

[MS-E911WS]: Web Service for E911 Support Protocol Specification

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments
03/31/2010	0.1	Major	Initial Availability
04/30/2010	0.2	Editorial	Revised and edited the technical content
06/07/2010	0.3	Editorial	Revised and edited the technical content
06/29/2010	0.4	Editorial	Changed language and formatting in the technical content.
07/23/2010	0.4	No change	No changes to the meaning, language, or formatting of the technical content.
09/27/2010	1.0	Major	Significantly changed the technical content.
11/15/2010	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
12/17/2010	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
03/18/2011	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
06/10/2011	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
01/20/2012	2.0	Major	Significantly changed the technical content.
04/11/2012	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
07/16/2012	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
10/08/2012	2.0.1	Editorial	Changed language and formatting in the technical content.

1 Introduction

This document specifies the Web Service for E911 Support Protocol interface that is used by protocol clients to retrieve locations associated with network identifiers, or locations within a city. A location is a civic address with up to room-level granularity. The network identifiers that can be specified are the Wireless Access Point, Received Signal Strength Indication, Media Access Control Address, Chassis, Port, Subnet, and Internet Protocol Address.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. Sections 1.5 and 1.9 are also normative but cannot contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [\[MS-GLOS\]](#):

- authentication**
- certificate**
- fully qualified domain name (FQDN)**
- Hypertext Transfer Protocol (HTTP)**
- Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**
- Kerberos**
- NT LAN Manager (NTLM) Authentication Protocol**
- Secure Sockets Layer (SSL)**
- Transmission Control Protocol (TCP)**
- type-length-value (TLV)**

The following terms are defined in [\[MS-OFCGLOS\]](#):

- endpoint**
- presence information**
- Presence Information Data Format (PIDF)**
- Session Initiation Protocol (SIP)**
- Simple Object Access Protocol (SOAP)**
- SOAP body**
- SOAP envelope**
- SOAP message**
- Transport Layer Security (TLS)**
- Uniform Resource Identifier (URI)**
- Uniform Resource Locator (URL)**
- Web Services Description Language (WSDL)**
- WSDL message**
- XML namespace**
- XML namespace prefix**
- XML schema**

The following terms are specific to this document:

public safety answering point (PSAP): A call center that is responsible for answering calls to a telephone number for an emergency service and, in some cases, dispatching that service.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the technical documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information. Please check the archive site, <http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624>, as an additional source.

1.3 Overview

This protocol is used to retrieve the locations based on network identifiers, or based on city.

This protocol specifies a request that contains the network identifiers for which locations need to be retrieved. The response contains the response status and, if the request is processed successfully, the locations that are most appropriate for the network identifiers specified. This protocol also specifies another request that contains the city, state, and country/region for which locations need to be retrieved. The response contains the response status and, if the request is processed successfully, the locations in that city, state, and country/region.

This protocol is defined as a Web service. This protocol specifies the structure of the schema used to construct the body in the request and response messages. This protocol uses **Simple Object Access Protocol (SOAP)**, as described in [\[SOAP1.1\]](#), and **Web Services Description Language (WSDL)**, as described in [\[WSDL\]](#) to describe the structure of the message body. The full WSDL is included in section [6](#).

1.4 Relationship to Other Protocols

This protocol uses SOAP over **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#), as shown in the following layering diagram.

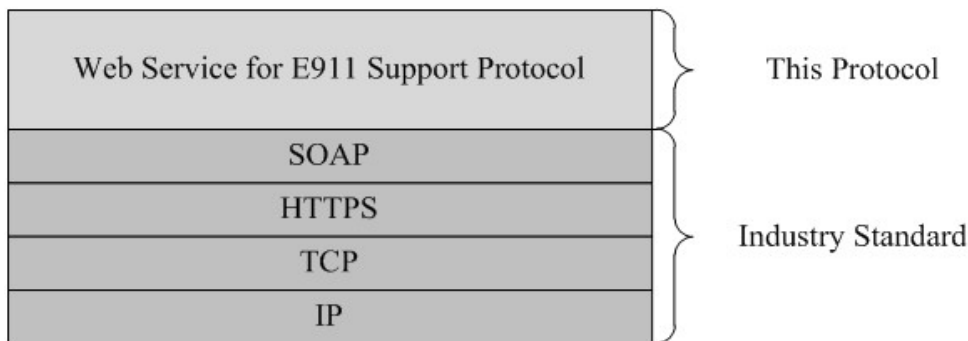

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

For a protocol client that uses this protocol with a protocol server, it is assumed that the protocol server has an operational SOAP1.1/HTTP1.1 /TCP/IP stack. It is also assumed that the protocol client has the **fully qualified domain name (FQDN) (1)** of the protocol server to which the protocol client will connect. The protocol client can obtain the FQDN (1) of the protocol server via a different channel, for example, the **Session Initiation Protocol (SIP)** signaling channel. The protocol server also requires that the protocol client be able to negotiate **Hypertext Transfer Protocol (HTTP)** over **Transport Layer Security (TLS)** to establish the connection.

1.6 Applicability Statement

This protocol is designed so that a client can acquire the location that can be passed on with an E911(Enhanced 911 call with location information in it) call, so that a **public safety answering point (PSAP)** can dispatch emergency help to the correct destination. The locations returned can also be used by the client to publish **presence information**.

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

This protocol uses SOAP, as specified in [\[SOAP1.1\]](#), over HTTPS as specified in section [1.4](#). The protocol uses the security model described in section [5.<1>](#)

2.2 Common Message Syntax

This section contains common definitions that are used by this protocol. The syntax of the definitions uses **XML schema**, as specified in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and WSDL, as specified in [\[WSDL\]](#).

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
soap	http://schemas.xmlsoap.org/wsdl/soap	[SOAP1.1]
xsd	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1] , [XMLSCHEMA2]
http	http://schemas.xmlsoap.org/wsdl/http	[RFC2616]
ca	urn:ietf:params:xml:ns:pidf:geopriv10:civicAddr	[RFC5139]
pidf	urn:ietf:params:xml:ns:pidf	[RFC3863]
wsaw	http://www.w3.org/2006/05/addressing/wsdl	[WSA1.0]
wsdl	http://schemas.xmlsoap.org/wsdl	[WSDL]
tns	urn:schema:Microsoft.Rtc.WebComponent.Lis.2010	

2.2.2 Messages

None.

2.2.3 Elements

The following table summarizes the set of common XML schema element definitions defined by this specification. XML schema element definitions that are specific to a particular operation are described with the operation.

Element	Description
Entity	The Uniform Resource Identifier (URI) that the Location Object returned in the Presence Information Data Format (PIDF) document references.
ReturnCode	The return code indicating whether the request succeeded or the reason for failure.

Element	Description
presenceList	List of pidf:presence elements each containing a location object.

2.2.3.1 Entity

The **Entity** element contains the Uniform Resource Identifier (URI) that the Location Object returned in the Presence Information Data Format (PIDF) document references. It is expected to be the URI of the user making the Web service request.

The schema for this element is as follows:

```
<xsd:element minOccurs="1" maxOccurs="1" name="Entity" type="tns:restrictedAnyURI" />
```

2.2.3.2 ReturnCode

The **ReturnCode** element contains the return code in the response, indicating whether the request succeeded or the reason for failure.

The schema for this element is as follows:

```
<xsd:element minOccurs="1" maxOccurs="1" name="ReturnCode" type="tns:ReturnCodeType" />
```

The **ReturnCodeType** type and each of the values it can take are described in section 2.2.5.1.

2.2.3.3 presenceList

The **presenceList** element contains the list of **pidf:presence** elements in the response, each of which contains a **location** object.

The schema for this element is as follows:

```
<xsd:element minOccurs="0" maxOccurs="1" name="presenceList" type="tns:presenceListType" />
```

The **presenceListType** type is described in section 2.2.4.1.

2.2.4 Complex Types

The following table summarizes the set of common XML schema complex type definitions defined by this specification. XML schema complex type definitions that are specific to a particular operation are described with the operation.

Complex type	Description
presenceListType	List of pidf:presence elements.

2.2.4.1 presenceListType

The **presenceListType** complex type contains a list of **pidf:presence** elements. The **pidf:presence** element, as defined by PIDF [RFC3863], has a GEOPRIV Location Object, as defined in [RFC4119], extension for the status value embedded in it. The **location-info** element embedded in the **geopriv** element MUST conform to the Civic Location Format defined in [RFC5139]. The client ignores all except the following elements returned in the Civic Address: **country/region, A1, A3, PRD, RD, STS, POD, HNO, HNS, LOC, NAM, PC**. If the address cannot be trusted to match the network identifiers specified in the location request, the **method** element embedded in the **geopriv** element MUST have the value "Manual".

The schema for this type is as follows:

```
<xsd:complexType name="presenceListType">
  <xsd:sequence>
    <xsd:element minOccurs="0" maxOccurs="unbounded" ref="pidf:presence" />
  </xsd:sequence>
</xsd:complexType>
```

2.2.5 Simple Types

The following table summarizes the set of common XML schema simple type definitions defined by this specification. XML schema simple type definitions that are specific to a particular operation are described with the operation.

Simple type	Description
ReturnCodeType	The return code indicating whether the request succeeded or the reason for failure.
restrictedAnyURI	s:anyURI but bounded to length between 1 and 64.

2.2.5.1 ReturnCodeType

The **ReturnCodeType** simple type contains the return code indicating whether the request succeeded or the reason for failure. The return code can be one of the following four values:

- 200=Success
- 400=Bad Request
- 404=Not Found
- 500=Internal Server Error

The schema for this type is as follows:

```
<xsd:simpleType name="ReturnCodeType">
  <xsd:annotation>
    <xsd:documentation>200=Success; 400=Bad Request; 404=Not Found; 500=Internal Server
    Error;</xsd:documentation>
  </xsd:annotation>
  <xsd:restriction base="xsd:string">
    <xsd:enumeration value="200" />
    <xsd:enumeration value="400" />
    <xsd:enumeration value="404" />
  </xsd:restriction>
</xsd:simpleType>
```

```
        <xsd:enumeration value="500" />
    </xsd:restriction>
</xsd:simpleType>
```

2.2.5.2 restrictedAnyURI

The **restrictedAnyURI** simple type is the same as the **xsd:anyURI** simple type, except that the length of **restrictedAnyURI** is restricted to a value from 1 through 64^{<2>}.

The schema for this type is as follows:

```
<xsd:simpleType name="restrictedAnyURI">
  <xsd:annotation>
    <xsd:documentation>anyURI but bounded to length between 1 and 64.</xsd:documentation>
  </xsd:annotation>
  <xsd:restriction base="xsd:anyURI">
    <xsd:minLength value="1" />
    <xsd:maxLength value="64" />
  </xsd:restriction>
</xsd:simpleType>
```

2.2.6 Attributes

This specification does not define any common XML schema attribute definitions.

2.2.7 Groups

This specification does not define any common XML schema group definitions.

2.2.8 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

2.2.9 Common Data Structures

This specification does not define any common XML schema data structures.

3 Protocol Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

3.1 Server Details

The Location Information Service listens on a port type called `ILIService`. The interface exposes two operations called `GetLocations` and `GetLocationsInCity`.

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The Location Information Service does not retain any state between requests, but conceptually has access to configuration that maps network identifiers such as the following:

- Wireless Access Point Basic Service Set Identifier—mapped as `WAPBSSID`
- Received Signal Strength Indication—mapped as `RSSI`
- Media Access Control Address—mapped as `MAC`
- Chassis—mapped as `ChassisID`, which is a binary large object (BLOB) representing the `ChassisID type-length-value (TLV)`, as defined by [\[IEEE802.1AB\]](#)
- Port—mapped as `PortID`, which is a BLOB representing the `PortID type-length-value (TLV)`, as defined by [\[IEEE802.1AB\]](#)
- Subnet—mapped as `SubnetID`
- Internet Protocol Address to Locations—mapped as `IP`

3.1.2 Timers

None.

3.1.3 Initialization

As part of initialization, the server **MUST** start listening for incoming requests on an HTTPS **Uniform Resource Locator (URL)**. The client **MUST** have access to this HTTPS URL and can obtain the URL by a channel that is separate from the HTTPS channel used for retrieving locations, for example, through SIP.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of WSDL operations as defined by this specification:

Operation	Description
GetLocations	This operation retrieves the most appropriate locations that match the network identifiers specified in a location request.
GetLocationsInCity	This operation retrieves the locations in city, state, and country/region specified in the request.

3.1.4.1 GetLocations

The following excerpt from this protocol's WSDL specifies the messages that constitute this operation.

```
<wsdl:operation name="GetLocations">
  <wsdl:input wsaw:Action="LIService/GetLocations" name="GetLocationsRequest"
  message="tns:GetLocationsRequest" />
  <wsdl:output wsaw:Action="LIService/GetLocationsResponse" name="GetLocationsResponse"
  message="tns:GetLocationsResponse" />
</wsdl:operation>
```

When a client needs to request a location, a **Transmission Control Protocol (TCP)** connection MUST be made to the server and **Secure Sockets Layer (SSL)** MUST be negotiated. The address of the server that makes the TCP connection can be obtained through a different channel, such as SIP. After successful SSL negotiation, a SOAP HTTP request, **GetLocationsRequest** message, MUST be constructed with a **SOAP body** containing the **GetLocationsRequest** element.

On receiving a **GetLocationsRequest** request, the server queries its repository of locations to get all of the locations that match the network identifiers specified in the request. The order in which these locations are looked up by using the network identifiers is WAPBSSID, ChassisID+PortID, ChassisID, SubnetID, MAC. This order, however, is implementation-specific and depends on what is considered the most-appropriate location match by the server. After obtaining a location match, the server MUST construct the **GetLocationsResponse** message, containing the **GetLocationsResponse** element, and it MUST send the message in the SOAP HTTP response, which is a 2xx response to a SOAP HTTP request. In case of errors, the **GetLocationsResponse** message MUST specify the error that was encountered by the server, and the error MUST be sent in the 2xx SOAP HTTP response. The **GetLocationsResponse** message is specified in section [3.1.4.1.1.2](#). Errors in protocols and in the security model described in section [2.1](#) and section [1.4](#) should be handled per their own specifications.

3.1.4.1.1 Messages

The following table summarizes the set of WSDL message definitions that are specific to this operation.

Message	Definition
GetLocationsRequest	A request from a client to retrieve the locations of the endpoint (5) .
GetLocationsResponse	The response from a server after it executes a request to retrieve the locations of an endpoint (5).

3.1.4.1.1.1 GetLocationsRequest

The **GetLocationsRequest SOAP message** is a request that is sent from the client to retrieve the locations of the endpoint (5). Typically this message is sent just after login and whenever the client endpoint (5) connects to another wireless access point, but it is implementation-specific. The request information MUST be captured in the **GetLocationsRequest** element in the SOAP body of the message. The **GetLocationsRequest** element is specified in section [3.1.4.1.2.1.<3>](#)

3.1.4.1.1.2 GetLocationsResponse

The **GetLocationsResponse** SOAP message is a response that is sent by the server after it executes a request to retrieve the locations of the endpoint (5). This message contains the locations that match the network identifiers specified in the request. The result is represented in the **GetLocationsResponse** element, which MUST be in the SOAP body of the SOAP message. The **GetLocationsResponse** element is specified in section [3.1.4.1.2.2](#). If the server is able to successfully match any locations for the network identifiers, the response element contains the locations matched and a **ReturnCodeType** indicating success. These locations are included in the complex type **presenceListType**, which is specified in section [2.2.4](#). In case of an error, the response element MUST specify the reason for the failure to retrieve locations in the simple type **ReturnCodeType**, which is specified in section [2.2.5](#). Because no location matches occur in the case of an error, the **presenceListType** complex type will not be present in such a case.

3.1.4.1.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Definition
GetLocationsRequest	Container in the request to retrieve the locations for network identifiers.
GetLocationsResponse	Container in the response to a request to retrieve the locations for network identifiers.

3.1.4.1.2.1 GetLocationsRequest

The **GetLocationsRequest** element is the overall container of the information that is sent in the SOAP request to retrieve locations for network identifiers. The schema of the request body within the **SOAP envelope** is as follows: [<4>](#)

```
<xsd:element name="GetLocationsRequest">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element minOccurs="1" maxOccurs="1" name="Entity"
type="tns:restrictedAnyURI" />
      <xsd:element minOccurs="0" maxOccurs="1" name="WAPBSSID"

3.1.4.1.2.2 GetLocationsResponse

The **GetLocationsResponse** element is the overall container in the response to the **GetLocationsRequest** request. **GetLocationsResponse** encapsulates the results of the operation to retrieve locations for network identifiers. It contains an optional **presenceList** element of type **presenceListType**, and one **ReturnCode** element of type **ReturnCodeType**. The schema for this element within the SOAP envelope is as follows.

```
<xsd:element name="GetLocationsResponse">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element minOccurs="1" maxOccurs="1" name="ReturnCode" type="tns:ReturnCodeType"
/>
      <xsd:element minOccurs="0" maxOccurs="1" name="presenceList"
type="tns:presenceListType" />
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
```

None.

3.1.4.1.4 Simple Types

None.

3.1.4.1.5 Attributes

None.

3.1.4.1.6 Groups

None.

3.1.4.1.7 Attribute Groups

None.

3.1.4.2 GetLocationsInCity

The following excerpt from the WSDL for this protocol specifies the messages that constitute this operation.

```
<wsdl:operation name="GetLocationsInCity">
  <wsdl:input wsaw:Action="LIService/GetLocationsInCity" name="GetLocationsInCityRequest"
message="tns:GetLocationsInCityRequest" />
  <wsdl:output wsaw:Action="LIService/GetLocationsInCityResponse"
name="GetLocationsInCityResponse" message="tns:GetLocationsInCityResponse" />
</wsdl:operation>
```

</wsdl:operation>

When a client needs to request a location, a TCP connection MUST be made to the server and SSL MUST be negotiated. The address of the server that makes the TCP connection can be obtained through a different channel, such as SIP. After successful SSL negotiation, a SOAP HTTP request, **GetLocationsInCityRequest** message, MUST be constructed with a SOAP body containing the **GetLocationsInCityRequest** element.

On receiving a **GetLocationsInCityRequest** request, the server queries its repository of locations to get all of the locations that match the city, state, and country/region specified in the request. After obtaining the locations, the server MUST construct the **GetLocationsInCityResponse** message, containing the **GetLocationsInCityResponse** element, and it MUST send the message in the SOAP HTTP response, which is a 2xx response to a SOAP HTTP request. In case of errors, the **GetLocationsInCityResponse** message MUST specify the error that was encountered by the server, and the error MUST be sent in the 2xx SOAP HTTP response. The **GetLocationsInCityResponse** message is specified in section 3.1.4.2.1.2. Errors in protocols and in the security model described in section 2.1 and section 1.4 should be handled per their own specifications.

3.1.4.2.1 Messages

The following **WSDL message** definitions are specific to this operation.

Message	Definition
GetLocationsInCityRequest	A request from a client to retrieve the locations in a city.
GetLocationsInCityResponse	The response from a server after it executes a request to retrieve the locations in a city.

3.1.4.2.1.1 GetLocationsInCityRequest

The **GetLocationsInCityRequest** SOAP message is a request that is sent from the client, typically as a result of a user action to retrieve locations in a city. The request information MUST be captured in the **GetLocationsInCityRequest** element in the SOAP body of the message. The **GetLocationsInCityRequest** element is specified in section [3.1.4.2.2.1](#).

3.1.4.2.1.2 GetLocationsInCityResponse

The **GetLocationsInCityResponse** SOAP message is a response that is sent by the server after it executes a request to retrieve locations in a city. This message contains the result of matching locations in the repository with the city, state, and country/region specified in the request. The result is represented in the **GetLocationsInCityResponse** element, which MUST be in the SOAP body of the SOAP message. The **GetLocationsInCityResponse** element is specified in section [3.1.4.2.2.2](#). If the server is able to successfully match any locations for the city, state and country/region, the **response** element contains the locations matched and a **ReturnCodeType** indicating success. These locations are included in the complex type **presenceListType**, which is specified in section [2.2.4](#). In case of an error, the response element MUST specify the reason for the failure to retrieve locations in the simple type **ReturnCodeType**, which is specified in section [2.2.5](#). Because no location matches occur in the case of an error, the **presenceListType** complex type will not be present in such a case.

3.1.4.2.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Definition
GetLocationsInCityRequest	Container of the information in a request to retrieve locations in a city, state, and country/region.
GetLocationsInCityResponse	Container of the information in a response to a request to retrieve locations in a city, state, and country/region.

3.1.4.2.2.1 GetLocationsInCityRequest

The **GetLocationsInCityRequest** element is the overall container of the information that is sent in the SOAP request to retrieve locations for city, state, and country/region. The schema of the request body within the SOAP envelope is as follows.

```
<xsd:element name="GetLocationsInCityRequest">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element minOccurs="1" maxOccurs="1" name="Entity"
type="tns:restrictedAnyURI" />
      <xsd:element minOccurs="1" maxOccurs="1" name="Country" type="ca:iso3166a2" />
      <xsd:element minOccurs="1" maxOccurs="1" name="State" type="tns:StateType" />
      <xsd:element minOccurs="1" maxOccurs="1" name="City" type="tns:CityType" />
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
```

3.1.4.2.2.2 GetLocationsInCityResponse

The **GetLocationsInCityResponse** element is the overall container in the response to the **GetLocationsInCityRequest** request. **GetLocationsInCityResponse** encapsulates the results of the operation to retrieve locations for city, state, and country/region. It contains an optional **presenceList** element of type **presenceListType**, and one **ReturnCode** element of type **ReturnCodeType**. The schema for this element within the SOAP envelope is as follows.

```
<xsd:element name="GetLocationsInCityResponse">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element minOccurs="1" maxOccurs="1" name="ReturnCode" type="tns:ReturnCodeType"
/>
      <xsd:element minOccurs="0" maxOccurs="1" name="presenceList"
type="tns:presenceListType" />
    </xsd:sequence>
  </xsd:complexType>
</xsd:element>
```

3.1.4.2.3 Complex Types

None.

3.1.4.2.4 Simple Types

The following table summarizes the XML schema simple type definitions that are specific to this operation.

Simple type	Description
CityType	A string of length between 1 and 64 that represents the City .
StateType	A string of length 2 that represents the State .

3.1.4.2.4.1 CityType

The **CityType** simple type is a string that has a length of from 1 through 64 and that represents the city.

The schema is as follows:

```
<xsd:simpleType name="CityType">
  <xsd:annotation>
    <xsd:documentation>any string of length between 1 and 64.</xsd:documentation>
  </xsd:annotation>
  <xsd:restriction base="xsd:string">
    <xsd:minLength value="1" />
    <xsd:maxLength value="64" />
  </xsd:restriction>
</xsd:simpleType>
```

3.1.4.2.4.2 StateType

The **StateType** simple type is a string of length 2 that represents the state.

The schema is as follows:

```
<xsd:simpleType name="StateType">
  <xsd:annotation>
    <xsd:documentation>any string of length 2.</xsd:documentation>
  </xsd:annotation>
  <xsd:restriction base="xsd:string">
    <xsd:minLength value="2" />
    <xsd:maxLength value="2" />
  </xsd:restriction>
</xsd:simpleType>
```

3.1.4.2.5 Attributes

None.

3.1.4.2.6 Groups

None.

3.1.4.2.7 Attribute Groups

None.

3.1.5 Timer Events

None.

3.1.6 Other Local Events

None.

4 Protocol Examples

To retrieve the location for the network identifiers of a client, the protocol client constructs the following WSDL message.

```
<soap:Body>
  <GetLocationsRequest xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <Entity>sip:voip_911_user1@contoscovdomain.com</Entity>
    <!-- <WAPBSSID>string</WAPBSSID> -->
    <RSSI>0</RSSI>
    <MAC>12-22-22-22-22-22</MAC>
    <!-- <ChassisID>base64Binary</ChassisID> -->
    <!-- <PortID>base64Binary</PortID> -->
    <SubnetID>192.168.0.0</SubnetID>
    <IP>192.168.0.244</IP>
  </GetLocationsRequest>
</soap:Body>
```

The protocol server then responds with the following. [<5>](#)

```
<soap:Body>
  <GetLocationsResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <ReturnCode>200</ReturnCode>
    <presenceList>
      <presence entity="sip:voip_911_user1@contoscovdomain.com"
        xmlns="urn:ietf:params:xml:ns:pidf">
        <tuple id="_LIS:0">
          <status>
            <geopriv xmlns="urn:ietf:params:xml:ns:pidf:geopriv10">
              <location-info>
                <civicAddress xmlns="urn:ietf:params:xml:ns:pidf:geopriv10:civicAddr">
                  <country>US</country>
                  <A1>WA</A1>
                  <A3>Redmond</A3>
                  <PRD />
                  <RD>163rd</RD>
                  <STS>Ave</STS>
                  <POD>NE</POD>
                  <HNO>3910</HNO>
                  <HNS />
                  <LOC>30/3351</LOC>
                  <NAM>Microsoft</NAM>
                  <PC>98052</PC>
                </civicAddress>
              </location-info>
            </geopriv>
          </status>
        </tuple>
      </presence>
    </presenceList>
  </GetLocationsResponse>
</soap:Body>
```

To retrieve the locations for the city, state, and country/region specified by a client, the protocol client constructs the following WSDL message.

```
<soap:Body>
  <GetLocationsInCityRequest xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <Entity>sip:voip_911_user1@vcontoscodomain.com</Entity>
    <Country>US</Country>
    <State>WA</State>
    <City>San Francisco</City>
  </GetLocationsInCityRequest>
</soap:Body>
```

The protocol server then responds with the following.

```
<soap:Body>
  <GetLocationsInCityResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <ReturnCode>404</ReturnCode>
  </GetLocationsInCityResponse>
</soap:Body>
```

5 Security

5.1 Security Considerations for Implementers

This protocol allows HTTP connections only over SSL. Users are authenticated using **Kerberos** v5 and **NT LAN Manager (NTLM) Authentication Protocol authentication (2)** methods. NTLM is described in [\[MS-NLMP\]](#). Clients can also be authenticated using the SPNEGO-based Kerberos and NTLM HTTP authentication (2), as described in [\[RFC4559\]](#). Clients can also be authenticated using custom **certificate (1)**-based authentication (2), as described in [\[MS-OCAUTHWS\]](#).

5.2 Index of Security Parameters

None.

6 Appendix A: Full WSDL

For ease of implementation, the full WSDL and schema are provided in this appendix.

```

</xsd:schema>
```

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® Lync® Server 2010
- Microsoft® Lync® 2010
- Microsoft® Lync® Server 2013
- Microsoft® Lync® 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 2.1:](#) Lync Server 2010, Lync 2010: These product versions support only Internet Protocol version 4 (IPv4). They do not support Internet Protocol version 6 (IPv6).

[<2> Section 2.2.5.2:](#) Lync Server 2010, Lync 2010: The limit is 1 to 454 characters.

[<3> Section 3.1.4.1.1.1:](#) Lync 2010: Lync 2010 populates the elements of the **GetLocationsRequest** request out of order. To interoperate with this client, the server MUST support requests that have the elements out of order. The out-of-order element sequence is specified in the product behavior note in section [3.1.4.1.2.1](#).

[<4> Section 3.1.4.1.2.1:](#) Lync 2010: The Lync 2010 implementation differs from the given schema, in the sense that it sends the **GetLocationsRequest** with an out-of-order sequence of IP and MAC elements. To enable interoperability with Lync 2010, the server needs to use the following schema to validate the request.

```
<xsd:element name="GetLocationsRequest">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element minOccurs="1" maxOccurs="1" name="Entity"
type="tns:restrictedAnyURI" />
      <xsd:element minOccurs="0" maxOccurs="1" name="WAPBSSID"
type="tns:EnetMacAddressType" />
      <xsd:element minOccurs="0" maxOccurs="1" name="RSSI" type="xsd:unsignedByte" />
      <xsd:element minOccurs="0" maxOccurs="1" name="IP" type="tns:IPAddress" />
      <xsd:element minOccurs="0" maxOccurs="1" name="MAC" type="tns:EnetMacAddressType"
/>
      <xsd:element minOccurs="0" maxOccurs="1" name="ChassisID"
type="tns:LLDPChassisIDOrPortIDTLVType" />
      <xsd:element minOccurs="0" maxOccurs="1" name="PortID"
type="tns:LLDPChassisIDOrPortIDTLVType" />
      <xsd:element minOccurs="0" maxOccurs="1" name="SubnetID" type="tns:IPAddress" />
    </xsd:sequence>
  </xsd:complexType>
```

</xsd:element>

[<5> Section 4:](#) Lync Server 2010: Though attribute `id` of the element `tuple`, has the type `xsd:ID`, the Lync Server implementation currently differs in a way that it has a colon (:) character in its value in the server response.

[<6> Section 6:](#) Lync Server 2010, Lync 2010: Though attribute `id` of the complex type `tuple` has the type `xsd:ID`, the current implementations differ in that they have a colon (:) character in the `id` value in the response.

8 Change Tracking

This section identifies changes that were made to the [MS-E911WS] protocol document between the July 2012 and October 2012 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
1.3 Overview	Changed the name from 'Protocol Overview (Synopsis)' to 'Overview'	N	Content updated for template compliance.
2.2.1 Namespaces	Refined table headings, and trimmed extraneous content from descriptions.	N	Content updated.
