This document specifies types, methods, and properties of the SharePoint Client-Side Object Model Protocol that can be used to communicate with and manipulate aspects of a collaboration server.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

## 1.1 Glossary

This document uses the following terms:

**absolute URL:** The full Internet address of a page or other World Wide Web resource. The absolute URL includes a protocol, such as "http," a network location, and an optional path and file name — for example, <http://www.treyresearch.net/>.

**access control list (ACL):** A list of access control entries (ACEs) that collectively describe the security rules for authorizing access to some resource; for example, an object or set of objects.

**alert:** An Internet message that is sent to subscribers automatically to notify them when user-defined criteria are met. Alerts are generated automatically when items such as documents, webpages, list items, sites, or other resources on a server are changed.

**anchor text:** The text that is included with a hyperlink to describe the target content of a hyperlink.

**app:** (1) See **web application**.

(2) See **SharePoint Add-in**.

**app principal:** Designates an authenticated entity that is not a user.

**app product identifier:** A unique designation that is shared by all versions of an **app**.

**application:** A participant that is responsible for beginning, propagating, and completing an atomic transaction. An application communicates with a transaction manager in order to begin and complete transactions. An application communicates with a transaction manager in order to marshal transactions to and from other applications. An application also communicates in application-specific ways with a resource manager in order to submit requests for work on resources.

**attachment:** An external file that is included with an Internet message or associated with an item in a SharePoint list.

**authentication:** The act of proving an identity to a server while providing key material that binds the identity to subsequent communications.

**Azure Blob Storage:** A service for storing large amounts of unstructured data, such as text or binary data, that can be accessed from anywhere in the world via **HTTP** or HTTPS.

**back-end database server:** A server that hosts data, configuration settings, and stored procedures that are associated with one or more applications.

**object:** (1) A set of attributes (1), each with its associated values. Two attributes of an object have special significance: an identifying attribute and a parent-identifying attribute. An identifying attribute is a designated single-valued attribute that appears on every object; the value of this attribute identifies the object. For the set of objects in a replica, the values of the identifying attribute are distinct. A parent-identifying attribute is a designated single-valued attribute that appears on every object; the value of this attribute identifies the object's parent. That is, this attribute contains the value of the parent's identifying attribute, or a reserved value identifying no object. For the set of objects in a replica, the values of this parent-identifying attribute define a tree with objects as vertices and child-parent references as directed edges with the **child** as an edge's tail and the parent as an edge's head. Note that an object is a value, not a variable; a replica is a variable. The process of adding, modifying, or deleting an object in a replica replaces the entire value of the replica with a new value. As the word replica suggests, it is often the case that two replicas contain "the same objects". In this usage, objects in two replicas are considered the same if they have the same value of the identifying attribute and if there is a process in place (replication) to converge the values of the remaining attributes. When the members of a set of replicas are considered to be the same, it is common to say "an object" as shorthand referring to the set of corresponding objects in the replicas.

It also has a physical structure that is composed of entities, starting with the root, or document, entity.

**XML element:** An **XML** structure that typically consists of a start tag, an end tag, and the information between those tags. Elements can have attributes (1) and can contain other elements.

**XML fragment:** Lines of text that adhere to **XML** tag rules, as described in [XML], but do not have a Document Type Definition (DTD) or schema, processing instructions, or any other header information.

**XML schema:** A description of a type of **XML document** that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by **XML** itself. An XML schema provides a view of a document type at a relatively high level of abstraction.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

[MS-BDCMFFS] Microsoft Corporation, "[Business Data Connectivity Model File Format](#)".

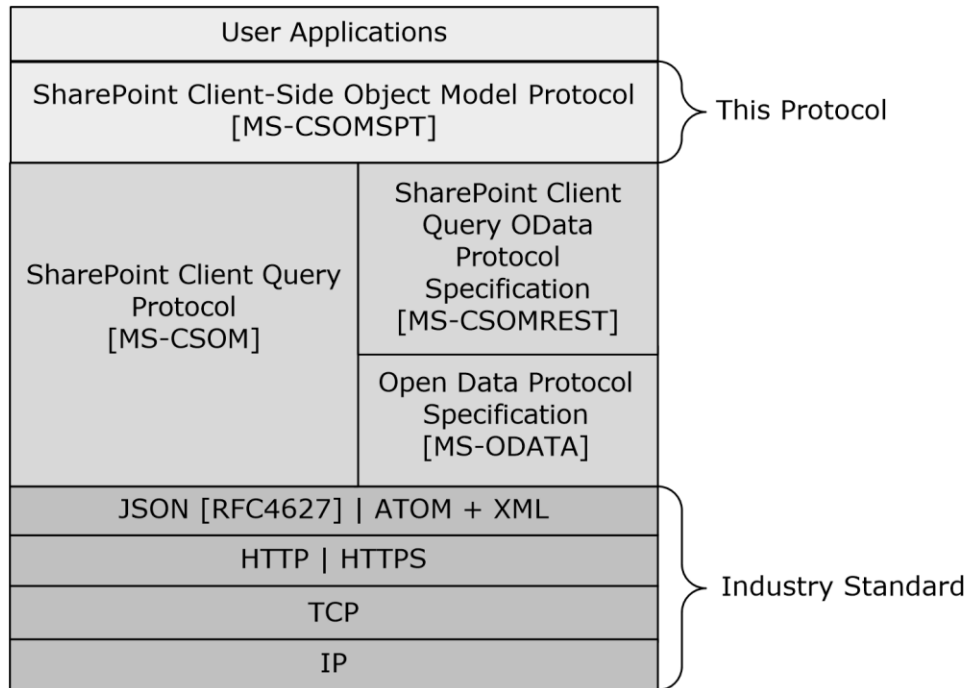

### 1.3 Overview

This protocol defines types, methods, and properties that protocol clients use to access **site**, **list**, and other types of data associated with a collaboration server. The set of types and **members** provide a

means for remote clients to perform collaboration and communication **tasks**, such as updating **items** or checking in **documents**.

## 1.4 Relationship to Other Protocols

This protocol is a set of types, properties, and methods that can be accessed by using the SharePoint Client Query protocol, as described in [\[MS-CSOM\]](#), and the SharePoint Client Query OData Protocol, as described in [\[MS-CSOMREST\]](#). This protocol specifies properties, methods, and types used to access a collaboration server as described in [\[MS-WSSTS\]](#).

**Figure 1: This protocol in relation to other protocols**

## 1.5 Prerequisites/Preconditions

This protocol operates against a site that is identified by a **URL** that is known by protocol clients. This protocol assumes that **authentication** has been performed by underlying protocols.

## 1.6 Applicability Statement

This protocol can be used by a protocol client to read data from, write data to, and execute operations against a protocol server. The protocol is optimized to enable a protocol client to specify the exact set of data and operations to perform in a single batch, making it suitable for situations where the connection speed between the protocol client and the protocol server can be slow.

Because of the complexity of the structure of requests and responses, it is not suitable for cases where the inputs and outputs need to be quickly understood and specified by a human. Because the protocol features minimal services for type and operation discovery, it is not suitable for protocol servers that implement a different set of functionality compared to the set of functionality described for a collaboration server in [\[MS-WSSTS\]](#).

## **1.7 Versioning and Capability Negotiation**

This protocol operates in the context of the authenticated user that made a request to the service and in the context of a particular site. Localization-specific properties, such as the title of a list, are returned by using the preferred language of the user, if available, or by using the default language of the site as a fallback. Certain properties can be read or written for specific locales, and are listed in the document.

## **1.8 Vendor-Extensible Fields**

A protocol server can provide additional properties and methods beyond those specified in this document to provide extended collaboration server functionality; however, because no means are provided for a protocol client to discover that extended functionality, the functionality is taken advantage of only by protocol clients that have built-in knowledge of the extensions.

A protocol client is expected to be tolerant of the situation where certain methods and properties specified in this specification are not available, because either the protocol server does not support the functionality or the administrator has disabled certain functionalities.

## **1.9 Standards Assignments**

None.

## 2 Messages

### 2.1 Transport

Messages are transported by using the SharePoint Client Query Protocol, as specified in [\[MS-CSOM\]](#), or the SharePoint Client Query OData Protocol, as specified in [\[MS-CSOMREST\]](#).

### 2.2 Message Syntax

#### 2.2.1 Common Exceptions

The protocol server MUST validate the request from the protocol client and return the exception listed in the following table to the protocol client under the specified conditions.

Error Code	Error Type Name	Condition
- 2130575251	Microsoft.SharePoint.SPException	The protocol server requires a <b>form digest</b> but the form digest in the <b>X-RequestDigest</b> HTTP header is not as same as the one generated by the protocol server.
- 2130575252	Microsoft.SharePoint.Exception	The protocol client sent a valid form digest in the <b>X-RequestDigest</b> ( <a href="#">[MS-WSSHP]</a> section 2.2.11 and <a href="#">[MS-SITESS]</a> section 3.1.4) HTTP header, but the form digest is expired.
- 2146232832	Microsoft.SharePoint.SPException	The protocol server requires a form digest but the protocol client did not send an <b>X-RequestDigest</b> ( <a href="#">[MS-WSSHP]</a> section 2.2.11) HTTP header.

When a protocol server processes a CSOM operation in the request, the following table lists common exceptions that could occur when accessing or updating a property or invoking a method.

Error Code	Error Type Name	Condition
- 2147024891	System.UnauthorizedAccessException	The user does not have <b>permission</b> to access a property, update a property or call a method.

Besides the preceding exceptions and the exceptions that are listed for the specific properties or methods, the protocol server can return other exceptions to the protocol client, for which the protocol client could use the error message for display purposes but could not use the error code or error type to determine the causes of the exception.

Unless specified, exceptions listed for the specific properties are thrown for both read and write operations.

## 3 Protocol Details

### 3.1 Common Details

The protocol server endpoint is formed by appending "\_vti\_bin/client.svc/ProcessQuery" to the URL of the site, for example [http://www.contoso.com/Repository/\\_vti\\_bin/client.svc/ProcessQuery](http://www.contoso.com/Repository/_vti_bin/client.svc/ProcessQuery).

The length of a **CSOM String** is the number of characters in its value. The length of a **CSOM array** is the number of elements in the array.

ObjectPath Properties are properties of type CSOM Object as defined in [\[MS-CSOM\]](#) section 2.2.4.4, Scalar Properties are properties of any type except of type CSOM Object as defined in [\[MS-CSOM\]](#) section 2.2.4 and [\[MS-CSOM\]](#) section 2.2.5.

#### 3.2.1 Abstract Data Model

This protocol shares the abstract data model used by the SharePoint Client Query protocol, as described in [\[MS-CSOM\]](#) section 3.1.1, to communicate with the protocol server.

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. ### 3.2.5.119.2.1.2 CreateMigrationJob

**Return Type:** CSOM GUID

Creates a new migration import job and queues it up for later processing by a separate timer job. The job will consume a well formed (pre-defined format) import package that is located in the Azure Blob Storage Containers specified in this method. The SLA for migration job processing is controlled through pre-configured queue and work-load throttling settings, and there is no guaranteed SLA or return time for a submitted job.

Once processed, the job results are placed into log files at the *azureContainerManifestUri* location if that was set to be writable in the SAS token specified in the URI. The same output log is also placed at the "\_catalogs/MaintenanceLogs" location of the target site collection as a text file. The logs will only be copied to the destination locations once the job has finished and is removed from the queue. The output of the log files SHOULD be examined and verified to determine if further work is required post-import.

The unique identifier for the migration job is returned if the job is successfully queued, or if unsuccessful, a null value will be returned. The migration job unique identifier can be used to query the migration job status while it is in the queue or being processed by using the **GetMigrationJobStatus** (section [3.2.5.119.2.1.6](#)) method.

#### Parameters:

*gWebId*: The unique identifier for the targeted destination web for the package import. Additional information and identifiers for the import are specified within the import package itself.

Type: CSOM GUID

*azureContainerSourceUri*: A valid URL including SAS token for accessing the Azure Blob Storage Container that contains the binary files of type block.

Type: CSOM String

*azureContainerManifestUri*: A valid URL including SAS token for accessing the Azure Blob Storage Container that contains the manifest. If write access is granted in the SAS token in this URI, then it will also be used for the log output. This can be the same URL as *azureContainerSourceUri*.

Type: CSOM String

*azureQueueReportUri*: A valid URL including SAS token for accessing the user-provided Azure Queue. If not null, and proper access is granted in the SAS token in this URI, it will be used for a real-time status update.

Type: CSOM String

##### 3.2.5.147.1.1 User

**Value:** 0

**Personalization data** that is user-specific, as well as personalization data that applies to all users, is loaded for all Web Parts on a Web Part Page that support personalization data. ##### 3.2.5.187.2.1.1 UpdateDocumentSharingInfo

This method is a static CSOM method.

**Return Type:** CSOM array of Microsoft.SharePoint.Client.Sharing.UserSharingResult

This method allows a caller with the 'ManagePermission' permission to update sharing information about a document to enable document sharing with a set of users. It returns an array of **UserSharingResult** (section [3.2.5.190](#)) elements where each element contains the sharing status for each user.

**Parameters:**

*resourceAddress*: A URL that points to a securable object, which can be a document, folder or the root folder of a document library.

Type: CSOM String

*userRoleAssignments*: An array of recipients and assigned roles on the securable object pointed to by the *resourceAddress* parameter.

Type: CSOM array of Microsoft.SharePoint.Client.Sharing.UserRoleAssignment

*validateExistingPermissions*: A Boolean flag indicating how to honor a requested permission for a user. If this value is "true", the protocol server will not grant the requested permission if a user already has sufficient permissions, and if this value is "false", the protocol server will grant the requested permission whether or not a user already has the same or more permissions. This parameter is applicable only when the parameter *additiveMode* is set to true.

Type: CSOM Boolean

*additiveMode*: A Boolean flag indicating whether the permission setting uses the additive or strict mode. If this value is "true", the permission setting uses the additive mode, which means that the specified permission will be added to the user's current list of permissions if it is not there already, and if this value is "false", the permission setting uses the strict mode, which means that the specified permission will replace the user's current permissions.

Type: CSOM Boolean

*sendServerManagedNotification*: A Boolean flag to indicate whether or not to generate an email notification to each recipient in the "userRoleAssignments" array after the document update is completed successfully. If this value is "true", the protocol server will send an email notification if an email server is configured, and if the value is "false", no email notification will be sent.

Type: CSOM Boolean

*customMessage*: A custom message to be included in the email notification.

Type: CSOM String

*includeAnonymousLinksInNotification*: A Boolean flag that indicates whether or not to include anonymous access links in the email notification to each recipient in the *userRoleAssignments* array after the document update is completed successfully. If the value is "true", the protocol server will include an anonymous access link in the email notification, and if the value is "false", no link will be included.

Type: CSOM Boolean

*propagateAcl*: A flag to determine if permissions SHOULD be pushed to items with unique permission.

Type: CSOM Boolean

### **3.2.5.187.2.1.2 IsDocumentSharingEnabled**

This method is a static CSOM method.

*list*: The list to check member sharing.

Type: Microsoft.SharePoint.Client.List

### **3.2.5.187.2.1.4 RemoveItemsFromSharedWithMeView**

This method is a static CSOM method.

**Return Type:** CSOM array of Microsoft.SharePoint.Client.Sharing.SharedWithMeViewItemRemovalResult

Removes an item so that it no longer shows in the current user's 'Shared With Me' view. However, this does not remove the user's actual permissions to the item. Up to 200 items may be provided in a single call. Returns a list of results indicating whether the items were successfully removed. The length of this array will match the length of the *itemUrls* array that was provided.

**Parameters:**

*itemUrls*: A list of absolute URLs of the items to be removed from the view. These items may belong to any site or site collection in the tenant.

Type: CSOM array of CSOM String

### **3.2.5.313 Microsoft.SharePoint.Client.SandboxedCodeActivationCapabilities**

**ShortName:** SP.SandboxedCodeActivationCapabilities

**Flag:** false

The sandboxed code capabilities for the site collection.

Note that the `SandboxedCodeActivationCapabilities` enum in `ms.online.sp.powershell` `Get/Set-SPOSite` cmdlet defines the first enum value as 'Unknown'. This is because the `SandboxedCodeActivationCapabilities` in that code base needs an unknown value, indicating that the default use of `Get-SPOSite` does not return site properties. So you have to show the value in this case as unknown (that is the current model for that code base). If you add the `-Detailed` switch to `Get-SPOSite`, it will get the site properties.

#### **3.2.5.313.1 Field Values**

##### **3.2.5.313.1.1 Check**

**Value:** 1

The sandboxed code capability for the site collection is chosen based on the presence of existing solutions with sandboxed code. This is the default sandboxed code capability for site collections.

##### **3.2.5.313.1.2 Disabled**

##### **3.2.5.313.1.3 Enabled**

#### 4.4 Add a Lookup Field

In this example, a new lookup field is added to an existing list that points to another existing list. The following steps provide an overview of this operation.

1. Get the context from the protocol server that corresponds to the URL where the service is called.
2. Get the associated **Web** object (1) from the context.
3. Get the necessary list information from **Web** (Request 1).
4. Add a lookup field to "List 1" that points to "List 2" (Request 2).

#### 4.5 Attempt to Delete a Site With an Account That Does Not Have Permissions for the Operation

The protocol client attempts to delete a site object (1) on the protocol server. However, the current user does not have permissions to perform this operation, so deleting a site causes an error. The protocol server returns a **CSOM error**. The following steps provide an overview of this operation.

1. Get the context to a **Site** object (1).
2. Get the **Web** object (1) from the **Site** object (1).
3. Execute **delete** operation on the **Web** object (1).

## 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

- Microsoft SharePoint Foundation 2010
- Microsoft SharePoint Foundation 2013
- Microsoft SharePoint Server 2016

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.
