## 1.3 Overview

This protocol is a Web service based protocol that is used to access **workbooks** controlled by a protocol server. The protocol specified in this document is stateful and relies on **sessions (2)** to maintain state. Workbooks hosted on a protocol server are used to present, store, manipulate, and **calculate** tabular data. For an overview of the specific implementation of a workbook server system that uses this protocol, see [\[MSDN-ESO\]](#).

The protocol provides the following sets of functionality that can be performed on workbooks:

- Open existing workbooks for viewing and editing and close open workbooks.
- Create new workbooks.

- Save workbooks.
- Retrieve the full contents of the current open copy.
- Recalculation.
- **Refresh connected data.**
- Set specific values into a **worksheet cell** or **range**.
- Get specific values from a worksheet cell or range.
- Cancel a request.
- Get the names of all the **published items** in a workbook.
- Get a **URL** to an image of a chart in a workbook.
- Get information about a session.
- Get the version of the protocol server.

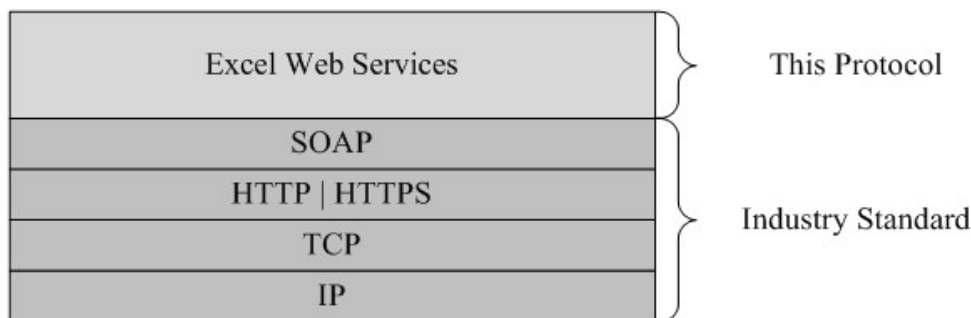

### 1.3.1 Published Items and Results Returned by this Protocol

A protocol server can have functionality where only portions of the workbook are available for use by protocol clients. The parts of the workbook that are accessible from the protocol server are said to be published. Some of the operations in this protocol could fail if the workbook item being exposed or changed is not published and the user does not have sufficient permissions to view items that have not been published.

### 1.4 Relationship to Other Protocols

This protocol uses the **SOAP** message protocol for formatting request and response messages, as described in [\[SOAP1.1\]](#), [\[SOAP1.2/1\]](#) and [\[SOAP1.2/2\]](#). It transmits those messages by using **HTTP**, as described in [\[RFC2616\]](#), or **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#).

The following diagram shows the underlying messaging and transport stack used by the protocol:

**Figure 1: This protocol in relation to other protocols**

## 1.5 Prerequisites/Preconditions

This protocol operates against a **site (2)** that is identified by a URL that is known by protocol clients. The protocol server endpoint is formed by appending "\_vti\_bin/ExcelService.asmx" to the URL of the site (2), for example [http://www.contoso.com/Repository/\\_vti\\_bin/ExcelService.asmx](http://www.contoso.com/Repository/_vti_bin/ExcelService.asmx).

This protocol assumes that authentication has been performed by the underlying protocols.

## 1.6 Applicability Statement

This protocol can be used at any time to access a simple interface that supports basic operations that leverage server side calculation of workbooks is needed. It is appropriate to use this as a public-facing interface to workbooks hosted on a server.

## 1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Supported transports:** This protocol can be implemented by using transports that support sending SOAP messages, as described in section [2.1](#).
- **Protocol versions:** This protocol is not versioned.
- **Capability negotiation:** This protocol does not support capability negotiation.

## 1.8 Vendor-Extensible Fields

None.

## 1.9 Standards Assignments

None.

## 2 Messages

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The **WSDL** in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the protocol as specified restricts the same elements to being non-empty, not null, and present.

### 2.1 Transport

Protocol servers **MUST** support SOAP over HTTP. Protocol servers **MAY** additionally support SOAP over HTTPS for securing communication with clients.

Protocol messages **MUST** be formatted as specified either in [\[SOAP1.1\]](#) section 4 or in [\[SOAP1.2/1\]](#) section 5. Protocol server faults **MUST** be returned either by using HTTP Status Codes as specified in [\[RFC2616\]](#) section 10, or by using **SOAP faults** as specified either in [\[SOAP1.1\]](#), section 4.4 or in [\[SOAP1.2/1\]](#) section 5.4. The version of the SOAP fault returned **MUST** correspond to the version of SOAP used for the request **WSDL message**.

### 2.2 Common Message Syntax

This section contains common definitions that are used by this protocol. The syntax of the definitions uses **XML schema**, as specified in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and WSDL, as specified in [\[WSDL\]](#).

#### 2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
http	<a href="http://schemas.xmlsoap.org/wsdl/http/">http://schemas.xmlsoap.org/wsdl/http/</a>

### 2.2.5.1 CellError

**Namespace:** http://schemas.microsoft.com/office/excel/server/webservices

The **CellError** type is an enumeration of a set of cell error values that a worksheet cell can contain.

It is defined as follows.

```
<xs:simpleType name="CellError" xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:restriction base="xs:string">
    <xs:enumeration value="Div0"/>
    <xs:enumeration value="NA"/>

A string that is used by the protocol server to find a sheet (1) in a workbook in some of the operations specified in this protocol.

It has the following specification:

- MUST NOT be longer than 31 characters.
- If empty, the protocol server MUST use the first sheet (1) in the workbook unless specified otherwise in the operation.
- If no sheet (1) in the workbook matches the requested **SheetName** simple type, the protocol server MUST return a SOAP fault response, which SHOULD contain the **InvalidSheetName** subcode but MAY contain any other subcode.

## 2.2.9 Common Data Structures

This protocol allows protocol servers to notify protocol clients of application-level faults by using SOAP faults. Except where specified, these SOAP faults are not significant for interoperability, and protocol clients can interpret them in an implementation-specific manner.

If [\[SOAP1.2/1\]](#) or [\[SOAP1.2/2\]](#) is used for transport, the protocol server MUST use the **Value** element inside the **Subcode** element to pass the error code, as specified in [\[SOAP1.2/1\]](#), Section 5.4.1.3. Expected subcode values are specified in each operation. Common expected subcodes are specified in the [Common List of Subcodes](#).

### 3 Protocol Details

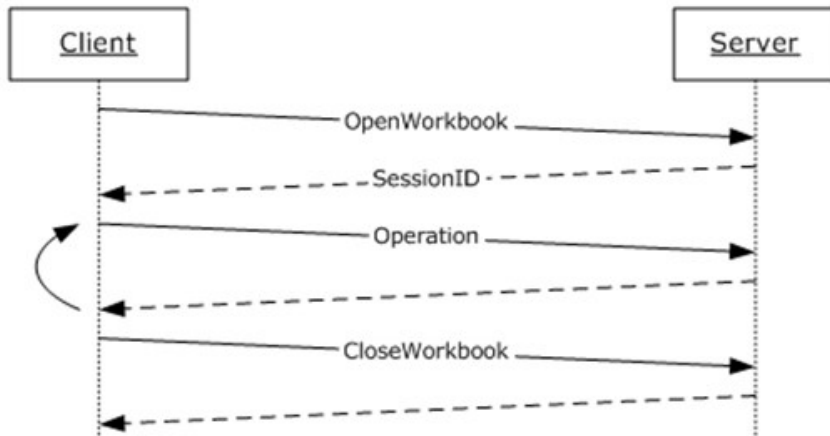

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The WSDL in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the protocol as specified restricts the same elements to being non-empty, not null, and present.

The client side of this protocol simply passes calls through, and no additional timers or other state is required. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret HTTP status codes returned by the protocol server as specified in [\[RFC2616\]](#) section 10.

This protocol allows protocol servers to perform implementation-specific localization of text in various messages. Except where specified, the localization of this text is an implementation-specific behavior of the protocol server and not significant for interoperability.

The following high-level sequence diagram illustrates the operation of the protocol.

**Figure 2: High-level sequence diagram**

#### Session Behavior

##### View Sessions

A view session is created on a successful **OpenWorkbook** or **OpenWorkbookEx** request. A view session stops responding to operations after a successful call to the **CloseWorkbook** operation or after the view session has timed out.

##### New Workbook Sessions

A new workbook session is created on a successful **NewWorkbook** request. A new workbook session stops responding to operations after a successful call to the **CloseWorkbook** operation or after the new workbook session has timed out.

## **Edit Sessions**

An edit session is created on a successful **OpenWorkbookForEditing** request, unless one already exists for the same **workbookPath**, as specified in [OpenWorkbookForEditing](#) (section 3.1.4.21). A new participant is added to the edit session on a successful **OpenWorkbookForEditing** request.

A participant that makes a call to **CloseWorkbook** is removed from the edit session if the operation completes successfully. An edit session stops responding to operations when all of its participants are removed.

### **Request Behavior**

A request is created when a **Web service** operation starts running on the server, and ends when the Web service operation finishes, when it is successfully cancelled by a **CancelRequest** call, or after the request has timed out.

## **3.1 Server Details**

### **3.1.1 Abstract Data Model**

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This specification does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this specification.

**Session:** An entity that gives context to operations done against a workbook. A session (2) is associated with a workbook state, which can be modified by state changing requests.

**Request:** An entity that represents a running request on the protocol server.

### **3.1.2 Timers**

#### **3.1.2.1 Session Timeout**

The protocol server MAY<2> time sessions (2) out. When a session (2) times out, the protocol server MUST NOT serve any requests to the timed out session (2).

#### **3.1.2.2 Request Timeout**

The protocol server MAY<3> time requests out. When a request times out, the protocol server SHOULD<4> return a SOAP fault response, with the subcode **MaxRequestDurationExceeded**.

### **3.1.3 Initialization**

None.

### **3.1.4 Message Processing Events and Sequencing Rules**

Groups that represent required and optional interfaces are shown in the following tables. Group 1 is the required set of interfaces. Group 2 is an optional set of interfaces<5>.

If one interface from an optional group is implemented, all interfaces in that group MUST be implemented.

The groups form an additive set: Group 1 is required. If one interface from Group 2 is implemented, all interfaces in Group 1 and Group 2 are implemented.

The following table summarizes the list of operations as defined by this specification.

This operation is used to calculate a specific range in the workbook.

The following is the WSDL port type specification of the **Calculate WSDL operation**.

```
<wsdl:operation name="Calculate" xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:input message="tns:CalculateSoapIn"/>
  <wsdl:output message="tns:CalculateSoapOut"/>
</wsdl:operation>
```

The protocol client sends a **CalculateSoapIn** request message, and the protocol server responds with a **CalculateSoapOut** response message as follows:

1. If the protocol determines that the workbook does not need to be calculated, it MUST succeed the operation and it MUST ignore the **sheetName** and **rangeCoordinates** parameters.
2. **sheetName** MUST NOT be empty if **rangeCoordinates** is not empty, as defined in [RangeCoordinates](#). If **sheetName** is empty, the whole workbook MUST be calculated.
3. If **rangeCoordinates** is empty, as defined in section [2.2.4.4](#), and the **sheetName** is not empty, the whole sheet (2), which was specified in **sheetName**, MUST be calculated.
4. If **rangeCoordinates** is not empty, the specified range MUST be calculated.
5. If there was an application error on the protocol server during the operation, the protocol server MUST return a SOAP fault response, which SHOULD contain one of the following subcodes or any other subcodes specified in section [2.2.9.2](#), but MAY instead contain any subcode specified in section [2.2.9.1](#) or any other subcode.

### 3.1.4.13 GetRangeA1

This operation is used to retrieve the contents of a named range in the workbook.

The following is the WSDL port type specification of the **GetRangeA1** WSDL operation.

```

<wsdl:operation name="GetRangeA1" xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:input message="tns:GetRangeA1SoapIn"/>
  <wsdl:output message="tns:GetRangeA1SoapOut"/>
</wsdl:operation>

```

The protocol client sends a **GetRangeA1SoapIn** request message, and the protocol server responds with a **GetRangeA1SoapOut** response message, as follows:

- The **rangeName** specifies the named range of the cells on the sheet (2) to retrieve. The sheet (2) that contains the sheet (2) cells to retrieve is determined in the following manner:
- If **rangeName** specifies a sheet (2), that is the sheet (2) that MUST be used.

- Otherwise, the sheet (2) specified in **sheetName** MUST be used, as specified in section [2.2.5.3](#). If neither **sheetName** nor **rangeName** specify a sheet (2), the protocol server MAY [<7>](#) use any sheet (2) in the workbook.
- Each element inside the **GetRangeA1Result** element MUST be of type **ArrayOfAnyType**. Each element inside the **GetRangeA1Result** is a row (2) of sheet (1) cells returned from the protocol server. The number of rows (2) MUST be equal to the rows (2) in the named range specified by **rangeName**.
- Each element inside each of the **ArrayOfAnyType** type nested inside **GetRangeA1Result** MUST be a single workbook sheet (2) cell. The number of elements inside each such nested **ArrayOfAnyType** MUST be equal to the number of columns (2) in the named range specified by **rangeName**.
- If **formatted** is false, all sheet (2) cells returned as part of the **GetRangeA1Result** element MUST either be empty and have the xsi:nil attribute set to true or be one of the following types: **Boolean**, **double**, **string**, or [CellError](#) (section [2.2.5.1](#)).
- If **formatted** is true, all sheet (2) cells returned as part of the **GetRangeA1Result** element MUST be type **string**, and MUST be number formatted according to how the sheet (2) cell is number formatted in the workbook.
- If there was an application error on the protocol server during the operation, the protocol server MUST return a SOAP fault response, which SHOULD contain one of the following subcodes or any other subcodes specified in section [2.2.9.2](#), but MAY instead contain any subcode specified in section [2.2.9.1](#) or any other subcode.

Subcode

### 3.1.4.29 SetParameters

This operation sets values of workbook parameters in a workbook.

The following is the WSDL port type specification of the **SetParameters** WSDL operation.

```
<wsdl:operation name="SetParameters" xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:input message="tns:SetParametersSoapIn"/>
  <wsdl:output message="tns:SetParametersSoapOut"/>
</wsdl:operation>
```

The protocol client sends a **SetParametersSoapIn** request message, and the protocol server responds with a **SetParametersSoapOut** response message, as follows:

- For each [ParameterInfo](#) (section [3.1.4.29.3.2](#)) in **parameters**, if the workbook parameter is a PivotTable page field:
  - If the number of elements in the **Values** array of ParameterInfo is equal to or greater than 1, the protocol server uses the values as the PivotTable **manual filter**.
  - If the number of elements in the **Values** array of ParameterInfo is 0, the protocol server changes the PivotTable manual filter to the **default filter value**.
- For each ParameterInfo in **parameters**, if the workbook parameter is a  **slicer** page filter:
  - If the number of elements in the **Values** array of ParameterInfo is equal to or greater than 1, the protocol server uses the values as the slicer manual filter.
  - If the number of elements in the **Values** array of ParameterInfo is 0, the protocol server changes the slicer manual filter to the default filter value.
- For each ParameterInfo in **parameters**, if the workbook parameter is neither a slicer page filter nor a PivotTable page filter:
  - If the number of elements in the **Values** array of ParameterInfo is not exactly 1, the protocol server ignores all elements in the array.
  - If the number of elements in the **Values** array of ParameterInfo is exactly 1, the protocol server applies that value to the parameter.
- If there was an application error on the protocol server during the operation, the protocol server MUST return a SOAP fault response, which SHOULD contain one of the following subcodes or any other subcodes specified in section [2.2.9.2](#), but MAY instead contain any subcode specified in section [2.2.9.1](#) or any other subcode.

## 4 Protocol Examples

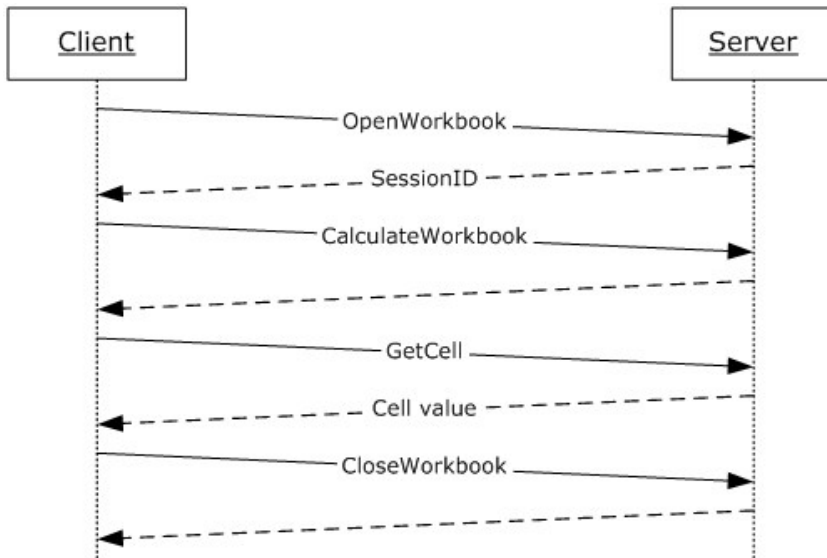

The following subsections contain examples of this protocol's usage.

For an example of a system that implements this protocol, see [\[MSDN-WDCAEWS\]](#).

### 4.1 Getting the Value of a Worksheet Cell

This example shows a simple, and typical, flow of how this protocol is used to enable a protocol client to get calculated results from a workbook. This example assumes a workbook has already been created and is stored in a location that the protocol server can load workbook files from.

In this example, a workbook is loaded on the protocol server, recalculated, a value is fetched, and the workbook is closed. The following UML diagram illustrates this example.

**Figure 3: Getting the value of a worksheet cell example**

The order of operations, including the relevant **SOAP** requests and responses for each step, is as follows:

- Load the workbook.

## 4.2 Refreshing Data and Retrieving a Workbook

This example illustrates how this protocol is used to enable a more complex series of actions, including refreshing connected data and retrieving the resulting workbook after a calculation. This example assumes a workbook has already been created and is stored in a location that the workbook protocol server can load files from. In this example a workbook is loaded on the protocol server, some values are set into the workbook, the connected data is refreshed, the workbook is recalculated, and finally the desired result of that calculation is retrieved and the workbook is closed. The following UML diagram illustrates this example.

**Figure 4: Refresh data and retrieve workbook example**

## 5 Security

### 5.1 Security Considerations for Implementers

There are security risks associated with exposing session identifiers (2). If the session identifier is exposed, it is possible for an attacker to read information from, or modify data in, a session (2) on the protocol server. An implementer of this protocol is to consider keeping session identifiers protected. There could be some cases where it is desirable to expose the session identifier, but implementers are to use caution in how they expose session identifiers and consider the security risks.

### 5.2 Index of Security Parameters

None.

## 7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft Office SharePoint Server 2007
- Microsoft SharePoint Server 2010
- Microsoft SharePoint Server 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

## 8 Change Tracking

This section identifies changes that were made to the [MS-ESP] protocol document between the February 2014 and April 2014 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.

- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).
