[MS-CUSTOMUI]:

Custom UI XML Markup Specification

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights**. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the <u>Patent Map</u>.
- **Trademarks**. The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Preliminary Documentation. This particular Open Specifications document provides documentation for past and current releases and/or for the pre-release version of this technology. This document provides final documentation for past and current releases and preliminary documentation, as applicable and specifically noted in this document, for the pre-release version. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. Because this documentation might change between the pre-release version and the final

version of this technology, there are risks in relying on this preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

Revision Summary

1 Introduction

In creating an interoperable implementation, it is helpful to understand specific implementation choices made by other products implementing the same standard. For example, portions of the standard may provide only general guidance, leaving specific implementation choices up to the application implementer; in some circumstances it may be helpful for other implementers to understand those choices.

The information contained in this document provides information about how to implement UI customization in the context of ECMA-376 Office Open XML File Formats, as described in [ECMA-376].

1.1 Glossary

This document uses the following terms:

- **add-in**: Supplemental functionality that is provided by an external application or macro to extend the capabilities of an application.
- **KeyTip:** A small, pop-up window that appears over commands on the ribbon when users press the ALT key. By pressing the key that is displayed in a KeyTip, users can execute the command that is associated with the KeyTip.
- **macro**: A set of instructions that are recorded or written, and then typically saved to a file. When a macro is run, all of the instructions are performed automatically.
- **XML fragment**: Lines of text that adhere to XML tag rules, as described in [XML], but do not have a Document Type Definition (DTD) or schema, processing instructions, or any other header information.
- **XML namespace**: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].
- **XML** namespace prefix: An abbreviated form of an **XML** namespace, as described in [XML].
- **XML schema**: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by XML itself. An XML schema provides a view of a document type at a relatively high level of abstraction.
- **XML schema definition (XSD)**: The World Wide Web Consortium (W3C) standard language that is used in defining XML schemas. Schemas are useful for enforcing structure and constraining the types of data that can be used validly within other XML documents. XML schema definition refers to the fully specified and currently recommended standard for use in authoring **XML schemas**.
- MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

[ECMA-376] ECMA International, "Office Open XML File Formats", 1st Edition, ECMA-376, December 2006, http://www.ecma-international.org/publications/standards/Ecma-376.htm

1.2.2 Informative References

None.

2 Custom UI

The subordinate clauses specify the semantics for the Custom UI XML markup contained within the ECMA-376 Office Open XML File Formats, as specified in [ECMA-376]. These semantics describe customization of the UI interface. Examples in the following clauses highlight customizations in the context of the Microsoft Office Fluent interface (UI) but the concepts extend naturally to any user interface.

Customization of the UI is accomplished via the addition of parts containing Custom UI XML markup to the containing document package.

2.1 Parts

The parts described in the subordinate sections detail the additional part types utilized by CustomUI in an ECMA-376 Office Open XML File Formats [ECMA-376] file.

2.1.1 Quick Access Toolbar Customizations Part

Content Type:	application/xml
Root Namespace:	http://schemas.microsoft.com/office/2006/01/customui
Source Relationship:	http://schemas.microsoft.com/office/2006/relationships/ui/userCustomization

The syntax of the structures contained in this part uses **XML schema definition (XSD)**, as specified in [XMLSCHEMA1] and [XMLSCHEMA2].

This specification defines and references various **XML namespaces** by using the mechanisms specified in [XMLNS].

An instance of this part type contains information about the quick access toolbar customizations specific to the containing package.

For example, a user can customize the quick access toolbar for his WordProcessingML document to contain the UI controls that they commonly use.

A package is permitted to contain at most one Quick Access Toolbar Customizations part, and that part is the target of a relationship in the package-relationship item for the document.

For example, the following package part-relationship item contains a relationship to a Quick Access Toolbar Customizations part, which is stored in the ZIP item /userCustomization/customUI.xml:

```
<Relationships xmlns="...">
<Relationship Id="rId2"
Type="http://.../2006/relationships/ui/userCustomization"
Target="/userCustomization/customUI.xml" />
</Relationships>
```

The root element for a part of this content type is **customUI**.

For example, the following Quick Access Toolbar Customizations content markup specifies that the control with identifier "SpellingAndGrammar" is to be added to the quick access toolbar for the package:

<mso:customUI xmlns:mso="http://schemas.microsoft.com/office/2006/01/customui">
<mso:ribbon>

```
<mso:qat>
<mso:documentControls>
<mso:control idQ="mso:SpellingAndGrammar" visible="true" />
</mso:documentControls>
</mso:qat>
</mso:ribbon>
</mso:customUI>
```

A Quick Access Toolbar Customizations part is located within the package containing the source relationship. Expressed syntactically, the **TargetMode** attribute of the **Relationship** element is "Internal".

A Quick Access Toolbar Customizations part does not have implicit or explicit relationships to any other part defined by ECMA-376 Office Open XML File Formats, as specified in [ECMA-376].

2.1.2 Ribbon Extensibility Part

Content Type:	application/xml	
Root Namespace:	http://schemas.microsoft.com/office/2006/01/customui	
Source Relationship:	http://schemas.microsoft.com/office/2006/relationships/ui/extensibility	

The syntax of the structures contained in this part uses **XML schema definition (XSD)**, as specified in [XMLSCHEMA1] and [XMLSCHEMA2].

This specification defines and references various **XML** namespaces by using the mechanisms specified in [XMLNS].

An instance of this part type contains information about the ribbon customizations specific to the containing package.

For example, a SpreadsheetML document that represents a timecard could contain custom UI controls to guide the user in filling out the timecard.

A package is permitted to contain at most one Ribbon Extensibility part, and that part is the target of a relationship in the package-relationship item for the document.

For example, the following package part-relationship item contains a relationship to a Ribbon Extensibility part, which is stored in the ZIP item /customUI/customUI.xml:

```
<Relationships xmlns="...">
<Relationship Id="rId5"
Type="http://.../2006/relationships/ui/extensibility"
Target="/customUI/customUI.xml" />
</Relationships>
```

The root element for a part of this content type is **customUI**.

For example, the following Ribbon Extensibility content markup specifies that the ribbon tab with identifier "TabHome" is to be hidden for the containing package:

```
<customUI xmlns="http://schemas.microsoft.com/office/2006/01/customui">
<ribbon>
<tabs>
<tab idMso="TabHome" visible="false" />
</tabs>
</ribbon>
```

A Ribbon Extensibility part is located within the package containing the source relationship. Expressed syntactically, the **TargetMode** attribute of the **Relationship** element is "Internal".

A Ribbon Extensibility part is permitted to have explicit relationships to the following parts defined by ECMA-376 Office Open XML File Formats, as specified in [ECMA-376]:

Image Part, as specified in [ECMA-376] Part 1 section15.2.13.

2.2 Elements

A Custom UI document contains customizations of an application's UI. Customizations are mainly of two types:

- Modifications of the application's built-in UI, such as hiding or disabling built-in UI controls or repurposing command actions.
- Creation of custom UI controls, such as a custom ribbon tab, menu item, or quick access toolbar button.

For example, consider the following Custom UI document:

```
<customUI xmlns="http://schemas.microsoft.com/office/2006/01/customui">
  <commands>
    <command idMso="Bold" enabled="false" />
  </commands>
  <ribbon>
    <t.abs>
      <tab idMso="TabHome" visible="false" />
      <tab id="CustomTab" label="Custom Tab">
        <group id="CustomGroup" label="Custom Group">
          <button id="CustomButton" label="Custom Button"</pre>
            size="large" imageMso="HappyFace" onAction="OnButtonClick" />
        </group>
      </t.ab>
    </tabs >
  </ribbon>
</customUI>
```

This example disables the command with an identifier of "Bold", hides the ribbon tab with an identifier of "TabHome", and creates a new custom ribbon tab with a custom button in it.

The full XML Schema Definition of the XML Schema fragments listed in this section is defined in Appendix A of [MS-CUSTOMUI2].

2.2.1 box (Box Grouping Container)

This element specifies a grouping container control that can be used to align controls vertically or horizontally. **Box** elements can be nested to create complex UI layouts.

For example, consider a group of controls that are laid out horizontally, as follows:

Figure 1: Controls grouped horizontally

This layout is specified using the following **XML fragment**:

```
<box id="box" boxStyle="horizontal">
    <button id="button1" label="Button 1" imageMso="HappyFace" />
    <button id="button2" label="Button 2" imageMso="HappyFace" />
</box>
```

This is contrasted to the default vertical layout that is used if the **box** element is not specified.

The following table summarizes the elements that are parents of this element.

Parent Elements	Section
box	2.2.1
group	2.2.23

The following table summarizes the child elements of this element.

Child Elements	Section	
box (Box Grouping Container)	2.2.1	
button (Button)	2.2.2	
buttonGroup (Button Grouping Container)	2.2.5	
checkBox (Check Box)	2.2.6	
comboBox (Combo Box)	2.2.7	
control (Control Clone) 2.2.12		
dropDown (Drop-down Control) 2.2.17		
dynamicMenu (Dynamic Menu)	2.2.19	
editBox (Edit Box) 2.2.20		
gallery (Gallery) 2.2.21		
labelControl (Text Label) 2.2.25		
menu (Menu) 2.2.28		
splitButton (Split Button)	2.2.38	
toggleButton (Toggle Button)	2.2.43	

Attributes	Description
boxStyle (box style)	Specifies the layout direction for the child controls inside of the box element. If this attribute is omitted, the child controls SHOULD be laid out horizontally. For example, consider a group of controls to be laid out vertically. This is specified using the following XML: <pre></pre>
getVisible (getVisible callback)	specified in section 2.3.1. Specifies the name of a callback function that is called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The <code>id</code> and <code>idQ</code> attributes are mutually exclusive. At least one of these attributes is to be specified. For example, consider the following XML fragment: <pre></pre>
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id and idQ attributes are mutually exclusive. At least one of these attributes is to be specified. For example, consider the following XML fragment: CustomUI

Attributes	Description
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section <u>2.3.9</u> .
insertAfterMso (identifier of built- in control to insert after)	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tabli> <</tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an id of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab display="mailto:controls"> <tab display<="" td=""></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built- in control to insert before)	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple, as specified in section 2.3.5.

Attributes	Description	
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.	
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>	
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.	
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:	
	<tab idmso="TabHome" visible="false"></tab>	
	·	
	In this example, the built-in tab with an identifier of "TabHome" is to be hidden.	
	The possible values for this attribute are defined by the XML schema boolean datatype.	

The following XML schema fragment defines the contents of this element:

2.2.2 button (Button)

This element specifies a standard push-button control that performs an action when clicked.

For example, consider a button control, as follows:

Figure 2: A button control

This is specified using the following XML fragment:

```
<button id="button" label="Button" imageMso="HappyFace" />
```

The following table summarizes the elements that are parents of this element.

Parent Elements	Section
box	2.2.1
group	2.2.23

Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows: Button This is a verbose description that describes the function of this control in detail. This is specified using the following XML fragment: <pre></pre>
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
getDescription (getDescription callback)	Specifies the name of a callback function that is called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider the following XML fragment: <pre></pre>
getEnabled (getEnabled	Specifies the name of a callback function that is called to determine the enabled state of this control.

Attributes	Description
callback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being enabled. For example, consider the following XML fragment:
	<pre></pre>
	In this example, the IsButtonEnabled callback function is to be called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage	Specifies the name of a callback function to be called to determine the icon of this control.
(getImage callback)	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is to be called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function that is called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is to be called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel	Specifies the name of a callback function to be called to determine the label of this control.
callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is to be called when the application needs to determine the label of the button.
₩	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is to be called when the application needs to determine the screentip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application is to display the icon of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider the following XML fragment:
	<pre></pre>
	Sputton Iu- Button getshownmage- Isbuttonimagevisible //
	In this example, the IsButtonImageVisible callback function is to be called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application is to display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is to be called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSize (getSize	Specifies the name of a callback function to be called to determine the size of this control.
callback)	The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.
	For example, consider the following XML fragment:
	<pre><button getsize="GetButtonSize" id="button"></button></pre>
	In this example, the GetButtonSize callback function is to be called when the application needs to determine the size of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is to be called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is to be called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control is passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an id of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:

Attributes	Description
	<pre></pre>
	The possible values for this attribute are defined by the $\mathbf{ST}_{\mathbf{QID}}$ simple type, as specified in section $\underline{2.3.9}$.
image (custom image identifier)	Specifies the relationship identifier for an image that is to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre></pre>
imageMso (built-in image identifier)	Specifies the identifier of a built-in image that is to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"/<a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"/<a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"/<a "="" href="mageMso">mageMso="mageMso="Bold"/">mageMso="
	This specifies a custom button that uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>

Attributes	Description
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.

Attributes	Description
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<button id="button" imagemso="HappyFace" keytip="K"></button>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string that is to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows: Button Custom Group
	This is the screentip Book3.xlsx Press F1 for more help.
	This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	size="large" screentip="This is the screentip" />
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control displays its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
size (control size)	The possible values for this attribute are defined by the XML schema boolean datatype. Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows: Blood Custom Group This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton> The possible values for this attribute are defined by the ST_Size simple type, as specified

Attributes	Description
	in section <u>2.3.10</u> .
supertip (supertip)	Specifies a string that is to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>
visible (control visibility)	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11. Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.

The following XML schema fragment defines the contents of this element:

```
<xsd:complexType name="CT Button">
    <xsd:complexContent>
    <xsd:extension base="CT_ButtonRegular">
    <xsd:attributeGroup ref="AG_SizeAttributes"/>
    </xsd:extension>
    </xsd:complexContent>
</xsd:complexType>
```

2.2.3 button (Unsized Button)

This element specifies a push-button that, because of its location, cannot have its size changed. The **size** attribute is not present. This element otherwise behaves like the regular **button** element, as specified in section 2.2.2.

The following table summarizes the elements that are parents of this element.

Parent Elements	Section
buttonGroup	2.2.5
dialogBoxLauncher	2.2.15
documentControls	2.2.16
dropDown	2.2.17
gallery	2.2.21
gallery	2.2.22
menu	2.2.28
menu	2.2.26
menu	2.2.29
menu	2.2.27
officeMenu	2.2.31
sharedControls	2.2.35

Attributes	Description
description	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	the function of this control in detail." />
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section 2.3.8.
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is always disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
getEnabled (getEnabled	Specifies the name of a callback function to be called to determine the enabled state of this control.
callback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is to be called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage	Specifies the name of a callback function to be called to determine the icon of this control.
(getImage callback)	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is to be called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as

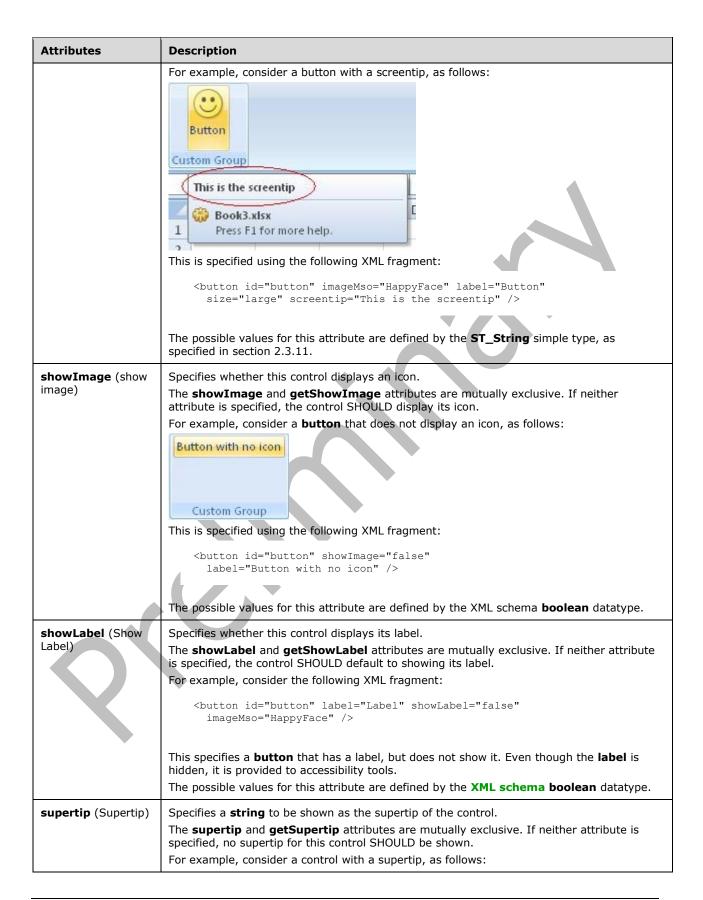

Attributes	Description
	specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function that is called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is to be called when the application needs to determine the KeyTip of the button . The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is to be called when the application needs to determine the label of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is to be called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application is to display the icon of this control.
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is to be called when the application needs to determine whether to display the icon of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel	Specifies the name of a callback function to be called to determine whether the application

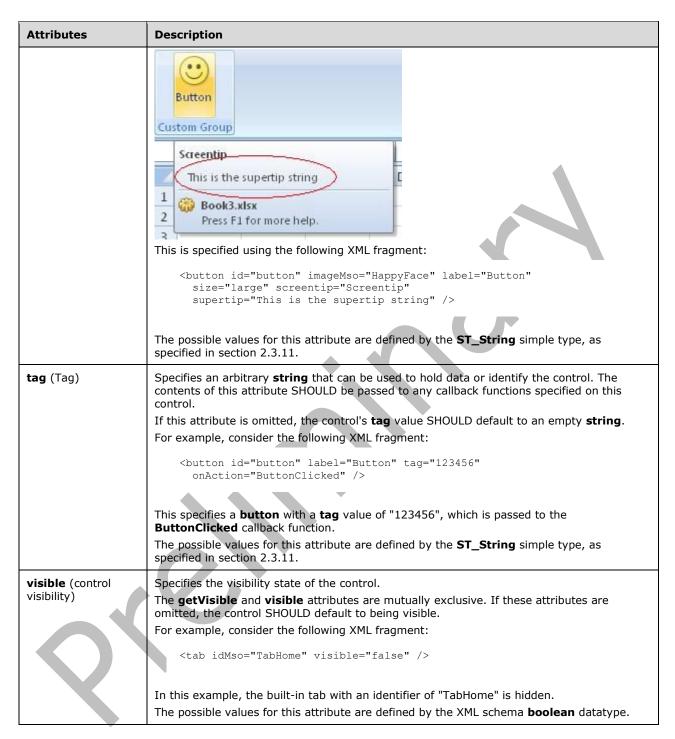

Attributes	Description
(getShowLabel callback)	is to display the label of this control. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <but <br=""></but>
	In this example, the IsButtonLabelVisible callback function is to be called when the application needs to determine whether to display the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip callback)	Specifies the name of a callback function to be called to determine the supertip of this control. The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonSupertip callback function is to be called when the application needs to determine the supertip of the button . The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>
id (control identifier)	specified in section 2.3.2. Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <a <b="" are="" attribute="" by="" defined="" for="" href="https://px.doi.org/10.1001/journal.org/10</td></tr><tr><td>idMso (built-in</td><td>This specifies a custom button control with an id of " mybutton".="" possible="" the="" this="" values="">ST_UniqueID simple type, as specified in section 2.3.13. Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes

Attributes	Description
	MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"></tab></tabs></ribbon></customui></pre>
	In this case, "ex" is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab . The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre> <</pre>
	This specifies a custom button whose icon is to be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ	Specifies the qualified identifier of a control that this control is to be inserted before. If the

Attributes	Description
(qualified identifier	value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (Keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (Label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked"></button></pre>
	This specifies a button that calls the ButtonClicked callback function when it is invoked.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.

The following XML schema fragment defines the contents of this element:

2.2.4 button (Button Inside of a Split Button)

This element specifies a push-button that is a child of a split button control. The **visible** and **getVisible** attributes are not present because the visibility is controlled by the split button. This element otherwise behaves in the same way as the unsized **button** element, as specified in section 2.2.3.

The following table summarizes the elements that are parents of this element.

Parent Elements	Section
splitButton	2.2.38
splitButton	2.2.36
splitButton	2.2.37

Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description , as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	The possible values for this attribute are defined by the $\mathbf{ST_LongString}$ simple type, as specified in section $\underline{2.3.8}$.
enabled (enabled	Specifies the enabled state of the control.
state)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is always disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description

Attributes	Description
callback)	of this control.
	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getEnabled (getEnabled	Specifies the name of a callback function to be called to determine the enabled state of this control.
callback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
,	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel	Specifies the name of a callback function to be called to determine the label of this control.
callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function that is called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display
	no screentip at all. For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function that is called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function that is called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function that is called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function that is called to determine the visibility state of this control. This attribute is prohibited.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an id of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui <="" pre="" xmlns="http://schemas.microsoft.com/office/2006/01/customui"></customui></pre>

Attributes	Description
	<pre>xmlns:ex="http://www.example.com"> <ribbon></ribbon></pre>
	<tabs></tabs>
	<tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image that is used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" image="ForestPic"></button>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the $\mathbf{ST_Uri}$ simple type, as specified in section $\underline{2.3.14}$.
imageMso (built-in	Specifies the identifier of a built-in image that is used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that uses the built-in image with an id of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab>

Attributes	Description
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of x:OtherTab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.

Attributes	Description
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows: Button Custom Group This is the screentip
	Book3.xlsx 1 Press F1 for more help.
	This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	size="large" screentip="This is the screentip" />
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:
	<button id="button" label="Button with no icon" showimage="false"></button>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Custom Group Screentip This is the supertip string Book3.xlsx
	Press F1 for more help.

Attributes	Description
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="Screentip" size="large" supertip="This is the supertip string"></button></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. This attribute is prohibited. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre></pre>

2.2.5 buttonGroup (Button Grouping Container)

This element specifies a grouping container that groups controls together visually. The child controls are laid out horizontally.

For example, consider a group of buttons, as follows:

Figure 3: A group of buttons

This is specified using the following XML fragment:

```
<buttonGroup id="buttonGroup">
  <button id="button1" imageMso="Bold" />
  <button id="button2" imageMso="Italic" />
  <button id="button3" imageMso="Underline" />
  </buttonGroup>
```

The following table summarizes the elements that are parents of this element.

Parent Elements	Section
box	2.2.1
group	<u>2.2.23</u>

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
control (Unsized Control Clone) 2.2.11	
dynamicMenu (Unsized Dynamic Menu) 2.2.18	
gallery (Unsized Gallery)	2.2.22
menu (Unsized Menu) 2.2.26	
splitButton (Unsized Split Button) 2.2.36	
toggleButton (Unsized Toggle Button) 2.2.42	

Attributes	Description
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section <u>2.3.2</u> .
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id and idQ attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section <u>2.3.13</u> .
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id and idQ attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: CustomUI
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in

Attributes	Description
	section <u>2.3.5</u> .
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso	Specifies the identifier of a built-in control that this control is to be inserted before. If the
(identifier of built-in control to insert before)	value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the built- in tab with an id of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
*	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
visible (control	Specifies the visibility state of the control.
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:

Attributes	Description
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

menu	2.2.26
menu	2.2.29

Parent Elements	Section	
menu	2.2.27	
officeMenu	<u>2.2.31</u>	

Attributes	Description	
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows: Button This is a verbose description that describes the function of this control in detail. This is specified using the following XML fragment: <pre></pre>	
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section $2.3.8$.	
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>	
	very useful, thus the enabled attribute is not commonly used.	
	The possible values for this attribute are defined by the XML schema boolean datatype.	
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider the following XML fragment: <pre></pre>	
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is	

Attributes	Description				
	specified, the control SHOULD default to being enabled.				
	For example, consider the following XML fragment:				
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>				
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.				
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.				
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:				
	<pre><button getimage="GetButtonImage" id="button"></button></pre>				
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.				
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.				
	For example, consider the following XML fragment:				
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>				
	In this example, the GetButtonKeytip callback function is called when the application				
	needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.				
getLabel (getLabel callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.				
	For example, consider the following XML fragment:				
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>				
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.				
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.				
getPressed (getPressed callback)	Specifies the name of a callback function to be called to determine the toggled state of this control. If this attribute is omitted, the control SHOULD default to the off state. For example, consider the following XML fragment:				
	<pre><togglebutton getpressed="IsButtonToggled" id="toggle"></togglebutton></pre>				

Attributes	Description
	In this example, the IsButtonToggled callback function is called when the application needs to determine the toggle state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example the CatPutton Severation callback function is called when the application
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application displays the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.

Attributes	Description		
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.		
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.		
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.		
	For example, consider the following XML fragment:		
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>		
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.		
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.		
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.		
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.		
	For example, consider the following XML fragment:		
	<pre><button id="MyButton" label="Button"></button></pre>		
	This specifies a custom button control with an id of "MyButton".		
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.		
idMso (built-in	Specifies the identifier of a built-in control.		
control identifier)	The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.		
	For example, consider the following XML fragment:		
	<pre><control idmso="Bold"></control></pre>		
	This creates a clone of the control with an identifier of "Bold".		
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section $2.3.5$.		
idQ (qualified	Specifies a qualified identifier for a control.		
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.		
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.		
	For example, consider the following XML fragment:		
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon></ribbon></customui></pre>		
	<tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"> </group></tab>		

Attributes	Description				
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab . The possible values for this attribute are defined by the ST_QID simple type, as specified				
	in section 2.3.9.				
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.				
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.				
	For example, consider the following XML fragment:				
	<pre><button id="button" image="ForestPic"></button></pre>				
	This specifies a custom button whose icon is to be the embedded image file referenced by the relationship identifier of "ForestPic".				
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.				
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.				
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.				
	For example, consider the following XML fragment:				
<pre><button id="button" imagemso="Bold"></button></pre>					
	This specifies a custom button to use the built-in image with an id of "Bold".				
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.				
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.				
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.				
	For example, consider the following XML fragment:				
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>				
	In this example, a new custom tab with an id of "MyTab" is be inserted after the built-in tab with an identifier of "TabHome".				
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.				

Attributes	Description		
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.		
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>		
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom		
	tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified		
	in section 2.3.9.		
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.		
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>		
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".		
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.		
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>		
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".		
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.		
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.		
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.		
	For example, consider a button with KeyTip 'K', as follows:		

Attributes	Description		
	This is specified using the following XML fragment:		
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>		
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.		
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: 		
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.		
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user.		
	For example, consider the following XML fragment:		
	<pre><button id="button" label="Button" onaction="ButtonClicked"></button></pre>		
	This specifies a button that calls the ButtonClicked callback function when it is invoked. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.		
screentip (screentip)			

Attributes	Description			
showImage (show	Specifies whether this control displays an icon.			
image)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.			
	For example, consider a button that does not display an icon, as follows:			
	Button with no icon Custom Group			
	This is specified using the following XML fragment:			
	<pre></pre>			
	The possible values for this attribute are defined by the XML schema boolean datatype.			
showLabel (show label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:			
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>			
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.			
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Button Custom Group			
	This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <b< td=""></b<>			

Attributes	Description			
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.			
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.			
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .			
	For example, consider the following XML fragment:			
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>			
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.			
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:			
	<tab idmso="TabHome" visible="false"></tab>			
	In this example, the built-in tab with an id of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.			

2.2.7 comboBox (Combo Box)

This element specifies a standard combo box control that allows a user to input a text **string** or select one from a list.

For example, consider a combo box control, as follows:

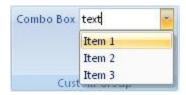

Figure 5: A combo box control

This is specified using the following XML fragment:

```
<comboBox id="comboBox" label="Combo Box">
    <item id="item1" label="Item 1" />
    <item id="item2" label="Item 2" />
    <item id="item3" label="Item 3" />
    </comboBox>
```

The following table summarizes the elements that are parents of this element.

```
Parent Elements

box (section 2.2.1); group (section 2.2.23)
```

The following table summarizes the child elements of this element.

Child Elements		Section
item (Selection Item)		2.2.24

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment:

Attributes	Description	
	The possible values for this attribute are defined by the $ST_Delegate$ simple type, as specified in section $2.3.2$.	
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:	
	<pre><button getimage="GetButtonImage" id="button"></button></pre>	
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getItemCount (getItemCount callback)	Specifies the name of a callback function to be called to determine the number of selection items in this control.	
campacity	If this attribute is omitted, the control SHOULD display any selection items that are specified as child elements. If no such items are specified, the control SHOULD be empty. For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" id="gallery"></gallery></pre>	
	In this example, the GetGalleryItemCount callback function is called when the application needs to determine the number of items in the gallery. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getItemID (getItemID callback)	Specifies the name of a callback function to be called to determine the identifier of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD have empty	
	identifiers. For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getitemid="GetGalleryItemID" id="gallery"></gallery></pre>	
	In this example, the GetGalleryItemID callback function is called when the application needs to determine the identifier of a selection item.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getItemImage (getItemImage	Specifies the name of a callback function to be called to determine the icon of a specific dynamically-created selection item, identified by index.	
callback)	If this attribute is omitted, dynamically-created selection items SHOULD NOT display icons.	
	For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getitemimage="GetGalleryItemImage" id="gallery"></gallery></pre>	
	In this example, the GetGalleryItemImage callback function is called when the application needs to determine the icon of a selection item.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	

Attributes	Description	
getItemLabel (getItemLabel callback)	Specifies the name of a callback function to be called to determine the label of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display labels. For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getitemlabel="GetGalleryItemLabel" id="gallery"></gallery></pre>	
	In this example, the GetGalleryItemLabel callback function is called when the application needs to determine the label of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as	
	specified in section 2.3.2.	
getItemScreentip (getItemScreentip	Specifies the name of a callback function to be called to determine the screentip of a specific dynamically-created selection item, identified by index.	
callback)	If this attribute is omitted, dynamically-created selection items SHOULD use their labels as their screentips, or display no screentips at all.	
	For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getitemscreentip="GetGalleryItemScreentip" id="gallery"></gallery></pre>	
	In this example, the GetGalleryItemScreentip callback function is called when the application needs to determine the screentip of a selection item.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getItemSupertip (getItemSupertip callback)	Specifies the name of a callback function to be called to determine the supertip of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display	
	supertips. For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getitemsupertip="GetGalleryItemSupertip" id="gallery"></gallery></pre>	
	getremoupertry decourrery remoupertry	
	In this example, the GetGalleryItemSupertip callback function is called when the application needs to determine the supertip of a selection item.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.	
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.	
	For example, consider the following XML fragment:	
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>	
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getLabel (getLabel	Specifies the name of a callback function to be called to determine the label of this control.	

Attributes	Description
callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getText (getText callback)	Specifies the name of a callback function to be called to determine the text that is displayed in the control.
	For example, consider the following XML fragment:
	<editbox gettext="GetEditBoxText" id="editBox"></editbox>
	In this example, the GetEditBoxText callback function is called when the application needs to determine the text to display in the control.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<button getvisible="IsButtonVisible" id="button"></button>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an id of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control.
	The contents of this attribute are application-defined.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<control idmso="Bold"></control>

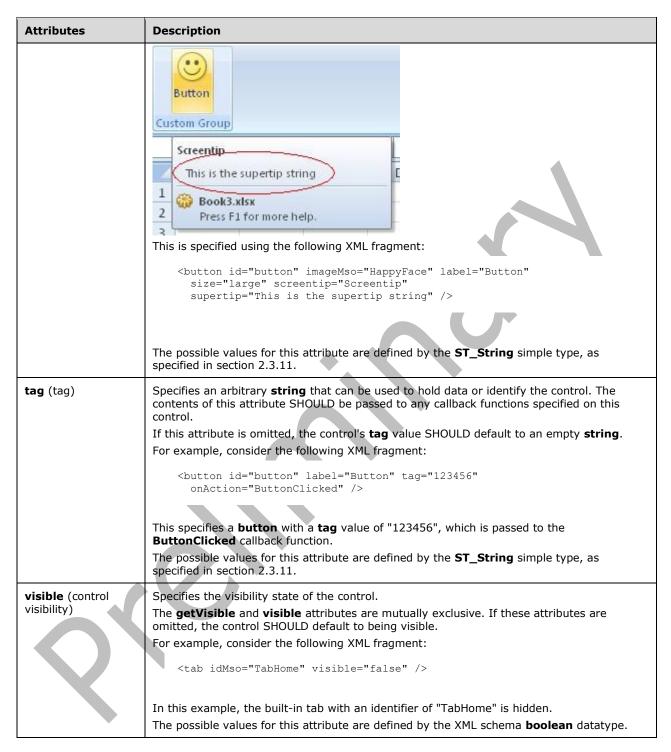

Attributes	Description
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section $\underline{2.3.5}$.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon></ribbon></customui></pre>
	<tabs <="" td=""></tabs>
	<pre><tab idq="ex:OtherTab" label="Shared Tab"></tab></pre>
	>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section $2.3.9$.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image to be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that uses the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in

Attributes	Description	
	section 2.3.5.	
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.	
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>	
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".	
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.	
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.	
of control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>	
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".	
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.	
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.	
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>	
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".	
¥	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.	
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.	
of control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:	
I	To example, consider the following Artic magnitude.	

Attributes	Description
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"> </tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
invalidateContent OnDrop (invalidate content on drop)	Specifies whether this control invalidates its contents and re-queries for them when the user opens its drop-down menu. If this attribute is omitted, its value SHOULD default to "false". For example, consider the following XML fragment: <pre></pre>
	In this example, this combo box clears out its items and re-calls the GetComboBoxItemCount and GetComboBoxItemLabel callback functions to populate its contents each time the user opens it. The possible values for this attribute are defined by the XML schema boolean datatype.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows: This is specified using the following XML fragment: <pre></pre>
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
maxLength (maximum input string length)	Specifies an integer to be used as the maximum length of a string that can be entered into the control. If the maxLength attribute is omitted, the length of the input string SHOULD NOT be limited, except by application-specific constraints. For example, consider the following XML fragment:

Attributes	Description
	<editbox id="editBox" maxlength="10"></editbox>
	This specifies an edit box control that can only accept strings up to 10 characters in length.
	The possible values for this attribute are defined by the $ST_StringLength$ simple type, as specified in section $2.3.12$.
onChange (onChange	Specifies the name of a callback function to be called when the text in the control has been changed by the user.
callback)	For example, consider the following XML fragment:
	<pre><editbox id="editBox" onchange="EditBoxTextChanged"></editbox></pre>
	This specifies an edit box control that calls the EditBoxTextChanged callback function when the user inputs a text string .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows:
	Button Custom Group
	This is the screentip
	Book3.xisx 1 Press F1 for more help.
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="This is the screentip" size="large"></button></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show	
image)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider a button that does not display an icon, as follows:
	Button with no icon
	Custom Group
	This is specified using the following XML fragment:

Attributes	Description	
	<pre><button id="button" label="Button with no icon" showimage="false"></button></pre>	
	The possible values for this attribute are defined by the XML schema boolean datatype.	
showItemImage (show item image)	Specifies whether this control displays icons on its selection items. If this attribute is omitted, the items' icons SHOULD be shown by default. For example, consider the following XML fragment: <pre></pre>	
	This specifies a gallery control that does not show any icons on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.	
showLabel (show label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>	
sizeString (size string)	Specifies a string whose size is used to determine the width of the text input area of this control. If this attribute is omitted, the application SHOULD determine the width of the text input area of the control automatically. For example, consider the following XML fragment: <editbox id="editBox" sizestring="wwwwwwwwwwww"></editbox>	
	This specifies an edit box control that SHOULD be wide enough to display the string "WWWWWWWWWWWW". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows:	

```
<xsd:complexType name="CT_ComboBox">
    <xsd:complexContent>
    <xsd:extension base="CT_EditBox">
    <xsd:sequence>
    <xsd:element name="item" type="CT Item" minOccurs="0" maxOccurs="1000"/>
```

```
</xsd:sequence>
  <xsd:attributeGroup ref="AG_DropDownAttributes"/>
  <xsd:attributeGroup ref="AG_DynamicContentAttributes"/>
  </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
```

2.2.8 command (Repurposed Command)

This element specifies that a particular built-in command in the application is to be repurposed.

The **enabled** and **getEnabled** attributes can be specified to disable a command.

The **onAction** attribute allows the functionality of a command to be repurposed to run a callback function. Only commands that execute simple actions (for example, commands represented as button controls) can be repurposed using **onAction**.

For example, consider the following XML fragment:

```
<commands>
  <command idMso="Bold" enabled="false" />
  <command idMso="Paste" onAction="MyPasteFunction" />
</commands>
```

In this example, the **Bold** command is permanently disabled and that the callback function **MyPasteFunction** is called when the **Paste** command is invoked.

The following table summarizes the elements that are parents of this element.

Parent Elements	
commands (section 2.2.9)	

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked"></button></pre>
	This specifies a button that calls the ButtonClicked callback function when it is invoked. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

2.2.9 commands (List of Repurposed Commands)

This element specifies a list of repurposed commands. This element SHOULD NOT be specified if the containing Custom UI XML document is a Quick Access Toolbar Customizations part.

The following table summarizes the elements that are parents of this element.

Parent Elements	
customUI (section 2.2.14)	

The following table summarizes the child elements of this element.

Child Elements	Subclause
command (Repurposed Command)	section 2.2.8

The following XML schema fragment defines the contents of this element:

2.2.10 contextual Tabs (List of Contextual Tab Sets)

This element specifies a list of contextual tab sets. This element SHOULD NOT be specified if the containing Custom UI XML document is a Quick Access Toolbar Customizations part.

The following table summarizes the elements that are parents of this element.

Parent Elements	
ribbon (section 2.2.33)	

The following table summarizes the child elements of this element.

Child Elements		Subclause
tabSet (Contextual Tab Set)		section <u>2.2.41</u>

The following XML schema fragment defines the contents of this element:

2.2.11 control (Unsized Control Clone)

This element specifies a clone of a control that, because of its location, cannot have its size changed. The **size** attribute is not present. The element otherwise behaves like the regular **control** element, as specified in section 2.212.

The following table summarizes the elements that are parents of this element.

```
Parent Elements

buttonGroup (section 2.2.5); menu (section 2.2.28); menu (section 2.2.26); menu (section 2.2.29); menu (section 2.2.27); officeMenu (section 2.2.31)
```

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment:

Attributes	Description
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being enabled. For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	Spaceon in paceon germanica isbaccommunica //
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage	Specifies the name of a callback function to be called to determine the icon of this control.
(getImage callback)	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control.
	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.

Attributes	Description
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application
	needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

Attributes	Description
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes
	MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"></tab></tabs></ribbon></customui></pre>
	<pre><group id="MyGroup" label="My Group"></group></pre>

Attributes	Description
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified
	in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that uses the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.

Attributes	Description
after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
Ť	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	GK.
	This is specified using the following XML fragment:

Attributes	Description
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <br< td=""></br<>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:

Attributes	Description
	<pre><button id="button" label="Button with no icon" showimage="false"></button></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Custom Group Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: Supertip="This is the supertip string" /> This is specified using the following xML fragment: This is specified using the following XML fragment: <b< th=""></b<>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment:
	<pre> <</pre>

Attributes	Description
	onAction="ButtonClicked" />
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function.
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control	Specifies the visibility state of the control.
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

The following XML schema fragment defines the contents of this element:

2.2.12 control (Control Clone)

This element specifies a clone of an existing control. Built-in controls can be cloned using the **idMso** attribute. Custom controls cannot be cloned. Custom controls cannot be created using the **control** element.

When an existing control is cloned, its non-location-specific properties, such as the icon and label, are copied to the clone. Location-specific properties, such as the size and visibility of the control, are not copied. These properties can be set by specifying additional attributes on the **control** element.

For example, consider the following XML fragment:

```
<control idMso="Paste" size="large" />
```

This results in a large copy of the **Paste** control, as follows:

Figure 6: A Paste control

The following table summarizes the elements that are parents of this element.

Parent Elements

box (section 2.2.1); **group** (section 2.2.23)

The following table summarizes the attributes of this element.

Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section 2.3.8.
enabled (enabled	Specifies the enabled state of the control.
state)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled
	by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section <u>2.3.2</u> .
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button getimage="GetButtonImage" id="button"></button>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>

Attributes	Description
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
Caliback	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application displays the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application
	needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSize (getSize	Specifies the name of a callback function to be called to determine the size of this control.
callback)	The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.
	For example, consider the following XML fragment:
	<button getsize="GetButtonSize" id="button"></button>
	In this example, the CotPuttonSize callback function is called when the application needs
	In this example, the GetButtonSize callback function is called when the application needs to determine the size of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre></pre>
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment: <pre></pre>

Attributes	Description
	<pre>xmlns:ex="http://www.example.com"> <ribbon></ribbon></pre>
	<pre><rippon></rippon></pre>
	<pre><tab idq="ex:OtherTab" label="Shared Tab"> </tab></pre>
	<pre><group id="MyGroup" label="My Group"></group></pre>
	(/ Customory
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the $\mathbf{ST}_{\mathbf{QID}}$ simple type, as specified in section $2.3.9$.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" image="ForestPic"></button>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the $\mathbf{ST_Uri}$ simple type, as specified in section $\underline{2.3.14}$.
imageMso (built-in	Specifies the identifier of a built-in image to be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre></pre>
	This specifies a custom button that uses the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab>

Attributes	Description
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be
	appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.

Attributes	Description
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows: Button Custom Group
	This is the screentip Book3.xlsx Press F1 for more help.
	This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	size="large" screentip="This is the screentip" />
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: <
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control displays its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
size (control size)	Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows: Bold Custom Group This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton>

Attributes	Description
	The possible values for this attribute are defined by the ST_Size simple type, as specified in section $\frac{2.3.10}{1.0}$.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment: In this example, the built-in tab with an identifier of "TabHome" is hidden.
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

The following XML schema fragment defines the contents of this element:

2.2.13 control (Quick Access Toolbar Control Clone)

This element specifies a clone of an existing control. It is specific to control clones on the quick access toolbar, but otherwise behaves the same way as the regular **control** element, as specified in section 2.2.12.

The following table summarizes the elements that are parents of this element.

Parent Elements		
documentControls (section 2.2.16); sharedControls (section 2.2.35)		

The following table summarizes the attributes of this element.

	· · · · · · · · · · · · · · · · · · ·
Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre></pre>
	specified in section 2.3.8.
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.

Attributes	Description
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider the following XML fragment:
	<pre></pre>
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The <code>getImage</code> , <code>image</code> , and <code>imageMso</code> attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified,

Attributes	Description
	no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control. This attribute SHOULD have no effect if the size or getSize attributes specify that the
	control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

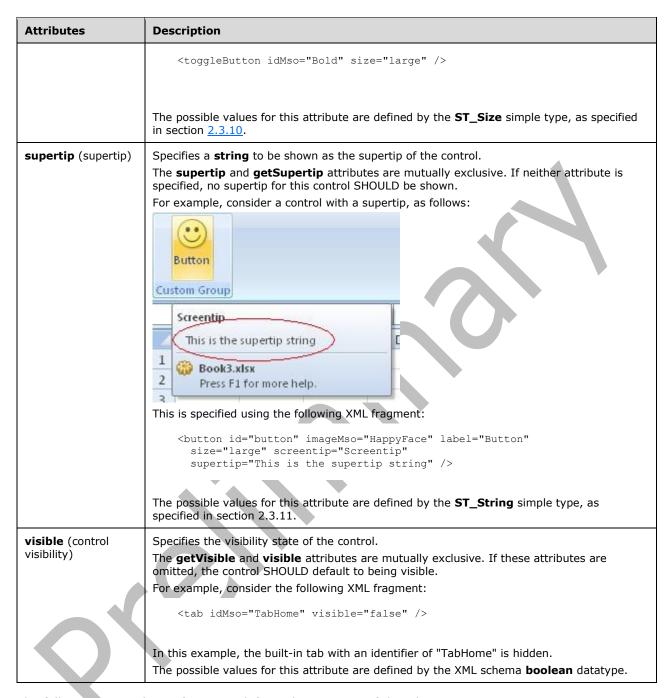

Attributes	Description
getSize (getSize callback)	Specifies the name of a callback function to be called to determine the size of this control. The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider the following XML fragment:
	<pre><button getsize="GetButtonSize" id="button"></button></pre>
	In this example, the GetButtonSize callback function is called when the application needs to determine the size of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (custom control identifier)	Specifies the identifier for a custom control. All new custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The identifier is qualified with an XML namespace prefix that specifies the owner of the control. If the namespace is equal to the Custom UI namespace, the <code>idQ</code> attribute behaves in the same manner as the <code>idMso</code> attribute. If the namespace is equal to the name of the current file, the <code>idQ</code> attribute behaves like the <code>id</code> attribute. If the namespace is equal to the name of a different file, the attribute references a control from that file.
	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. For example, consider the following XML fragment:
	<tab idq="x:OtherTab"> <group id="MyGroup" label="My Group"></group></tab>
	In this case x is an XML namespace equal to the name of another file that has a Custom UI document with a tab with an identifier of "OtherTab". This example adds a custom group to that tab .
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" imagemso="Bold"></button>
	This specifies a custom button that uses the built-in image with an identifier of "Bold".

Attributes	Description
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the
	custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3,9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood. it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.

Attributes	Description
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The pessible values for this attribute and defined by the CT. Knothin simple true as
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section <u>2.3.7</u> .
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
screentip (screentip)	Specifies a string to be shown as the screentip for this control.
(screenup)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows:
	Button Custom Group
	This is the screentip Book3.xlsx Press F1 for more help.
	This is specified using the following XML fragment:

Attributes	Description				
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="This is the screentip" size="large"></button></pre>				
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.				
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".				
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.				
	For example, consider a button that does not display an icon, as follows: Button with no icon				
	Custom Group				
	This is specified using the following XML fragment:				
	<pre><button id="button" label="Button with no icon" showimage="false"></button></pre>				
	The possible values for this attribute are defined by the XML schema boolean datatype.				
showLabel (show label)	Specifies whether this control displays its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".				
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.				
	For example, consider the following XML fragment:				
	<pre></pre>				
	This specifies a button that has a label , but does not show it. Even though the label is				
	hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.				
size (control size)	Specifies the size of the control.				
	The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.				
	For example, consider a large button, as follows:				
	B Bold Custom Group				
	This is specified using the following XML fragment:				

The following XML schema fragment defines the contents of this element:

2.2.14 customUI (Custom UI Document Root)

This element specifies the root tag in a Custom UI XML document.

The following table summarizes the child elements of this element.

Child Elements	Section
commands (List of Repurposed Commands)	2.2.9
ribbon (Ribbon)	2.2.33

The following table summarizes the attributes of this element.

Attributes	Description
loadImage (loadImage	Specifies the name of a callback function to be called when the application needs to load an image for a control's icon.
callback)	For example, consider the following XML fragment:
	<pre><customui loadimage="LoadImageFunction" xmlns=""></customui></pre>
	In this example, the LoadImageFunction callback is called to load icon images.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
onLoad (onLoad callback)	Specifies the name of a callback function to be called when the Custom UI file is loaded by the application.
	For example, consider the following XML fragment:
	<pre><customui onload="OnCustomUILoaded" xmlns=""></customui></pre>
	In this example, the OnCustomUILoaded callback function is called when the containing Custom UI file is loaded.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

The following XML schema fragment defines the contents of this element:

2.2.15 dialogBoxLauncher (Dialog Box Launcher)

This element specifies a button that is the dialog box launcher control for a ribbon group.

For example, consider a dialog box launcher control, as follows:

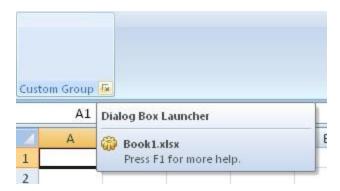

Figure 7: A dialog box launcher control

This is specified using the following XML fragment:

The following table summarizes the elements that are parents of this element.

```
Parent Elements

group (section 2.2.23)

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3

The following XML schema fragment defines the contents of this element:

2.2.16 documentControls (List of Document-Specific Quick Access Toolbar Controls)

This element specifies the list of controls on the quick access toolbar which are specific to the containing file.

For example, consider a set of controls on the document-specific quick access toolbar, as follows:

Figure 8: A set of controls on the document-specific quick access toolbar

This is specified using the following XML fragment:

```
<documentControls>
  <control idMso="CalculateNow" />
       <control idMso="HyperlinkInsert" />
</documentControls>
```

The following table summarizes the elements that are parents of this element.

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
control (Quick Access Toolbar Control Clone)	2.2.13
separator (Separator)	2.2.34

The following XML schema fragment defines the contents of this element:

2.2.17 dropDown (Drop-down Control)

This element specifies a drop-down control that allows users to make a selection from a list of options. A drop-down control can optionally have buttons after its selection items.

For example, consider a drop-down control, as follows:

Figure 9: A drop-down control

This is specified using the following XML fragment:

```
<dropDown id="dropDown" label="DropDown">
  <item id="item1" label="Item 1" />
  <item id="item2" label="Item 2" />
  <item id="item3" label="Item 3" />
  <button id="button" label="Button..." />
```

The following table summarizes the elements that are parents of this element.

Parent Elements box (section 2.2.1); group (section 2.2.23)

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
item (Selection Item)	2.2.24

The following table summarizes the attributes of this element.

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>

Attributes	Description
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemCount (getItemCount callback)	Specifies the name of a callback function to be called to determine the number of selection items in this control. If this attribute is omitted, the control SHOULD display any selection items that are specified as child elements. If no such items are specified, the control SHOULD be empty.
	For example, consider the following XML fragment: <gallery getitemcount="GetGalleryItemCount" id="gallery"></gallery>
	In this example, the GetGalleryItemCount callback function is called when the application needs to determine the number of items in the gallery. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemID (getItemID callback)	Specifies the name of a callback function to be called to determine the identifier of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD have empty identifiers. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemid="GetGalleryItemID" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemID callback function is called when the application needs to determine the identifier of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemImage (getItemImage callback)	Specifies the name of a callback function to be called to determine the icon of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display icons. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemimage="GetGalleryItemImage" id="gallery"></gallery> In this example, the GetGalleryItemImage callback function is called when the</pre>
	application needs to determine the icon of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemLabel (getItemLabel callback)	Specifies the name of a callback function to be called to determine the label of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display labels. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemlabel="GetGalleryItemLabel" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemLabel callback function is called when the application needs to determine the label of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

Attributes	Description
getItemScreentip (getItemScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD use their labels as their screentips, or display no screentips at all. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemscreentip="GetGalleryItemScreentip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemScreentip callback function is called when the application needs to determine the screentip of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemSupertip (getItemSupertip	Specifies the name of a callback function to be called to determine the supertip of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD NOT display supertips. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemsupertip="GetGalleryItemSupertip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemSupertip callback function is called when the application needs to determine the supertip of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre></pre>
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
getScreentip	specified in section 2.3.2. Specifies the name of a callback function to be called to determine the screentip of this
(getScreentip	control.

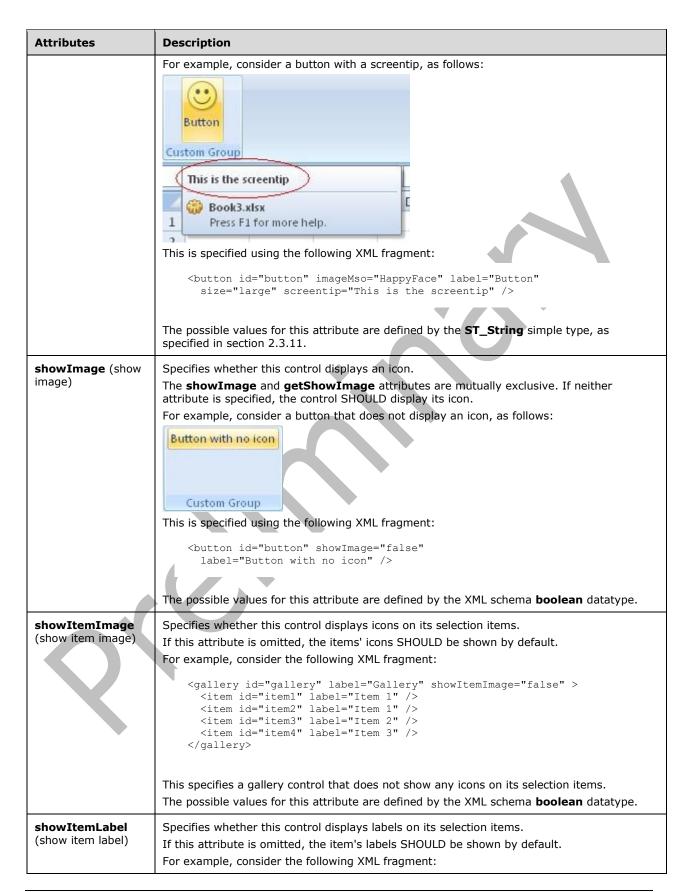

Attributes	Description
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSelectedItemI D	Specifies the name of a callback function to be called to determine the identifier of the item to be selected in this control.
(getSelectedItemI D callback)	The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemid="GetItemID" getselecteditemid="GetGallerySelectedItemID" id="gallery"></gallery></pre>
	,
	In this example, the GetGallerySelectedItemID callback function is called when the application needs to determine the selected item in the gallery. In this example the callback function returns one of the identifiers returned by the GetItemID callback function.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSelectedItemI ndex	Specifies the name of a callback function to be called to determine the index of the item to be selected in this control.
(getSelectedItemI ndex callback)	The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getselecteditemindex="GetGallerySelectedItemIndex" id="gallery"></gallery></pre>
	In this example, the GetGallerySelectedItemIndex callback function is called when the application needs to determine the selected item in the gallery.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application displays the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
•	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel	Specifies the name of a callback function to be called to determine whether the application

Attributes	Description
(getShowLabel	displays the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an id of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined.
	The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes

Attributes	Description
	MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab . The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing
	file. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image to be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="button" imagemso="Bold"></button>
	This specifies a custom button that uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ	Specifies the qualified identifier of a control that this control is to be inserted before. If the

Attributes	Description
(qualified identifier	value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified
	in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked"></button></pre>
	This specifies a button that calls the ButtonClicked callback function when it is invoked.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.

Attributes	Description
	<pre><gallery id="gallery" label="Gallery" showitemlabel="false"></gallery></pre>
	This specifies a gallery control that does not show any labels on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
sizeString (size string)	Specifies a string whose size is used to determine the width of the text input area of this control. If this attribute is omitted, the application SHOULD determine the width of the text input area of the control automatically. For example, consider the following XML fragment: <editbox id="editBox" sizestring="wwwwwwwwwwwww"></editbox> This specifies an edit box control that is wide enough to display the string
	"WWWWWWWWWWW". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows:
	Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:

Attributes	Description
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="Screentip" size="large" supertip="This is the supertip string"></button></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as
	specified in section 2.3.11.
visible (control	Specifies the visibility state of the control.
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	· · · · ·
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```

   </xsd:extension>
   </xsd:complexContent>
</xsd:complexType>
```

2.2.18 dynamicMenu (Unsized Dynamic Menu)

This element specifies a dynamic menu control that, because of its location, cannot have its anchor size changed. The **size** attribute is not present. It otherwise behaves identically to the regular **dynamicMenu** element, as specified in section 2.2.19.

The following table summarizes the elements that are parents of this element.

Parent Elements buttonGroup (section 2.2.5); menu (section 2.2.28); menu (section 2.2.26); menu (section 2.2.29); menu (section 2.2.27); officeMenu (section 2.2.31)

Attributes	Description
description (description)	Specifies a detailed description of the control, which SHOULD be displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows: Button This is a verbose description that describes the function of this control in detail. This is specified using the following XML fragment: <pre></pre>
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
getContent (getContent callback)	Specifies the name of a callback function to be called when the application needs to determine the contents of the control. For example, consider a dynamic menu control, as follows:

Attributes	Description
	Dynamic Menu Button 1 Button 2 Button 3 This is specified using the following XML fragment: <dynamicmenu getcontent="GetMenuContent" id="dynamic" label="Dynamic Menu"></dynamicmenu>
	The GetMenuContent callback function is called when the menu is dropped, and in this case would return a string with the following XML:
	<pre><menu xmlns="http://schemas.microsoft.com/office/2006/01/customui"></menu></pre>
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:

Attributes	Description
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
getLabel (getLabel callback)	Specified in section 2.3.2. Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
getScreentip (getScreentip callback)	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2. Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider the following XML fragment: <pre></pre>
getShowImage (getShowImage callback)	needs to determine the screentip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2. Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.

Attributes	Description
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application
	needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<button getsupertip="GetButtonSupertip" id="button"></button>
	In this example, the GetButtonSupertip callback function is called when the application
	needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	<pre> //group> </pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" image="ForestPic"></button>

Attributes	Description
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image that is used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" imagemso="Bold"></button>
	This specifies a custom button that uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in
insertBeforeQ	section 2.3.5. Specifies the qualified identifier of a control that this control SHOULD be inserted before. If
(qualified identifier of control to insert before)	the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
invalidateContent OnDrop (invalidate content on drop)	Specifies whether this control SHOULD invalidate its contents and re-query for them when the user opens its drop-down menu.
content on drop)	If this attribute is omitted, its value SHOULD default to false. For example, consider the following XML fragment:
	<pre><combobox getitemcount="GetComboBoxItemCount" getitemlabel="GetComboBoxItemLabel" id="comboBox" invalidatecontentondrop="true"></combobox></pre>
	In this example, this combo box clears out its items and re-calls the GetComboBoxItemCount and GetComboBoxItemLabel callback functions to populate its contents each time the user opens it.
	The possible values for this attribute are defined by the XML schema boolean datatype.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control.

Attributes	Description
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: <b< td=""></b<>
	The possible values for this attribute are defined by the XML schema boolean datatype.

Attributes	Description
showLabel (show label)	Specifies whether this control SHOULD display its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Button Custom Group
	Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:
	<pre></pre>
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control	Specifies the visibility state of the control.

Attributes	Description
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.19 dynamicMenu (Dynamic Menu)

This element specifies a dynamic menu control that populates its contents dynamically.

For example, consider a dynamic menu control, as follows:

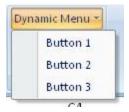

Figure 10: A dynamic menu control

This is specified using the following XML fragment:

```
<dynamicMenu id="dynamic" label="Dynamic Menu" getContent="GetMenuContent" />
```

The **GetMenuContent** callback function is called when the menu is dropped, and in this case would return a string with the following XML:

The following table summarizes the elements that are parents of this element.

Parent Elements

box (section 2.2.1); **group** (section 2.2.23)

Attributes	Description
description (description)	Specifies a detailed description of the control, which SHOULD be displayed in detailed views. The description and getDescription attributes are mutually exclusive. If pointer attribute
	The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	* * * *
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section <u>2.3.8</u> .
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute tiers be disabled by the control to the control of the
	by the application. For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getContent (getContent	Specifies the name of a callback function to be called when the application needs to determine the contents of the control.
callback)	For example, consider a dynamic menu control, as follows:
	Dynamic Menu 🕆
	Button 1
	Button 2
	Button 3
	This is an arified using the following VMI fragments
	This is specified using the following XML fragment:
	<pre><dynamicmenu getcontent="GetMenuContent" id="dynamic" label="Dynamic Menu"></dynamicmenu></pre>
	The GetMenuContent callback function is called when the menu is dropped, and in this

Attributes	Description
	case would return a string with the following XML:
	<pre><menu xmlns="http://schemas.microsoft.com/office/2006/01/customui"></menu></pre>
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment:
	<pre></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>
Ţ	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute

Attributes	Description
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	<pre> //group> </pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" image="ForestPic"></button>

Attributes	Description
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a system butten that SHOULD use the built in image with an identifier of
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be
	appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.

Attributes	Description
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
invalidateContent OnDrop (invalidate content on drop)	Specifies whether this control SHOULD invalidate its contents and re-query for them when the user opens its drop-down menu.
content on drop)	If this attribute is omitted, its value SHOULD default to false. For example, consider the following XML fragment:
	<pre></pre> <pre><</pre>
	getItemLabel="GetComboBoxItemLabel" invalidateContentOnDrop="true" />
	In this example, this combo box clears out its items and re-calls the GetComboBoxItemCount and GetComboBoxItemLabel callback functions to populate its contents each time the user opens it.
	The possible values for this attribute are defined by the XML schema boolean datatype.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	GK.
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.

Attributes	Description
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:

Attributes	Description
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
size (control size)	hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype. Specifies the size of the control.
	The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows: Bold Custom Group This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton> The possible values for this attribute are defined by the ST_Size simple type, as specified in section 2.3.10.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string This is the supertip string This is specified using the following XML fragment:
	This is specified using the following XML fragment: <button <="" id="button" imagemso="HappyFace" label="Button" screentip="Screentip" size="large" td=""></button>

Attributes	Description
	supertip="This is the supertip string" />
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as
	specified in section 2.3.11.
visible (control	Specifies the visibility state of the control.
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.20 editBox (Edit Box)

This element specifies an edit box control that allows a user to enter a **string** of text.

For example, consider an edit box control, as follows:

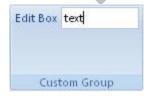

Figure 11: An edit box control

This is specified using the following XML fragment:

The following table summarizes the elements that are parents of this element.

Parent Elements box (section 2.2.1); group (section 2.2.23)

Attributes	Description
enabled (Enabled State)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used. The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button . The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:

Attributes	Description
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider the following XML fragment:
	<pre></pre>
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider the following XML fragment: <pre></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:

Attributes	Description
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider the following XML fragment:
	<pre></pre>
	watton in baccon getsupereip deebacconsapereip //
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getText (getText callback)	Specifies the name of a callback function to be called to determine the text that SHOULD be displayed in the control.
	For example, consider the following XML fragment:
	<editbox gettext="GetEditBoxText" id="editBox"></editbox>
	In this example, the GetEditBoxText callback function is called when the application needs to determine the text to display in the control.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>

Description
This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The <code>id</code> , <code>idQ</code> , and <code>idMso</code> attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <code> </code>
Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs></tabs></ribbon></customui></pre>
In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
<button id="button" image="ForestPic"></button>
This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic". The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.

Attributes	Description
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"/<a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"/<a "="" bold"="" href="mageMso="><a "="" bold"="" href="mageMso=">mageMso="Bold"
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab></tab>

Attributes	Description
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows: This is specified using the following XML fragment: <pre></pre>
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
maxLength (maximum input string length)	Specifies an integer to be used as the maximum length of a string that can be entered into the control. If the maxLength attribute is omitted, the length of the input string SHOULD NOT be limited except by application-specific constraints. For example, consider the following XML fragment:

Attributes	Description
	<editbox id="editBox" maxlength="10"></editbox>
	This specifies an edit box control that can only accept strings up to 10 characters in length.
	The possible values for this attribute are defined by the $ST_StringLength$ simple type, as specified in section $2.3.12$.
onChange (onChange	Specifies the name of a callback function to be called when the text in the control has been changed by the user.
callback)	For example, consider the following XML fragment:
	<editbox id="editBox" onchange="EditBoxTextChanged"></editbox>
	This specifies an edit box control that calls the EditBoxTextChanged callback function when the user inputs a text string .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows:
	Button Custom Group
	This is the screentip
	Book3.xisx 1 Press F1 for more help.
	2
	This is specified using the following XML fragment:
	<pre></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show	
image)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider a button that does not display an icon, as follows:
	Button with no icon
	Custom Group
	This is specified using the following XML fragment:

Attributes	Description
	<pre><button id="button" label="Button with no icon" showimage="false"></button></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (Show Label)	Specifies whether this control displays its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
sizeString (size string)	Specifies a string whose size is used to determine the width of the text input area of this control. If this attribute is omitted, the application SHOULD determine the width of the text input area of the control automatically. For example, consider the following XML fragment: <pre></pre>
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.21 gallery (Gallery)

This element specifies a gallery control, which displays a drop-down grid of items that the user can select from. A gallery can optionally have buttons following its selection items.

For example, consider a gallery control that shows a selection of pictures, as follows:

Figure 12: A gallery control

This is specified using the following XML fragment:

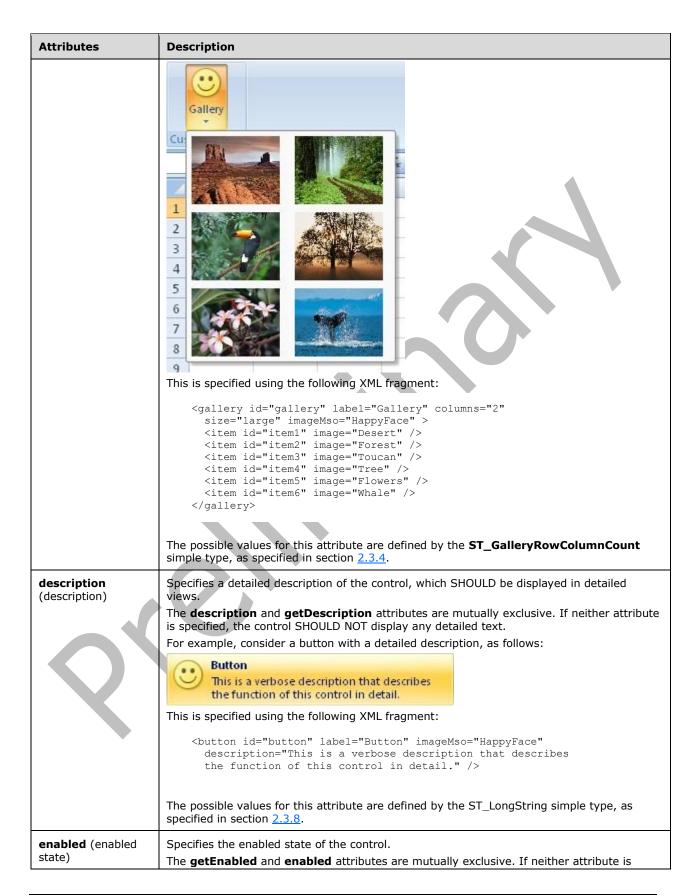

The following table summarizes the elements that are parents of this element.

Parent Elements	
box (section <u>2.2.1</u>); group (section <u>2.2.23</u>)	

The following table summarizes the child elements of this element.

Child Elements Section	
button (Unsized Button)	2.2.3
item (Selection Item)	2.2.24

Attributes	Description
columns (column count)	Specifies the number of columns that the gallery's items SHOULD be arranged into.
	If the columns attribute is omitted, the application SHOULD choose the number of columns automatically based on the number of items.
	For example, consider a gallery control with six items arranged into two columns, as follows:

Attributes	Description
	specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used. The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
,	specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this everyle the Industrian Emphasis called supplied in called when the application
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button getimage="GetButtonImage" id="button"></button>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemCount (getItemCount	Specifies the name of a callback function to be called to determine the number of selection items in this control.
callback)	If this attribute is omitted, the control SHOULD display any selection items that are specified as child elements. If no such items are specified, the control SHOULD be empty. For example, consider the following XML fragment:

Attributes	Description
	<pre><gallery getitemcount="GetGalleryItemCount" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemCount callback function is called when the application needs to determine the number of items in the gallery.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemHeight (getItemHeight	Specifies the name of a callback function to be called to determine the height of the selection items in this control.
callback)	The itemHeight and getItemHeight attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents.
	The getItemHeight and getItemWidth attributes are mutually required. If only one of the attributes is specified, its value is ignored.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemheight="GetGalleryItemHeight" getitemwidth="GetGalleryItemWidth" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemHeight callback function is called when the application needs to determine the height of the items in the gallery.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemID (getItemID	Specifies the name of a callback function to be called to determine the identifier of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD have empty identifiers.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemid="GetGalleryItemID" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemID callback function is called when the application needs to determine the identifier of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemImage (getItemImage	Specifies the name of a callback function to be called to determine the icon of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD NOT display icons. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemimage="GetGalleryItemImage" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemImage callback function is called when the application needs to determine the icon of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getItemLabel (getItemLabel	Specifies the name of a callback function to be called to determine the label of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD NOT display labels.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemlabel="GetGalleryItemLabel" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemLabel callback function is called when the application needs to determine the label of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemScreentip (getItemScreentip	Specifies the name of a callback function to be called to determine the screentip of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD use their labels as their screentips, or display no screentips at all.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemscreentip="GetGalleryItemScreentip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemScreentip callback function is called when the application needs to determine the screentip of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemSupertip (getItemSupertip	Specifies the name of a callback function to be called to determine the supertip of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD NOT display supertips.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemsupertip="GetGalleryItemSupertip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemSupertip callback function is called when the application needs to determine the supertip of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemWidth (getItemWidth	Specifies the name of a callback function to be called to determine the width of the selection items in this control.
callback)	The itemWidth and getItemWidth attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents.
	The getItemHeight and getItemWidth attributes are mutually required. If only one of the attributes is specified, its value is ignored.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemheight="GetGalleryItemHeight" getitemwidth="GetGalleryItemWidth" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemWidth callback function is called when the application needs to determine the width of the items in the gallery.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of

this control. The getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a keyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>	
needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, specified in section 2.3.2. getLabel (getLabel callback) Specifies the name of a callback function to be called to determine the label of this The getLabel and label attributes are mutually exclusive. If neither attribute is specified in section 2.3.2. For example, consider the following XML fragment: Specified In Section 2.3.2 getScreentip (getScreentip callback) Specifies the name of a callback function to be called to determine the screentip of control. The possible values for this attribute are defined by the ST_Delegate simple type, specified, the application SHOULD display the label of the control as the screentip of control. The getScreentip and screentip attributes are mutually exclusive. If neither attributes are mutually exclusive. If neither attributes are mutually exclusive at the screentip of control. The getScreentip and screentip attributes are mutually exclusive. If neither attributes is specified, the application SHOULD display the label of the control as the screentip of screentip at all. For example, consider the following XML fragment: Specified In Section 2.3.2 getSelectedItemI D Specifies the name of a callback function to be called to determine the apprised to determine the screentip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, specified in section 2.3.2. Specifies the name of a callback function to be called to determine the identifier of that is selected in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item. For example, consider the following XML fragment: Specified In Section 2.3.2 getSelectedItemID and getSelectedItemIndex attributes are mut	
The getLabel and label attributes are mutually exclusive. If neither attribute is spinolabel SHOULD be displayed. For example, consider the following XML fragment:	
control. The getScreentip and screentip attributes are mutually exclusive. If neither attrispecified, the application SHOULD display the label of the control as the screentip on screentip at all. For example, consider the following XML fragment: 	pecified,
that is selected in this control. (getSelectedItemI D callback) that is selected in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exceeded in this control should be a selected item. For example, consider the following XML fragment: <pre></pre>	ribute is or display plication
In this example, the GetGallerySelectedItemID callback function is called when application needs to determine the selected item in the gallery. In this example the function returns one of the identifiers returned by the GetItemID callback function. The possible values for this attribute are defined by the ST_Delegate simple type, specified in section 2.3.2.	n the ne callback

Attributes	Description	
ndex (getSelectedItemI ndex callback)	be selected in this control. The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item. For example, consider the following XML fragment:	
	<pre><gallery getitemcount="GetGalleryItemCount" getselecteditemindex="GetGallerySelectedItemIndex" id="gallery"></gallery></pre>	
	In this example, the GetGallerySelectedItemIndex callback function is called when the application needs to determine the selected item in the gallery. The possible values for this attribute are defined by the ST_Delegate simple type, as	
	specified in section 2.3.2.	
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.	
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".	
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.	
	For example, consider the following XML fragment:	
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>	
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.	
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".	
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.	
	For example, consider the following XML fragment:	
	<pre></pre>	
	In this example, the IsButtonLabelVisible callback function is called when the application	
	needs to determine whether to display the label of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	
getSize (getSize	Specifies the name of a callback function to be called to determine the size of this control.	
callback)	The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.	
	For example, consider the following XML fragment:	
	<pre><button getsize="GetButtonSize" id="button"></button></pre>	
	In this example, the GetButtonSize callback function is called when the application needs to determine the size of the button.	
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.	

Attributes	Description
getSupertip (getSupertip callback)	Specifies the name of a callback function to be called to determine the supertip of this control. The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<button getvisible="IsButtonVisible" id="button"></button>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents.

Attributes	Description
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	//group>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" image="ForestPic"></button>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
▼	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be

Attributes	Description		
	appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>		
	\\ \(\cds \)		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".		
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.		
of control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:		
	<pre><tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"> </tab></pre>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".		
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.		
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.		
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<pre><tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab></pre>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".		
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.		
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the		

invalidateContent OnDrop (invalidate Content on drop) Specifies whether this control SHOULD invalidate its contents and re-query for them when the user opens its drop-down menu. If this attribute is omitted, its value SHOULD default to false. For example, consider the following XML fragment: <pre></pre>	Attributes	Description	
in section 2.3.9. invalidateContent OnDrop (invalidate content on drop) Specifies whether this control SHOULD invalidate its contents and re-query for them when the user opens its drop-down menu. If this attribute is omitted, its value SHOULD default to false. For example, consider the following XML fragment: <pre></pre>		custom tab with a qualified identifier of "x:OtherTab".	
the user opens its drop-down menu. If this attribute is omitted, its value SHOULD default to false. For example, consider the following XML fragment: <pre></pre>		The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.	
For example, consider the following XML fragment: ComboBox id="comboBox" getItemCount="GetComboBoxItemCount" getItemCount" getItemCount="GetComboBoxItemLabel="invalidateContentOnDrop="true" /> In this example, this combo box SHOULD clear out its items and re-call the GetComboBoxItemCount and GetComboBoxItemLabel callback functions to populate its contents each time the user opens it. The possible values for this attribute are defined by the XML schema boolean datatype. Specifies the height of the selection items in this control. The itemHeight and getItemHeight attributes are mutually exclusive. If neither attributes is specified, the items SHOULD all take the size of the first item, based on its contents. The itemHeight and itemWidth attributes are mutually required. If only one of the attributes is specified its value is ignored. For example, consider a gallery control with 68 pixel tall items. This is specified using the following XML fragment: Cgallery id="gallery" label="Gallery" itemWidth="88" itemifieight="68" size="large" imageMso="HappyFace" > (item id="item") image="Desert" /> (item id="item")	OnDrop (invalidate	·

attributes is specified, its value is ignored.		The itemWidth and getItemWidth attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents.	
For example, consider a gallony control with 00 pivel wide items. This is an airis the			
following XML fragment:		For example, consider a gallery control with 88 pixel wide items. This is specified using the following XML fragment:	
<pre><gallery id="gallery" imagemso="HappyFace" itemheight="68" itemwidth="88" label="Gallery" size="large"> <item id="item1" image="Desert"></item> <item id="item2" image="Forest"></item> <item id="item3" image="Toucan"></item> <item id="item4" image="Tree"></item> </gallery></pre>		<pre>itemHeight="68" size="large" imageMso="HappyFace" ></pre>	
The possible values for this attribute are defined by the ST_GalleryItemWidthHeight simple type, as specified in section 2.3.3.			
keytip (keytip) Specifies a string to be used as the suggested KeyTip for this control.	keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.	

Attributes	Description
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<button id="button" imagemso="HappyFace" keytip="K"></button>
	The possible values for this attribute are defined by the \mathbf{ST} _Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked"></button></pre>
	In this example, the button calls the ButtonClicked callback function when it is invoked. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
rows (row count)	Specifies the number of rows that the gallery's items are arranged into. If the rows attribute is omitted, the application SHOULD choose the number of rows automatically based on the number of items.
	For example, consider a gallery control with six items arranged into two rows, as follows: Gallery G

Attributes	Description
Attributes	This is specified using the following XML fragment:
	<pre><gallery id="gallery" imagemso="HappyFace" label="Gallery" rows="2" size="large"> <item id="item1" image="Desert"></item> <item id="item2" image="Forest"></item> <item id="item3" image="Toucan"></item> <item id="item4" image="Tree"></item> <item id="item5" image="Flowers"></item> <item id="item6" image="Whale"></item> </gallery></pre>
	The possible values for this attribute are defined by the ST_GalleryRowColumnCount simple type, as specified in section 2.3.4.
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:
showImage (show image)	Specified in section 2.3.11. Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: <button <="" id="button" showimage="false" th=""></button>

Attributes	Description		
	label="Button with no icon" />		
	The possible values for this attribute are defined by the XML schema boolean datatype.		
showItemImage (show item image)			
	This specifies a gallery control that does not show any icons on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.		
showItemLabel (show item label)	Specifies whether this control displays labels on its selection items. If this attribute is omitted, the item's labels SHOULD be shown by default. For example, consider the following XML fragment:		
	<pre><gallery id="gallery" label="Gallery" showitemlabel="false"></gallery></pre>		
	In this example, the gallery control does not show any labels on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.		
showInRibbon (show in ribbon)	This attribute has no meaning and MUST NOT be used.		
showLabel (show label)	Specifies whether this control SHOULD display its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.		
	For example, consider the following XML fragment: <pre></pre>		
•	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML scheme boolean datatype.		
	The possible values for this attribute are defined by the XML schema boolean datatype.		
size (control size)	Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.		
	For example, consider a large button, as follows:		

Attributes	Description		
	B Bold Custom Group This is specified using the following XML fragment:		
	in section 2.3.10.		
sizeString (size string)	Specifies a string whose size is used to determine the width of the text input area of this control. If this attribute is omitted, the application SHOULD determine the width of the text input area of the control automatically. For example, consider the following XML fragment: <pre></pre>		
	specified in section 2.3.11. Specifies a string to be shown as the supertin of the control		
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: 		
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this		

Attributes	Description	
	If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment:	
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>	
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:	
	<pre></pre>	

```
<xsd:complexType name="CT_Gallery">
    <xsd:complexContent>
    <xsd:extension base="CT_GalleryRegular">
    <xsd:attributeGroup ref="AG_SizeAttributes"/>
    </xsd:extension>
    </xsd:complexContent>
</xsd:complexType>
```

2.2.22 gallery (Unsized Gallery)

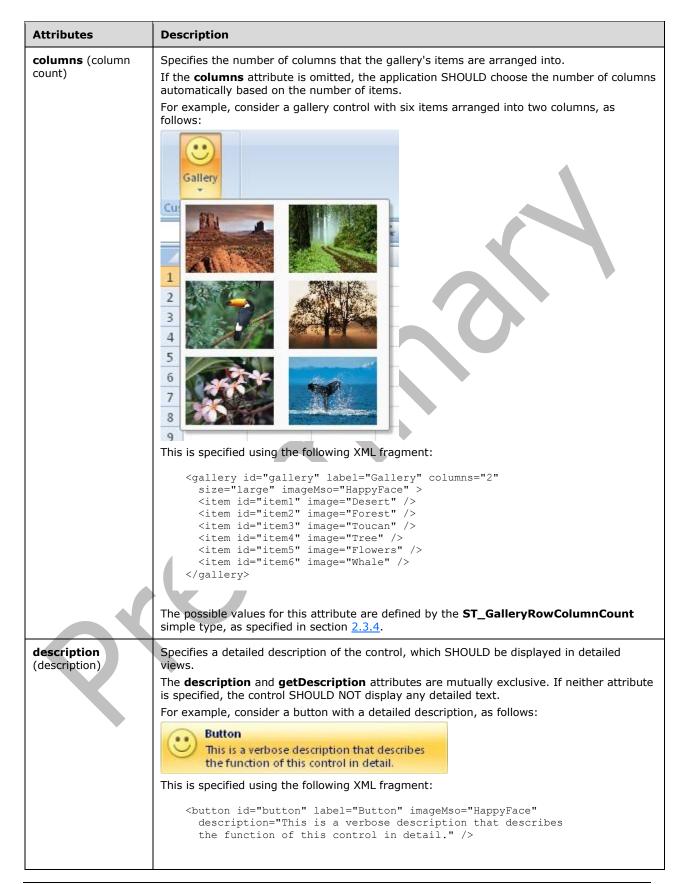

This element specifies a gallery which, because of its location, cannot have its size changed. The **size** attribute is not present. It otherwise behaves identically to the regular **gallery** element, as specified in section <u>2.2.21</u>.

The following table summarizes the elements that are parents of this element.

Parent Elements
buttonGroup (section $2.2.5$); menu (section $2.2.28$); menu (section $2.2.26$); menu (section $2.2.27$); officeMenu (section $2.2.21$)

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
item (Selection Item)	2.2.24

Attributes	Description
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section $\frac{2.3.8}{1.00}$.
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
	useful, thus the enabled attribute is not commonly used. The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment: <pre></pre>
	needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<button getimage="GetButtonImage" id="button"></button>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST. Delegate simple type, as
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

Attributes	Description
getItemCount (getItemCount callback)	Specifies the name of a callback function to be called to determine the number of selection items in this control. If this attribute is omitted, the control SHOULD display any selection items that are specified as child elements. If no such items are specified, the control SHOULD be empty. For example, consider the following XML fragment:
	<pre></pre>
getItemHeight (getItemHeight callback)	Specifies the name of a callback function to be called to determine the height of the selection items in this control. The itemHeight and getItemHeight attributes are mutually exclusive. If neither attribute
	is specified, the items SHOULD all take the size of the first item, based on its contents. The getItemHeight and getItemWidth attributes are mutually required. If only one of the attributes is specified, its value is ignored. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemheight="GetGalleryItemHeight" getitemwidth="GetGalleryItemWidth" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemHeight callback function is called when the application needs to determine the height of the items in the gallery. The possible values for this attribute are defined by the ST. Delegate simple type, as
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemID (getItemID callback)	Specifies the name of a callback function to be called to determine the identifier of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD have empty identifiers.
	For example, consider the following XML fragment: <pre></pre>
0)	In this example, the GetGalleryItemID callback function is called when the application needs to determine the identifier of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemImage (getItemImage callback)	Specifies the name of a callback function to be called to determine the icon of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display icons. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemimage="GetGalleryItemImage" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemImage callback function is called when the application needs to determine the icon of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section 2.3.2.
getItemLabel (getItemLabel callback)	Specifies the name of a callback function to be called to determine the label of a specific dynamically-created selection item, identified by index.
	If this attribute is omitted, dynamically-created selection items SHOULD NOT display labels.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemlabel="GetGalleryItemLabel" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemLabel callback function is called when the application needs to determine the label of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemScreentip (getItemScreentip	Specifies the name of a callback function to be called to determine the screentip of a specific dynamically-created selection item, identified by index.
callback)	If this attribute is omitted, dynamically-created selection items SHOULD use their labels as their screentips, or display no screentips at all. For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemscreentip="GetGalleryItemScreentip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemScreentip callback function is called when the application needs to determine the screentip of a selection item. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getItemSupertip (getItemSupertip callback)	Specifies the name of a callback function to be called to determine the supertip of a specific dynamically-created selection item, identified by index. If this attribute is omitted, dynamically-created selection items SHOULD NOT display
-	supertips.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemsupertip="GetGalleryItemSupertip" id="gallery"></gallery></pre>
	In this example, the GetGalleryItemSupertip callback function is called when the application needs to determine the supertip of a selection item.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getItemWidth (getItemWidth	Specifies the name of a callback function to be called to determine the width of the selection items in this control.
callback)	The itemWidth and getItemWidth attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents.
	The getItemHeight and getItemWidth attributes are mutually required. If only one of the attributes is specified, its value is ignored.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemheight="GetGalleryItemHeight" getitemwidth="GetGalleryItemWidth" id="gallery"></gallery></pre>

Attributes	Description
	In this example, the GetGalleryItemWidth callback function is called when the application needs to determine the width of the items in the gallery.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel	Specifies the name of a callback function to be called to determine the label of this control.
callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs
	to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSelectedItemI D	Specifies the name of a callback function to be called to determine the identifier of the item to be selected in this control.
(getSelectedItemI D callback)	The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getitemid="GetItemID" getselecteditemid="GetGallerySelectedItemID" id="gallery"></gallery></pre>
	In this example, the GetGallerySelectedItemID callback function is called when the

Attributes	Description
	application needs to determine the selected item in the gallery. The callback function returns one of the identifiers returned by the GetItemID callback function.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSelectedItemI ndex	Specifies the name of a callback function to be called to determine the index of the item to be selected in this control.
(getSelectedItemI ndex callback)	The getSelectedItemID and getSelectedItemIndex attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display a selected item.
	For example, consider the following XML fragment:
	<pre><gallery getitemcount="GetGalleryItemCount" getselecteditemindex="GetGallerySelectedItemIndex" id="gallery"></gallery></pre>
	In this example, the GetGallerySelectedItemIndex callback function is called when the
	application needs to determine the selected item in the gallery. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.

Attributes	Description
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes
	MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs></tabs></ribbon></customui></pre>
	<pre><tab3 <tab="" idq="ex:OtherTab" label="Shared Tab"></tab3></pre>

Attributes	Description
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified
image (custom image identifier)	in section 2.3.9. Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic". The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
_	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in

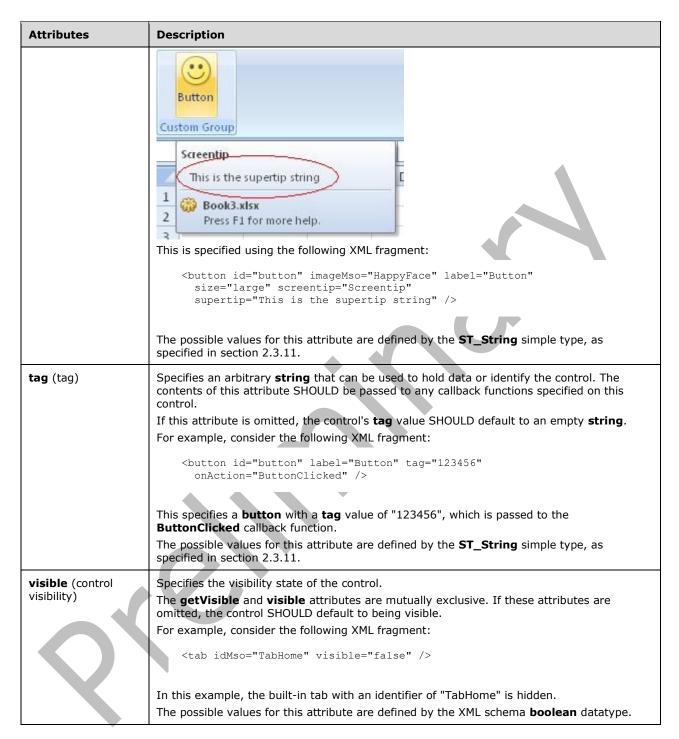

Attributes	Description
	section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
*	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
invalidateContent OnDrop (invalidate	Specifies whether this control SHOULD invalidate its contents and re-query for them when the user opens its drop-down menu.
content on drop)	If this attribute is omitted, its value SHOULD default to false.
	For example, consider the following XML fragment:
	<pre><combobox <="" getitemcount="GetComboBoxItemCount" getitemlabel="GetComboBoxItemLabel" id="comboBox" pre=""></combobox></pre>

Attributes	Description
	invalidateContentOnDrop="true" />
	In this example, this combo box SHOULD clear out its items and re-call the GetComboBoxItemCount and GetComboBoxItemLabel callback functions to populate its contents each time the user opens it. The possible values for this attribute are defined by the XML schema boolean datatype.
itemHeight (selection item height)	Specifies the height of the selection items in this control. The itemHeight and getItemHeight attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents. The itemHeight and itemWidth attributes are mutually required. If only one of the
	attributes is specified, its value is ignored.
	For example, consider a gallery control with 68 pixel tall items. This is specified using the following XML fragment:
	<pre><gallery id="gallery" imagemso="HappyFace" itemheight="68" itemwidth="88" label="Gallery" size="large"> <item id="item1" image="Desert"></item> <item id="item2" image="Forest"></item> <item id="item3" image="Toucan"></item> <item id="item4" image="Tree"></item> </gallery></pre>
	The possible values for this attribute are defined by the ST_GalleryItemWidthHeight simple type, as specified in section 2.3.3.
itemWidth (selection item width)	Specifies the width of the selection items in this control. The itemWidth and getItemWidth attributes are mutually exclusive. If neither attribute is specified, the items SHOULD all take the size of the first item, based on its contents.
	The itemHeight and itemWidth attributes are mutually required. If only one of the attributes is specified, its value is ignored.
	For example, consider a gallery control with 88 pixel wide items. This is specified using the following XML fragment:
	<pre><gallery id="gallery" imagemso="HappyFace" itemheight="68" itemwidth="88" label="Gallery" size="large"> <item id="item1" image="Desert"></item> <item id="item2" image="Forest"></item> <item id="item3" image="Toucan"></item> <item id="item4" image="Tree"></item> </gallery></pre>
	The possible values for this attribute are defined by the ST_GalleryItemWidthHeight simple type, as specified in section 2.3.3.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>

Attributes	Description
	The possible values for this attribute are defined by the \mathbf{ST} _Keytip simple type, as specified in section $\underline{2.3.7}$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment: <pre></pre>
rows (row count)	Specified in section 2.3.2. Specifies the number of rows that the gallery's items are arranged into. If the rows attribute is omitted, the application SHOULD choose the number of rows automatically based on the number of items.
	For example, consider a gallery control with six items arranged into two rows, as follows: Gallery Gallery This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	The possible values for this attribute are defined by the ST_GalleryRowColumnCount simple type, as specified in section 2.3.4.
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: Custom Group This is the screentip Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:
	The possible values for this attribute are defined by the XML schema boolean datatype.
showItemImage (show item image)	Specifies whether this control displays icons on its selection items. If this attribute is omitted, the items' icons SHOULD be shown by default. For example, consider the following XML fragment:
	<pre><gallery id="gallery" label="Gallery" showitemimage="false"> <item id="item1" label="Item 1"></item> <item id="item2" label="Item 1"></item> <item id="item3" label="Item 2"></item> <item id="item4" label="Item 3"></item></gallery></pre>

Attributes	Description
	This specifies a gallery control that does not show any icons on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.
showItemLabel (show item label)	Specifies whether this control displays labels on its selection items. For example, consider the following XML fragment:
	<pre><gallery id="gallery" label="Gallery" showitemlabel="false"></gallery></pre>
	In this example, the gallery control does not show any labels on its selection items. The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label.
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
sizeString (size	Specifies a string whose size is used to determine the width of the text input area of this
string)	control. If this attribute is omitted, the application SHOULD determine the width of the text input area of the control automatically.
	For example, consider the following XML fragment:
	<pre><editbox id="editBox" sizestring="WWWWWWWWWWWW"></editbox></pre>
0)	This specifies an edit box control that is wide enough to display the string "WWWWWWWWWWWW". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows:

2.2.23 group (Group)

This element specifies a grouping of controls on a ribbon tab. All controls displayed in a ribbon tab MUST be contained within a **group**.

For example, consider a group with a single button, as follows:

Figure 13: A group with a single button

This is specified using the following XML fragment:

```
<group id="group" label="Custom Group">
     <button id="button" label="Button" imageMso="HappyFace" />
</group>
```

The following table summarizes the elements that are parents of this element.

```
Parent Elements

tab (section 2.2.39)
```

The following table summarizes the child elements of this element.

Child Elements	Section
box (Box Grouping Container)	2.2.1
button (Button)	2.2.2
buttonGroup (Button Grouping Container) 2.2.5	
checkBox (Check Box) 2.2.6	
comboBox (Combo Box) 2.2.7	
control (Control Clone) 2.2.12	
dialogBoxLauncher (Dialog Box Launcher) 2.2.15	
dropDown (Drop-down Control) 2.2.17	
dynamicMenu (Dynamic Menu) 2.2.19	

Child Elements	Section
editBox (Edit Box)	2.2.20
gallery (Gallery)	2.2.21
labelControl (Text Label)	2.2.25
menu (Menu)	2.2.28
separator (Separator)	2.2.34
splitButton (Split Button)	2.2.38
toggleButton (Toggle Button)	2.2.43

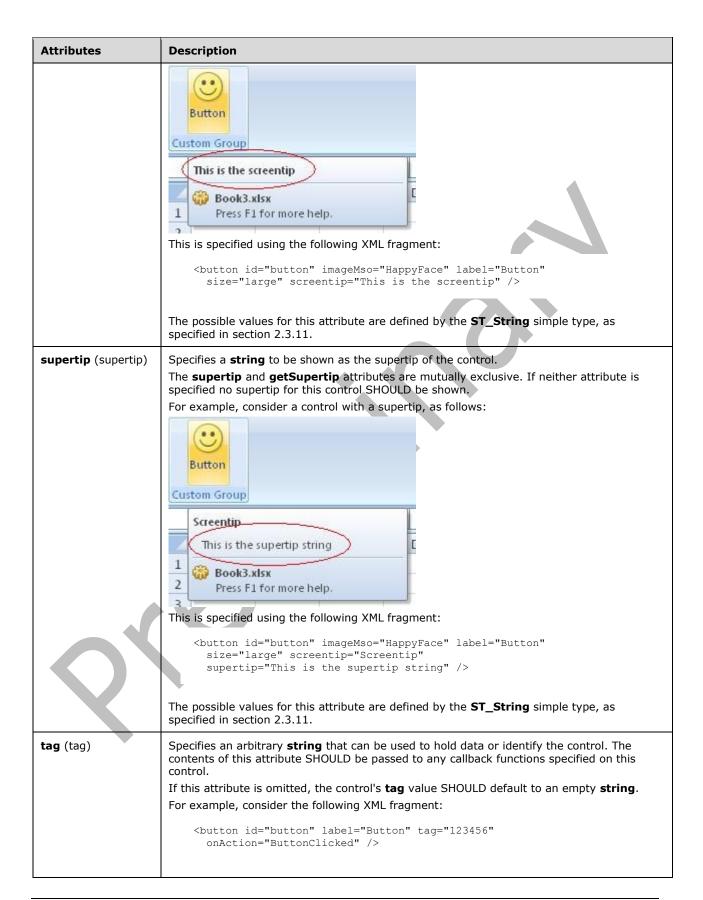

Attributes	Description
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre></pre>
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip	Specifies the name of a callback function to be called to determine the screentip of this

Attributes	Description
(getScreentip	control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an id of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section $2.3.13$.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined.

Attributes	Description
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom
	UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"></tab></tabs></ribbon></customui></pre>
	<pre></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.

Attributes	Description
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section <u>2.3.11</u> .
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows:

Attributes	Description
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function.
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT Group">
   <xsd:sequence>
   <xsd:sequence>
   <xsd:choice minOccurs="0" maxOccurs="1000">
   <xsd:group ref="EG Controls"/>
   <xsd:element name="separator" type="CT_Separator"/>
   </xsd:choice>
   </xsd:sequence>
   <xsd:element name="dialogBoxLauncher" type="CT DialogLauncher" minOccurs="0"</pre>
             maxOccurs="1"/>
   </xsd:sequence>
   <xsd:attributeGroup ref="AG_IDAttributes"/>
   <xsd:attributeGroup ref="AG Label"/>
   <xsd:attributeGroup ref="AG Image"/>
   <xsd:attributeGroup ref="AG_PositionAttributes"/>
<xsd:attributeGroup ref="AG_Screentip"/>
   <xsd:attributeGroup ref="AG Visible"/>
   <xsd:attributeGroup ref="AG Keytip"/>
</xsd:complexType>
```

2.2.24 item (Selection Item)

This element specifies an item in a selection-type control.

For example, consider a drop-down control with three selection items, as follows:

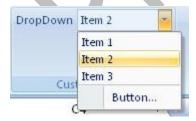

Figure 14: A drop-down control with selection items

This is specified using the following XML fragment:

```
<dropDown id="dropDown" label="DropDown">
```

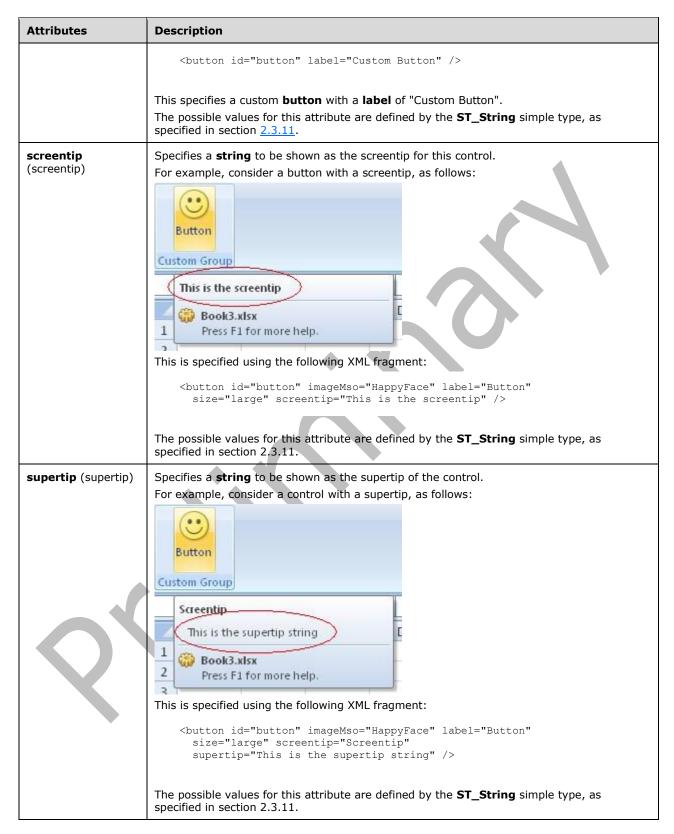

```
<item id="item1" label="Item 1" />
  <item id="item2" label="Item 2" />
  <item id="item3" label="Item 3" />
   <button id="button" label="Button..." />
  </dropDown>
```

The following table summarizes the elements that are parents of this element.

```
Parent Elements

comboBox (section 2.2.7); dropDown (section 2.2.17); gallery (section 2.2.21); gallery (section 2.2.22)
```

Attributes	Description
id (custom control identifier)	Specifies the identifier for a custom control. All new custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
image (custom image identifier)	Specifies the identification information for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file. The image , and imageMso attributes are mutually exclusive. For example, consider the following XML fragment:
	<pre></pre>
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood. The image, and imageMso attributes are mutually exclusive. For example, consider the following XML fragment: In this example, the system button was the built in image with an identifier of "Bold"
	In this example, the custom button uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
label (label)	Specifies a string to be used as the label for this control. For example, consider the following XML fragment:

```
<xsd:complexType name="CT Item">
    <xsd:attribute name="id" type="ST_UniqueID" use="optional"/>
    <xsd:attribute name="label" type="ST_String" use="optional"/>
    <xsd:attribute name="image" type="ST_Uri" use="optional"/>
    <xsd:attribute name="imageMso" type="ST_ID" use="optional"/>
    <xsd:attribute name="screentip" type="ST_String" use="optional"/>
    <xsd:attribute name="screentip" type="ST_String" use="optional"/>
    <xsd:attribute name="supertip" type="ST_String" use="optional"/>
    </xsd:complexType>
```

2.2.25 labelControl (Text Label)

This element specifies a control that displays a simple string of text.

For example, consider a label control, as follows:

Figure 15: A label control

This is specified using the following XML fragment:

```
<labelControl id="label" label="Label Control" />
```

The following table summarizes the elements that are parents of this element.

Parent Elements	
box (section <u>2.2.1</u>); group (section <u>2.2.23</u>)	

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
O	For example, consider the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>

Attributes	Description
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the GetButtonSupertip callback function is called when the application
	needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ , and idMso attributes are mutually exclusive. At least one of these attributes
	MUST be specified. For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	<pre> //group> </pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the

Attributes	Description
	containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these
	attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab></pre>
	<pre></pre> <pre> </pre> <pre> <pre> <pre> </pre> <pre> <pre> <pre> <pre> <pre> </pre> <pre> <pr< td=""></pr<></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre>
	(tab)
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".

Attributes	Description
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="button" label="Custom Button"></button>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip Book3.xlsx Press F1 for more help.
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon This is specified using the following XML fragment:
showLabel (show label)	The possible values for this attribute are defined by the XML schema boolean datatype. Specifies whether this control SHOULD display its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>
tag (tag)	Specified in section 2.3.11. Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
O,	If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:

Attributes	Description
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.26 menu (Unsized Menu)

This element specifies a menu control that, because of its location, cannot have its size changed. The **size** attribute is not present. It otherwise behaves identically to the regular **menu** element, as specified in section 2.2.28.

The following table summarizes the elements that are parents of this element.

```
Parent Elements

buttonGroup (section 2.2.5); menu (section 2.2.28); menu (section 2.2.26); menu (section 2.2.29); splitButton (section 2.2.38); splitButton (section 2.2.36)
```

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
checkBox (Check Box)	2.2.6
control (Unsized Control Clone)	2.2.11
dynamicMenu (Unsized Dynamic Menu)	2.2.18
gallery (Unsized Gallery)	2.2.22
menu (Unsized Menu)	2.2.26
menuSeparator (Menu Separator)	2.2.30
splitButton (Unsized Split Button)	2.2.36
toggleButton (Unsized Toggle Button)	2.2.42

The following table summarizes the attributes of this element.

Attributes	Description
description (description)	Specifies a detailed description of the control, which SHOULD be displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section 2.3.8.
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment:
	<pre></pre>
getDescription (getDescription callback)	Specifies the name of a callback function to be called to determine the detailed description of this control. The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider the following XML fragment:
	<pre></pre>
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
	, ,

Attributes	Description
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getImage (getImage	Specifies the name of a callback function to be called to determine the icon of this control.
callback)	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of
(getKeytip callback)	this control.
Caliback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel	Specifies the name of a callback function to be called to determine the label of this control.
callback)	The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider the following XML fragment:
	application needs to determine whether to display the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
getSupertip (getSupertip callback) getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the supertip of this control. The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider the following XML fragment:
id (control	specifies the identifier for a custom control. All custom controls MUST have unique

Attributes	Description
identifier)	identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"> </group> </tab></tabs></ribbon></customui></pre>
	<pre> > </pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified
	in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section <u>2.3.14</u> .
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment: <tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If

Attributes	Description
(identifier of built-in control to insert before)	the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <table a="" controls="" controls<="" likely="" of="" state="" td="" the=""></table>
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
itemSize (item size)	Specifies the size of the child controls in this menu. If this attribute is omitted, the menu's child controls SHOULD default to the normal size. For example, consider a menu control with large menu items, as follows: Menu with large items Button 1 Button 1 Wenu id="menu" label="Menu with large items" itemSize="large">
	The possible values for this attribute are defined by the ST_ItemSize simple type, as specified in section $2.3.6$.

Attributes	Description
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows: This is specified using the following XML fragment: <pre></pre>
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: Custom Group This is the screentip Book3.xlsx 1
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.

Attributes	Description
	For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:
showLabel (show label)	The possible values for this attribute are defined by the XML schema boolean datatype. Specifies whether this control SHOULD display its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:
	<pre></pre>
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Decorpoonup Screentip This is specified using the following XML fragment: Supertip-"This is specified using the following the following the following the following the size="large" screentip="Screentip" supertip="This is the supertip string" /> The side of this thick the string of the string of the supertip string of the super
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.

Attributes	Description
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.27 menu (Menu with Title)

This element specifies a menu control that, because of its location, can optionally include a title string via the **title** or **getTitle** attributes. It otherwise behaves identically to the regular **menu** element, as specified in section 2.2.28.

For example, consider a menu control with a title, as follows:

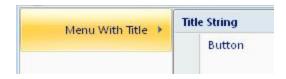

Figure 16: A menu control with title

This is specified with the following XML fragment:

The following table summarizes the elements that are parents of this element.

```
Parent Elements

menu (section 2.2.27); officeMenu (section 2.2.31); splitButton (section 2.2.37)
```

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
checkBox (Check Box)	2.2.6
control (Unsized Control Clone)	2.2.11
dynamicMenu (Unsized Dynamic Menu)	2.2.18
gallery (Unsized Gallery)	2.2.22
menu (Menu with Title)	2.2.27
menuSeparator (Menu Separator)	2.2.30
splitButton (Split Button with Title)	2.2.37
toggleButton (Unsized Toggle Button)	2.2.42

The following table summarizes the attributes of this element.

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.

Attributes	Description
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
	needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display

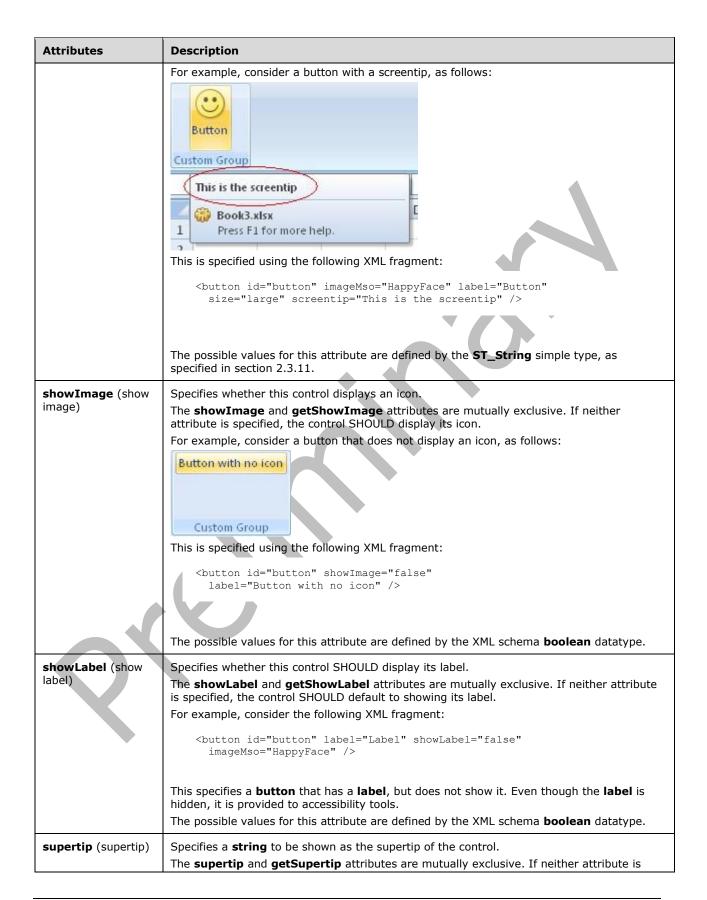

Attributes	Description
	no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute
	is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getTitle (getTitle	Specifies the name of a callback function to be called to determine the title of this control.
callback)	The title and getTitle attributes are mutually exclusive. If neither attribute is specified no title SHOULD be shown.
	For example, consider the following XML fragment:
	<menu gettitle="GetMenuTitle" id="menu" label="Menu"></menu>

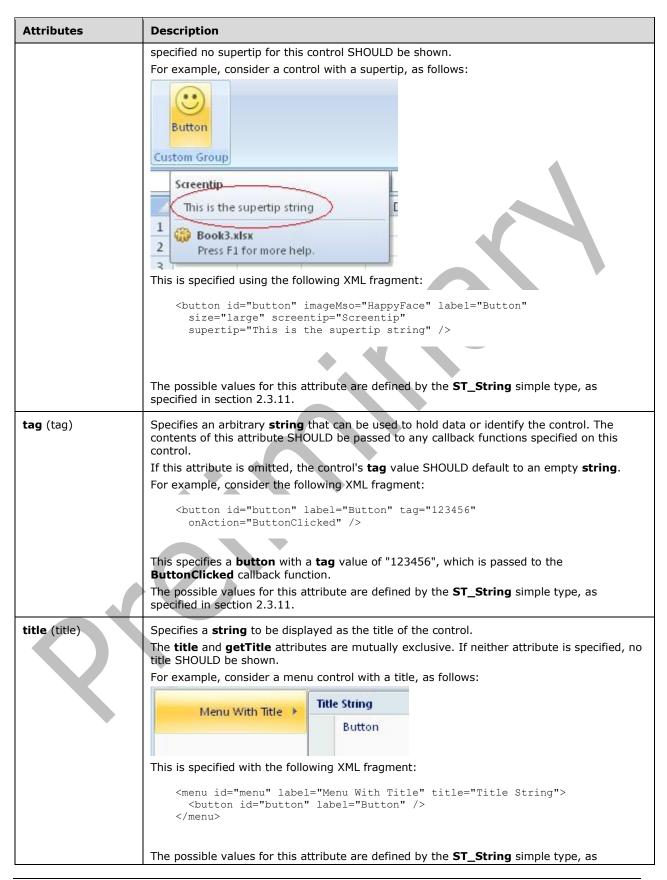

Attributes	Description
	In this example, the GetMenuTitle callback function is called when the application needs to determine the title of the menu. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre></pre>
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><customui <="" pre="" xmlns="http://schemas.microsoft.com/office/2006/01/customui"></customui></pre>

Description
<pre>xmlns:ex="http://www.example.com"> <ribbon></ribbon></pre>
<tabs></tabs>
<pre><tab idq="ex:OtherTab" label="Shared Tab"></tab></pre>
<pre> </pre>
In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
For example, consider the following XML fragment:
<pre><button id="button" image="ForestPic"></button></pre>
This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
The contents of this attribute are application-defined and SHOULD be ignored if not understood.
The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
For example, consider the following XML fragment:
<pre><button id="button" imagemso="Bold"></button></pre>
This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
For example, consider the following XML fragment:
<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab>

Attributes	Description
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tablive="mailto:custom control="" of="" td="" the="" the<="" to=""></tablive="mailto:custom>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
insertBeforeQ (qualified identifier of control to insert before)	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5. Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
itemSize (item	Specifies the size of the child controls in this menu.
itemSize (item	Specifies the size of the child controls in this illettu.

Attributes	Description
size)	If this attribute is omitted, the menu's child controls SHOULD default to the normal size.
	For example, consider a menu control with large menu items, as follows:
	Menu with large items Button 1 Button 2
	Button 3 This is specified using the following XML fragment:
	<pre><menu id="menu" itemsize="large" label="Menu with large items"></menu></pre>
	The possible values for this attribute are defined by the ST_ItemSize simple type, as specified in section 2.3.6.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is a selfied units the following VMI for smooth
	This is specified using the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.

Attributes	Description
	specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment: <tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

2.2.28 menu (Menu)

This element specifies a drop-menu control.

For example, consider a menu control, as follows:

Figure 17: A menu control

This is specified using the following XML fragment:

The following table summarizes the elements that are parents of this element.

Parent Elements box (section 2.2.1); group (section 2.2.23)

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
checkBox (Check Box)	2.2.6
control (Unsized Control Clone)	2.2.11
dynamicMenu (Unsized Dynamic Menu)	2.2.18
gallery (Unsized Gallery)	2.2.22
menu (Unsized Menu)	2.2.26
menuSeparator (Menu Separator)	2.2.30
splitButton (Unsized Split Button)	2.2.36
toggleButton (Unsized Toggle Button)	2.2.42

The following table summarizes the attributes of this element.

Attributes	Description
description (description)	Specifies a detailed description of the control, which SHOULD be displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre></pre>
	specified in section <u>2.3.8</u> .
enabled (enabled	Specifies the enabled state of the control.
state)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>

Attributes	Description
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section <u>2.3.2</u> .
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control.
Caliback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these
callback)	attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the GetButtonImage callback function is called when the application
	needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is
	specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application
	needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.

Attributes	Description
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control.
Caliback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section 2.3.2.
getSize (getSize callback)	Specifies the name of a callback function to be called to determine the size of this control. The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider the following XML fragment: <pre></pre>
getSupertip (getSupertip callback)	Specified in section 2.3.2. Specifies the name of a callback function to be called to determine the supertip of this control. The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control.

Attributes	Description
	The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: CustomUI
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood. The getImage , image , and imageMso attributes are mutually exclusive. If none of these

Attributes	Description
	attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<button id="button" imagemso="Bold"></button>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in control to insert	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	() tab/
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the
	built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	 /
	V, cas
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	\/ \(\tau \)
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in

Attributes	Description
	section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
itemSize (item	Specifies the size of the child controls in this menu.
size)	If this attribute is omitted, the menu's child controls SHOULD default to the normal size. For example, consider a menu control with large menu items, as follows:
	Menu with large items >
	Button 1
	Button 2
	Button 3
	This is specified using the following XML fragment:
	<pre><menu id="menu" itemsize="large" label="Menu with large items"></menu></pre>
	<pre><button id="button2" imagemso="Paste" label="Button 2"></button></pre>
	The possible values for this attribute are defined by the ST_ItemSize simple type, as specified in section 2.3.6.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	SK TO THE PROPERTY OF THE PROP
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	Appleade Noloth K //

Attributes	Description
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
screentip (screentip) showImage (show image)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip
	Custom Group This is specified using the following XML fragment: <button <="" id="button" showimage="false" th=""></button>

Attributes	Description
	label="Button with no icon" />
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
size (control size)	Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows: Bold Custom Group This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton> The possible values for this attribute are defined by the ST_Size simple type, as specified in section 2.3.10.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help.

Attributes	Description
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="Screentip" size="large" supertip="This is the supertip string"></button></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function.
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control.
	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT_Menu">
    <xsd:complexContent>
    <xsd:extension base="CT MenuRegular">
    <xsd:attributeGroup ref="AG_SizeAttributes"/>
    <xsd:attribute name="itemSize" type="ST_ItemSize" use="optional"/>
    </xsd:extension>
    </xsd:complexContent>
</xsd:complexType>
```

2.2.29 menu (Dynamic Menu Root XML Element)

This element specifies the root tag of the XML **string** returned by a dynamic menu control.

For example, consider a dynamic menu control, as follows:

Figure 18: A dynamic menu control

This is specified using the following XML fragment:

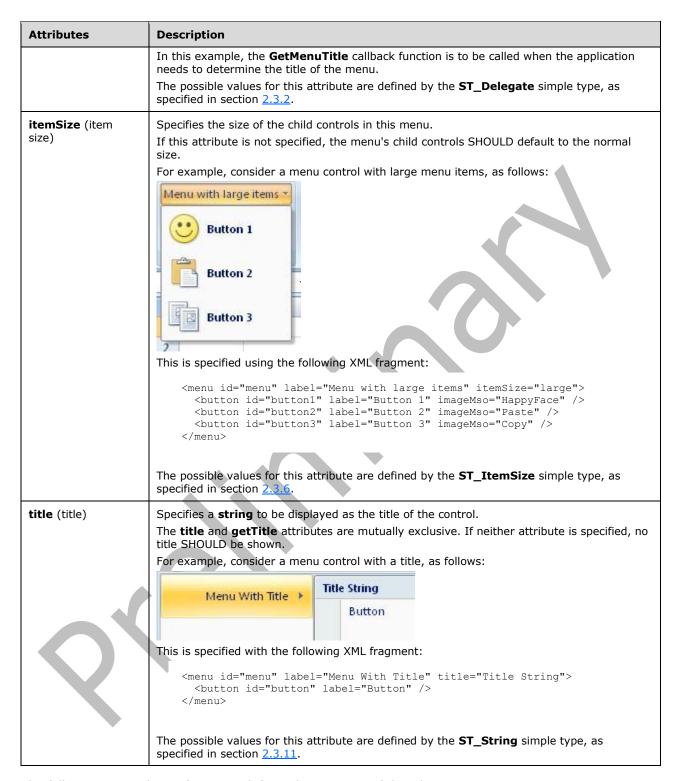

```
<dynamicMenu id="dynamic" label="Dynamic Menu" getContent="GetMenuContent" />
```

The **GetMenuContent** callback function is called when the menu is dropped, and in this case returns a string with the following XML:

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
checkBox (Check Box)	2.2.6
control (Unsized Control Clone)	2.2.11
dynamicMenu (Unsized Dynamic Menu)	2.2.18
gallery (Unsized Gallery)	2.2.22
menu (Unsized Menu)	2.2.26
menuSeparator (Menu Separator)	2.2.30
splitButton (Unsized Split Button)	2.2.36
toggleButton (Unsized Toggle Button)	2.2.42

Attributes	Description	
getTitle (getTitle callback)	Specifies the name of a callback function to be called to determine the title of this control. The title and getTitle attributes are mutually exclusive. If neither attribute is specified no title SHOULD be shown. For example, consider the following XML fragment:	
	<pre> </pre> <pre> <pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre>	

```
<xsd:complexType name="CT_MenuRoot">
    <xsd:sequence>
    <xsd:choice minOccurs="0" maxOccurs="1000">
    <xsd:group ref="EG MenuControlsBase"/>
```

```
<xsd:group ref="EG MenuOrSplitButtonRegular"/>
  </xsd:choice>
  </xsd:sequence>
   <xsd:attributeGroup ref="AG_Title"/>
   <xsd:attribute name="itemSize" type="ST_ItemSize" use="optional"/>
  </xsd:complexType>
```

2.2.30 menuSeparator (Menu Separator)

This element specifies a horizontal separator line in a menu control. Menu separators can optionally have title strings, which SHOULD display as headers in the menu.

For example, consider a menu with a separator in between two of its items, as follows:

Figure 19: Menu control with separator

This is specified using the following XML fragment:

The following table summarizes the elements that are parents of this element.

```
Parent Elements

menu (section 2.2.28); menu (section 2.2.26); menu (section 2.2.29); menu (section 2.2.27); officeMenu (section 2.2.31)
```

Attributes	Description
getTitle (getTitle callback)	Specifies the name of a callback function to be called to determine the title of this control. The title and getTitle attributes are mutually exclusive. If neither attribute is specified no title SHOULD be shown. For example, consider the following XML fragment: <menu gettitle="GetMenuTitle" id="menu" label="Menu"> </menu>
	In this example, the GetMenuTitle callback function is called when the application needs to determine the title of the menu. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2 .
id (control	Specifies the identifier for a custom control. All custom controls MUST have unique

Attributes	Description
identifier)	identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The <code>id</code> and <code>idQ</code> attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <pre></pre>
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id and idQ attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <pre></pre>
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If

Attributes	Description		
of control to insert after)	the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.		
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <pre></pre>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <pre></pre>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.		
title (title)	Specifies a string to be displayed as the title of the control. The title and getTitle attributes are mutually exclusive. If neither attribute is specified, no title SHOULD be shown. For example, consider a menu control with a title, as follows:		
	Menu With Title Title String		
	Button		

Attributes	Description
	This is specified with the following XML fragment:
	<pre><menu id="menu" label="Menu With Title" title="Title String"></menu></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section $2.3.11$.

```
<xsd:complexType name="CT MenuSeparator">
    <xsd:attributeGroup ref="AG_IDCustom"/>
    <xsd:attributeGroup ref="AG_PositionAttributes"/>
    <xsd:attributeGroup ref="AG_Title"/>
</xsd:complexType>
```

2.2.31 officeMenu (Office Menu)

This element specifies the Office Menu of the application. It is used to reference the built-in **Office** Menu. This element SHOULD NOT be specified if the containing Custom UI XML document is a Quick Access Toolbar Customizations part.

For example, consider the following XML fragment:

```
<officeMenu>
  <control idMso="FileSave" visible="false" />
</officeMenu>
```

This XML fragment specifies that the command with an identifier of "FileSave" on the Office Menu is hidden.

The following table summarizes the elements that are parents of this element.

Parent Elements	
ribbon (section 2.2.33)	

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
checkBox (Check Box)	2.2.6
control (Unsized Control Clone)	2.2.11
dynamicMenu (Unsized Dynamic Menu)	2.2.18
gallery (Unsized Gallery)	2.2.22
menu (Menu with Title)	2.2.27
menuSeparator (Menu Separator)	2.2.30

Child Elements	Section
splitButton (Split Button with Title)	2.2.37
toggleButton (Unsized Toggle Button)	2.2.42

2.2.32 qat (Quick Access Toolbar)

This element specifies the quick access toolbar. If the containing Custom UI file is a Ribbon Extensibility part the **qat** element cannot be used unless the **startFromScratch** attribute on the ribbon element is set to "true". In this case only the **sharedControls** child element SHOULD be used. If the containing Custom UI file is a Quick Access Toolbar Customizations part, the **documentControls** child element SHOULD be used.

For example, consider the following controls on the document-specific quick access toolbar:

Figure 20: Controls on the quick access toolbar

This is specified using the following XML fragment:

The following table summarizes the elements that are parents of this element.

Parent Elements	
ribbon (section 2.2.33)	

The following table summarizes the child elements of this element.

Child Elements	Section
documentControls (List of Document-Specific Quick Access Toolbar Controls)	2.2.16
sharedControls (List of Shared Quick Access Toolbar Controls)	2.2.35

2.2.33 ribbon (Ribbon)

This element is used to reference the Ribbon of the application and its contents.

The following table summarizes the elements that are parents of this element.

```
Parent Elements

customUI (section 2.2.14)
```

The following table summarizes the child elements of this element.

Child Elements	Section
contextualTabs (List of Contextual Tab Sets)	2.2.10
officeMenu (Office Menu)	2.2.31
qat (Quick Access Toolbar)	2.2.32
tabs (List of Tabs)	2.2.40

The following table summarizes the attributes of this element.

Attributes	Description
startFromScratch (start from scratch)	Specifies that the application's built-in ribbon UI is reduced to a minimal set of features, providing a clean slate on which to build custom UI.
	If this attribute is omitted, its value SHOULD default to "false".
	For example, consider the following XML fragment: <pre></pre>

```
<xsd:element name="tabs" type="CT Tabs" minOccurs="0" maxOccurs="1"/>
    <xsd:element name="contextualTabs" type="CT_ContextualTabs" minOccurs="0" maxOccurs="1"/>
    </xsd:all>
    <xsd:attribute name="startFromScratch" type="xsd:boolean" use="optional"/>
    </xsd:complexType>
```

2.2.34 separator (Separator)

This element specifies a vertical separator line between two sets of controls, either in the Quick Access Toolbar or within **group** elements.

For example, consider a vertical separator control between two buttons, as follows:

Figure 21: A vertical separator control

This is specified using the following XML fragment:

```
<button id="button1" label="Button 1" imageMso="HappyFace" size="large" />
<separator id="separator" />
<button id="button2" label="Button 2" imageMso="HappyFace" size="large" />
```

The following table summarizes the elements that are parents of this element.

Parent Elements
documentControls (section 2.2.16); group (section 2.2.23); sharedControls (section 2.2.35)

Attributes	Description
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control.
	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id and idQ attributes are mutually exclusive. At least one of these attributes MUST be specified.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id and idQ attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <pre></pre>
	<pre></pre>
insertAfterMso (identifier of built-in control to insert after)	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <pre></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.

Attributes	Description
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
visible (control	Specifies the visibility state of the control.
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT Separator">
   <xsd:attributeGroup ref="AG_IDCustom"/>
   <xsd:attributeGroup ref="AG_Visible"/>
   <xsd:attributeGroup ref="AG_PositionAttributes"/>
</xsd:complexType>
```

2.2.35 sharedControls (List of Shared Quick Access Toolbar Controls)

This element specifies the section of the quick access toolbar that is shared among all documents. This element SHOULD NOT be specified if the containing Custom UI XML document is a Quick Access Toolbar Customizations part. If the containing Custom UI XML document is a Ribbon Extensibility part, this element can be used if the **startFromScratch** attribute is set to "true" on the ribbon element.

For example, consider a Ribbon Extensibility XML document that adds the two buttons to the shared section of the quick access toolbar:

Figure 22: Shared controls on the quick access toolbar

This is specified using the following XML fragment:

```
<qat>
  <sharedControls>
    <button id="button1" imageMso="HappyFace" />
    <button idMso="Cut" />
    </sharedControls>
</qat>
```

The following table summarizes the elements that are parents of this element.

Parent Elements	
qat (section <u>2.2.32</u>)	

The following table summarizes the child elements of this element.

Child Elements	Section
button (Unsized Button)	2.2.3
control (Quick Access Toolbar Control Clone)	2.2.13
separator (Separator)	2.2.34

2.2.36 splitButton (Unsized Split Button)

This element specifies a split button control that, because of its location, cannot have its size changed. The **size** attribute is not present. It otherwise behaves identically to the regular **splitButton** element, as specified in section 2.2.38.

The following table summarizes the elements that are parents of this element.

Parent Elements	
buttonGroup (section 2.2.5); menu (section 2.2.28); menu (section 2.2.26); menu (section 2.2.29)	

The following table summarizes the child elements of this element.

Child Elements	Section
button (Button Inside of a Split Button)	2.2.4
menu (Unsized Menu)	2.2.26
toggleButton (Toggle Button Inside of a Split Button)	2.2.44

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
getImage (getImage	Specifies the name of a callback function to be called to determine the icon of this control.

Attributes	Description
callback)	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is
,	specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<button getlabel="GetButtonLabel" id="button"></button>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control. The showImage and getShowImage attributes are mutually exclusive. If neither
	attribute is specified, the control SHOULD display its icon.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs></ribbon></customui></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>

Attributes	Description
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a system butten that SHOULD use the built in image with an identifier of
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be
	appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.

Attributes	Description
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section $2.3.11$.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display

Attributes	Description
,	no screentip at all.
	For example, consider a button with a screentip, as follows:
	Custom Group This is the screentip Book3.xlsx
	1 Press F1 for more help. This is enesified using the following YMI fragments.
	This is specified using the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon.
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider a button that does not display an icon, as follows:
	Button with no icon Custom Group
	This is specified using the following XML fragment:
	<pre></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label.
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
·	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools.
	The possible values for this attribute are defined by the XML schema boolean datatype.

Attributes	Description
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Sacentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <b< th=""></b<>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment: <tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT_SplitButtonRegular">
    <xsd:complexContent>
```

2.2.37 splitButton (Split Button with Title)

This element specifies a split button control that, because of its location, can optionally include a title string via the **title** or **getTitle** attributes. It otherwise behaves identically to the regular **splitButton** element, as specified in section 2.2.38.

The following table summarizes the elements that are parents of this element.

Parent Elements	
menu (section 2.2.27); officeMenu (section 2.2.31)	

The following table summarizes the child elements of this element.

Child Elements	Section
button (Button Inside of a Split Button)	2.2.4
menu (Menu with Title)	2.2.27
toggleButton (Toggle Button Inside of a Split Button)	2.2.44

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control.
	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:

Attributes	Description
	<button getenabled="IsButtonEnabled" id="button"></button>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment: <button getlabel="GetButtonLabel" id="button"></button> In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>

Attributes	Description
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<button getsupertip="GetButtonSupertip" id="button"></button>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs

Attributes	Description
	to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><button id="MyButton" label="Button"></button></pre>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs></tabs></ribbon></customui></pre>
	<pre><tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.

Attributes	Description
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section <u>2.3.14</u> .
imageMso (built-in image identifier)	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>

Attributes	Description
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified
	in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	SK.
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="button" label="Custom Button"></button>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section <u>2.3.11</u> .
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: This is the screentip Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: specified using the following XML fragment: Specified using the following imageMso="HappyFace" label="Button" size="large" screentip="This is the screentip" /> The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment:
showLabel (show label)	Specifies whether this control SHOULD display its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute
	is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment:

Attributes	Description
	<pre><button id="button" imagemso="HappyFace" label="Label" showlabel="false"></button></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment: <pre></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment: <tab idmso="TabHome" visible="false"></tab>

Attributes	Description
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

The following XML schema fragment defines the contents of this element:

2.2.38 splitButton (Split Button)

This element specifies a split button control. A split button control is composed of either a button or a toggle button, and a drop-down menu. The icon and label shown on the split button come from the **button** or **toggleButton** child element.

For example, consider a split button control, as follows:

Figure 23: A split button control

This is specified using the following XML fragment:

```
<splitButton id="splitButton" size="large" >
  <button id="button" imageMso="HappyFace" label="Split Button" />
  <menu id="menu">
        <button id="button1" label="Button 1" />
        <button id="button2" label="Button 2" />
        </menu>
  </splitButton>
```

The following table summarizes the elements that are parents of this element.

```
Parent Elements

box (section 2.2.1); group (section 2.2.23)
```

The following table summarizes the child elements of this element.

Child Elements	Section
button (Button Inside of a Split Button)	
menu (Unsized Menu)	2.2.26
toggleButton (Toggle Button Inside of a Split Button)	2.2.44

Attributes	Description
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application. For example, consider the following XML fragment: <pre></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used. The possible values for this attribute are defined by the XML schema boolean datatype.
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled. For example, consider the following XML fragment: <pre></pre>
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The <code>getImage</code> , <code>image</code> , and <code>imageMso</code> attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:

Attributes	Description
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>
	<pre></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSize (getSize callback)	Specifies the name of a callback function to be called to determine the size of this control. The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.
	For example, consider the following XML fragment:
	<pre><button getsize="GetButtonSize" id="button"></button></pre>
	In this example, the GetButtonSize callback function is called when the application needs to determine the size of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider the following XML fragment:
	<pre></pre>
	• • •
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:

Attributes	Description
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon></ribbon></customui></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>

Attributes	Description
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" imagemso="Bold"></button></pre>
	This specifies a custom button that SHOULD use the built-in image with an identifier of
	"Bold".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.

Attributes	Description
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section $2.3.7$.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as specified in section $2.3.11$.
screentip	Specifies a string to be shown as the screentip for this control.
(screentip)	The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display

Attributes	Description
	no screentip at all.
	For example, consider a button with a screentip, as follows:
	Button Custom Group This is the screentip
	Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" label="Button" screentip="This is the screentip" size="large"></button></pre>
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither
	attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows:
	Button with no icon Custom Group
	This is specified using the following XML fragment:
	<pre><button id="button" label="Button with no icon" showimage="false"></button></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment: <pre></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools.

Attributes	Description The possible values for this attribute are defined by the XML schema boolean datatype.	
size (control size)	Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows:	
	B Bold Custom Group	
	This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton>	
	The possible values for this attribute are defined by the ST_Size simple type, as specified in section 2.3.10.	
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Custom Group	
	Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment:	
	<pre></pre>	
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.	
	If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment:	
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>	

Attributes	Description	
	This example is a button with a tag value of "123456", which is passed to the ButtonClicked callback function.	
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
visible (control	Specifies the visibility state of the control.	
visibility)	The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible.	
	For example, consider the following XML fragment:	
	<tab idmso="TabHome" visible="false"></tab>	
	In this example, the built-in tab with an identifier of "TabHome" is hidden.	
	The possible values for this attribute are defined by the XML schema boolean datatype.	

2.2.39 tab (Tab)

This element specifies a ribbon tab control.

For example, consider the following XML fragment:

```
<tab id="MyTab" label="My Custom Tab">
...
</tab>
```

This XML fragment specifies a custom tab with the label "My Custom Tab".

The following table summarizes the elements that are parents of this element.

Parent Elements
tabs (section 2.2.40); tabSet (section 2.2.41)

The following table summarizes the child elements of this element.

Child Elements	Section
group (Group)	2.2.23

Attributes	Description
getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of

Attributes	Description	
(getKeytip callback)	this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment: <pre></pre>	
getLabel (getLabel callback)	specified in section 2.3.2. Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:	
	<pre></pre>	
getVisible (getVisible callback)	Specifies the name of a callback function to be called to determine the visibility state of this control. The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment: <pre></pre>	
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: <pre></pre>	
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.	

Attributes	Description	
	For example, consider the following XML fragment:	
	<pre><control idmso="Bold"></control></pre>	
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.	
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ, and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment: CustomUI	
insertAfterMso (identifier of built-in control to insert after)	In section 2.3.9. Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.	
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	

Attributes	Description	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>	
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".	
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.	
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.	
control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>	
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".	
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.	
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.	
of control to insert before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.	
	For example, consider the following XML fragment:	
	<tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>	
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the	
	custom tab with a qualified identifier of "x:OtherTab".	
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.	
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.	
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.	
	For example, consider a button with KeyTip 'K', as follows:	
	J. C.	
	This is specified using the following XML fragment:	
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>	
	The possible values for this attribute are defined by the ST_Keytip simple type, as	

Attributes	Description	
	specified in section $2.3.7$.	
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:	
	<pre><button id="button" label="Custom Button"></button></pre>	
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control. If this attribute is omitted, the control's tag value SHOULD default to an empty string . For example, consider the following XML fragment:	
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>	
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:	
	<tab idmso="TabHome" visible="false"></tab>	
	In this example, the built-in tab with an identifier of "TabHome" is hidden. The possible values for this attribute are defined by the XML schema boolean datatype.	

2.2.40 tabs (List of Tabs)

This element specifies a list of ribbon tab controls. This element SHOULD NOT be specified if the containing Custom UI XML document is a Quick Access Toolbar Customizations part.

The following table summarizes the elements that are parents of this element.

```
Parent Elements
ribbon (section 2.2.33)
```

The following table summarizes the child elements of this element.

Child Elements	Section
tab (Tab)	2.2.39

The following XML schema fragment defines the contents of this element:

```
<xsd:complexType name="CT_Tabs">
    <xsd:sequence>
    <xsd:element name="tab" type="CT_Tab" minOccurs="1" maxOccurs="100"/>
    </xsd:sequence>
</xsd:complexType>
```

2.2.41 tabSet (Contextual Tab Set)

This element specifies a contextual tab set control. As the **id** and **idQ** attributes are not present, this element can only be used to refer to existing built-in tab sets. This element cannot be used to create new contextual tab sets.

For example, consider the following XML fragment:

This XML fragment is used to add a new custom tab to the tab set with an identifier of "TabSetPictureTools".

The following table summarizes the elements that are parents of this element.

Parent Elements	
contextualTabs (section 2.2.10)	

The following table summarizes the child elements of this element.

Child Elements	Subclause
tab (Tab)	section <u>2.2.39</u>

Attributes	Description
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button . The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. For example, consider the following XML fragment:
	<control idmso="Bold"></control>
	This is used to create a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre><tab idmso="TabHome" visible="false"></tab></pre>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT_TabSet">
    <xsd:sequence>
    <xsd:element name="tab" type="CT_Tab" minOccurs="0" maxOccurs="50"/>
    </xsd:sequence>
    <xsd:attribute name="idMso" type="ST_ID" use="required"/>
    <xsd:attributeGroup ref="AG Visible"/>
</xsd:complexType>
```

2.2.42 toggleButton (Unsized Toggle Button)

This element specifies a toggle button control that, because of its location, cannot have its size changed. The **size** attribute is not present. It otherwise behaves identically to the regular **toggleButton** element, as specified in section <u>2.2.43</u>.

The following table summarizes the elements that are parents of this element.

Parent Elements

buttonGroup (section $\underline{2.2.5}$); **menu** (section $\underline{2.2.28}$); **menu** (section $\underline{2.2.26}$); **menu** (section $\underline{2.2.29}$); **menu** (section $\underline{2.2.27}$); **officeMenu** (section $\underline{2.2.31}$)

Attributes	Description
description (description)	Specifies a detailed description of the control, which SHOULD be displayed in detailed views.
	The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section <u>2.3.8</u> .
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getEnabled (getEnabled	Specifies the name of a callback function to be called to determine the enabled state of this control.
callback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is

Attributes	Description
	specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<button getenabled="IsButtonEnabled" id="button"></button>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button getimage="GetButtonImage" id="button"></button></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as possified in section 2.2.2.
	specified in section 2.3.2.
getKeytip (getKeytip callback)	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control. The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	Sactor in Sacrotor Constant of the American
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
anti shel /anti shel	
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<button getlabel="GetButtonLabel" id="button"></button>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getPressed (getPressed	Specifies the name of a callback function to be called to determine the toggled state of this control.
callback)	If this attribute is omitted, the control SHOULD default to the off state.
	For example, consider the following XML fragment:
	<togglebutton getpressed="IsButtonToggled" id="toggle"></togglebutton>

Attributes	Description
	In this example, the IsButtonToggled callback function is called when the application needs to determine the toggle state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is
	specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application
	needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application SHOULD display the icon of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
*	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:

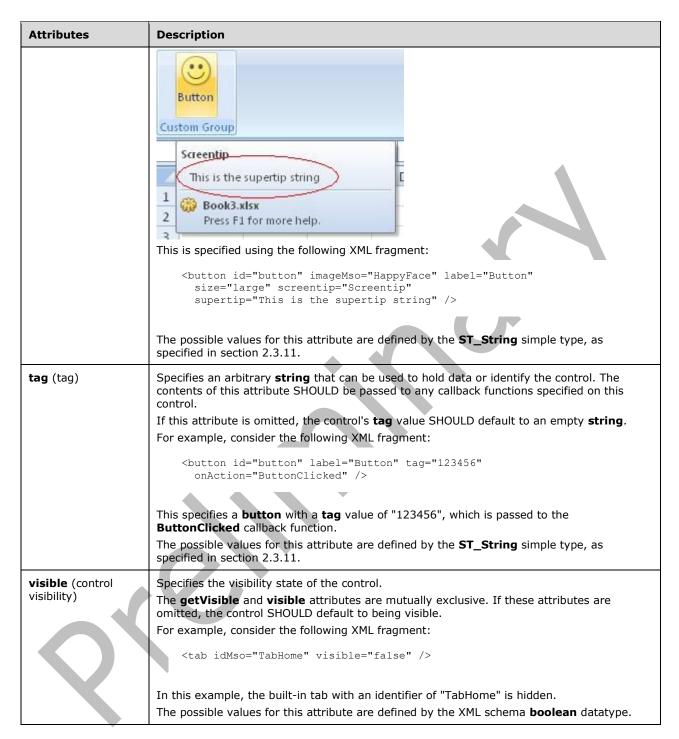

Attributes	Description
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<pre> <</br></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as
	specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre><control idmso="Bold"></control></pre>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui <="" pre="" xmlns="http://schemas.microsoft.com/office/2006/01/customui"></customui></pre>

<pre>xmlns:ex="http://www.example.com"></pre>
<ribbon></ribbon>
<tabs></tabs>
<tab idq="ex:OtherTab" label="Shared Tab"></tab>
In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab.
The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.
The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
For example, consider the following XML fragment:
<pre><button id="button" image="ForestPic"></button></pre>
This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".
The possible values for this attribute are defined by the $\mathbf{ST_Uri}$ simple type, as specified in section $\underline{2.3.14}$.
Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.
The contents of this attribute are application-defined and SHOULD be ignored if not understood.
The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
For example, consider the following XML fragment:
<pre><button id="button" imagemso="Bold"></button></pre>
This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".
The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
For example, consider the following XML fragment:
<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>

Attributes	Description
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier of control to insert after)	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <pre></pre>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"> </tab> In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab>
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.

Attributes	Description
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows:
	This is specified using the following XML fragment:
	<button id="button" imagemso="HappyFace" keytip="K"></button>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string that SHOULD be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button". The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
	<pre></pre>
screentip (screentip)	Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all.
	For example, consider a button with a screentip, as follows: Button Custom Group
	This is the screentip Book3.xlsx Press F1 for more help.
	This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	size="large" screentip="This is the screentip" /> The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
showImage (show image)	Specifies whether this control displays an icon. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the XML schema boolean datatype.
showLabel (show label)	Specifies whether this control SHOULD display its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows:

2.2.43 toggleButton (Toggle Button)

This element specifies a toggle button control that can be toggled between the pressed and unpressed states by the end-user.

For example, consider a toggle button control, as follows:

Figure 24: A toggle button control

This is specified with the following XML fragment:

```
<toggleButton id="toggleButton" label="Toggle Button" />
```

The following table summarizes the elements that are parents of this element.

Parent Elements	
box (section <u>2.2.1</u>); group (section <u>2.2.23</u>)	

Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows:
	Button This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
Q"	<pre></pre>
enabled (enabled	Specifies the enabled state of the control.
state)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<button enabled="false" id="button" label="Disabled Button"></button>

Attributes	Description
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section <u>2.3.2</u> .
getEnabled (getEnabled callback)	Specifies the name of a callback function to be called to determine the enabled state of this control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is
	specified, the control SHOULD default to being enabled. For example, consider the following XML fragment:
	<pre> <</br></br></br></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment:
	<pre><button getkeytip="GetButtonKeytip" id="button"></button></pre>
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.

Attributes	Description
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button. The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getPressed (getPressed callback)	Specifies the name of a callback function to be called to determine the toggled state of this control. If this attribute is omitted, the control SHOULD default to the "off" state. For example, consider the following XML fragment: <togglebutton getpressed="IsButtonToggled" id="toggle"></togglebutton> In this example, the IsButtonToggled callback function is called when the application needs to determine the toggle state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip callback)	Specifies the name of a callback function to be called to determine the screentip of this control. The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider the following XML fragment: <pre></pre>
getShowImage (getShowImage callback)	Specifies the name of a callback function to be called to determine whether the application displays the icon of this control. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider the following XML fragment:
matChavel = b = 1	specified in section 2.3.2.
getShowLabel	Specifies the name of a callback function to be called to determine whether the application

Attributes	Description
(getShowLabel callback)	displays the label of this control. This attribute SHOULD have no effect if the size or getSize attributes specify that the
	control is "large".
	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSize (getSize callback)	Specifies the name of a callback function to be called to determine the size of this control. The getSize and size attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size.
	For example, consider the following XML fragment:
	<pre><button getsize="GetButtonSize" id="button"></button></pre>
	In this example, the GetButtonSize callback function is called when the application needs to determine the size of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control.
callback)	The getVisible and visible attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being visible.
	For example, consider the following XML fragment:
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify

Attributes	Description
	which control corresponds to the function call. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an id of ""MyButton"". The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in control identifier)	Specifies the identifier of a built-in control. The contents of this attribute are application-defined. The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre></pre>
idQ (qualified control identifier)	Specifies a qualified identifier for a control. The idQ attribute can be used to reference controls or containers created by other Custom UI documents. The id, idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified. For example, consider the following XML fragment:
	<pre> <customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon> <tabs> <tab idq="ex:OtherTab" label="Shared Tab"></tab></tabs></ribbon></customui></pre>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the tab. The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
image (custom image identifier)	Specifies the relationship identifier for an image to be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.

Attributes	Description
	For example, consider the following XML fragment:
	<pre><button id="button" image="ForestPic"></button></pre>
	This specifies a custom button whose icon is the embedded image file referenced by the relationship identifier of "ForestPic".
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.
imageMso (built-in image identifier)	Specifies the identifier of a built-in image to be used as the icon of this control. The contents of this attribute are application-defined and SHOULD be ignored if not understood.
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed. For example, consider the following XML fragment:
	<button id="button" imagemso="Bold"></button>
	This specifies a custom button that uses the built-in image with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in	Specifies the identifier of a built-in control that this control is to be inserted before. If the

Attributes	Description
control to insert	value of this attribute is not understood, it SHOULD be ignored.
before)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<tab id="MyTab" insertbeforemso="TabHome" label="Custom Tab"></tab>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome".
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier	Specifies the qualified identifier of a control that this control is to be inserted before. If the value of this attribute is not understood, it SHOULD be ignored.
of control to insert before)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.
	For example, consider the following XML fragment:
	<pre><tab id="MyTab" insertbeforeq="x:OtherTab" label="Custom Tab"></tab></pre>
	In this example, a new custom tab with an id of "MyTab" is to be inserted before the custom tab with a qualified identifier of "x:OtherTab".
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control.
	The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider a button with KeyTip 'K', as follows:
	SK S
	This is specified using the following XML fragment:
	<pre><button id="button" imagemso="HappyFace" keytip="K"></button></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.
label (label)	Specifies a string to be used as the label for this control.
	The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button id="button" label="Custom Button"></button></pre>
	This specifies a custom button with a label of "Custom Button".
	The possible values for this attribute are defined by the ST_String simple type, as

Attributes	Description
	specified in section <u>2.3.11</u> .
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment:
screentip (screentip)	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2. Specifies a string to be shown as the screentip for this control. The screentip and getScreentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display no screentip at all. For example, consider a button with a screentip, as follows: Button Custom Group This is the screentip This is specified using the following XML fragment: <pre></pre>
showImage (show	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11. Specifies whether this control displays an icon.
image)	This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon. For example, consider a button that does not display an icon, as follows: Button with no icon Custom Group This is specified using the following XML fragment: <pre></pre>

Attributes	Description
showLabel (show label)	Specifies whether this control displays its label. This attribute SHOULD have no effect if the size or getSize attributes specify that the control is "large". The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>
size (control size)	The possible values for this attribute are defined by the XML schema boolean datatype. Specifies the size of the control. The size and getSize attributes are mutually exclusive. If neither attribute is specified, the control's size SHOULD default to the normal size. For example, consider a large button, as follows: Bold Custom Group This is specified using the following XML fragment: <togglebutton idmso="Bold" size="large"></togglebutton> The possible values for this attribute are defined by the ST_Size simple type, as specified in section 2.3.10.
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Saeentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>

Attributes	Description
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
tag (tag)	Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .
	For example, consider the following XML fragment:
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function. The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.
visible (control visibility)	Specifies the visibility state of the control. The getVisible and visible attributes are mutually exclusive. If these attributes are omitted, the control SHOULD default to being visible. For example, consider the following XML fragment:
	<tab idmso="TabHome" visible="false"></tab>
	In this example, the built-in tab with an identifier of "TabHome" is hidden.
	The possible values for this attribute are defined by the XML schema boolean datatype.

```
<xsd:complexType name="CT ToggleButton">
    <xsd:complexContent>
    <xsd:extension base="CT_ToggleButtonRegular">
    <xsd:attributeGroup ref="AG SizeAttributes"/>
    </xsd:extension>
    </xsd:complexContent>
</xsd:complexType>
```

2.2.44 toggleButton (Toggle Button Inside of a Split Button)

This element specifies a toggle button control that is part of a split button control. The **visible** and **getVisible** attributes are not present because the visibility is controlled by the split button. This element otherwise behaves in the same way as the regular **toggleButton** element, as specified in section 2.2.43.

The following table summarizes the elements that are parents of this element.

Parent Elements	
splitButton (section $\underline{2.2.38}$); splitButton (section $\underline{2.2.36}$); splitButton (section $\underline{2.2.37}$)	

Attributes	Description
description (description)	Specifies a detailed description of the control, which is displayed in detailed views. The description and getDescription attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text. For example, consider a button with a detailed description, as follows: Button
	This is a verbose description that describes the function of this control in detail.
	This is specified using the following XML fragment:
	<pre><button description="This is a verbose description that describes the function of this control in detail." id="button" imagemso="HappyFace" label="Button"></button></pre>
	The possible values for this attribute are defined by the ST_LongString simple type, as specified in section $2.3.8$.
enabled (enabled state)	Specifies the enabled state of the control. The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	This attribute cannot be used to enable a built-in control that would otherwise be disabled by the application.
	For example, consider the following XML fragment:
	<pre><button enabled="false" id="button" label="Disabled Button"></button></pre>
	This specifies a new button that is disabled. A permanently disabled button is not very useful, thus the enabled attribute is not commonly used.
	The possible values for this attribute are defined by the XML schema boolean datatype.
getDescription (getDescription	Specifies the name of a callback function to be called to determine the detailed description of this control.
callback)	The getDescription and description attributes are mutually exclusive. If neither attribute is specified, the control SHOULD NOT display any detailed text.
	For example, consider the following XML fragment:
	<pre><button getdescription="GetButtonDescription" id="button"></button></pre>
	In this example, the GetButtonDescription callback function is called when the application needs to determine the detailed description of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section $2.3.2$.
getEnabled (getEnabled	Specifies the name of a callback function to be called to determine the enabled state of this control.
callback)	The getEnabled and enabled attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to being enabled.
	For example, consider the following XML fragment:
	<pre><button getenabled="IsButtonEnabled" id="button"></button></pre>
	In this example, the IsButtonEnabled callback function is called when the application needs to determine the enabled state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as

Attributes	Description
	specified in section 2.3.2.
getImage (getImage callback)	Specifies the name of a callback function to be called to determine the icon of this control. The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.
	For example, consider the following XML fragment: <pre></pre>
	In this example, the GetButtonImage callback function is called when the application needs to determine the icon of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getKeytip (getKeytip	Specifies the name of a callback function to be called to determine the suggested KeyTip of this control.
callback)	The getKeytip and keytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically.
	For example, consider the following XML fragment: <pre></pre>
	Chucton Id- button getkeytip- Gethuttonkeytip //
	In this example, the GetButtonKeytip callback function is called when the application needs to determine the KeyTip of the button .
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getLabel (getLabel callback)	Specifies the name of a callback function to be called to determine the label of this control. The getLabel and label attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed.
	For example, consider the following XML fragment:
	<pre><button getlabel="GetButtonLabel" id="button"></button></pre>
	In this example, the GetButtonLabel callback function is called when the application needs to determine the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getPressed (getPressed	Specifies the name of a callback function to be called to determine the toggled state of this control.
callback)	If this attribute is omitted, the control SHOULD default to the off state. For example, consider the following XML fragment:
	<togglebutton getpressed="IsButtonToggled" id="toggle"></togglebutton>
	In this example, the IsButtonToggled callback function is called when the application needs to determine the toggle state of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getScreentip (getScreentip	Specifies the name of a callback function to be called to determine the screentip of this control.
callback)	The getScreentip and screentip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD display the label of the control as the screentip or display

Attributes	Description
	no screentip at all.
	For example, consider the following XML fragment:
	<pre><button getscreentip="GetButtonScreentip" id="button"></button></pre>
	In this example, the GetButtonScreentip callback function is called when the application needs to determine the screentip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowImage (getShowImage	Specifies the name of a callback function to be called to determine whether the application displays the icon of this control.
callback)	The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.
	For example, consider the following XML fragment:
	<pre><button getshowimage="IsButtonImageVisible" id="button"></button></pre>
	In this example, the IsButtonImageVisible callback function is called when the application needs to determine whether to display the icon of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getShowLabel (getShowLabel	Specifies the name of a callback function to be called to determine whether the application SHOULD display the label of this control.
callback)	The showLabel and getShowLabel attributes are mutually exclusive. If neither attribute is specified, the control SHOULD default to showing its label.
	For example, consider the following XML fragment:
	<pre><button getshowlabel="IsButtonLabelVisible" id="button"></button></pre>
	In this example, the IsButtonLabelVisible callback function is called when the application needs to determine whether to display the label of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getSupertip (getSupertip	Specifies the name of a callback function to be called to determine the supertip of this control.
callback)	The getSupertip and supertip attributes are mutually exclusive. If neither attribute is specified, no supertip for this control SHOULD be shown.
	For example, consider the following XML fragment:
	<pre><button getsupertip="GetButtonSupertip" id="button"></button></pre>
	In this example, the GetButtonSupertip callback function is called when the application needs to determine the supertip of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
getVisible (getVisible	Specifies the name of a callback function to be called to determine the visibility state of this control. This attribute is prohibited and the visibility is controlled by the split button.
callback)	For example, consider the following XML fragment:

Attributes	Description
	<pre><button getvisible="IsButtonVisible" id="button"></button></pre>
	In this example, the IsButtonVisible callback function is called when the application needs to determine the visibility of the button.
	The possible values for this attribute are defined by the ST_Delegate simple type, as specified in section 2.3.2.
id (control identifier)	Specifies the identifier for a custom control. All custom controls MUST have unique identifiers. The identifier of a control SHOULD be passed to callback functions to identify which control corresponds to the function call.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<button id="MyButton" label="Button"></button>
	This specifies a custom button control with an identifier of "MyButton".
	The possible values for this attribute are defined by the ST_UniqueID simple type, as specified in section 2.3.13.
idMso (built-in	Specifies the identifier of a built-in control.
control identifier)	The contents of this attribute are application-defined.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<control idmso="Bold"></control>
	This creates a clone of the control with an identifier of "Bold". The possible values for this attribute are defined by the ST_ID simple type, as specified in
	section 2.3.5.
idQ (qualified	Specifies a qualified identifier for a control.
control identifier)	The idQ attribute can be used to reference controls or containers created by other Custom UI documents.
	The id , idQ , and idMso attributes are mutually exclusive. At least one of these attributes MUST be specified.
	For example, consider the following XML fragment:
	<pre><customui xmlns="http://schemas.microsoft.com/office/2006/01/customui" xmlns:ex="http://www.example.com"> <ribbon></ribbon></customui></pre>
	<tabs> <tab idq="ex:OtherTab" label="Shared Tab"> <group id="MyGroup" label="My Group"></group></tab></tabs>
	In this case, ex is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a tab in that namespace with an identifier of "OtherTab". If

Attributes	Description		
	that tab cannot be found, it is created. A new group belonging to this file is added to the tab.		
	The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.		
image (custom image identifier)	Specifies the relationship identifier for an image which SHOULD be used as the icon for this control. This attribute is used to specify an embedded picture that resides locally within the containing file.		
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.		
	For example, consider the following XML fragment:		
	<button id="button" image="ForestPic"></button>		
	This specifies a custom button whose icon SHOULD be the embedded image file referenced by the relationship identifier of "ForestPic".		
	The possible values for this attribute are defined by the ST_Uri simple type, as specified in section 2.3.14.		
imageMso (built-in	Specifies the identifier of a built-in image which SHOULD be used as the icon of this control.		
image identifier)	The contents of this attribute are application-defined and SHOULD be ignored if not understood.		
	The getImage , image , and imageMso attributes are mutually exclusive. If none of these attributes are specified, no icon SHOULD be displayed.		
	For example, consider the following XML fragment:		
	<button id="button" imagemso="Bold"></button>		
	This specifies a custom button that SHOULD use the built-in image with an identifier of "Bold".		
	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertAfterMso (identifier of built-in	Specifies the identifier of a built-in control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.		
control to insert after)	The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		
	<tab id="MyTab" insertaftermso="TabHome" label="Custom Tab"></tab>		
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the built-in tab with an identifier of "TabHome".		
₩	The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.		
insertAfterQ (qualified identifier	Specifies the qualified identifier of a control that this control SHOULD be inserted after. If the value of this attribute is not understood, it SHOULD be ignored.		
of control to insert after)	The insertAfterMso , insertAfterQ , insertBeforeMso , and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML.		
	For example, consider the following XML fragment:		

Attributes	Description
	<tab id="MyTab" insertafterq="x:OtherTab" label="Custom Tab"> </tab>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted after the custom tab with a qualified identifier of "x:OtherTab". The possible values for this attribute are defined by the ST_QID simple type, as specified in section 2.3.9.
insertBeforeMso (identifier of built-in control to insert before)	Specifies the identifier of a built-in control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment: <tabli> <tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli></tabli>
	In this example, a new custom tab with an identifier of "MyTab" is to be inserted before the built-in tab with an identifier of "TabHome". The possible values for this attribute are defined by the ST_ID simple type, as specified in section 2.3.5.
insertBeforeQ (qualified identifier of control to insert before)	Specifies the qualified identifier of a control that this control SHOULD be inserted before. If the value of this attribute is not understood, it SHOULD be ignored. The insertAfterMso, insertAfterQ, insertBeforeMso, and insertBeforeQ attributes are mutually exclusive. If none of these attributes are specified, the controls SHOULD be appended to the existing set of controls, in the order they are defined in the XML. For example, consider the following XML fragment:
	<pre></pre>
keytip (keytip)	Specifies a string to be used as the suggested KeyTip for this control. The keytip and getKeytip attributes are mutually exclusive. If neither attribute is specified, the application SHOULD generate a KeyTip for the control automatically. For example, consider a button with KeyTip 'K', as follows: This is specified using the following XML fragment: <pre></pre>
	The possible values for this attribute are defined by the ST_Keytip simple type, as specified in section 2.3.7.

Attributes	Description	
label (label)	Specifies a string to be used as the label for this control. The label and getLabel attributes are mutually exclusive. If neither attribute is specified, no label SHOULD be displayed. For example, consider the following XML fragment: <pre></pre>	
onAction (onAction callback)	Specifies the name of a callback function to be called when this control is invoked by the user. For example, consider the following XML fragment: <pre></pre>	
screentip (screentip)		
showImage (show image)	Specifies whether this control displays an icon. The showImage and getShowImage attributes are mutually exclusive. If neither attribute is specified, the control SHOULD display its icon.	
	For example, consider a button that does not display an icon, as follows:	

Attributes	Description	
	Custom Group This is specified using the following XML fragment: <button id="button" label="Button with no icon" showimage="false"></button>	
	The possible values for this attribute are defined by the XML schema boolean datatype.	
showLabel (show label)	Specifies whether this control SHOULD display its label. The showLabel and getShowLabel attributes are mutually exclusive. If neither attribut is specified, the control SHOULD default to showing its label. For example, consider the following XML fragment: <pre></pre>	
	This specifies a button that has a label , but does not show it. Even though the label is hidden, it is provided to accessibility tools. The possible values for this attribute are defined by the XML schema boolean datatype.	
supertip (supertip)	Specifies a string to be shown as the supertip of the control. The supertip and getSupertip attributes are mutually exclusive. If neither attribute is specified no supertip for this control SHOULD be shown. For example, consider a control with a supertip, as follows: Button Custom Group Screentip This is the supertip string Book3.xlsx Press F1 for more help. This is specified using the following XML fragment: <pre></pre>	
tag (tag)	Specified in section 2.3.11. Specifies an arbitrary string that can be used to hold data or identify the control. The contents of this attribute SHOULD be passed to any callback functions specified on this control.	

Attributes	Description	
	If this attribute is omitted, the control's tag value SHOULD default to an empty string .	
	For example, consider the following XML fragment:	
	<pre><button id="button" label="Button" onaction="ButtonClicked" tag="123456"></button></pre>	
	This specifies a button with a tag value of "123456", which is passed to the ButtonClicked callback function.	
	The possible values for this attribute are defined by the ST_String simple type, as specified in section 2.3.11.	
visible (control visibility)	Specifies the visibility state of the control. This attribute is prohibited and the visibility is controlled by the split button.	
,,	For example, consider the following XML fragment:	
	<tab idmso="TabHome" visible="false"></tab>	
	In this example, the built-in tab with an identifier of "TabHome" is hidden.	
	The possible values for this attribute are defined by the XML schema boolean datatype.	

2.3 Simple Types

This is the complete list of simple types in the http://schemas.microsoft.com/office/2006/01/customui namespace.

2.3.1 ST_BoxStyle (Box Style)

Specifies the layout style of a **box** control.

This simple type's contents are a restriction of the XML schema **string** datatype.

The following are possible **enumeration** values for this type:

Enumeration Value	Description
horizontal (Horizontal)	Specifies that the child controls are laid out horizontally.
vertical (Vertical)	Specifies that the child controls are laid out vertically.

box@boxStyle (section 2.2.1)

The following XML schema fragment defines the contents of this simple type:

2.3.2 ST_Delegate (Callback Function Name)

Specifies the name of a callback function. The format of this string is application-defined and SHOULD be ignored if not understood.

Examples of this simple type are **macro** scripts and **add-in** callback functions.

This simple type's contents are a restriction of the XML schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 characters.
- This simple type's contents have a maximum length of 1024 characters.

The following XML schema fragment defines the contents of this simple type:

2.3.3 ST_GalleryItemWidthHeight (Gallery Item Width or Height)

Specifies the width or height of gallery items, in pixels.

This simple type's contents are a restriction of the XML schema positiveInteger datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 4096.

Referenced By

gallery@itemHeight (section $\underline{2.2.21}$); gallery@itemHeight (section $\underline{2.2.22}$); gallery@itemWidth (section 2.2.21); gallery@itemWidth (section 2.2.22)

2.3.4 ST_GalleryRowColumnCount (Gallery Row or Column Count)

Specifies the count of rows or columns in a **gallery** control.

This simple type's contents are a restriction of the XML schema positiveInteger datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 1024.

Referenced By

gallery@columns (section $\underline{2.2.21}$); gallery@columns (section $\underline{2.2.22}$); gallery@rows (section 2.2.21); gallery@rows (section 2.2.22)

The following XML schema fragment defines the contents of this simple type:

2.3.5 ST_ID (Control ID)

Specifies the identifier of a built-in control. The format of this **string** is defined by per application by the Custom UI Control identifier Tables, as specified in section $\underline{3}$.

This simple type's contents are a restriction of the XML schema **NCName** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 1024 characters.

Referenced By

The following XML schema fragment defines the contents of this simple type:

```
<xsd:simpleType name="ST_ID">
    <xsd:restriction base="xsd:NCName">
    <xsd:minLength value="1"/>
    <xsd:maxLength value="1024"/>
    </xsd:restriction>
</xsd:simpleType>
```

2.3.6 ST_ItemSize (Menu Item Size)

Specifies the size of the child controls in a **menu** control.

This simple type's contents are a restriction of the XML schema **string** datatype.

The following are possible **enumeration** values for this type:

Enumeration Value	Description		
large (Large)	Specifies that the child controls have large sizes.		
normal (Normal)	Specifies that the child controls have normal sizes.		

Referenced By menu@itemSize (section 2.2.28); menu@itemSize (section 2.2.26); menu@itemSize (section 2.2.29); menu@itemSize (section 2.2.27)

The following XML schema fragment defines the contents of this simple type:

2.3.7 ST_Keytip (Keytip)

Specifies a **KeyTip** string.

This simple type's contents are a restriction of the XML schema **token** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 3 characters.

Referenced By

button@keytip (section 2.2.2); button@keytip (section 2.2.3); button@keytip (section 2.2.4); checkBox@keytip (section 2.2.6); comboBox@keytip (section 2.2.12); control@keytip (section 2.2.12); control@keytip (section 2.2.13); control@keytip (section 2.2.11); dropDown@keytip (section 2.2.17); dynamicMenu@keytip (section 2.2.18); editBox@keytip (section 2.2.20); gallery@keytip (section 2.2.21); gallery@keytip (section 2.2.22); group@keytip (section 2.2.23); labelControl@keytip (section 2.2.25); menu@keytip (section 2.2.28); menu@keytip (section 2.2.26); menu@keytip (section 2.2.27); splitButton@keytip (section 2.2.36); splitButton@keytip (section 2.2.37); tab@keytip (section 2.2.39); toggleButton@keytip (section 2.2.42); toggleButton@keytip (section 2.2.44)

The following XML schema fragment defines the contents of this simple type:

```
<xsd:simpleType name="ST Keytip">
    <xsd:restriction base="xsd:token">
    <xsd:minLength value="1"/>
    <xsd:maxLength value="3"/>
    <xsd:whiteSpace value="collapse"/>
    </xsd:restriction>
</xsd:simpleType>
```

2.3.8 ST_LongString (Long String)

Specifies a string that can have an extended length.

This simple type's contents are a restriction of the XML schema **string** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 4096 characters.

button@description (section 2.2.2); button@description (section 2.2.3); button@description (section 2.2.4); checkBox@description (section 2.2.6); control@description (section 2.2.12); control@description (section 2.2.13); dynamicMenu@description (section 2.2.13); dynamicMenu@description (section 2.2.13); gallery@description (section 2.2.13); menu@description (section 2.2.23); menu@description (section 2.2.23); toggleButton@description (section 2.2.23); toggleButton@description (section 2.2.33); toggleButton@description (section 2.2.33); toggleButton@description (section 2.2.33);

The following XML schema fragment defines the contents of this simple type:

2.3.9 ST_QID (Qualified Control ID)

Specifies a control identifier that is qualified by an XML namespace prefix. The prefix determines which namespace to which the control belongs.

If the namespace is equal to the Custom UI namespace, the qualified identifier references the application's built-in control set.

For example, consider the following XML fragment:

In this example the **mso** namespace prefix is set to the Custom UI namespace, so names qualified with **mso** refer to built-in controls. Thus, the use of the **idQ** attribute on the **tab** element is equivalent to using the **idMso** attribute, as follows:

```
<tab idMso="TabHome" visible="false" />
```

If the prefix is set to any other value, qualified identifiers reference controls in a unique custom namespace. If multiple Custom UI documents refer to controls in the same namespace, they can share common containers.

For example, consider the following XML fragment:

4

In this case, **ex** is an XML namespace prefix for the namespace http://www.example.com. This XML fragment refers to a **tab** in that namespace with an identifier of "OtherTab". If that tab cannot be found, it is created. A new group belonging to this file is added to the **tab**.

This simple type's contents are a restriction of the **XML schema QName** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 1024 characters.

2.3.10 ST_Size (Control Size)

Specifies the size of a control.

This simple type's contents are a restriction of the **XML schema string** datatype.

The following are possible **enumeration** values for this type:

Enumeration Value	Description		
large (Large Control Size)	Specifies the large control size.		
normal (Normal Control Size)	Specifies the normal control size.		

Referenced By

button@size (section $\underline{2.2.2}$); control@size (section $\underline{2.2.12}$); control@size (section $\underline{2.2.13}$); dynamicMenu@size (section $\underline{2.2.19}$); gallery@size (section $\underline{2.2.21}$); menu@size (section $\underline{2.2.28}$); splitButton@size (section $\underline{2.2.38}$); toggleButton@size (section $\underline{2.2.43}$)

The following XML schema fragment defines the contents of this simple type:

```
<xsd:simpleType name="ST_Size">
    <xsd:restriction base="xsd:string">
    <xsd:enumeration value="normal"/>
    <xsd:enumeration value="large"/>
    </xsd:restriction>
</xsd:simpleType>
```

2.3.11 ST_String (Short String)

Specifies a string with a limited length.

This simple type's contents are a restriction of the XML schema **string** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 1024 characters.

The following XML schema fragment defines the contents of this simple type:

```
<xsd:simpleType name="ST_String">
   <xsd:restriction base="xsd:string">
   <xsd:minLength value="1"/>
   <xsd:maxLength value="1024"/>
   </xsd:restriction>
</xsd:simpleType>
```

2.3.12 ST_StringLength (String Length)

Specifies the length of a string, in characters.

This simple type's contents are a restriction of the XML schema **positiveInteger** datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 1024.

Referenced By

 $comboBox@maxLength \ (section \ \underline{2.2.7}); \ editBox@maxLength \ (section \ \underline{2.2.20})$

```
<xsd:simpleType name="ST_StringLength">
```

```
<xsd:restriction base="xsd:positiveInteger">
  <xsd:minInclusive value="1"/>
  <xsd:maxInclusive value="1024"/>
  </xsd:restriction>
</xsd:simpleType>
```

2.3.13 ST_UniqueID (Custom Control ID)

Specifies a custom control identifier.

This simple type's contents are a restriction of the XML schema **identifier** datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 character.
- This simple type's contents have a maximum length of 1024 characters.

Referenced By

box@id (section 2.2.1); button@id (section 2.2.2); button@id (section 2.2.3); button@id (section 2.2.4); buttonGroup@id (section 2.2.5); checkBox@id (section 2.2.6); comboBox@id (section 2.2.7); control@id (section 2.2.12); control@id (section 2.2.11); dropDown@id (section 2.2.17); dynamicMenu@id (section 2.2.19); dynamicMenu@id (section 2.2.18); editBox@id (section 2.2.20); gallery@id (section 2.2.21); gallery@id (section 2.2.21); gallery@id (section 2.2.22); group@id (section 2.2.23); item@id (section 2.2.24); labelControl@id (section 2.2.25); menu@id (section 2.2.26); menu@id (section 2.2.26); menu@id (section 2.2.27); menuSeparator@id (section 2.2.30); separator@id (section 2.2.34); splitButton@id (section 2.2.38); splitButton@id (section 2.2.36); toggleButton@id (section 2.2.37); tab@id (section 2.2.39); toggleButton@id (section 2.2.42); toggleButton@id (section 2.2.44)

The following XML schema fragment defines the contents of this simple type:

2.3.14 ST_Uri (Image Relationship ID)

Specifies the relationship identifier of a part that is the target of a relationship from the containing Custom UI document.

The target part is an image part type, as specified in [ECMA-376] Part 1 section 15.2.13.

This simple type's contents are a restriction of the XML schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 1 characters.
- This simple type's contents have a maximum length of 1024 characters.

5 Appendix C: Product Behavior

- The 2007 Microsoft Office system
- Microsoft Office 2010 suites
- Microsoft Office 2013
- Microsoft Office 2016
- Microsoft Office 2019
- Microsoft Office 2021

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

6 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
