1 Introduction

This document specifies the Excel Calculation Web Service Version 3 Protocol. This protocol enables communication between a protocol client that displays workbooks for viewing and editing with a protocol server that loads and calculates workbooks.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. Sections 1.5 and 1.9 are also normative but cannot contain those terms. All other sections and examples in this specification are informative.

1.3 Protocol Overview (Synopsis)

This protocol is used for communication between a protocol server, which provides access to **workbooks**, and a protocol client, which renders the data provided by the protocol server. The communication is always initiated by the protocol client using different operations, whose functionality is outlined in section [1.3.2](#).

1.3.1 Session-based Protocol

The protocol is **session (2)** based and uses a unique **session identifier (2)**. This session identifier is generated when a new session is created and is used thereafter to refer to that particular session.

Multiple sessions (2) can exist at the same time. Multiple participants can share an individual **edit session**. Sessions can be created and closed independently.

1.3.2 Protocol Operations

The protocol provides the following functionality, which can be performed on workbooks:

- Open, create new, and close.
- Save or retrieve the contents of an open session (2).
- Recalculation.
- **Refresh connected data.**
- Set specific values into a **range**.
- Set the formatting, including formatting using a **number format**, for a range.
- Get specific values from a range.
- Get rendering data for a range.
- Retrieve charts and images.
- **Sort and filter tables.**

- Sort, filter, **expand**, and **collapse PivotTables**.
- Filter **cube functions**.
- Find values.
- Cancel a request.
- Get information about a session.
- Get the version of the protocol.

1.3.3 Published Items and Results Returned by this Protocol

A protocol server can have functionality where only portions of the workbook are available for consumption by protocol clients. The parts of the workbook that are available to be accessed by the protocol client are known as **published**. Some of the operations in this protocol could fail if the workbook item being exposed or changed is not published or if the user does not have sufficient permissions to view items that are not published.

1.4 Relationship to Other Protocols

This protocol uses the **SOAP** message protocol for formatting request and response messages, as described in [\[SOAP1.1\]](#), [\[SOAP1.2/1\]](#) and [\[SOAP1.2/2\]](#). It transmits those messages by using **HTTP**, as described in [\[RFC2616\]](#), or **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#).

The following diagram shows the underlying messaging and transport stack used by the protocol:

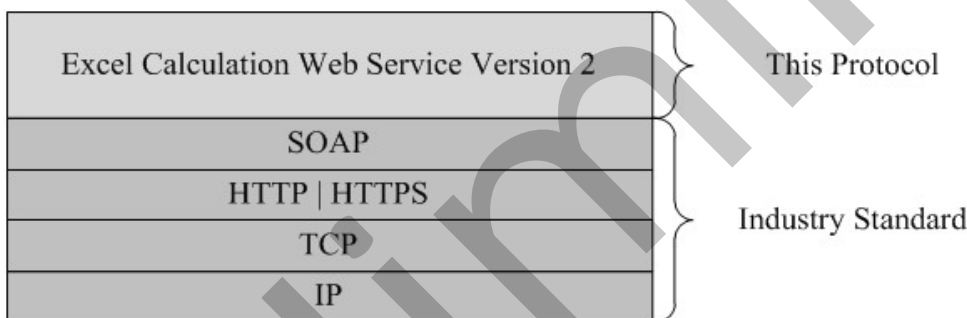

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol operates against a protocol server that exposes one or more **endpoint (4) URIs** that are known by protocol clients. The endpoint (4) URI of the protocol server and the transport that is used by the protocol server are either known by the protocol client or obtained by using the discovery mechanism that is described in [\[MS-SPTWS\]](#).

The protocol client obtains the requisite ApplicationClassId and ApplicationVersion values and the endpoint (4) URI of the protocol server that provides the discovery mechanism, as described in [\[MS-SPTWS\]](#), by means that are independent of either protocol.

This protocol requires the protocol client to have appropriate permission to call the methods on the protocol server.

The protocol client implements the token-based security mechanisms that are required by the protocol server and related security protocols, as described in [\[MS-SPSTWS\]](#).

1.6 Applicability Statement

This protocol enables communication between a protocol server, which **calculates** workbooks, and a protocol client which does the following:

- Displays workbooks and allows users to interact with those workbooks.
- Provides programmatic access to those workbooks through a public Web service.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Supported Transports:** This protocol can be implemented by using transports that support sending SOAP (Simple Object Access Protocol) messages, as specified in section [2.1](#).
- **Protocol Versions:** This protocol is not versioned.

Capability Negotiation: This protocol does not support version negotiation.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The **WSDL** in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the protocol as specified restricts the same elements to being non-empty, present, and not null.

2.1 Transport

Protocol servers **MUST** support SOAP over HTTP or HTTPS.

All protocol messages **MUST** be transported by using HTTP bindings at the transport level.

Protocol messages **MUST** be formatted as specified in either [\[SOAP1.1\]](#) section 4 or [\[SOAP1.2/1\]](#) section 5. Protocol server faults **MUST** be returned by using either HTTP status codes, as specified in [\[RFC2616\]](#) section 10, or **SOAP faults**, as specified in [\[SOAP1.1\]](#) section 4.4 or [\[SOAP1.2/1\]](#) section 5.4.

If the HTTPS transport is used, a server certificate **MUST** be deployed.

This protocol **MAY** transmit an additional SOAP header, the **ServiceContext** header, as specified in [\[MS-SPSTWS\]](#).

This protocol does not define any means for activating a protocol server or protocol client. The protocol server **MUST** be configured and begin listening in an implementation-specific way. In addition, the protocol client **MUST** know the format and transport that is used by the protocol server, for example, the SOAP format over an HTTP transport.

2.2 Common Message Syntax

This section contains common structures used by this protocol. The syntax of the structures uses **XML schema**, as specified in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and Web Services Description Language (WSDL), as specified in [\[WSDL\]](#).

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

xs	http://www.w3.org/2001/XMLSchema	[XMLSCHEM A1] [XMLSCHEM A2]

2.2.2 Messages

In the event of an application error the protocol server returns a soap fault as a response to the operation, as specified in [\[SOAP1.1\]](#), section 4.4.

The protocol client MUST ignore all elements of the soap fault, except for the **SOAP fault detail** element.

The soap fault detail element MUST contain the protocol server alert as specified in **ExcelServerMessage** (section [2.2.4.24](#)).

2.2.2.1 Common List of Id Element Values

The **Id** element of the **ExcelServerMessage** SHOULD [<1>](#) be one of the following values, unless specified otherwise:

- **CollabLocaleMismatch**
- **ConfirmDataRefresh**
- **EditModeAccessDenied**
- **EditModeCannotAcquireLockUnknownReason**
- **InternalError**
- **InvalidEditSession**
- **InvalidOrTimedOutSession**
- **MaxRequestDurationExceeded**

2.2.4.44 VisibleSheetRange

Namespace:

http://schemas.microsoft.com/office/Excel/Server/WebServices/ExcelServerInternalService/

The **VisibleSheetRange** complex type is used to specify the **Workbook** ([\[MS-EXSPXML\]](#) section 2.1.1) to be returned in the response message. The **baseline range**, in the context of this type and the operation that uses it, is the raw range initially found on the workbook before it is modified to only include visible worksheet cells. If the **ObjectName** element is present and not empty, and if the associated session is not an edit session, and if **DisallowAutoNOV** is false, the following apply:

- If the **ExcelRange** element is present and not empty:
 - The sheet (2) of the **baseline range** is determined in the following manner:
 - If a sheet (2) was specified by **ExcelRange**, that is the sheet (2) which will be used.
 - Otherwise, the protocol server will locate a published item by matching **ObjectName** to the name of the published item.

- If a match is found, the sheet (2) which contains the matching published item MUST be used.
- Otherwise, the protocol server MUST return an **ExcelServerMessage** as specified in section [2.2.4.24](#). The **Id** element of the **ExcelServerMessage** MUST be **EcsInvalidNamedObject**.
- The protocol server will locate a published range which exactly matches **ExcelRange** on the **baseline range**'s sheet.
 - If a match is found, the published range is the **baseline range**.
 - Otherwise, the protocol server MUST locate a published item on the **baseline range**'s sheet (2), which exactly matches **ExcelRange**.
 - If a match was found, the published item is the **baseline range**.
 - Otherwise, the protocol server MUST return an **ExcelServerMessage** as specified in section [2.2.4.24](#). The **Id** element of the **ExcelServerMessage** MUST be **EcsInvalidNamedObject**.
- If **ExcelRange** is not present or is empty, the protocol server will locate **ObjectName** in all the published items that belong to the workbook by matching **ObjectName** to the name of the published item.
 - If a match was found, the **baseline range** MUST be the published item's range.
 - Otherwise, the protocol server MUST return an **ExcelServerMessage** as specified in the section [2.2.4.24](#). The **Id** element of the **ExcelServerMessage** MUST be **EcsInvalidNamedObject**.
- The protocol server MUST NOT use any range outside of the **baseline range** to retrieve data from.

If **ObjectName** is not present or is empty, and the workbook contains published items, and if the associated session is not an edit session, and if DisallowAutoNOV is false:

- If **ExcelRange** is present and not empty:
 - The sheet (2) of the **baseline range** MUST be determined in the following manner:
 - If a sheet (2) was specified by **ExcelRange**, that is the sheet (2) which MUST be used.
 - Otherwise, the sheet (2) which contains the first published item MUST be used.
 - The protocol server will locate a published range which exactly matches **ExcelRange** on the **baseline range**'s sheet (2).
 - If a match is found, the published range is the **baseline range**.
 - Otherwise, the protocol server will locate a published item on the **baseline range**'s sheet (2), which contains **ExcelRange** in its entirety.
 - If a match was found, the published item is the **baseline range**.

The number of visible columns in the retrieved range MUST be equal to **VisibleColumnsRequested** unless there are not enough visible columns in the **baseline range** to retrieve, in which case all the remaining visible columns in the **baseline range** MUST be retrieved.

If the retrieved range is encompassed by a published chart, and either a) **ObjectName** is present and not empty, or b) **ObjectName** is not present or is empty, and the workbook contains published items, then the returned **Workbook** ([\[MS-EXSPXML\]](#) section 2.1.1) will contain the **CT_Images** element ([\[MS-EXSPXML\]](#) section 2.2.34) with a single **CT_Image** element ([\[MS-EXSPXML\]](#) section 2.2.33). 3 Protocol Details

In the following sections, the schema definition might differ from the processing rules imposed by the protocol. The WSDL in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL might specify differences that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **present**, and **not null**.

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret HTTP status codes returned by the protocol server as specified in [RFC2616](#), section 10.

This protocol allows protocol servers to perform implementation-specific authorization checks and notify protocol clients of authorization faults as specified previously in this section.

This protocol allows protocol servers to perform implementation-specific localization of text in various messages. Except where specified, the localization of this text is an implementation-specific behavior of the protocol server and not significant for interoperability.

The following high-level sequence diagram illustrates the operation of the protocol.

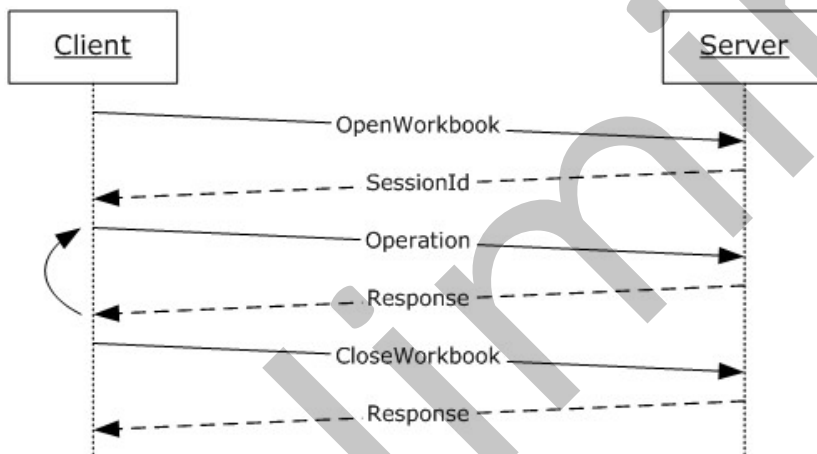

Figure 2: Excel Calculation Web Service Protocol high-level sequence diagram

Session Behavior

View Sessions

A view session is created on a successful **OpenWorkbook** request, as specified in **OpenWorkbook** (section [3.1.4.30](#)). A view session stops responding to operations after a successful call to the **CloseWorkbook** operation or after the view session has timed out.

NewWorkbook Sessions

A new workbook session is created on a successful **OpenWorkbook** request, as specified in **OpenWorkbook**. A new workbook session stops responding to operations after a successful call to the **CloseWorkbook** operation or after the new workbook session has timed out.

Edit Sessions

An edit session is created on a successful **OpenWorkbook** request, unless one already exists for the same workbook, as specified by the **url** element in **OpenWorkbook**. A new participant is added to the edit session on a successful **OpenWorkbook** request.

The current participant is removed from the edit session on a successful call to **CloseWorkbook**. An edit session stops responding to operations when all of its participants have been removed.

Request Behavior

A request is created when a **Web service** operation starts running on the protocol server, and ends when the Web service operation finishes, when it is successfully cancelled by a **CancelRequest** call, or after the request has timed out.

3.1 Server Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

Session: An entity which gives context to operations done against a workbook. A session (2) is associated with a workbook state, which can be modified by state changing operations.

State Identifier: Each session has a counter which represents its state.

Request: An entity which represents a running request on the protocol server.

Instance Identifier: A unique identifier for the protocol server. Used to identify each instance of the protocol server in farm installations.

Asynchronous Operations: An operation on the protocol server which begins when a request is received, in which the protocol server returns a response before the operation is complete. The protocol client–protocol server communication is defined as follows:

1. The protocol client issues an initiating request against the server, specifying an estimated response timeout.
2. The protocol server begins a normal operation.
3. If the operation has finished before the estimated response timeout, the protocol server returns a response to the protocol client, as expected for the specific operation.
4. If the operation has not finished before the estimated response timeout, the protocol server returns a response which contains a unique request identifier to the protocol client.
5. The protocol client then queries the protocol server about the completion of the operation by issuing the same operation that was issued in the initiating request, including the unique request identifier which was returned by the protocol server on the response to the initiating request.

6. If the operation is still incomplete, go back to step 4.
7. If the operation is complete, the protocol server returns a response to the protocol client, as expected for the specific operation.

3.1.2 Timers

3.1.2.1 Session Timeout

The **Session Timeout** timer measures the time it take for a sessions (2) to time out.

3.1.2.2 Request Timeout

The **Request Timeout** timer measures the time it takes for a request to time out.

3.1.3 Initialization

None.

When the protocol client needs to determine the caption for the **Year**, **Month**, **Day**, **Hour**, **Minute** or **Second** elements of **AutoFilterDateNodeInfo**, it MUST do the following:

- For the **Year** element value in **AutoFilterDateNodeInfo**, determine the element index of a matching value in the **YearKeys** element and then access the value at the determined index in the **YearValues** element.
- For the **Month** element value in **AutoFilterDateNodeInfo**, determine the element index of a matching value in the **MonthKeys** element, and then access the value at the determined index in the **MonthValues** element.
- For the **Day** element value in **AutoFilterDateNodeInfo**, determine the element index of a matching value in the **DayKeys** element and then access the value at the determined index in the **DayValues** element.

The protocol client sends an **ExcelServiceSoap_GetPivotFilterItemList_InputMessage** request message, and the protocol server responds with an **ExcelServiceSoap_GetPivotFilterItemList_OutputMessage** response message, as follows:

1. The protocol client sends the following information in the **pivotOperationOptions** element:
 - The PivotTable or PivotChart manual filter.
 - The PivotTable or PivotChart member that is the common ancestor of all the PivotTable or PivotChart members in the hierarchy to be returned.
2. The protocol server returns the PivotTable members or PivotChart members in the **itemList** element as follows:
 - The **PivotFilterItems** element of **itemList** MUST contain a list of the PivotTable or PivotChart members that are child PivotTable members or child PivotChart members of a particular PivotTable or PivotChart—specifically, of the member that has an **Id** element equal to the **ParentId** element of **pivotOperationOptions**. If no more than 1000 such child members exist, the list MUST contain all those child members. If more than 1000 such child members exist, the list MUST contain the first 1000 such child members.
 - If the PivotTable or PivotChart member that has an **Id** element equal to the **ParentId** element of **pivotOperationOptions** has more than 1000 child PivotTable members or child PivotChart members, the **ItemListMaxExceeded** element of **itemList** MUST be set to **true**. Otherwise, the **ItemListMaxExceeded** element of **itemList** MUST be set to **false**.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.2](#). The **Id** element of the **ExcelServerMessage** SHOULD [<27>](#) be one of the values specified in section [2.2.2.1](#).

Complex type	Description
GetRangeImageInformation	A container for information used to determine how the requested range image will be rendered.

3.1.4.54.3.1 GetRangeImageInformation

Namespace:

http://schemas.microsoft.com/office/Excel/Server/WebServices/ExcelServerInternalService/

The **GetRangeImageInformation** type is a container for information used to determine how the requested worksheet range image renders.

```
<xs:complexType name="GetRangeImageInformation" xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:sequence>
    <xs:element minOccurs="0" maxOccurs="1" name="RangeId" type="xs:string"/>
    <xs:element minOccurs="1" maxOccurs="1" name="Width" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="Height" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="Width100" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="Height100" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="ShowHeaders" type="xs:int"/>
    <xs:element minOccurs="0" maxOccurs="1" name="SheetName" type="xs:string"/>
    <xs:element minOccurs="1" maxOccurs="1" name="FirstRow" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="LastRow" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="FirstColumn" type="xs:int"/>
    <xs:element minOccurs="1" maxOccurs="1" name="LastColumn" type="xs:int"/>
  </xs:sequence>
</xs:complexType>
```

RangeId: If present the value is a worksheet range, a Table name, or a PivotTable name to generate an image for by protocol server.

Width: Width in pixels of the requested image. If the value is greater than zero, specifies a desired width in pixels for the requested range image. Provided this value is smaller than the expected width of the requested range it will be used to scale the resulting image smaller. When scaling the resulting image, the original aspect ratio will be maintained. If both **Width** and **Height** are greater than zero, the returned image will be scaled based on the axis to be resized the most.

Height: Height in pixels of the requested image. If the value is greater than zero, specifies a desired height in pixels for the requested range image. Provided this value is smaller than the expected height of the requested range it will be used to scale the resulting image smaller. When scaling the resulting image, the original aspect ratio will be maintained. If both **Width** and **Height** are greater than zero, the returned image will be scaled based on the axis to be resized the most.

Width100: The width in pixels used to limit the **LastColumn** of the range of the returned image. If the value is less than or equal to zero the protocol server ignores it. The cumulative pixel width of all visible columns (2) starting with **FirstColumn** thru **LastColumn** will be compared with **Width100**. If the cumulative width of a column (2) exceeds **Width100** then that column (2) will be treated as the **LastColumn**.

Height100: The height in pixels used to limit the **LastRow** of the range of the returned image. If the value is less than or equal to zero the protocol server ignores it. The cumulative pixel height of all visible rows (2) starting with **FirstRow** thru **LastRow** will be compared with **Height100**. If the cumulative height of a row (2) exceeds **Height100** then that row (2) will be treated as the **LastRow**.

ShowHeaders: MUST be 0.

SheetName: The name of the worksheet that the range is on as specified by the **FirstRow**, **LastRow**, **FirstColumn** and **LastColumn** elements contained in this type. MUST be present if **RangeId** is not present and MUST NOT be empty. MUST NOT be longer than 31 characters.

FirstRow: Specifies starting row (2) of the range to be returned as an image. MUST be present if **RangeId** is not present.

LastRow: Specifies ending row (2) of the range to be returned as an image. MUST be present if **RangeId** is not present.

FirstColumn: Specifies starting column (2) of the range to be returned as an image. MUST be present if **RangeId** is not present.

LastColumn: Specified ending column (2) of the range to be returned as an image. MUST be present if **RangeId** is not present.

The protocol client sends an **ExcelServiceSoap_ProcessRestRequest_InputMessage** request message, and the protocol server responds with an **ExcelServiceSoap_ProcessRestRequest_OutputMessage** response, message as follows:

The protocol server runs several operations as described as follows. For each of these, the **CommandParameter** (section [2.2.4.20](#)) input is constructed as follows:

- The **ProtocolClientId** field of the **CommandParameter** will be set to ms-rest.
- The **StateId** field of the **CommandParameter** will be set to -1.
- The **RequestSiteId** field of the **CommandParameter** will be set to the **RequestSiteId** property of the **request** parameter.
- The **WorkbookId** field of the **CommandParameter** will be set as follows:
 - For the **OpenWorkbook** operation (described in step 1.a), it will not be set.
 - For all other operations it will be set to the stored session identifier (2), which is obtained in step 1.
- The protocol server will first obtain a session identifier (2) as follows:
 1. If the **OpenWorkbookInParameters** field of the **request** parameter in the **ProcessRestRequest** input is specified:
 1. The protocol server will perform the **OpenWorkbook** operation as specified in section [3.1.4.30](#).
 2. The **inParameters** for the **OpenWorkbook** operation are specified by the **OpenWorkbookInParameters** of **request** parameter in the **ProcessRestRequest** input.

3. The **OpenWorkbookOutParameters** field of the **result** in the **ProcessRestRequestResponse** will be set to the **outParameters** field of the **OpenWorkbookResponse**.
 4. The **workbookId** field of the **OpenWorkbookResponse** will be used as the **WorkbookId** field of all **CommandParameter** objects used in the steps following this one.
2. If the **OpenWorkbookInParameters** field of the **request** parameter in the **ProcessRestRequest** input is not specified:
 - The **SessionId** field of the **request** parameter in the **ProcessRestRequest** input MUST be a valid session identifier (2). The protocol server will set the **WorkbookId** field of all **CommandParameter** objects used in the steps following this one to the value of the **SessionId** field of the **request** parameter in the **ProcessRestRequest** input.
 - If the **ListOfCellsToSet** field of the **request** parameter in the **ProcessRestRequest** input is specified and its length is not zero, the protocol server will then perform the **SetRangeA1** operation as specified in section [3.1.4.44](#) as follows:
 1. The **parameter** parameter of the **SetRangeA1** input will be prepared as described previously.
 2. The **setRangeRequests** parameter of the **SetRangeA1** input will be set specified as the **ListOfCellsToSet** field of the **request** parameter in the **ProcessRestRequest** input.
 - The protocol server will then perform a different operation depending on the type of the **request** parameter in the **ProcessRestRequest** input as follows:
 1. **RestRequest** (section [2.2.4.68](#)):
 1. The **result** field of the **ProcessRestRequestResponse** will be of type **RestResult** (section [2.2.4.69](#)).
 2. The protocol server will not perform any additional operations in this step.
 2. **RestChartPngRequest** (section [2.2.4.56](#)):
 1. The **result** field of the **ProcessRestRequestResponse** will be of type **RestChartPngResult** (section [2.2.4.57](#)).
 2. The protocol server will perform the **GetChart** operation as specified in section [3.1.4.14](#).
 3. The **parameter** parameter of the **GetChart** input will be prepared as described previously.
 4. The **getChartInformation** parameter of the **GetChart** input will be specified with **Height** as -1, **Width** as -1, and **Name** equal to the **ChartName** field of the **request** parameter in the **ProcessRestRequest** input.
 5. The **result** field of the **ProcessRestRequestResponse** will have the **ImageFormatType** field set to the **imageFormatType** field of the **GetChartResponse** and the **ImageData** field set to the **binaryChartImage** field of the **GetChartResponse**.
 3. **RestRangePngRequest** (section [2.2.4.63](#)):
 1. The **result** field of the **ProcessRestRequestResponse** will be of type **RestPngResult** (section [2.2.4.60](#)).

2. The protocol server will perform the **GetRangeImage** operation as specified in section [3.1.4.54](#).
 3. The **parameter** parameter of the **GetRangeImage** input will be prepared as described previously.
 4. The **getRangeImageInformation** parameter of the **GetRangeImage** input will be specified with **RangeId** as the **RangeName** field in the **request** parameter in the **ProcessRestRequest** input. **ShowHeaders** will be set to 1 if the **Nov** field of the **request** parameter in the **ProcessRestRequest** input is true and 0 otherwise.
 5. The **result** field of the **ProcessRestRequestResponse** will have the **ImageFormatType** field set to the **imageFormatType** field of the **GetRangeImageResponse** and the **ImageData** field set to the **binaryRangeImage** field of the **GetRangeImageResponse**.
4. **RestPublishedObjectsRequest** (section [2.2.4.61](#)):
1. The **result** field of the **ProcessRestRequestResponse** will be of type **RestPublishedObjectsResult** (section [2.2.4.62](#)).
 2. The protocol server will perform the **GetPublishedObjects** operation as specified in section [3.1.4.20](#).
 3. The **parameter** parameter of the **GetPublishedObjects** input will be prepared as described previously.
 4. The **options** parameter of the **GetPublishedObjects** input will be specified as the **Options** field in the **request** parameter in the **ProcessRestRequest** input.
 5. The **result** field of the **ProcessRestRequestResponse** will have the **PublishedObjects** field set to the **publishedObjects** field of the **GetPublishedObjectsResult**.
5. **RestRangeValuesRequest** (section [2.2.4.64](#)):
1. The **result** field of the **ProcessRestRequestResponse** will be of type **RestRangeValuesResult** (section [2.2.4.65](#)).
 2. The protocol server will perform the **GetRangeValuesA1** operation as specified in section [3.1.4.24](#).
 3. The **parameter** parameter of the **GetRangeValuesA1** input will be prepared as described previously.
 4. The **rangeRequests** parameter of the **GetRangeValuesA1** input will be specified as an **ArrayOfRangeValuesA1** containing a single **RangeValuesA1** as follows:
 1. </wsdl:operation>
```

The protocol client sends an **ExcelServiceSoap_DdaGetSelectedData_InputMessage** request message, and the protocol server responds with an **ExcelServiceSoap_DdaGetSelectedData_OutputMessage** response message, as follows:

1. The protocol client sends the identifying the Office Web Extension, a range string that describes the selected range, a filter and value format options.
2. The protocol server will parse the range string to a range on a worksheet and return the cell contents in that range. Each element inside the **selectedData** element MUST be of type **ArrayOfAnyType** and is a row of cell returned from the protocol server. The number of rows MUST be less than or equal to the number of rows requested.
3. The result can be filtered to omit values from hidden cells depending on **filterType** in the request. If **filterType** is **DdaFilterType.OnlyVisible** and the requested range contains hidden cells then those rows and columns MUST NOT be in the result.
4. The result MUST contain either all formatted values or unformatted cell contents depending on **valueFormat** in the request. If **valueFormat** is **DdaValueType.Formatted** then all values returned in **selectedData** MUST be of type string. If **valueFormat** is **DdaValueType.Unformatted** then values returned in **selectedData** MUST be one of the following types: **boolean**, **double**, **string** or **CellError** (section [2.2.5.5](#)).

This operation is not a state changing operation on the protocol server.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.2](#). The **Id** element of the **ExcelServerMessage** SHOULD [<86>](#) be one of the values specified in section [2.2.2.1](#)

All worksheet cells in the **data** element MUST either be empty and with the `xsi:nil` attribute set to true or one of the following types: **boolean**, **dateTime**, **decimal**, **double**, **float**, **int**, **short**, **string**, or **unsigned byte**. If the value is of type **string**, it MUST NOT be longer than 32767 characters. If the protocol server does not support the value, it MUST fail. If the protocol server does not support setting a value in the specified location, it MUST fail.
6. If location or the cell contents extends beyond the binding range then the operation MUST fail.
7. If any of the changed cells are hidden and the user has only view access then the operation MUST fail.

This operation is a state changing operation on the protocol server.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.2](#). The **Id** element of the **ExcelServerMessage** SHOULD [<90>](#) be one of the values specified in section [2.2.2.1](#)

The protocol client sends an **ExcelServiceSoap_DdaSetSelectedData_InputMessage** request message, and the protocol server responds with an **ExcelServiceSoap_DdaSetSelectedData_OutputMessage** response message, as follows:

1. The protocol client sends information identifying the Office Web Extension, a matrix of cell contents, and range string that describes the selected range.
2. The protocol server parses the string to a range on a worksheet and sets the cell contents in that range.
3. Each element inside the **data** element MUST be of type **ArrayOfAnyType** and be a row of worksheet cell data sent to the protocol server. The number of rows in **data** MUST be equal to the number of rows in the specified binding element minus the value of **startRow**.
4. Each element inside each of the **ArrayOfAnyType** type nested inside **data** MUST be a single worksheet cell. The number of elements inside each such nested **ArrayOfAnyType** MUST be equal to the number of columns in the specified binding minus the value of **startCol**.
5. All worksheet cells in the **data** element MUST either be empty and with the `xsi:nil` attribute set to true or one of the following types: **boolean**, **dateTime**, **decimal**, **double**, **float**, **int**, **short**, **string**, or **unsigned byte**. If the value is of type **string**, it MUST NOT be longer than 32767 characters. If the protocol server does not support the value, it MUST fail. If the protocol server does not support setting a value in the specified location, it MUST fail.
6. If the given cell matrix does not exactly match the selected range then this method MUST fail.

This operation is a state changing operation on the protocol server.

In the event of an application error on the protocol server during this operation, a SOAP fault is returned, as specified in section [2.2.2](#). The **Id** element of the **ExcelServerMessage** SHOULD [<91>](#) be one of the values specified in section [2.2.2.1](#)

4 Protocol Examples

4.1 Filtering and sorting a list and returning XML

This example shows how this protocol is used to open a view session. It demonstrates how this protocol is used to filter a list (2) in a workbook and to fetch the representation of the workbook in XML format as specified in [\[MS-EXSPXML\]](#). It also demonstrates how this protocol is used to sort the list (2).

This example assumes that a workbook has already been created and is stored in a location that the protocol server can load files from. The workbook contains a list with an AutoFilter. The following UML diagram illustrates this example.

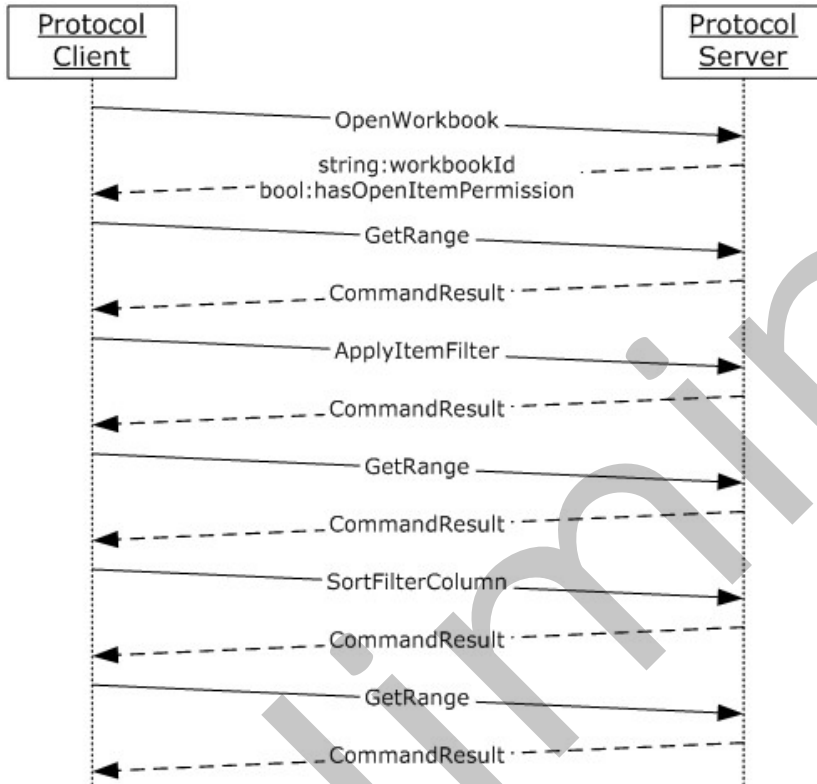

Figure 3: Communication sequence diagram for filtering and sorting a list and returning XML

The order of operations, including the relevant **XML** for each step, is as follows:

5 Security

5.1 Security Considerations for Implementers

In addition to the security considerations applicable to the underlying protocols, there are security risks associated with exposing session identifiers (2). If the session identifier is exposed, then it is possible for an attacker to read information from, or modify data in, a session on the protocol server. An implementer of this protocol needs to consider keeping session identifiers protected. There could be some cases where it is desirable to expose the session identifier, however, an implementer is to use caution in how they expose session identifiers and consider the security risks.

5.2 Index of Security Parameters

None.

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® SharePoint® Server 2013 Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.
