The following terms are specific to this document:

calculated field: A user-defined field that can perform calculations by using the contents of other fields.

data validation criteria: See data validation.

declarative workflow: A workflow that is created with XAML (Extensible Application Markup Language) files and does not require precompiled code to run.

default scalar property set: A set of properties that are retrieved by default for an object. The properties map to fields in a storage schema.

field group: A named collection of related fields.

field link: A property that specifies a reference from a content type to a field (2) or field definition.

list definition: An XML-based definition of the set of fields, forms, views, and default properties for a list (1).

list folder: A folder that is contained within a SharePoint list. A list folder can contain documents or list items, and it retains the characteristics of other items in the list, such as a customizable schema.

marketplace billing market: A specifier that identifies the region of the credit card used to buy apps.

marketplace content market: A collection of metadata associated with each individual app that contains information such as the region and locale of the app.

marketplace deployment identifier: The identifier of the location to which app licenses are sold.

personalization scope: A mode of the Web Part Manager that indicates whether the available data is shared by all users or specific to an individual user.

personalized Web Parts: A Web Part that has been modified by a user for personal use. The view of the Web Part is unavailable to other users.

relationship behavior constraint: A setting that defines any dependent relationships, such as cascading or restrict behaviors, between list items.

site collection group: A named collection of users and domain groups that can be managed for a site collection or site. A group can be used to assign permission levels, send email messages, and indicate site membership for multiple users simultaneously.

taxonomy navigation: A hierarchy of navigation menus that represents the navigation menus in terms and term sets and are independent of where their underlying objects, such as pages, are located.

user custom action: An extension to the user interface, such as a button on a toolbar or a link on a site settings page, that is submitted by a user of a site collection. Unlike a custom action, the definition of a user custom action is stored in a back-end database server.

view style: A pre-defined, named collection of settings that specify how to lay out data in a list view.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Overview

This protocol defines types, methods, and properties that protocol clients use to access **site (2)**, **list (1)**, and other types of data associated with a collaboration server (2). The set of types and **members (1)** provide a means for remote clients to perform collaboration and communication **tasks (2)**, such as updating **items** or checking in **documents**.

1.4 Relationship to Other Protocols

This protocol is a set of types, properties, and methods that can be accessed by using the SharePoint Client Query protocol, as described in [\[MS-CSOM\]](#), and the SharePoint Client Query OData Protocol, as described in [\[MS-CSOMREST\]](#). This protocol specifies properties, methods, and types used to access a collaboration server (2) as described in [\[MS-WSSTS\]](#).

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol operates against a site (2) that is identified by a **URL** that is known by protocol clients. This protocol assumes that **authentication (2)** has been performed by underlying protocols.

1.6 Applicability Statement

This protocol can be used as a protocol for a protocol client to read data from, write data to, and execute operations against a protocol server (2). The protocol is optimized to enable a protocol client to specify the exact set of data and operations to perform in a single batch, making it suitable for situations where the connection speed between the protocol client and the protocol server (2) can be slow. Because of the complexity of the structure of requests and responses, it is not suitable for cases where the inputs and outputs need to be quickly understood and specified by a human. Because the protocol features minimal services for type and operation discovery, it is not suitable for protocol servers (2) that implement a different set of functionality compared to the set of functionality described for a collaboration server (2) in [\[MS-WSSTS\]](#).

1.7 Versioning and Capability Negotiation

This protocol operates in the context of the authenticated user that made a request to the service, and that it runs in the context of a particular site (2). Localization-specific properties, such as the title of a list (1), are returned by using the preferred language of the user, if available, or by using the default language of the site (2) as a fallback. Certain properties can be read or written for specific locales, and are listed in the document.

1.8 Vendor-Extensible Fields

A protocol server (2) can provide additional properties and methods beyond those specified in this document to provide extended collaboration server (2) functionality; however, because no means are provided for a protocol client to discover that extended functionality, the functionality is taken advantage of only by protocol clients that have built-in knowledge of the extensions.

A protocol client is expected to be tolerant of the situation where certain methods and properties specified in this specification are not available, because either the protocol server (2) does not support the functionality or the administrator has disabled certain functionalities.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

[\[MS-CSOM\]](#) is used for transport.

Messages are transported by using the SharePoint Client Query Protocol, as specified in [\[MS-CSOM\]](#), or the SharePoint Client Query OData Protocol, as specified in [\[MS-CSOMREST\]](#).

2.2 Message Syntax

None.

2.2.1 Common Exceptions

The protocol server (2) MUST validate the request from the protocol client and return the exception listed in the following table to the protocol client under the specified conditions.

Error Code	Error Type Name	Condition
- 2130575251	Microsoft.SharePoint.SPException	The protocol server (2) requires a form digest but the form digest in the X-RequestDigest HTTP header is not as same as the one generated by the protocol server (2).
- 2130575252	Microsoft.SharePoint.Exception	The protocol client sent a valid form digest in the X-RequestDigest ([MS-WSSHP] section 2.2.11 and [MS-SITESH] section 3.1.4) HTTP header, but the form digest is expired.
- 2146232832	Microsoft.SharePoint.SPException	The protocol server (2) requires a form digest but the protocol client did not send an X-RequestDigest ([MS-WSSHP] section 2.2.11) HTTP header.

When a protocol server (2) processes a CSOM operation in the request, the following table lists common exceptions that could occur when accessing or updating a property or invoking a method.

Error Code	Error Type Name	Condition
- 2147024891	System.UnauthorizedAccessException	The user does not have permission to access a property, update a property or call a method.

Besides the preceding exceptions and the exceptions that are listed for the specific properties or methods, the protocol server (2) can return other exceptions to the protocol client, for which the protocol client could use the error message for display purposes but could not use the error code or error type to determine the causes of the exception.

Unless specified, exceptions listed for the specific properties are thrown for both read and write operations.

3 Protocol Details

3.1 Common Details

The protocol server (2) endpoint is formed by appending "_vti_bin/client.svc/ProcessQuery" to the URL of the site (2), for example http://www.contoso.com/Repository/_vti_bin/client.svc/ProcessQuery.

The length of a **CSOM String** is the number of characters in its value. The length of a **CSOM array** is the number of elements in the array.

ObjectPath Properties are properties of type CSOM Object as defined in [\[MS-CSOM\]](#) section 2.2.4.4, Scalar Properties are properties of any type except of type CSOM Object as defined in [\[MS-CSOM\]](#) section 2.2.4 and [\[MS-CSOM\]](#) section 2.2.5.

3.2 Server Details

3.2.1 Abstract Data Model

This protocol shares the abstract data model used by the SharePoint Client Query protocol, as described in [\[MS-CSOM\]](#) section 3.1.1, to communicate with the protocol server.

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This specification does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this specification.

This protocol deals with various structures associated with sites (2), lists (1), items, navigation, and other structures as specified in [\[MS-WSSTS\]](#).

3.2.1.1 Parent Type

This protocol deals with various types that are logically derived from a parent type. The following table lists the relation between such types.

3.2.1.2 Abstract Data Model for REST List Items Support

This section describes the relationship between the abstract data model as specified in [MS-WSSTS] section 2.1.2.7 and the Entity Data Model as specified in [MC-CSDL] section 1.0.<1> The mapping between Entity Data Model concepts and those of the AtomPub specification is specified in [MS-ODATA] section 2.2.1. The described relationship is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model, as long as their external behavior is consistent with the behavior specified in [MS-ODATA] and [MC-CSDL].

Data structures as specified in [MS-WSSTS] map to Entity Data Model terms as shown in the following table:

List Item Data Structure	Entity Data Model Term
List Item	Entity
Lookup Field	Integer and NavigationProperty
Choice Field	Multi-Value Property
Attachments Field	Bool
ID Field	EntityKey
Content Type	Entity

List Item Data Structure	Entity Data Model Term
All other fields of a list item	NavigationProperty

4.5 Attempt to Delete a Site With an Account That Does Not Have Permissions for the Operation

The protocol client attempts to delete a site (2) object (1) on the protocol server (2). However, the current user does not have permissions to perform this operation, so deleting a site (2) causes an error. The protocol server (2) returns a **CSOM error**. The following steps provide an overview of this operation.

1. Get the context to a **Site** object (1).
2. Get the **Web** object (1) from the **Site** object (1).
3. Execute **delete** operation on the **Web** object (1).

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® SharePoint® Foundation 2010
- Microsoft® SharePoint® Foundation 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.
