference the request is targeted to.
2. If permitted, making changes contained in the request.

The following recommendations apply:

- If the MCU receives the **modifyConferenceAnnouncements** request for a non-existent conference, it MUST send a failure response with the reason "ConferenceDoesntExist".

The following steps complete the processing of the **modifyConferenceAnnouncement** request:

- If the **modifiable** attribute of the **entry-exit-announcements** element under the **entity-view** is set to "false", the MCU **modifyConferenceAnnouncements** MUST send a failure response with the reason "notSupported".

If the **modifiable** attribute of the **entry-exit-announcements** element under the **entity-view** is set to "true", the MCU SHOULD update its value of the **enabled** attribute of the **entry-exit-announcements** element.

Upon completion of the previous procedure, the MCU MUST send a **modifyConferenceAnnouncements** success response, which is characterized by a "success" response code for the **modifyConferenceAnnouncements** request. If the new values of the **enabled** attribute of the **entry-exit-announcements** element is different from its previous values, the MCU MUST send an MCU Conference Roster notification containing the updated **entry-exit-announcements** element state to the focus.

### 3.2.5.6 modifyConference Request

The **modifyConference** request is used to initiate changes to the conference properties by a participant (2) to an MCU. Unless specified otherwise, the rules common to all MCUs for processing **modifyConference** requests specified in [\[MS-CONFPRO\]](#) section 3.1.4.2, [\[MS-CONFPRO\]](#) section 3.1.5.4, and [\[MS-CONFPRO\]](#) section 3.2.5.3 apply.

This section specifies the **modifyConference** behavior that is specific to the AVMCU role.

The following rules apply to the MCU handling of **modifyConference** requests:

- The MCU MUST check if the originator URI in the request is present in the conference.
- If the originator of the request is not present in the conference, the MCU MUST send a **ModifyConference** error response equal to "unauthorized" and reason equal to "OtherFailure".

- If the originator is present in the conference, the MCU checks the originating user's role. If the role is not "presenter", the AVMCU MUST send a **ModifyConference** error response equal to "unauthorized" and reason equal to "OtherFailure".

If the request contains changes to **conference-media-type** and **media-Filters-Rules** type, the MCU MUST send a **ModifyConference** error response equal to "unauthorized" and reason equal to "OtherFailure".

### 3.2.5.6.1 Handling media-filters-rules type in modifyConference Request

This section specifically describes the cases that contain the **media-Filters-Rules** type in either the **mediaFiltersRules** element or **confMediaFiltersRules** element.

If the request is valid, the following processing rules apply to all instances of the **media** element of **type** equal to "audio" or "video" for non-trusted users, with the exception of the originator of the request.

- The MCU SHOULD [<17><18>](#) update the **media-Filters-Rules** type in the **entity-state** with the **mediaFiltersRules** or **confMediaFiltersRules** received in the **modifyConference** request. If any existing elements within the **entity-state** are omitted from the content in the **modifyConference** request, this implies no change from their current state.
- In the **mediaFilterRules** element within the **entity-state**, if the value of **media-ingress-filter** specified in **media-filters-role-rule-type** for a user role is "**blocked**", the MCU MUST update the **media-ingress-filter** in the **media** element, specified by the **type** element in the **mediaFilterRules**, of all user endpoints (5) with that user role to "**blocked**". The MCU MUST also update the **status** element under the **media** state wherever changes are made to maintain the mapping specified in section [3.2.1](#). Note that these changes during **modifyConference** processing are not followed by a SIP RE-INVITE from the MCU to renegotiate the SDP media attributes as is the case in the processing of **modifyEndpointMedia** requests described in section [3.2.5.4](#)
- If the **media-ingress-filter** value for a user role in **mediaFiltersRules** within the **entity-state** is "unblocked" the MCU MUST NOT apply changes to the **media-ingress-filter** instances in the **media** element for all instances of user endpoints (5) with that role.

If the modified media type is "video", then the following additional steps SHOULD [<19>](#) be followed:

- **media-filters-role-rule-type** with a **media-ingress-filter** value of "**blocked**" SHOULD only be supported for "video-mode" of value "dominant-speaker-switched"
- If the "video-mode" is "manual-switched" and the **mediaFilterRules** element includes a **media-ingress-filter** rule for any role with a value of "**blocked**", the MCU SHOULD switch to "dominant-speaker-switched". This implies that the previous video restriction specified by the **intended-primary-presenter-source** has been removed and has been replaced by the role base filter specified by **media-filters-role-rule-type**.

Following these steps, the MCU MUST send a **modifyConference** "Success" response to the focus.

After processing the **modifyConference** request, the MCU MUST send a conference notification containing the following:

- The new values within the MCU **entity-state** element.
- The current user state of all users that were affected by the **ModifyConference** request.

Example contents of a **ModifyConference** request, response, and the resulting conference notifications are shown in section [4.5](#).

### 3.2.5.6.2 Handling video-parameters-type in modifyConference Request

This section describes how the MCU SHOULD [<20>](#) handle a **modifyConference** request that contains **video-parameters-type** as described in section [2.2.1.1.2](#).

If **video-mode** in the request is set to "manual-switched":

- If the source specified in the **intended-primary-presenter-source** type does not exist in the conference, MCU SHOULD send a **ModifyConference** error response equal to "OtherFailure" and reason equal to "OtherFailure".
- If the source specified in the **intended-primary-presenter-source** is a video contributor in the conference, then the MCU MUST not allow any media to propagate into the conference from any other video source with label "main-video".

If the **video-mode** has changed from "dominant-speaker-switched" to "manual-switched", then the AVMCU SHOULD perform the following additional step:

- If a **media-filters-rules-type** exists for type "video" in either **mediaFiltersRules** or **confMediaFilterRules**, the MCU SHOULD update the **media-ingress-filter** value for all user roles to "unblocked" and the **mayModifyFilterRules** value for all user roles to "true".

Following these steps, the MCU MUST send a **modifyConference** "Success" response to the focus.

If **modifyConference** operation was successful and there is a change to the conference, a notification containing the following elements MUST be sent:

- The new values within the **entity-state** element reflecting the new video mode and new video source.
- If a video source is not specified, the MCU SHOULD add an **intended-primary-presenter-source** type with the **empty** attribute set to "true"

If the **video-mode** in the request is set to "dominant-speaker-switched" and initiates a change in video mode from "manual-switched":

- The MCU SHOULD allow all video sources to contribute video into the conference as specified by "dominant-speaker-switched" mode in section [2.2.1.1.2](#), unless a client's **media** instance was previously "blocked" by a **media-ingress-filter** as specified in section [2.2.2.1.2.1](#).

If **modifyConference** operation was successful and there is a change to the conference, a notification containing the following elements MUST be sent:

- The new values within the MCU **entity-state** element reflecting the new video mode as "dominant-speaker-switched"

### 3.2.6 Timer Events

None.

## 3.2.7 Other Local Events

### 3.2.7.1 User signaling (SIP dialog) Events

This section specifies the A/V-specific extension actions taken when the MCU processes SIP messages and events.

#### 3.2.7.1.1 Receipt of an Initial SDP Answer in SIP 200-OK Message Sent as Response to addUser Dial-out INVITE

When the MCU receives the first non-provisional 200 OK message containing an SDP answer in response to a sent INVITE, the following conceptual interim step prepares for subsequent C3P messages related to the invited user.

- The received SDP answer content is processed using the rules defined in section [3.2.5.1.4](#).

At this point, the MCU MUST perform the following steps:

- Send an **addUser** "success" response to the focus.
- Send a MCU Conference Roster notification to the focus containing the "full" user state.

#### 3.2.7.1.2 Receipt of Initial SIP INVITE Messages (Dial-in User join)

This section describes processing rules for received SIP INVITE messages that are not already associated with an existing SIP **dialog**. Receipt of this message occurs during normal **addUser** dial-in sequences. Receipt of this message is normally preceded by the receipt and processing of the C3P **addUser** dial-in message, as specified in section [3.2.5.3](#).

There are two steps to process the received SIP INVITE message. The first step is to match or associate the INVITE message to a previously received C3P **addUser** dial-in message. The second step is to process A/V-specific SDP content within the INVITE message body.

The following steps describe processing rules for validating the routing and addressing information in the INVITE message and for matching the INVITE message to a previously-received C3P **addUser** dial-in message.

The rules for matching the INVITE message to a previously-received C3P **addUser** dial-in message use the following information from the INVITE message:

- The **URI** value contained in the **FROM** header.
- The following **endpoint** identification attributes. The format is defined in [\[MS-SIPRE\]](#):
  - **EPID**
  - **SIP.INSTANCE**
  - **GRUU**

The contents of previously-received C3P **addUser** dial-in messages are stored in the MCU's list of pending **addUser** dial-in requests. The MCU searches the contents of the list for a matching entry using the following comparisons, in order, until a match is found or all of the comparisons have been attempted.

The MCU MUST NOT accept the INVITE message if a matching entry is not found using only the following comparisons, and MUST apply the comparisons in the following order of precedence.

1. If **GRUU** is present, search the list for an entry containing a matching value of the **endpoint-uri** attribute of the **endpoint** element within the **user** element.
2. If **EPID** is present, search the list for an entry containing a matching value of the **epid** attribute of the **endpoint** element within the **user** element AND that also has a value of the **entity** attribute of the **user** element that matches the **URI** value contained in the **FROM** header.
3. If **SIP.INSTANCE** is present, search the list for an entry containing a matching value of the **sip-instance** attribute of the **endpoint** element within the **user** element.

If no match is found, the MCU MUST respond to the INVITE message with a SIP 404 Not Found message.

Once a matching **addUser** dial-in entry is found, it is removed from the list of pending **addUser** dial-in requests, and the SDP Media Negotiation steps begin.

#### **3.2.7.1.2.1 Construction of SDP Answer Contents**

User media instances are constructed and initialized with a one-to-one relationship to conference media instances. This step facilitates the construction of SDP answer contents and subsequent C3P messages related to the added user.

At this point, it is necessary to correlate the newly-offered SDP media instances and user media instances. The MCU MUST attempt to correlate all offered SDP media instances with user media instances, applying the rules and constraints specified in section [3.2.5.1.2](#). If none of the offered media instances can be correlated with a user media instance, the MCU MUST respond to the INVITE message with a SIP 488 Not Acceptable Here response, and do no further processing.

The MCU MUST apply the rules specified in section [3.2.5.1.3](#) when constructing the SDP answer. If the resulting SDP answer would reject all offered media instances, the MCU MUST respond to the INVITE message with a SIP 488 Not Acceptable Here response, and do no further processing.

#### **3.2.7.1.2.2 Accepting the Initial INVITE**

The MCU MUST send a SIP 200 OK message containing the SDP answer in response to the received INVITE message.

After completing the procedure in the previous section, the MCU MUST send an MCU Conference Roster notification for the user to the focus containing the "full" user state for the user that has just sent the INVITE message.

#### **3.2.7.1.2.3 Receipt of Subsequent SIP Re-INVITE Message**

This section describes processing rules for received SIP re-INVITE messages that occur on existing SIP dialogs. The processing rules guide the media renegotiation process.

When SIP re-INVITE messages are received, only the SDP-content-related content needs to be processed. It is assumed that a reasonable implementation would preserve the correlated relationships between media instances that were established or constructed during processing of the initially received SDP offer, as specified in section [3.2.7.1.2.1](#), or the initially constructed SDP offer, as specified in section [3.2.5.2.2](#), and thus those steps do not have to be repeated.

The rules for processing, or performing media-renegotiation of, re-INVITE messages:

- If the SDP offer contains new media instances through **m=** lines that have not previously appeared in any SDP offer, the new instances MUST be correlated with user media instances using the rules specified in section [3.2.5.1.2](#).
- The SDP answer content MUST be constructed using the aligned media instances and the rules defined in section [3.2.5.1.4](#).
- The MCU MUST send a SIP 200 OK message containing the SDP answer in response to the received INVITE message.

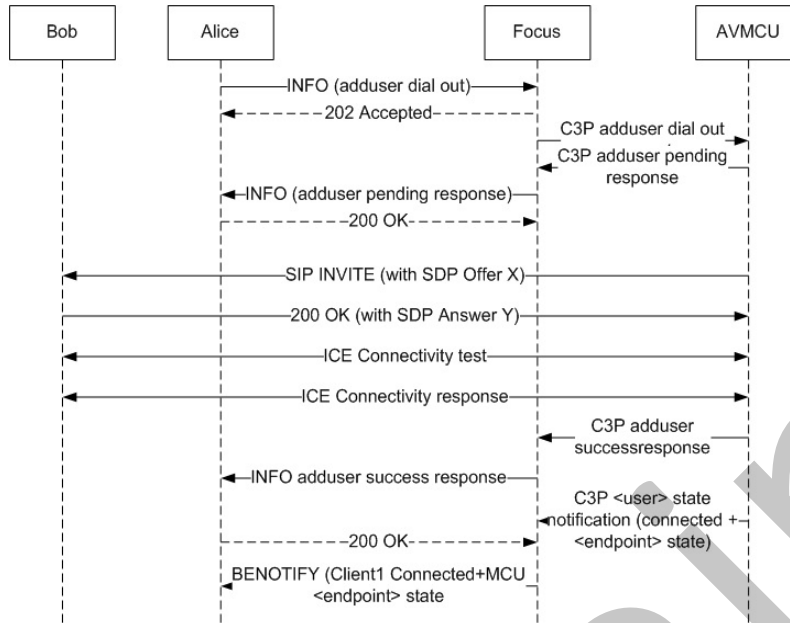

After completing the previous steps, if any of the **media** element instance values have changed, the MCU MUST send an MCU Conference Roster notification to the focus containing the "full" user state for the user that has just sent the INVITE message.

Preliminary

## 4 Protocol Examples

### 4.1 addUser Dial-out

The following example shows a typical call-flow sequence for an **addUser** dial-out. In the example, the user "Alice" (alice@fabrikam.com) is assumed to have already joined and subscribed to the conference.

**Figure 1: addUser dial-out call flow sequence**

When the focus receives the MCU **user** element state notification, it notifies the existing conference participant, "Alice", that the user, "Bob", has joined the conference. The **user** element state notification contains the MCU **endpoint** element and the elements it contains.

```

## 4.2 addUser Dial-in

The following example shows a typical call-flow sequence for an **addUser** dial-in. In the example, the user "Alice" (alice@fabrikam.com) is assumed to have already joined and subscribed to the conference. The user "Bob" is assumed to have joined and subscribed to the conference and has obtained the MCU service URI for "audio-video". The dial-in flow begins with Bob joining the A/V conference modality by sending a SIP INVITE message to the service URI.

**Figure 2: addUser dial-in call flow sequence**

Following is a sample conference state notification package showing the state prior to Bob sending the INVITE message:

```

### 4.3 modifyEndpointMedia

The **modifyEndpointMedia** request can be used to change the state of media for a user. The following diagram shows a sample message flow for **modifyEndpointMedia**, where the user "Alice" is muting the user "Bob".

### Figure 3: modifyEndpointMedia message flow

A sample **modifyEndpointMedia** request message appears next.

Note that the **mediaKeys** element, **userEntity**, **endpointEntity**, and **mediaId** attributes specify the Audio media instance of Bob's endpoint (5).

  </users>
</conference-info>

```

Note that in the previous example, the value of the audio media instance's **status** element is still "sendrecv".

Subsequently, after the MCU processes the received SDP answer, it sends another notification containing the updated media state to the focus. The following example shows that the **status** element value of the "audio" media type has changed to "recvonly" as a result of the SDP renegotiation.

```

#### 4.4 modifyConferenceAnnouncements

The **modifyConferenceAnnouncements** request can be used to change the value of the **enabled** attribute of the **entry-exit-announcements** element under the **entity-view** for a conference. The following diagram shows a sample message flow for **modifyConferenceAnnouncements**, where the user "Bob" is issuing the request.

**Figure 4: modifyConferenceAnnouncements message flow**

A sample **modifyConferenceAnnouncements** request message is as follows:.

```

## 4.5 modifyConference

In the context of Audio Video Conferencing, the **modifyConference** request can be used to change the value of the **mediaFiltersRules** element or video-parameters-type under the entity-state for a conference. The following diagram shows a sample message flow for **modifyConference**, where the user "Bob" is issuing the request.

**Figure 5: modifyConference message flow**

An example **modifyConference** request message that modifies a **mediaFiltersRules** is as follows:

```

## 7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® Office Communications Server 2007
- Microsoft® Office Communications Server 2007 R2
- Microsoft® Office Communicator 2007
- Microsoft® Office Communicator 2007 R2
- Microsoft® Lync™ Server 2010
- Microsoft® Lync™ 2010
- Microsoft® Lync Server 15 Technical Preview
- Microsoft® Lync 15 Technical Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 2.2.1.1.2:](#) Office Communications Server 2007, Office Communicator 2007, Office Communications Server 2007 R2, Office Communicator 2007 R2, Lync Server 2010, Lync 2010: "manual-switched" is not a supported value for video-mode.

[<2> Section 2.2.1.1.2:](#) Office Communications Server 2007, Office Communicator 2007, Office Communications Server 2007 R2, Office Communicator 2007 R2, Lync Server 2010, Lync 2010: Video Source Requests are not supported and the video source is selected by the MCU.

[<3> Section 2.2.1.1.5.3:](#) Office Communications Server 2007, Office Communicator 2007, Office Communications Server 2007 R2, Office Communicator 2007 R2, Lync Server 2010, Lync 2010: type element is not supported and ignored if present in a request or notification. It is assumed to have a value of "audio"

[<4> Section 2.2.2.1.2.3:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The media-source-id element is not supported. It is ignored if present in a notification.

[<5> Section 2.2.2.1.2.4:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The source-name element is not supported. It is ignored if present in a notification.

[<6> Section 2.2.2.1.5:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The multi-view-capable element is not supported. It is ignored if present in either a request or a notification.

[<7> Section 2.2.2.2.1.6:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The video-presentation-mode-capable element is not supported. It is ignored if present in either a request or a notification.

[<8> Section 2.2.2.2.1.7:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The confMediaFiltersRules element is not supported. It is ignored if present in either a request or a notification.

[<9> Section 3.2.3.1.1.2.1:](#) Office Communications Server 2007, Office Communications Server 2007 R2: This behavior is not supported.

[<10> Section 3.2.3.1.1.2.2:](#) Office Communications Server 2007, Office Communications Server 2007 R2: This behavior is not supported.

[<11> Section 3.2.3.1.1.2.3:](#) Office Communications Server 2007, Office Communications Server 2007 R2: This behavior is not supported.

[<12> Section 3.2.3.1.1.2.5:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The multi-view-capable element is not supported. It is ignored if present in either a request or a notification.

[<13> Section 3.2.3.1.1.2.6:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The video-presentation-mode-capable element is not supported. It is ignored if present in either a request or a notification.

[<14> Section 3.2.3.1.1.2.7:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The confMediaFiltersRules element is not supported. It is ignored if present in either a request or a notification.

[<15> Section 3.2.5.4:](#) Applicable to Office Communications Server 2007 and Office Communications Server 2007 R2.

[<16> Section 3.2.5.4:](#) Applicable to Lync Server 2010.

[<17> Section 3.2.5.6.1:](#) Office Communications Server 2007, Office Communicator 2007, Office Communications Server 2007 R2, Office Communicator 2007 R2: The modification of **media-filters-rule-type** is not supported.

[<18> Section 3.2.5.6.1:](#) Lync Server 2010, Lync 2010: The modification of **media-filters-rule-type** is only supported for mediaFiltersRules element and the type is assumed to be "audio".

[<19> Section 3.2.5.6.1:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The modification of **media-filters-rule-type** for media type "video" is not supported.

[<20> Section 3.2.5.6.2:](#) Office Communicator 2007, Office Communications Server 2007, Office Communicator 2007 R2, Office Communications Server 2007 R2, Lync 2010, Lync Server 2010: The modification of **video-parameters-type** is not supported.

## 8 Change Tracking

This section identifies changes that were made to the [MS-CONFAV] protocol document between the June 2011 and January 2012 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [protocol@microsoft.com](mailto:protocol@microsoft.com).

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">1 Introduction</a>	Added information about normative and informative sections.	N	Content updated.
<a href="#">1.2 References</a>	Added information about the publishing year.	N	Content updated.
<a href="#">1.3 Protocol Overview (Synopsis)</a>	Added a section number to the MS-CONFBAS reference.	N	Content updated.
<a href="#">1.3.1 Overview of Conceptual Conference Document Structure</a>	Added a section number to the MS-CONFBAS reference.	N	Content updated.
<a href="#">1.3.2 Scope</a>	Updated the description by changing "A/V MCU" to "AVMCU".	N	Content updated.
<a href="#">2.2.1 Extension Semantics of application/conference-info+xml</a>	Updated the description by	N	Content updated.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">Document Format</a>	changing "can" to "MAY" throughout.		
<a href="#">2.2.1.1.1.1 Media-Filter-Type</a>	Updated the description by and accompanying schema. Added an introduction to the list of enumeration values.	N	Content updated.
<a href="#">2.2.1.1.2 video-parameters-type*</a>	Added description of manual-switched video mode along with description of intended-primary-prsenter-source element	N	New content added due to protocol revision.
<a href="#">2.2.1.1.2 video-parameters-type*</a>	Added a product behavior note to clarify default modes that implementations should support.	N	New product behavior note added.
<a href="#">2.2.1.1.2 video-parameters-type*</a>	Added a product behavior note to clarify the condition in which the client supports Video Source Requests.	N	New product behavior note added.
<a href="#">2.2.1.1.2.1 contributing-sources-type</a>	Added this section and accompanying schema and description.	N	New content added.
<a href="#">2.2.1.1.3 capabilities-type*</a>	Added the schema for this type.	N	Content updated.
<a href="#">2.2.1.1.4 entry-exit-announcements type</a>	Added the schema for this type and updated the description.	N	Content updated.
<a href="#">2.2.1.1.5 media-filters-rules-type</a>	Added subsection for new element	N	New content

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
	that indicates the media-type to which the media-filters-rules are applied to.		added due to protocol revision.
<a href="#">2.2.1.1.5.1 mayModifyOwnFilters</a>	Added the schema for this type and updated the description.	N	Content updated.
<a href="#">2.2.1.1.5.2 initialFilters</a>	Added the schema for this type and updated the description.	N	Content updated.
<a href="#">2.2.1.1.5.3 type</a>	Added this section and accompanying schema and description.	N	New content added.
<a href="#">2.2.1.1.5.3 type</a>	Added a product behavior note to clarify the information about the type element being optional.	N	New product behavior note added.
<a href="#">2.2.2.1 MCU endpoint Element Syntax</a>	Added a section number to the references.	N	New content added.
<a href="#">2.2.2.1.1.1 media Element Instances</a>	Added the schema for the elements. Updated the label element description.	N	Content updated.
<a href="#">2.2.2.1.2.3 media-source-id Element</a>	Added syntax definition for media-source-id.	N	New content added due to protocol revision.
<a href="#">2.2.2.1.2.3 media-source-id Element</a>	Added a product behavior note to clarify the information about the media-source-id element.	N	New product behavior note added.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">2.2.2.1.2.4 source-name Element</a>	Added syntax definition for source-name.	N	New content added due to protocol revision.
<a href="#">2.2.2.1.2.4 source-name Element</a>	Added a product behavior note to clarify the information about the source-name element.	N	New product behavior note added.
<a href="#">2.2.2.2 MCU conference-view Element Syntax</a>	Added a section number to the references.	N	Content updated.
<a href="#">2.2.2.2.1.3 presentation-mode-capable</a>	Updated the element description and added the schema.	N	Content updated.
<a href="#">2.2.2.2.1.5 multi-view-capable Element</a>	Added syntax definition for multi-view-capable.	N	New content added due to protocol revision.
<a href="#">2.2.2.2.1.5 multi-view-capable Element</a>	Added a product behavior note to clarify the information about the multi-view-capable element.	N	New product behavior note added.
<a href="#">2.2.2.2.1.6 video-presentation-mode-capable Element</a>	Added section to describe video-presentation-mode-capable syntax	N	New content added due to protocol revision.
<a href="#">2.2.2.2.1.6 video-presentation-mode-capable Element</a>	Added a product behavior note to clarify the information about the video-presentation-mode-capable element.	N	New product behavior note added.
<a href="#">2.2.2.2.1.7</a>	Added section to	N	New

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">confMediaFiltersRules Element</a>	describe confMediaFiltersRules syntax		content added due to protocol revision.
<a href="#">2.2.2.2.1.7 confMediaFiltersRules Element</a>	Added a product behavior note to clarify the information about the confMediaFiltersRules element.	N	New product behavior note added.
<a href="#">2.2.3.1 addUser Dial-out Request Document Syntax</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">2.2.3.1.1 endpoint Element</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">2.2.3.2 addUser Dial-in Request Document Syntax</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">2.2.3.2.1 endpoint Element</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">2.2.3.3 modifyEndpointMedia Request Syntax</a>	Clarified content.	Y	Content updated for template compliance.
<a href="#">2.2.3.3 modifyEndpointMedia Request Syntax</a>	Added the schema for the element and updated the description.	N	Content updated.
<a href="#">2.2.3.4 modifyConferenceAnnouncements Request Syntax</a>	Added the schema for the element and updated the description.	N	Content updated.
<a href="#">2.2.3.4 modifyConferenceAnnouncements Request Syntax</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">3.1.5.1 Constructing the Outgoing addUser Dial-in Request</a>	Updated the section number	N	Content updated.

	supported.		added.
<a href="#">3.2.3.1.1.2.3 presentation-mode-capable element</a>	Updated the condition in which the element is present.	N	Content updated.
<a href="#">3.2.3.1.1.2.3 presentation-mode-capable element</a>	Added a product behavior note to clarify the information about the presentation-mode-capable element.	N	New product behavior note added.
<a href="#">3.2.3.1.1.2.5 multi-view-capable Element</a>	Added initialization description for multi-view-capable element	N	New content added due to protocol revision.
<a href="#">3.2.3.1.1.2.5 multi-view-capable Element</a>	Added a product behavior note to clarify the information about the multi-view-capable element.	N	New product behavior note added.
<a href="#">3.2.3.1.1.2.6 video-presentation-mode-capable Element</a>	Added initialization description for video-presentation-mode-capable element	N	New content added due to protocol revision.
<a href="#">3.2.3.1.1.2.6 video-presentation-mode-capable Element</a>	Added a product behavior note to clarify the information about the video-presentation-mode-capable element.	N	New product behavior note added.
<a href="#">3.2.3.1.1.2.7 confMediaFiltersRules Element</a>	Added initialization description for confMediaFiltersRules element	N	New content added due to protocol revision.
<a href="#">3.2.3.1.1.2.7 confMediaFiltersRules Element</a>	Added a product behavior note to	N	New product

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
	clarify the information about the confMediaFiltersRules element.		behavior note added.
<a href="#">3.2.5.1 Common Rules for Processing SDP Offers and Answers</a>	Added an MCU condition.	N	Content updated.
<a href="#">3.2.5.1.1 Generating an Initial SDP Offer</a>	Added an MCU condition for multiple instances of a media element.	N	Content updated.
<a href="#">3.2.5.2 addUser Dial-out Request</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">3.2.5.2.1 Constructing the Outgoing SIP INVITE Request</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">3.2.5.3 addUser Dial-in Request</a>	Clarified content.	Y	Content updated for template compliance.
<a href="#">3.2.5.3.1 Constructing the addUser Dial-in Response</a>	Updated the section number for the reference.	N	Content updated.
<a href="#">3.2.5.4 modifyEndpointMedia Request</a>	Updated the list of rules and recommendations.	N	Content updated.
<a href="#">3.2.5.4 modifyEndpointMedia Request</a>	Added a product behavior note to clarify the information about the "OtherFailure" reason.	N	New product behavior note added.
<a href="#">3.2.5.4 modifyEndpointMedia Request</a>	Added a product behavior note to clarify the information about MCU determining if another renegotiation is necessary.	N	New product behavior note added.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">3.2.5.5 modifyConferenceAnnouncements Request</a>	Updated the list of recommendations and changed "AVMCU" to "MCU".	N	Content updated.
<a href="#">3.2.5.6 modifyConference Request</a>	Added handling of video-parameters-type in ModifyConference request by adding subsections for media-filters-rules type and video-parameters type	N	New content added due to protocol revision.
<a href="#">3.2.5.6 modifyConference Request</a>	Updated the list of rules and changed "AVMCU" to "MCU".	N	Content updated.
<a href="#">3.2.5.6.1 Handling media-filters-rules type in modifyConference Request</a>	Updated the list of processing rules, changed "AVMCU" to "MCU", and added steps for condition in which the modified media type is "video".	N	Content updated.
<a href="#">3.2.5.6.1 Handling media-filters-rules type in modifyConference Request</a>	Added this subsection.	N	New content added.
<a href="#">3.2.5.6.1 Handling media-filters-rules type in modifyConference Request</a>	Added a product behavior note to clarify the information about MCU updating the media-Filters-Rules type and when it is not supported.	N	New product behavior note added.
<a href="#">3.2.5.6.1 Handling media-filters-rules type in modifyConference Request</a>	Added a product behavior note to clarify the information about MCU updating the	N	New product behavior note added.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
	media-Filters-Rules type for a certain condition.		
<a href="#">3.2.5.6.1 Handling media-filters-rules type in modifyConference Request</a>	Added a product behavior note to clarify the information about additional steps being followed if the modified media type is "video".	N	New product behavior note added.
<a href="#">3.2.5.6.2 Handling video-parameters-type in modifyConference Request</a>	Added this subsection and information about how the MCU should handle the request.	N	New content added.
<a href="#">3.2.5.6.2 Handling video-parameters-type in modifyConference Request</a>	Added a product behavior note to clarify the information about MCU handling a modifyConference request.	N	New product behavior note added.
<a href="#">4.4 modifyConferenceAnnouncements</a>	Modified the schema associated with the entity-view notification.	N	Content updated.
<a href="#">4.5 modifyConference</a>	Modified the description of the example by adding that the modifyConference request can be used to change the value of the mediaFiltersRules element or video-parameters-type.	N	Content updated.
<a href="#">4.5 modifyConference</a>	Modified the schema associated with the entity-view notification.	N	Content updated.
<a href="#">4.5 modifyConference</a>	Added the example schema	N	Content updated.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
	for the modifyConference request message, response, and entity-view notification.		
<a href="#">6.1 conference-info Namespace (urn:ietf:params:xml:ns:conference-info)</a>	Added updates to clarify the schema.	N	Content updated.
<a href="#">6.3 avconfinfoextensions Namespace (http://schemas.microsoft.com/rtc/2005/08/avconfinfoextensions)</a>	Removed comments from schema.	N	Editorially updated.
<a href="#">6.4 commonmceuextensions Namespace (http://schemas.microsoft.com/rtc/2009/03/commonmceuextensions)</a>	Added this subsection and schema.	N	New content added.
<a href="#">Z Appendix B: Product Behavior</a>	Updated the product list.	N	New content added.
