

[MS-OCAUTHWS]: OC Authentication Web Service Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments
03/31/2010	0.1	Major	Initial Availability
04/30/2010	0.2	Editorial	Revised and edited the technical content
06/07/2010	0.3	Editorial	Revised and edited the technical content
06/29/2010	0.4	Editorial	Changed language and formatting in the technical content.
07/23/2010	0.4	No change	No changes to the meaning, language, or formatting of the technical content.
09/27/2010	1.0	Major	Significantly changed the technical content.
11/15/2010	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
12/17/2010	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
03/18/2011	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
06/10/2011	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
01/20/2012	2.0	Major	Significantly changed the technical content.
04/11/2012	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
07/16/2012	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
10/08/2012	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
02/11/2013	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
07/30/2013	2.0	No change	No changes to the meaning, language, or formatting of the technical content.
11/18/2013	2.1	Minor	Clarified the meaning of the technical content.
02/10/2014	2.1	No change	No changes to the meaning, language, or formatting of the technical content.
04/30/2014	2.2	Minor	Clarified the meaning of the technical content.
07/31/2014	2.3	Minor	Clarified the meaning of the technical content.
10/30/2014	2.4	Minor	Clarified the meaning of the technical content.

1 Introduction

The OC Authentication Web Service Protocol defines the message formats, server behavior, and client behavior for the purposes of authentication and certificate enrollment.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [\[RFC2119\]](#). Sections 1.5 and 1.9 are also normative but do not contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [MS-OFCGLOS]:

- authentication**
- base64 encoding**
- certificate**
- certificate chain**
- certification**
- certification authority (CA)**
- endpoint**
- fully qualified domain name (FQDN)**
- GUID**
- Hypertext Transfer Protocol (HTTP)**
- Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**
- Integrated Windows authentication**
- Kerberos**
- NT LAN Manager (NTLM) Authentication Protocol**
- private key**
- proxy**
- public key**
- Security Assertion Markup Language (SAML)**
- security association (SA)**
- security token**
- security token service (STS)**
- server**
- Session Initiation Protocol (SIP)**
- SOAP**
- SOAP fault**
- SOAP message**
- Transport Layer Security (TLS)**
- Uniform Resource Identifier (URI)**
- Uniform Resource Locator (URL)**
- user agent server (UAS)**
- web application**
- web service**
- Web Services Description Language (WSDL)**
- web ticket**
- WSDL message**
- WSDL operation**
- X.509**
- XML namespace**
- XML schema**
- XML schema definition (XSD)**

The following terms are specific to this document:

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specification documents do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Protocol Overview (Synopsis)

This protocol can be used to generate a **security token**, which can subsequently be used for **authentication** (2) with other services. This protocol also allows a protocol client to request **X.509 v3 certificates** (2), which can subsequently be used for certificate-based authentication (2).

This protocol is used by the Web Ticket Service, described in section [1.3.1](#), by the Certificate Provisioning Service, described in section [1.3.2](#), and by the Authentication Broker Service, described in section [1.3.3](#).

1.3.1 Web Ticket Service

The Web Ticket Service is a **security token service (STS)**. The type of credentials that a client presents to the Web Ticket Service is described in section [3.2](#). The security token returned in the response is called a **Web ticket**.

The client presents the Web ticket as its credentials when authenticating to certain **Web applications** (2). See the individual Web application (2) specifications for details, for example Lync Autodiscover Web Service described in [\[MS-OCDISCWS\]](#) or Certificate Provisioning Service described in this document. The Web ticket can be presented in the body of the **Hypertext Transfer Protocol (HTTP)** message or in the HTTP header, depending on the type of Web application (2).

1.3.1.1 Web Service Web Applications

The following figure illustrates this protocol for Web applications (2) that are **Web services**.

Figure 1: This protocol for Web service Web applications

1. The client requests the Web service's metadata using WS Metadata Exchange protocol as described in [\[WS-MetadataExchange\]](#).
2. The Web service metadata is returned. The client discovers the **Uniform Resource Locator (URL)** of the Web Ticket Service. See details in section [3.2](#).
3. The client requests the Web Ticket Service's metadata.
4. The Web Ticket Service metadata is returned. The following authentication (2) types can be associated with the bindings in the metadata: **Integrated Windows authentication**, OCS-signed certificate authentication, and Live ID authentication. For details, see section [3.2](#).
5. The client sends an RST (Request Security Token). For details, see section [3.2.4.1.1.1](#).
6. The Web Ticket Service responds with an RSTR (Request Security Token Response). For details, see section [3.2.4.1.1.2](#).
7. The client sends a request to the Web service, with the Web ticket attached. For details, see section [3.2](#).
8. The Web service sends a response.

1.3.1.2 Non-Web Service Web Applications

The following figure illustrates this protocol for Web applications (2) that are non-Web services.

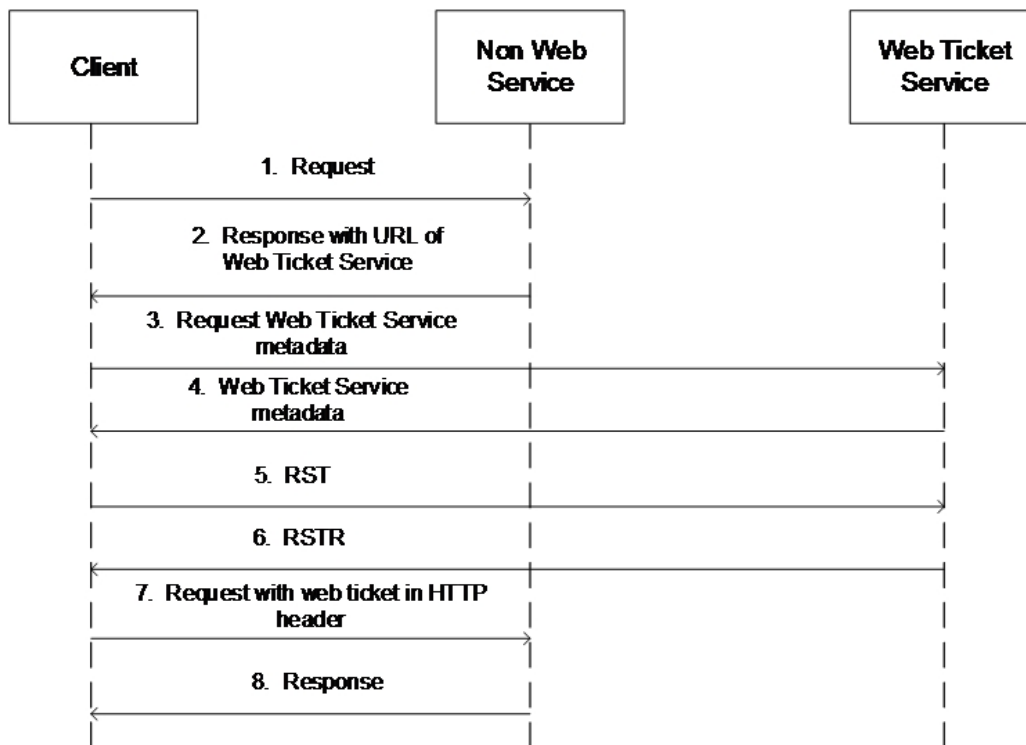

Figure 2: This protocol for non-Web service Web applications

1. The client sends a GET or POST HTTP request to the non-Web service Web application (2) with content defined by the requirements of that application.
2. A response with status code 401 and a HTTP header containing the URL of the Web Ticket Service. For details, see section [3.2](#).
3. The client requests the Web Ticket Service's metadata using WS Metadata Exchange protocol as described in [\[WS-MetaDataExchange\]](#).
4. The Web Ticket Service metadata is returned. The following authentication (2) types can be associated with the bindings in the metadata: Integrated Windows authentication, OCS-signed certificate authentication, and Live ID authentication. For details, see section [3.2](#).
5. The client sends an RST (Request Security Token). For details, see section [3.2.4.1.1.1](#).
6. The Web Ticket Service responds with a RSTR (Request Security Token Response). For details, see section [3.2.4.1.1.2](#).
7. The client sends a request to the non-Web service Web application (2), with the Web ticket in an HTTP header. For details, see section [3.2](#).
8. The Web service sends a response.

1.3.2 Certificate Provisioning Service

The Certificate Provisioning Service provides an X.509 v3 certificate (2) for the authenticated user to the client. The client can use the obtained certificate (2) for authentication (2) against other

services. One example of an authentication (2) mechanism that uses this certificate (2) can be found in [\[MS-SIPAE\]](#) section 4.4.

1.3.3 Authentication Broker Service

The Authentication Broker Service provides a web service-based **TLS** implementation. This is to be used by a client that does not have local support for TLS and wishes to use TLS-DSK authentication (2) mechanism with the **SIP** server which is detailed in [\[MS-SIPAE\]](#).

The following diagram illustrates the sequence of events. Details of the call flows are explained in section [3.3](#).

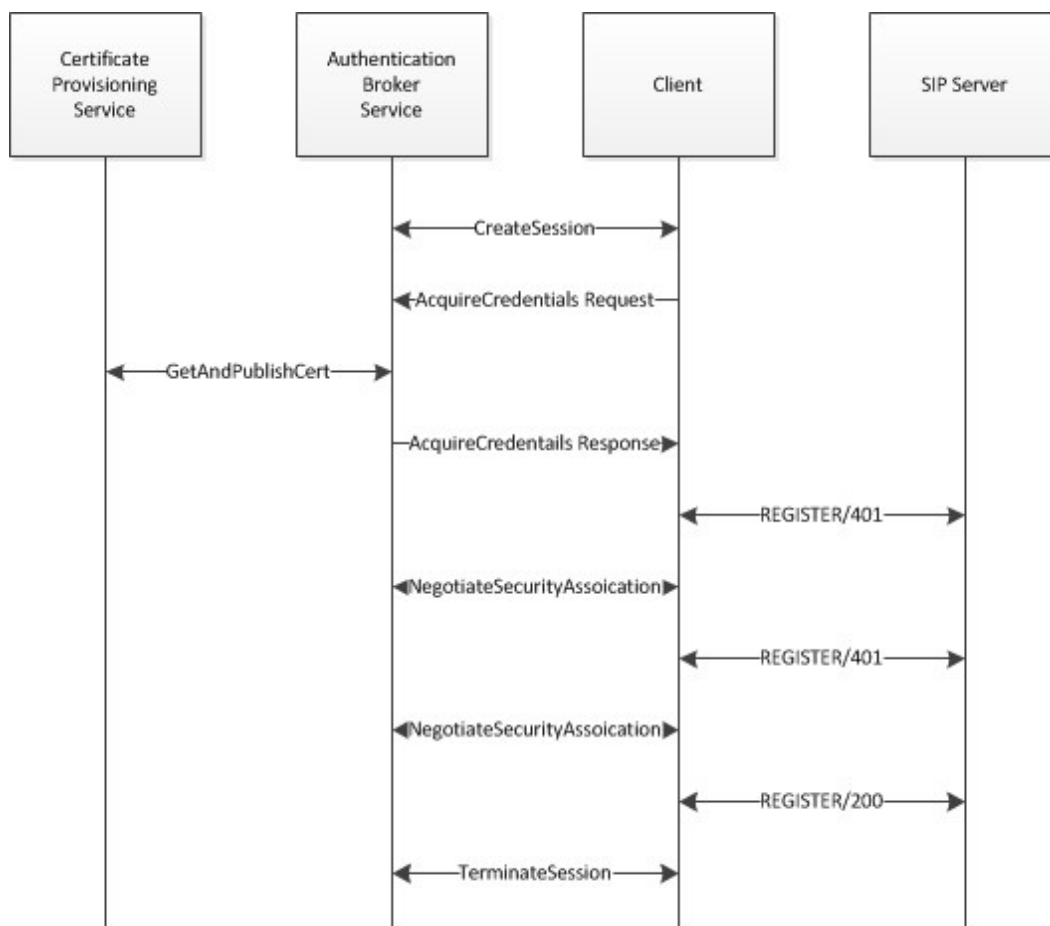

Figure 3: Sequence of events for Authentication Broker Service

1.4 Relationship to Other Protocols

The Web Ticket Service and Web applications (2) that accept Web tickets as client credentials use **Simple Object Access Protocol (SOAP)** over **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#), SOAP 1.1, as described in [\[SOAP1.1\]](#), and WS-Trust 1.3, as described in [\[WS-Trust1.3\]](#), as shown in the following figure.

Where:

Figure 4: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol facilitates the issuance of X.509 v3 certificates (2). A server implementation of the protocol requires the functionality of a **certification authority (CA)** (2), capable of interpreting requests in PKCS#10, as described in [\[RFC2986\]](#), and generating the appropriate certificate (2).

Protocol clients are required to be able to understand PKCS#7 format, as described in [\[RFC2315\]](#) and [\[RFC5652\]](#), and X.509 v3 certificate (2) format, as described in [\[RFC5280\]](#), which are used by the server to send the **certificate chain** and the certificate (2).

A protocol client needs to retrieve the Web Ticket Service URL before using this protocol. The two ways for the client to do so are shown in the figures in section [1.3.1.1](#). If the client retrieves it from a Web service, the URL ought to be read from the metadata document of a participating Web service, from the **wsp:Policy/sp:IssuedToken/sp:Issuer/wsa10:Address** element associated with the service's binding that accepts a Web ticket, as described in [\[WSSP1.2-2012\]](#) and [\[WS-MetaDataExchange\]](#). If the client retrieves it from a non-Web service, the Web application (2) is required to return it in a 401 response in an HTTP header extension named **X-MS-WebTicketURL**, as described in [\[MS-OCDISCWS\]](#).

In order to use the Authentication Broker Service, a protocol client needs to retrieve the Internal/External AuthBroker Service URL, which is included as part of the User type in the response of the Lync Autodiscover Web Service [\[MS-OCDISCWS\]](#). The section below shows a sample response.

```
<AutodiscoverResponse AccessLocation="Internal"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

  <User>
```

```
<Link token="Internal/Autodiscover"
href="https://pool1.contoso.com/Autodiscover/AutodiscoverService.svc/root"/>

<Link token="Internal/AuthBroker" href="https://pool1.contoso.com/Reach/sip.svc"/>

<Link token="Internal/Ucwa" href="https://pool1.contoso.com/Ucwa/discovery"/>

<Link token="External/Autodiscover"
href="https://pool1external.contoso.com/Autodiscover/AutodiscoverService.svc/root"/>

<Link token="External/AuthBroker"
href="https://pool1external.contoso.com/Reach/sip.svc"/>

<Link token="External/Ucwa"
href="https://pool1external.contoso.com/Ucwa/discovery"/>

<Link token="Internal/Mcx" href="https://pool1.contoso.com/Mcx/McxService.svc"/>

<Link token="External/Mcx"
href="https://pool1external.contoso.com/Mcx/McxService.svc"/>

</User>

</AutodiscoverResponse>
```

1.6 Applicability Statement

This protocol is applicable when clients require authentication (2) with servers using X.509 v3 certificates (2).

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

This protocol provides extensibility by the use of **any** and **anyAttribute** in the schema, as specified in [\[XMLSCHEMA1\]](#). Vendors can choose to include their own elements by taking advantage of this extensibility.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

This protocol uses the **SOAP message** protocol for formatting request and response messages, as specified in [\[SOAP1.2/1\]](#) and [\[SOAP1.2/2\]](#). It transmits those messages using HTTPS, as specified in [\[RFC2818\]](#).

2.2 Common Message Syntax

This section contains common definitions that are used by this protocol. The syntax of the definitions uses **XML schema**, as specified in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and **WSDL**, as specified in [\[WSDL\]](#).

The table in section [2.2.1](#) lists common namespaces.

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
xs	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1]

2.2.2 Messages

This specification does not define any common WSDL message definitions.

2.2.3 Elements

This specification does not define any common XML schema element definitions.

2.2.4 Complex Types

The following table summarizes the set of common XML schema complex type definitions defined by this specification. XML schema complex type definitions that are specific to a particular operation are described with the operation.

Complex type	Description
af:OCSDiagnosticsFaultType	Authentication-specific error information in the SOAP fault detail. It is returned for some failures during Live ID authentication (2) or Web ticket verification at a Web service.
af:MSWebAuthenticationType	WS-Policy assertion that describes the Live ID environment.
af:BindingType	WS-Policy assertion that the protocol client can communicate with the associated port. The absence of this assertion means that the client MUST NOT communicate with the associated WSDL port.
tns:ErrorInfoType	The base type of all the types that describe errors in any operation.

2.2.4.1 af:OCSDiagnosticsFaultType

The **af:OCSDiagnosticsFaultType** element is a child element of **s:Fault/s:detail**, as defined in [\[SOAP1.1\]](#).

```
<xs:complexType name="OCSDiagnosticsFaultType">
  <xs:sequence>
    <xs:element name="Ms-Diagnostics-Fault" type="af:MsDiagnosticsFaultType" minOccurs="1" />
    <xs:any processContents="lax" namespace="##any" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
</xs:complexType>
```

```

</xs:sequence>
<xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>

```

The **af:Ms-Diagnostics-Fault** element is a child element of **af:OCSDiagnosticsFaultType** element. It describes the authentication-specific error information.

```

<xs:complexType name="MsDiagnosticsFaultType">
  <xs:sequence>
    <xs:element name="ErrorId" type="xs:positiveInteger" minOccurs="1" maxOccurs="1" />
    <xs:element name="Reason" type="xs:string" minOccurs="1" maxOccurs="1" />
    <xs:any processContents="lax" namespace="##any" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>

```

The **af:ErrorId** element carries a unique positive integer value for each specific error condition.

The **af:Reason** element carries a string that provides a reason for an explanation of specific error.

Error IDs and reason string used by OC Authentication Web Service are documented in Section 7.22 of [\[MS-OCER\]](#).

2.2.4.2 af:MSWebAuthenticationType

The **af:MSWebAuthenticationType** element is a WS-Policy assertion and a child element of the **wsp:Policy** element. It contains policy elements that provide information about a security token service that can issue tokens accepted by OC Authentication Web Service.

```

<xs:complexType name="MSWebAuthenticationType">
  <xs:sequence>
    <xs:element name="Policy" type="wsp:Policy" minOccurs="1" />
    <xs:any processContents="lax" namespace="##any" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>

```

The **af:LiveIdEnvironmentType** element is a child element of the **wsp:Policy** element inside **af:MSWebAuthenticationType**. It describes the environment in which the security token service operates.

```

<xs:simpleType name="LiveIdEnvironmentType">
  <xs:restriction base="xs:string" >
    <xs:enumeration value="PRODUCTION" />
    <xs:enumeration value="PPE" />
    <xs:enumeration value="INT" />
  </xs:restriction>
</xs:simpleType>

```

The **"PRODUCTION"** enumeration value indicates production environment.

The **"PPE"** enumeration value indicates pre-production environment.

The **"INT"** enumeration value indicates integration environment.

2.2.4.3 af:BindingType

The **af:BindingType** element is a WS-Policy assertion and a child element of the **wsp:Policy** element.

```
<xs:complexType name="BindingType">
  <xs:sequence>
    <xs:any processContents="lax" namespace="##any" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

2.2.4.4 tns:ErrorInfoType

The **tns:ErrorInfoType** type is defined as follows.

```
<xs:complexType name="ErrorInfoType">
  <xs:sequence>
    <xs:element name="Description" type="xs:string" minOccurs="0" maxOccurs="1" />
    <xs:element name="AdditionalContext" minOccurs="0" maxOccurs="1">
      <xs:complexType>
        <xs:sequence>
          <xs:any processContents="lax" namespace="##any" minOccurs="0" maxOccurs="unbounded" />
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:sequence>
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

tns:Description: Contains a textual description of the error.

tns:AdditionalContext: Can contain any implementation-defined context.

2.2.5 Simple Types

The following table summarizes the set of common XML schema simple type definitions defined by this specification. XML schema simple type definitions that are specific to a particular operation are described with the operation.

Simple type	Description
tns:ResponseClassType	Specifies whether the response for an operation is success, warning, or failure.

2.2.5.1 tns:ResponseClassType

The **tns:ResponseClassType** type is defined as follows.

```

<xs:simpleType name="ResponseClassType">
  <xs:restriction base="xs:string">
    <xs:enumeration value="Success" />
    <xs:enumeration value="Warning" />
    <xs:enumeration value="Error" />
  </xs:restriction>
</xs:simpleType>

```

The enumeration values have the usual meaning, and are used by the server to represent the class of the response.

2.2.6 Attributes

The following table summarizes the set of common XML schema attribute definitions defined by this specification. XML schema attribute definitions that are specific to a particular operation are described with the operation.

Attribute	Description
tns:ResponseClass	An instance of ResponseClassType that specifies the class of Response .

2.2.6.1 ResponseClass

The **ResponseClass** attribute is defined as follows.

```

<xs:attribute name="ResponseClass" type="tns:ResponseClassType" use="required" />

```

This attribute is an instance of type **ResponseClassType**, which is defined in section [2.2.5.1](#). It appears as a required attribute in all the responses of the **GetAndPublishCert** operation, which is defined in section [3.1.4.1](#).

2.2.7 Groups

This specification does not define any common XML schema group definitions.

2.2.8 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

3 Protocol Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

3.1 Certificate Provisioning Service Server Details

The Certificate Provisioning Service hosts a message **endpoint** (5) that receives **GetAndPublishCert** messages. When received, the server uses the **certification** request, which is part of the message, to generate and sign a certificate (2). It then stores the certificate (2) in an implementation-defined manner, so that it can be used to verify a client certificate (2) presented for authentication (2). After that, it sends the certificate (2) to the client as part of **GetAndPublishCertResponse**, as specified in section [3.1.4.1.2.2](#).

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The server SHOULD keep the following states:

Certificate Issuer: A **proxy**, with which the server can communicate with a CA (2), used for generating X.509 v3 certificates (2). The nature of the proxy is implementation-dependent.

Trusted Certificate Authorities: A list of CAs (2) whose certificate chains are required to be trusted by the protocol clients in order for them to create Transport Layer Security (TLS) connections with the server. This list MUST have sufficient data that the certificates (2) in the chain can be located.

3.1.2 Timers

None.

3.1.3 Initialization

The CA (2) that would be used for generating X.509 v3 certificates (2) SHOULD be initialized with at least one **public key/private key** pair, used for signing the certificates (2).

The certificate (2) issuer proxy SHOULD be constructed and initialized, so that it can communicate with the CA (2).

The Trusted Certificate Authorities list SHOULD be initialized.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of operations as defined by this specification:

Operation	Description
GetAndPublishCert	A mechanism for clients to get a certificate (2), which can then be used for

Operation	Description
	authentication (2) purposes.

3.1.4.1 GetAndPublishCert

This operation is defined as part of the **CertProvisioningService** portType.

```
<wsdl:operation name="GetAndPublishCert">
  <wsdl:input message="tns:GetAndPublishCertMsg" />
  <wsdl:output message="tns:GetAndPublishCertResponseMsg" />
</wsdl:operation>
```

GetAndPublishCert generates a X.509 v3 certificate (2) using the PKCS#10 certification request in the request, and then stores the certificate (2) in an implementation-specific manner, so that it can be used to verify client certificates (2) supplied during authentication (2).

If an error occurs during processing, an error response MUST be sent using the **ErrorInfo** element in **GetAndPublishCertResponse**, as specified in section [3.1.4.1.2.2](#).

SOAP faults SHOULD NOT be used for error reporting.

3.1.4.1.1 Messages

The following table summarizes the set of WSDL message definitions that are specific to this operation.

Message	Description
tns:GetAndPublishCertMsg	The request for certificate provisioning.
tns:GetAndPublishCertResponseMsg	The response for certificate provisioning.

3.1.4.1.1.1 tns:GetAndPublishCertMsg

The **tns:GetAndPublishCertMsg** represents the incoming message and is defined as follows.

```
<wsdl:message name="GetAndPublishCertMsg">
  <wsdl:part name="request" element="tns:GetAndPublishCert" />
</wsdl:message>
```

tns:GetAndPublishCert: Refers to the **GetAndPublishCert** definition in section [3.1.4.1.2.1](#).

3.1.4.1.1.2 tns:GetAndPublishCertResponseMsg

The **tns:GetAndPublishCertResponseMsg** represents the outgoing message and is defined as follows.

```
<wsdl:message name="GetAndPublishCertResponseMsg">
  <wsdl:part name="response" element="tns:GetAndPublishCertResponse" />
</wsdl:message>
```

tns:GetAndPublishCertResponse: Refers to the **GetAndPublishCertResponse** definition in section [3.1.4.1.2.2](#).

3.1.4.1.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Description
tns:GetAndPublishCert	Container for the client request for certificate provisioning.
tns:GetAndPublishCertResponse	Container for the response to a request for certificate provisioning.
wst:RequestSecurityToken	Used to request a security token (for any purpose).
wst:RequestSecurityTokenResponse	Used to return a security token or response to a security token request.

3.1.4.1.2.1 tns:GetAndPublishCert

The **tns:GetAndPublishCert** element contains the client request, and is defined as follows.

```
<xs:element name="GetAndPublishCert" type="tns:GetAndPublishCertType" />
```

tns:GetAndPublishCertType: Refers to the **GetAndPublishCertType** definition in section [3.1.4.1.3.1](#).

3.1.4.1.2.2 tns:GetAndPublishCertResponse

The **tns:GetAndPublishCertResponse** element contains the response from server, and is defined as follows.

```
<xs:element name="GetAndPublishCertResponse" type="tns:GetAndPublishCertResponseType" />
```

tns:GetAndPublishCertResponseType: Refers to the **GetAndPublishCertResponseType** definition in section [3.1.4.1.3.2](#).

3.1.4.1.2.3 wst:RequestSecurityToken

The **wst:RequestSecurityToken** element is defined in [\[WS-Trust1.3\]](#) section 3.1, and further extended in [\[MS-WSTEP\]](#) section 3.1.4.1.2.5. For this protocol, this element MUST be a child of the **GetAndPublishCert** element and has the following extra restrictions:

1. **/wst:RequestedSecurityToken/wst:RequestType** MUST be "http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue".
2. **/wst:RequestedSecurityToken/wst:TokenType** MUST be "http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-x509-token-profile-1.0#X509v3".
3. **/wst:RequestedSecurityToken/wsse:BinarySecurityToken** MUST contain a PKCS#10 Certification Signing Request (CSR) ([\[MS-WCCE\]](#) section 2.2.2.6.1) encoded with **base64 encoding**

4. **/wst:RequestedSecurityToken/wsBinarySecurityToken/@EncodingType** MUST be "http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd#base64binary".
5. The **/wst:RequestedSecurityToken/wsse:BinarySecurityToken/@ValueType** attribute MUST be "http://schemas.microsoft.com/OCS/AuthWebServices.xsd#PKCS10".

Any optional element or attribute not mentioned in this section SHOULD be ignored.

The server SHOULD be able to process **ValidityPeriod** and **ValidityPeriodUnits**, as specified in [\[MS-WCCE\]](#) section 3.1.1.4.3.1.1.

3.1.4.1.2.4 wst:RequestSecurityTokenResponse

The **wst:RequestSecurityTokenResponse** element is defined in [\[WS-Trust1.3\]](#) section 3.2, and is further extended in [\[MS-WSTEP\]](#) section 3.1.4.1.3.4. For this protocol, this element is a child of the **GetAndPublishCertResponse** element.

In case of an error, this element MUST NOT be present in the **GetAndPublishCertResponse**.

In case of success, the following restrictions MUST be adhered to:

1. **/wst:RequestSecurityTokenResponse/wstep:DispositionMessage** MUST be "Issued".
2. **/wst:RequestSecurityTokenResponse /wstep:DispositionMessage/@lang** attribute MUST be "en-US".
3. **/wst:RequestSecurityTokenResponse/wst:TokenType** MUST be "http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-x509-token-profile-1.0#X509v3".
4. **/wst:RequestSecurityTokenResponse/wst:RequestedSecurityToken** MUST contain **BinarySecurityToken**, which MUST contain the X.509 v3 certificate (2) using base64 encoding.
5. The **Common Name** of the **Subject (Section 4.1.2.6 of [RFC3280])** in the returned certificate (2) MUST have the same value as the **Entity** attribute in the client request.
6. **SubjectKeyIdentifier (Section 4.2.1.2 of [RFC3280])** in the returned certificate (2) SHOULD contain the value of the **DeviceId** attribute in the client request.
7. **/wst:RequestSecurityTokenResponse/wst:RequestedSecurityToken/wsse:BinarySecurityToken/@ValueType** MUST be "http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-x509-token-profile-1.0#X509v3".
8. **/wst:RequestSecurityTokenResponse/wst:RequestedSecurityToken/wsse:BinarySecurityToken/@EncodingType** MUST be "http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd#base64binary".
9. **/wst:RequestSecurityTokenResponse/wsse:BinarySecurityToken** MUST contain the **BinarySecurityToken** that came as part of the incoming request.

Any element or attribute not mentioned in this section SHOULD be ignored.

3.1.4.1.3 Complex Types

The following table summarizes the XML schema complex type definitions that are specific to this operation.

Complex type	Description
tns:GetAndPublishCertType	Describes the client request for certificate provisioning.
tns:GetAndPublishCertResponseType	Describes the server response to a request for certificate provisioning.
tns:GetAndPublishCertErrorInfoType	Describes any failure in a GetAndPublishCert operation.

3.1.4.1.3.1 tns:GetAndPublishCertType

The **tns:GetAndPublishCertType** type describes the client request and is defined as follows.

```
<xs:complexType name="GetAndPublishCertType">
  <xs:sequence>
    <xs:element ref="wst:RequestSecurityToken" minOccurs="1" maxOccurs="1" />
    <xs:any namespace="##other" processContents="lax" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:attribute name="DeviceId" type="xs:string" use="required" />
  <xs:attribute name="Entity" type="xs:anyURI" use="required" />
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

wst:RequestSecurityToken: Refers to the **RequestSecurityToken**, as defined in section [3.1.4.1.2.3](#).

DeviceId: Refers to the **DeviceId**, as defined in section [3.1.4.1.5.1](#).

Entity: Refers to the **Entity**, as defined in section [3.1.4.1.5.2](#).

3.1.4.1.3.2 tns:GetAndPublishCertResponseType

The **tns:GetAndPublishCertResponseType** type describes the server response and is defined as follows.

```
<xs:complexType name="GetAndPublishCertResponseType">
  <xs:sequence>
    <xs:element ref="wst:RequestSecurityTokenResponse" minOccurs="0" maxOccurs="1" />
    <xs:element name="ErrorInfo" type="tns:GetAndPublishCertErrorInfoType" minOccurs="0" maxOccurs="1" />
  </xs:sequence>
  <xs:attribute name="DeviceId" type="xs:string" use="required" />
  <xs:attribute name="Entity" type="xs:anyURI" use="required" />
  <xs:attribute name="ResponseClass" type="tns:ResponseClassType" use="required" />
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

wst:RequestSecurityTokenResponse: Refers to **RequestSecurityTokenResponse** element in section [3.1.4.1.2.4](#).

ErrorInfo: This element contains information about the error that occurred, if the operation is not successful. It MUST be an instance of the **GetAndPublishCertErrorInfoType**, as defined in section [3.1.4.1.3.3](#).

DeviceId: Refers to the **DeviceId** definition in section [3.1.4.1.5.1](#). This attribute contains the same value as the one contained in the **DeviceId** attribute of the client request.

Entity: Refers to the **Entity** definition in section [3.1.4.1.5.2](#). This attribute contains the same value as the one contained in **Entity** attribute of the client request.

ResponseClass: Refers to the **ResponseClass** definition in section [2.2.6.1](#).

3.1.4.1.3.3 tns:GetAndPublishCertErrorInfoType

The **tns:GetAndPublishCertErrorInfoType** type is defined as follows.

```
<xs:complexType name="GetAndPublishCertErrorInfoType">
  <xs:complexContent>
    <xs:extension base="ErrorInfoType">
      <xs:sequence />
      <xs:attribute name="ResponseCode" type="GetAndPublishCertResponseCodeType"
use="required" />
    </xs:extension>
  </xs:complexContent>
</xs:complexType>
```

It is used to describe any failure in a **GetAndPublishCert** operation.

tns:ResponseCode: It MUST be an instance of a **GetAndPublishCertResponseCodeType**, as defined in section [3.1.4.1.4.1](#), and contains a code that describes the failure.

3.1.4.1.4 Simple Types

The following table summarizes the XML schema simple type definitions that are specific to this operation.

Simple type	Description
tns:GetAndPublishResponseCodeType	The status of the certificate provisioning request.

3.1.4.1.4.1 tns:GetAndPublishResponseCodeType

The **tns:GetAndPublishResponseCodeType** type is defined as follows.

```
<xs:simpleType name="GetAndPublishCertResponseCodeType">
  <xs:restriction base="xs:string">
    <xs:enumeration value="NoError" />
    <xs:enumeration value="InternalError" />
    <xs:enumeration value="InvalidPublicKey" />
    <xs:enumeration value="InvalidValidityPeriod" />
    <xs:enumeration value="InvalidEKU" />
    <xs:enumeration value="InvalidSipUri" />
    <xs:enumeration value="InvalidCSR" />
    <xs:enumeration value="DataStoreUnavailable" />
    <xs:enumeration value="InvalidDeviceId" />
  </xs:restriction>
</xs:simpleType>
```

```

    <xs:enumeration value="RequestMalformed" />
    <xs:enumeration value="AccountDisabled" />
    <xs:enumeration value="UserImproperlyProvisioned" />
  </xs:restriction>
</xs:simpleType>

```

NoError: Indicates success.

InternalError: Indicates an unexpected server error.

InvalidPublicKey: Indicates that the certification request did not contain a valid public key.

InvalidValidityPeriod: Indicates that the CSR contained an invalid or unacceptable validity period.

InvalidEKU: Indicates that the CSR contained invalid Enhanced Key Usage.

InvalidSipUri: Indicates that the **Entity**, as defined in section [3.1.4.1.5.2](#), is invalid.

InvalidCSR: Indicates that the CSR is invalid.

DataStoreUnavailable: Indicates that the store where the certificate (2) was supposed to be stored was not available.

InvalidDeviceId: Indicates that the **DeviceId**, as defined in section [3.1.4.1.5.1](#), is invalid.

RequestMalformed: Indicates that the **wst:RequestSecurityToken**, as defined in section [3.1.4.1.2.3](#), is invalid.

AccountDisabled: Indicates that the account of the user operating the client is disabled.

UserImproperlyProvisioned: Indicates that the user is not provisioned on a server that supports this protocol.

3.1.4.1.5 Attributes

The following table summarizes the XML schema attribute definitions that are specific to this operation.

Attribute	Description
DeviceId	Part of GetAndPublishCertType , as specified in section 3.1.4.1.3.1 , and GetAndPublishCertResponseType , as specified in section 3.1.4.1.3.2 .
Entity	Part of GetAndPublishCertType and GetAndPublishCertResponseType .

3.1.4.1.5.1 DeviceId

The **DeviceId** attribute is part of **GetAndPublishCertType** and **GetAndPublishCertResponseType**, and is defined as follows.

```

<xs:attribute name="DeviceId" type="xs:string" use="required" />

```

This is an identifier for the device on which the client is operating, and serves to identify a device unique among the various devices that the same user might be using simultaneously. It **MUST** be

unique for each device being used by the same user. **DeviceId** MUST be convertible to a **GUID**. If the client uses an identifier for the device with any other service, which uses the certificate (2) retrieved using the **GetAndPublishCert** operation for authentication (2), **DeviceId** and the aforementioned identifier MUST be equal or it MUST be possible for the **DeviceId** to be generated using the identifier using a deterministic mathematical transformation. This transformation MUST be known to the certificate (2) verification engine.

3.1.4.1.5.2 Entity

The **Entity** attribute is part of **GetAndPublishCertType** and **GetAndPublishCertResponseType**, and is defined as follows.

```
<xs:attribute name="Entity" type="xs:anyURI" use="required" />
```

This is an identifier for the user who is using the client. It MUST be same as the Session Initiation Protocol (SIP) **Uniform Resource Identifier (URI)** for the authenticated user, as specified in [\[RFC3261\]](#) section 19.1, without the "sip:" prefix.

3.1.4.1.6 Groups

This specification does not define any common XML schema group definitions.

3.1.4.1.7 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

3.1.5 Timer Events

None.

3.1.6 Other Local Events

None.

3.2 Web Ticket Service Server Details

The Web Ticket Service issues Web tickets using its **IssueToken** operation, which follows the protocol described in [\[WS-Trust1.3\]](#), except where indicated in section [3.2.4.1.1.1](#) and section [3.2.4.1.1.2](#).

Clients MUST authenticate to the Web Ticket Service using one of the following authentication (2) protocols:

- Integrated Windows authentication
- OCS-signed certificate authentication
- Live ID authentication
- OAuth2 authentication

Integrated Windows authentication follows the **Kerberos** and the **NT LAN Manager (NTLM) Authentication Protocol**, as specified in [\[RFC4559\]](#). If Integrated Windows authentication fails, the errors defined in section [3.2.4.1](#) are returned.

Certificate (2) authentication (2) signed by a **user agent server (UAS)** follows SOAP Message Security 1.1, as specified in [\[WSS\]](#), to validate an X.509 security token, as specified in [\[WSSX509TP\]](#). If OCS-signed certificate (2) authentication (2) fails, the errors defined in section [3.2.4.1](#) are returned. The certificate signed by the UAS can be obtained from the Certificate Provisioning Service described in section 3.1 of this document.

The Live ID token is presented as a **Security Assertion Markup Language (SAML)** token, as specified in [\[SAMLCore\]](#), and verified using SOAP Message Security 1.1, as specified in [\[WSS\]](#). The way in which the client retrieves the SAML token is out of the scope of this document. The type of Live ID environment for which the server is configured is specified in the Web service metadata as MSWebAuthentication policy assertion. See section [2.2.4.2](#) for MSWebAuthentication policy assertion schema. If Live ID authentication (2) fails, the errors defined in section [3.2.4.1](#) are returned.

The OAuth2 authentication follows the OAuth 2.0 Authorization Protocol described in [\[IETFDRAFT-OAuth2.0\]](#) with Extensions described in [\[MS-OAUTH2EX\]](#). The protocol server extracts the OAuth2 token from the Authorization header of the HTTP request and validates that:

- the token carries an actor token that was issued by the Authorization Server that protocol server trusts;
- the actor token is signed by a certificate associated with the Authorization Server that issued the token;
- the actor token nameid (name identifier) claim value matches the issuer claim in the token;
- both the token itself and actor token carry audience claim with a value in the following format: 00000004-0000-0ff1-ce00-000000000000/<host_fqdn>@<realm>, where:
 - 00000004-0000-0ff1-ce00-000000000000 is identifier associated with the protocol server described in the document,
 - <host_fqdn> is a placeholder which represents the **fully qualified domain name (FQDN)** (1) of the protocol server,
 - <realm> is a place holder which represents a realm value configured for the protocol server;
- the token carries at least one of the following claims: nameid (name identifier), smtp (e-mail address), sip (SIP address) and values in these claims match corresponding values of exactly one user in the UAS database.

If validation of OAuth2 token fails, the errors defined in section [3.2.4.1](#) are returned.

Sending the Web Ticket as Credentials to a Web Service Web Application

After the client receives a Web ticket from the Web Ticket Service, the client MUST attach the Web ticket, as it would a SAML token, to its requests to a participating Web service.

If the Web ticket fails validation, **OCSDiagnosticsFaults**, as described in section [2.2.4.1](#), SHOULD be returned. The following table describes the relevant **OCSDiagnosticsFaults**.

faultcode	ErrorId	Reason
wsse:InvalidSecurityToken	28032	The Web ticket is invalid.

faultcode	ErrorId	Reason
wsse:InvalidSecurityToken	28033	The Web ticket has expired.
wsse:InvalidSecurityToken	28034	Proof Web tickets are only valid at the same Web server where they were requested.

The Web service MAY also return faults specified in [\[WSSE 1.0\]](#).

The Web ticket can be sent as a signed security token or a proof-of-possession token, as specified in [\[WS-Trust1.3\]](#).

Sending the Web Ticket as Credentials to a Non-Web Service Web Application

After the client receives a Web ticket from the Web Ticket Service, the client **MUST** send the Web ticket in an HTTP header extension in its request to participating non-Web services.

```
X-MS-WebTicket = ticket-data *(";" ticket-extns)
ticket-data = "opaque" "=" base64-ticket
base64-ticket = 1*(ALPHA / DIGIT / "+" / "/" ) ; base-64 encoded SAML token
ticket-extns: 1*(ALPHA / DIGIT / "-" ) "=" 1*(ALPHA / DIGIT / "-")
```

The Web ticket, or SAML token, used to construct the **base64-ticket** **MUST** be a signed security token, as specified in [\[WS-Trust1.3\]](#).

If the Web ticket fails validation, an error response **MUST** be returned with an HTTP extension header called **X-Ms-diagnostics**, as described in section [3.2.4.1](#). The following table describes the relevant fault codes.

Faultcode	ErrorId	Reason
wsse:InvalidSecurityToken	28032	The Web ticket is invalid.
wsse:InvalidSecurityToken	28033	The Web ticket has expired.

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The Web Ticket Service **SHOULD** keep the following states:

Fully Qualified Domain Name of the Web Server Farm: This fully qualified domain name (FQDN) (1) is used to verify the address in the

wst:RequestSecurityToken/wsp:AppliesTo/wsa10:EndpointReference/wsa10:Address element of the RST. The logic for determining this FQDN is implementation-dependent.

3.2.2 Timers

None.

3.2.3 Initialization

None.

3.2.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of operations as defined by this specification:

Operation	Description
IssueToken	<p>Provides a Web ticket given one of the following credentials:</p> <ul style="list-style-type: none">▪ Integrated Windows authentication▪ Live ID▪ A certificate (2) signed by a UAS. <p>The operation is at the Web Ticket Service.</p>

3.2.4.1 IssueToken

The **IssueToken** interface provides an operation that returns a Web ticket for a client.

```
<wsdl:portType name="IWebTicketService">
  <wsdl:operation name="IssueToken">
    <wsdl:input wsaw:Action="http://docs.oasis-open.org/ws-sx/ws-trust/200512/RST/Issue"
      message="tns:IWebTicketService_IssueToken_InputMessage"/>
    <wsdl:output wsaw:Action="http://docs.oasis-open.org/ws-sx/ws-
      trust/200512/RSTRC/IssueFinal" message="tns:IWebTicketService_IssueToken_OutputMessage"/>
  </wsdl:operation>
</wsdl:portType>
```

If there is an error while processing the credentials of the user, then depending on the authentication (2) type used, the response message contains the error details in a custom HTTP header or in a SOAP fault.

HTTP X-Ms-diagnostics Header

The **X-Ms-diagnostics** header is an HTTP header that is returned if Integrated Windows authentication or certificate (2) authentication (2) signed by the UAS fails at the Web Ticket Service for the reasons in this section.

The header has the following format.

```
X-Ms-diagnostics = errorId ";" source ";" reason ";" fault
errorId = 1*DIGIT
source = DQUOTE 1*(ALPHA / DIGIT / "-" / "." / "_" / "~") DQUOTE
; Fully qualified domain name of server
```

```
token = DQUOTE 1*( ALPHA / DIGIT / "-" / "." / "_" / "~" ) DQUOTE
fault = DQUOTE 1*(ALPHA) ":" 1*(ALPHA) DQUOTE
```

The HTTP response code and the details of the **X-Ms-diagnostics** header are described later for each authentication (2) type.

The following table lists Integrated Windows authentication errors.

Type of error	Response code	ErrorId	token	faultcode
The user was authenticated but could not be found in the UAS database.	403	28000	User is not SIP enabled.	wsse:FailedAuthentication
Some unexpected error occurred in the system.	500	28001	Internal error while processing Integrated Windows authentication or authorization.	wsse:FailedAuthentication

SOAP Faults

The following **OCSDiagnosticsFaults**, as defined in section [2.2.4.1](#), are returned for Live ID authentication (2) failures, OCS-signed certificate (2) failures, or if there are internal errors processing the RST after Integrated Windows authentication or certificate (2) credentials signed by the UAS are successfully verified. The following table lists SOAP errors.

faultcode	ErrorId	Reason
wsse:SecurityTokenUnavailable	28028	The Live ID token encryption key cannot be resolved. Check that the token is obtained for this site in the appropriate Live ID environment.
wsse:SecurityTokenUnavailable	28017	The Live ID token signing key cannot be resolved. Check that the token is obtained from the appropriate Live ID environment.
wsse:UnsupportedSecurityToken	28018	The Live ID token was produced with the incorrect site policy.
wsse:FailedAuthentication	28019	The Live ID token identity is not associated with a user account.
wsse:InvalidSecurity	28020	There is no valid security token.
wsse:UnsupportedSecurityTokenType	28021	The security token type is unsupported.
wsse:InvalidSecurityToken	28022	There is no valid subject statement.
wsse:InvalidSecurity	28023	There is no valid message security.
wsse:FailedAuthentication	28024	Authentication (2) failed.

The "key cannot be resolved" errors above indicate that protocol server could not locate the key referenced in the token in local or remote stores that it knows about. The "incorrect site policy"

error above indicates that Live ID token presented to the protocol server was constructed using policy that the server does not understand.

The following table lists certificate (2) authentication (2) errors while processing the contents of a certificate (2) signed by the UAS.

faultcode	ErrorId	Reason
wsse:FailedAuthentication	28011	The certificate (2) is expired.
wsse:FailedAuthentication	28012	The certificate (2) is invalid.
wsse:FailedAuthentication	28013	The certificate (2) is not found.
wsse:FailedAuthentication	28014	The user was not found when queried in the database.
wsse:FailedAuthentication	28015	There was an internal error while processing a certificate (2) authentication (2) or authorization provided by the UAS.

The following table lists internal failures that occur after Integrated Windows authentication and UAS certificate (2) credentials are successfully verified.

SubCode	ErrorId	Reason
wsse:InvalidSecurity	28025	There is no valid security principal.
wsse:InvalidSecurity	28026	There is no valid security identity.
wsse:InvalidSecurity	28027	There is no valid message security.

The following table lists failures that occur while processing the RST.

SubCode	ErrorId	Reason
wst:RequestFailed	28035	The SIP URI in the claim type requirements of the Web ticket request does not match the SIP URI associated with the presented credentials.

3.2.4.1.1 Messages

The following table summarizes the set of WSDL message definitions that are specific to this operation.

Message	Description
tns:IWebTicketService_IssueToken_InputMessage	A request for a token to be issued.
tns:IWebTicketService_IssueToken_OutputMessage	The response to a request for a token to be issues.

3.2.4.1.1.1 tns:IWebTicketService_IssueToken_InputMessage

The **tns:IWebTicketService_IssueToken_InputMessage** represents the incoming message and is defined as follows.

```
<wsdl:message name="IWebTicketService_IssueToken_InputMessage">
```

```
<wsdl:part name="rst" type="q1:MessageBody"
xmlns:q1="http://schemas.microsoft.com/Message"/>
```

Refer to the **q1:MessageBody** definition in section [3.2.4.1.3.1](#).

3.2.4.1.1.2 tns:IWebTicketService_IssueToken_OutputMessage

The **tns:IWebTicketService_IssueToken_OutputMessage** represents the incoming message and is defined as follows.

```
<wsdl:message name="IWebTicketService_IssueToken_OutputMessage">
  <wsdl:part name="IssueTokenResult" type="q2:MessageBody"
xmlns:q2="http://chemas.microsoft.com/Message"/>
</wsdl:message>
```

Refer to the **q2:MessageBody** definition in section [3.2.4.1.3.2](#).

3.2.4.1.2 Elements

Elements are defined in the **XML schema definition (XSD)** associated with [\[WS-Trust1.3\]](#).

3.2.4.1.3 Complex Types

The following table summarizes the XML schema complex type definitions that are specific to this operation.

Complex type	Description
q1:MessageBody	Describes the type of tns:IWebTicketService_IssueToken_InputMessage .
q2:MessageBody	Describes the type of tns:IWebTicketService_IssueToken_OutputMessage .
wst:RequestSecurityTokenMsg	The alternative type of q1:MessageBody , as defined in section 3.2.4.1.3.1 .
wst:RequestSecurityTokenResponseMsg	The alternative type of q2:MessageBody , as defined in section 3.2.4.1.3.2 .

Other complex types are defined in the XSD associated with [\[WS-Trust1.3\]](#).

3.2.4.1.3.1 q1:MessageBody

The **q1:MessageBody** type is defined as follows:

```
<xs:complexType name="MessageBody">
  <xs:sequence>
    <xs:any namespace="##any" maxOccurs="unbounded" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
</xs:schema>
```

3.2.4.1.3.2 q2:MessageBody

Refer to the **q1:MessageBody** definition in section [3.2.4.1.3.1](#).

3.2.4.1.3.3 wst:RequestSecurityTokenMsg

The **wst:RequestSecurityTokenMsg** is the alternative type of **q1:MessageBody**, and is defined in [\[WS-Trust1.3\]](#), with the exception that only the following elements need to be in the message:

The **wst:RequestSecurityTokenMsg** is an incoming message, and is defined in [\[WS-Trust1.3\]](#), with the exception that only the following elements need to be in the message:

/wst:RequestSecurityToken/@Context: A required attribute that MUST be set to a **universally unique identifier (UUID)**.

/wst:RequestSecuritytoken/wst:TokenType: A required element that MUST be set to "http://docs.oasis-open.org/wss/oasis-wss-saml-token-profile-1.1#SAMLV1.1".

/wst:RequestSecurityToken/wst:RequestType: A required element that MUST be set to "http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue".

/wst:RequestSecurityToken/wsp:AppliesTo/wsa:EndpointReference/wsa:Address: A required element that MUST be set to the **HTTP URL** of the service for which the token is being requested. For example, the element could be set to the HTTP URL of the Certificate Provisioning Web Service. The server MUST validate that this address is part of the server farm.

/wst:RequestSecurityToken/wst:Entropy/wst:BinarySecret: This required element specifies a base64 encoded sequence of cryptographically random octets representing the requestor's entropy. The key size MUST be obtained from the WS-Policy, as specified in [\[MS-WSPOL\]](#), for the Web Ticket Service and SHOULD NOT be less than 128 bits. The entropy size SHOULD be the same size as the key size.

/wst:RequestSecuritytoken/wst:KeyType: A required element that MUST be set to "http://docs.oasis-open.org/ws-sx/ws-trust/200512/SymmetricKey".

/wst:RequestSecuritytoken/wst:Claims: An optional element representing a specific claim. Its **Dialect** attribute MUST be set to "urn:component:Microsoft.Rtc.WebAuthentication.2010:authclaims".

/wst:RequestSecuritytoken/wst:Claims/auth:ClaimType: An optional element, as specified in [\[WSFederation\]](#), representing a specific claim type. If this element is present, its **Uri** attribute MUST be set to "http://schemas.xmlsoap.org/ws/2005/05/identity/claims/uri".

/wst:RequestSecuritytoken/wst:Claims/auth:ClaimType/auth:Value: An optional element, as specified in [\[WSFederation\]](#), representing the **SIP URI** of the user for which the **Web ticket** will be created. If this element is included, the SIP URI MUST match the credentials submitted with the RST. If the element is not included, the server SHOULD use the credentials submitted with the RST to determine the SIP URI. If the SIP URI does not match the credentials, the server SHOULD respond with a fault message carrying fault code **wst:RequestFailed** as described in section [3.2.4.1](#).

If any one of the above required elements is not supplied or the element syntax does not conform to the syntax requirement specified in this section, the server SHOULD respond with a fault message carrying fault code **wst:InvalidRequest** as described in Section 3 of [\[WS-Trust1.3\]](#).

3.2.4.1.3.4 wst:RequestSecurityTokenResponseMsg

The **wst:RequestSecurityTokenResponseMsg** is the alternative type of **q2:MessageBody**, and is defined in [\[WS-Trust1.3\]](#), with the exception that only the following elements need be in the message:

/wst:RequestSecurityTokenResponse/@Context: A required attribute that MUST be set to the value from the corresponding request.

/wst:RequestSecurityTokenResponse/wst:TokenType: A required element that MUST be set to "http://docs.oasis-open.org/wss/oasis-wss-saml-token-profile-1.1#SAMLV1.1".

/wst:RequestSecurityTokenResponse/wst:RequestedSecurityToken/saml:Assertion: A required element that MUST be returned. This element and its contents SHOULD be treated as an opaque XML token by the User Agent.

/wst:RequestSecurityTokenResponse/wst:Lifetime/wsua:Created: An optional element that indicates the **Coordinated Universal Time (UTC)** when the token was created.

/wst:RequestSecurityTokenResponse/wst:Lifetime/wsua:Expires: A required element that indicates the **UTC** time when the token expires.

/wst:RequestSecurityTokenResponse/wst:RequestedUnattachedReference: An optional element that indicates how to reference the returned token when that token does not support references using **URI** fragments (XML ID). This information is included because the token is considered opaque to the requestor.

/wst:RequestSecurityTokenResponse/wst:RequestedAttachedReference: An optional element that indicates how to reference the token when it is not placed inside the message. This information is included because the token is considered opaque to the requestor.

/wst:RequestSecurityTokenResponse/wsp:AppliesTo/wsa:EndpointReference/wsa:Address: A required element that MUST be set to the **URL** of the **HTTP** URL of the server farm or service to which the ticket applies. Clients SHOULD perform a prefix match on this URL to determine which services the ticket applies to.

/wst:RequestSecurityTokenResponse/wst:RequestedProofToken/wst:ComputedKey: This required element MUST be set to the element specified in the **ComputedKeyAlgorithm** element of the metadata from the Web Ticket Service's binding. For example, it could be set to [http://docs.oasis-open.org/ws-sx/ws-trust/200512/CK/PSHA1](#).

/wst:RequestSecurityTokenResponse/wst:Entropy/wst:BinarySecret: This required element specifies a base64 encoded sequence of cryptographically random octets representing the Web Ticket Service's entropy. The size of the element SHOULD be the same as the KeySize specified in the WS-Policy associated with the binding at a **Web service** that accepts a **Web ticket**.

3.2.4.1.4 Simple Types

Simple types are defined in the XSD associated with [\[WS-Trust1.3\]](#).

3.2.4.1.5 Attributes

Attributes are defined in the XSD associated with [\[WS-Trust1.3\]](#).

3.2.4.1.6 Groups

This specification does not define any common XML schema group definitions.

3.2.4.1.7 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

3.2.5 Timer Events

None.

3.2.6 Other Local Events

None.

3.3 Authentication Broker Service Server Details

The Authentication Broker Service requires a session to be created using **CreateAuthBrokerSession** (as specified in section [3.3.4.1](#)) in order provide the TLS implementation data for authentication (2) with the SIP **server** (2). The service requires a valid **Web Ticket** which can be obtained using the Web Ticket Service (section [3.2](#)). The client is also required to provide a list of client-supported hash algorithms. The response from **CreateAuthBrokerSession** contains the **SessionId** that will be used for remaining requests, as well as the server-supported hash algorithms.

AuthBrokerAcquireCredential (as specified in section [3.3.4.3](#)) is called by the client in order to acquire a valid certificate for the user. This is passed the **SessionId** and the **SIPInstance**. The **server (2)** will need to acquire a new certificate from the Certificate Provisioning Service (section [3.1](#)) or locate a previously obtained certificate.

Once the above two calls are completed, the client will then initiate authentication (2) with the SIP server (2). When the TLS protocol implementation is required to generate responses, the client will make a call to **AuthBrokerNegotiateSecurityAssociation** (as specified in section [3.3.4.4](#)), passing the target and gssapi-data provided by the **server (2)** to generate the gssapi-data required for the response.

There are three conditions under which this call will function:

- client_hello – **AuthBrokerNegotiateSecurityAssociation** will generate an **SA** and a client_hello handshake message when no **input** element is provided. The result is encoded using the base64 algorithm, and returned in the response.
- gssapi-data challenge – The server (2) locates the SA that it created for the client_hello response, decodes the value of the "input" parameter using the base64 algorithm, and passes it along with the security context information stored in the SA to the TLS implementation. The server (2) obtains or locates a previously obtained certificate (1) and calls the TLS implementation to generate an output token that carries the TLS certificate, client_key_exchange, certificate_verify, change_cipher, _spec, and finished handshake messages. The server (2) then encodes the TLS token and returns it to the protocol client as part of the response.
- Finished_handshake – The server (2) locates the SA that it created for the client_hello response, decodes the value of the "input" parameter using the base64 algorithm and passes it, along with security context information stored in the SA, to the TLS implementation for validation. Once

information is validated, the server (2) computes, or derives, client and server (2) authentication (2) keys as described in [\[MS-SIPAE\]](#) section 3.2.5.1.

After the client is done with the requests, the session is terminated by calling **TerminateAuthBrokerSession** (section [3.3.4.2](#)).

3.3.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The Authentication Broker Service SHOULD keep the following states:

- The session identifier of the user.
- A certificate store that can be used to save and retrieve certificates
- The store of the challenge that is associated with the first **AuthBrokerNegotiateSecurityAssociation** (section [3.3.4.4](#)) that is used to generate the response for subsequent calls.

3.3.2 Timers

The server (2) keeps track of the session using a session expiration timer that automatically terminates the session after a period of inactivity.

3.3.3 Initialization

None.

3.3.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of operations as defined by this specification:

Operation	Description
CreateAuthBrokerSession	Creates a session to be used as part of the client authentication (2) with the SIP server (2) using TLS-DSK.
TerminateAuthBrokerSession	Ends the client session with Authentication Broker Service.
AuthBrokerAcquireCredential	Associates a specific SIPInstance with the session. This can be called once per session.
AuthBrokerNegotiateSecurityAssociation	Provides gssapi response data for challenges issues by the SIP server (2). Also provides client and server (2) authentication (2) keys once the finish handshake is received. This can be called multiple times per session.

3.3.4.1 CreateAuthBrokerSession

Creates a session to be used as part of the client authentication (2) with the SIP server (2) using TLS-DSK.

```
<wsdl:operation name="CreateAuthBrokerSession">
  <wsdl:input wsaw:Action="http://tempuri.org/IAuthBroker/CreateAuthBrokerSession"
    message="tns:IAuthBroker_CreateAuthBrokerSession_InputMessage" />
  <wsdl:output wsaw:Action="http://tempuri.org/IAuthBroker/CreateAuthBrokerSessionResponse"
    message="tns:IAuthBroker_CreateAuthBrokerSession_OutputMessage" />
</wsdl:operation>
```

3.3.4.1.1 Messages

The following table summarizes the XML schema message definitions that are specific to this operation.

Operation	Description
tns:IAuthBroker_CreateAuthBrokerSession_InputMessage	The request for CreateAuthBrokerSession .
tns:IAuthBroker_CreateAuthBrokerSession_OutputMessage	The response for CreateAuthBrokerSession .

3.3.4.1.1.1 tns:IAuthBroker_CreateAuthBrokerSession_InputMessage

The request **WSDL message** for the **CreateAuthBrokerSession WSDL operation**.

```
<wsdl:message name="IAuthBroker_CreateAuthBrokerSession_InputMessage">
  <wsdl:part name="parameters" element="tns:CreateAuthBrokerSession" />
</wsdl:message>
```

CreateAuthBrokerSession: Refers to the **CreateAuthBrokerSession** definition in section [3.3.4.1.2.1](#).

3.3.4.1.1.2 tns:IAuthBroker_CreateAuthBrokerSession_OutputMessage

The response WSDL message for the **CreateAuthBrokerSession** WSDL operation.

```
<wsdl:message name="IAuthBroker_CreateAuthBrokerSession_OutputMessage">
  <wsdl:part name="parameters" element="tns:CreateAuthBrokerSessionResponse" />
</wsdl:message>
```

CreateAuthBrokerSessionResponse: Refers to the **CreateAuthBrokerSessionResponse** definition in section [3.3.4.1.2.2](#).

3.3.4.1.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Description
tns:CreateAuthBrokerSession	Container for the client request to create a session.
tns:CreateAuthBrokerSessionResponse	Container for the response to a request to create a session.

3.3.4.1.2.1 tns:CreateAuthBrokerSession

The container for the client request to **CreateAuthBrokerSession**.

```
<xs:element name="CreateAuthBrokerSession">
- <xs:complexType>
- <xs:sequence>
  <xs:element minOccurs="0" name="supportedHashAlgorithms" nillable="true"
type="q5:ArrayOfstring" xmlns:q5="http://schemas.microsoft.com/2003/10/Serialization/Arrays"
/>
</xs:sequence>
</xs:complexType>
</xs:element>
```

supportedHashAlgorithms: An array of the supported hash algorithms made by the requestor.

3.3.4.1.2.2 tns:CreateAuthBrokerSessionResponse

The container for the response to a request to **CreateAuthBrokerSession**.

```
<xs:element name="CreateAuthBrokerSessionResponse">
- <xs:complexType>
- <xs:sequence>
  <xs:element minOccurs="0" name="CreateAuthBrokerSessionResult" nillable="true"
type="q6:CreateAuthBrokerSessionResponse"
xmlns:q6="http://schemas.datacontract.org/2004/07/Microsoft.Rtc.Internal.WebRelay.Sip" />
</xs:sequence>
</xs:complexType>
</xs:element>
```

CreateAuthBrokerSessionResult: The result of the request. The type is defined in section [3.3.4.1.3.1](#).

3.3.4.1.3 Complex Types

The following table summarizes the XML schema complex type definitions that are specific to this operation.

Element	Description
tns:CreateAuthBrokerSessionResponse	Describes the server (2) response for creating a new session.

3.3.4.1.3.1 tns:CreateAuthBrokerSessionResponse

Describes the server (2) response for creating a new session.

```
<xs:complexType name="CreateAuthBrokerSessionResponse">
  <xs:sequence>
    <xs:element minOccurs="0" name="HashAlgorithm" nillable="true" type="xs:string" />
    <xs:element minOccurs="0" name="SessionId" nillable="true" type="xs:string" />
  </xs:sequence>
</xs:complexType>
```

HashAlgorithm: The hash algorithm that will be used for the session. It is determined based on the **supportedHashAlgorithms** provided by the caller.

SessionId: A value that is unique to the session.

3.3.4.1.4 Simple Types

None.

3.3.4.1.5 Attributes

None.

3.3.4.1.6 Groups

None.

3.3.4.1.7 Attribute Groups

None.

3.3.4.2 TerminateAuthBrokerSession

Ends the client session with Authentication Broker Service.

```
<wsdl:operation name="TerminateAuthBrokerSession">
  <wsdl:input wsaw:Action="http://tempuri.org/IAuthBroker/TerminateAuthBrokerSession"
    message="tns:IAuthBroker_TerminateAuthBrokerSession_InputMessage" />
  <wsdl:output
    wsaw:Action="http://tempuri.org/IAuthBroker/TerminateAuthBrokerSessionResponse"
    message="tns:IAuthBroker_TerminateAuthBrokerSession_OutputMessage" />
</wsdl:operation>
```

3.3.4.2.1 Messages

The following table summarizes the XML schema message definitions that are specific to this operation.

Message	Description
tns:IAuthBroker_TerminateAuthBrokerSession_InputMessage	The request for

Message	Description
	TerminateAuthBrokerSession.
tns:IAuthBroker_TerminateAuthBrokerSession_OutputMessage	The response for TerminateAuthBrokerSession.

3.3.4.2.1.1 tns:IAuthBroker_TerminateAuthBrokerSession_InputMessage

The request WSDL message for the **TerminateAuthBrokerSession** WSDL operation.

```
<wsdl:message name="IAuthBroker_TerminateAuthBrokerSession_InputMessage">
  <wsdl:part name="parameters" element="tns:TerminateAuthBrokerSession" />
</wsdl:message>
```

3.3.4.2.1.2 tns:IAuthBroker_TerminateAuthBrokerSession_OutputMessage

The response WSDL message for the **TerminateAuthBrokerSession** WSDL operation.

```
<wsdl:message name="IAuthBroker_TerminateAuthBrokerSession_OutputMessage">
  <wsdl:part name="parameters" element="tns:TerminateAuthBrokerSessionResponse" />
</wsdl:message>
```

3.3.4.2.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Description
tns:TerminateAuthBrokerSession	Container for the client request to TerminateAuthBrokerSession.
tns:TerminateAuthBrokerSessionResponse	Container for the response to the client request to TerminateAuthBrokerSession.

3.3.4.2.2.1 tns:TerminateAuthBrokerSession

The container for the client request to **TerminateAuthBrokerSession.**

```
<xs:element name="TerminateAuthBrokerSession">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" name="sessionID" nillable="true" type="xs:string" />
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

sessionID: The **SessionId** that was returned from **CreateAuthBrokerSessionResponse.**

3.3.4.2.2.2 tns:TerminateAuthBrokerSessionResponse

The container for the response to the client request to **TerminateAuthBrokerSession**.

```
<xs:element name="TerminateAuthBrokerSessionResponse">
  <xs:complexType>
    <xs:sequence />
  </xs:complexType>
</xs:element>
```

3.3.4.2.5 Attributes

None.

3.3.4.2.6 Groups

None.

3.3.4.2.7 Attribute Groups

None.

3.3.4.3 AuthBrokerAcquireCredential

Associates a specific **SIPInstance** with the session.

```
<wsdl:operation name="AuthBrokerAcquireCredential">
  <wsdl:input wsaw:Action="http://tempuri.org/IAuthBroker/AuthBrokerAcquireCredential"
    message="tns:IAuthBroker_AuthBrokerAcquireCredential_InputMessage" />
  <wsdl:output
    wsaw:Action="http://tempuri.org/IAuthBroker/AuthBrokerAcquireCredentialResponse"
    message="tns:IAuthBroker_AuthBrokerAcquireCredential_OutputMessage" />
</wsdl:operation>
```

3.3.4.3.1 Messages

The following table summarizes the XML schema message definitions that are specific to this operation.

Message	Description
tns:IAuthBroker_AuthBrokerAcquireCredential_InputMessage	The request for AuthBrokerAcquireCredential .
tns:IAuthBroker_AuthBrokerAcquireCredential_OutputMessage	The response for AuthBrokerAcquireCredential .

3.3.4.3.1.1 tns:IAuthBroker_AuthBrokerAcquireCredential_InputMessage

The request WSDL message for the **AuthBrokerAcquireCredential** WSDL operation.

```
<wsdl:message name="IAuthBroker_AuthBrokerAcquireCredential_InputMessage">
  <wsdl:part name="parameters" element="tns:AuthBrokerAcquireCredential" />
</wsdl:message>
```

3.3.4.3.1.2 tns:IAuthBroker_AuthBrokerAcquireCredential_OutputMessage

The response WSDL message for the **AuthBrokerAcquireCredential** WSDL operation.

```
<wsdl:message name="IAuthBroker_AuthBrokerAcquireCredential_OutputMessage">
  <wsdl:part name="parameters" element="tns:AuthBrokerAcquireCredentialResponse" />
</wsdl:message>
```

3.3.4.3.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Elements	Description
tns:AuthBrokerAcquireCredential	Container for the client request to AuthBrokerAcquireCredential .
tns:AuthBrokerAcquireCredentialResponse	Container for the response to the client request to AuthBrokerAcquireCredential .

3.3.4.3.2.1 tns:AuthBrokerAcquireCredential

The container for the client request to **AuthBrokerAcquireCredential**.

```
<xs:element name="AuthBrokerAcquireCredential">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" name="sessionId" nillable="true" type="xs:string" />
      <xs:element minOccurs="0" name="sipInstance" nillable="true" type="xs:string" />
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

sessionId: The **SessionId** that was returned from **CreateAuthBrokerSessionResponse**.

sipInstance: The **SIPInstance** that uniquely identifies the endpoint, as defined in [\[MS-SIPRE\]](#) section 4.2.

3.3.4.3.2.2 tns:AuthBrokerAcquireCredentialResponse

The container for the response to the client request to **AuthBrokerAcquireCredential**.

```
<xs:element name="AuthBrokerAcquireCredentialResponse">
  <xs:complexType>
```

```

<xs:sequence>
  <xs:element minOccurs="0" name="AuthBrokerAcquireCredentialResult" type="xs:long" />
</xs:sequence>
</xs:complexType>
</xs:element>

```

AuthBrokerAcquireCredentialResult: The remaining lifetime, in seconds, of the certificate on the server (2) on the server. The value will be zero if the certificate has expired or if obtaining the certificate failed.

3.3.4.3.3 Complex Types

None.

3.3.4.3.4 Simple Types

None.

None.

3.3.4.3.6 Groups

None.

3.3.4.3.7 Attribute Groups

None.

3.3.4.4 AuthBrokerNegotiateSecurityAssociation

Provides gssapi response data for challenges issues by the SIP server (2) and client and server (2) authentication (2) keys once the handshake is complete.

```

<wsdl:operation name="AuthBrokerNegotiateSecurityAssociation">
  <wsdl:input
    wsaw:Action="http://tempuri.org/IAuthBroker/AuthBrokerNegotiateSecurityAssociation"
    message="tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_InputMessage" />
  <wsdl:output
    wsaw:Action="http://tempuri.org/IAuthBroker/AuthBrokerNegotiateSecurityAssociationResponse"
    message="tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_OutputMessage" />
</wsdl:operation>

```

3.3.4.4.1 Messages

The following table summarizes the XML schema message definitions that are specific to this operation.

Message	Description
tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_InputMessage	The request for AuthBrokerNegotiateSecurityAssocia

Message	Description
	tion.
tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_Output Message	The response for AuthBrokerNegotiateSecurityAssociation .

3.3.4.4.1.1

tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_InputMessage

The request WSDL message for the **AuthBrokerNegotiateSecurityAssociation** WSDL operation.

```
<wsdl:message name="IAuthBroker_AuthBrokerNegotiateSecurityAssociation_InputMessage">
  <wsdl:part name="parameters" element="tns:AuthBrokerNegotiateSecurityAssociation" />
</wsdl:message>
```

3.3.4.4.1.2

tns:IAuthBroker_AuthBrokerNegotiateSecurityAssociation_OutputMessage

The response WSDL message for the **AuthBrokerNegotiateSecurityAssociation** WSDL operation.

```
<wsdl:message name="IAuthBroker_AuthBrokerNegotiateSecurityAssociation_OutputMessage">
  <wsdl:part name="parameters" element="tns:AuthBrokerNegotiateSecurityAssociationResponse" />
</wsdl:message>
```

3.3.4.4.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

Element	Description
tns:AuthBrokerNegotiateSecurityAssociation	Container for the client request to AuthBrokerNegotiateSecurityAssociation .
tns:AuthBrokerNegotiateSecurityAssociationResponse	Container for the response to the client request to AuthBrokerNegotiateSecurityAssociation .

3.3.4.4.2.1 AuthBrokerNegotiateSecurityAssociation

The container for the client request to **AuthBrokerNegotiateSecurityAssociation**.

```
<xs:element name="AuthBrokerNegotiateSecurityAssociation">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" name="sessionid" nillable="true" type="xs:string" />
      <xs:element minOccurs="0" name="target" nillable="true" type="xs:string" />
      <xs:element minOccurs="0" name="input" nillable="true" type="xs:string" />
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

sessionid: The **SessionId** that was returned from **CreateAuthBrokerSessionResponse**.

target: The targetname, as specified in [\[MS-SIPAE\]](#) section 2.2.1, contained in the response from the SIP server (2).

input: The value of the gssapi-data, as specified in [\[MS-SIPAE\]](#) section 2.2.1, contained in the response from the SIP server (2). Do not set if this is the first message of the handshake.

3.3.4.4.2.2 AuthBrokerNegotiateSecurityAssociationResponse

The container for the response to the client request to **AuthBrokerNegotiateSecurityAssociation**.

```
<xs:element name="AuthBrokerNegotiateSecurityAssociationResponse">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" name="AuthBrokerNegotiateSecurityAssociationResult" nillable="true"
        type="q7:NegotiateSaResponse"
        xmlns:q7="http://schemas.datacontract.org/2004/07/Microsoft.Rtc.Internal.WebRelay.Sip" />
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

AuthBrokerNegotiateSecurityAssociationResult: A **NegotiateSaResponse**, as defined in section [3.3.4.4.3.1](#), that describes the server (2) response for the **AuthBrokerNegotiateSecurityAssociation** request.

3.3.4.4.3 Complex Types

The following table summarizes the XML schema complex type definitions that are specific to this operation.

Complex Type	Description
tns:NegotiateSaResponse	Describes the server (2) response for the AuthBrokerNegotiateSecurityAssociation request.
tns:SAReturnData	Describes the SA return data type.
tns:AuthReturnValuePair	Describes the base for the SA return data type.

3.3.4.4.3.1 tns:NegotiateSaResponse

Describes the server (2) response for the **AuthBrokerNegotiateSecurityAssociation** request.

```
<xs:complexType name="NegotiateSaResponse">
  <xs:complexContent mixed="false">
    <xs:extension base="tns:SAReturnData">
      <xs:sequence>
        <xs:element minOccurs="0" name="ClientSigningKey" nillable="true" type="xs:string" />
        <xs:element minOccurs="0" name="ServerSigningKey" nillable="true" type="xs:string" />
      </xs:sequence>
    </xs:extension>
  </xs:complexContent>
</xs:complexType>
```

For more information on **tns:SAReturnData** see section [3.3.4.4.3.2](#).

ClientSigningKey: The key generated to be used by the client as part of [\[MS-SIPAE\]](#).

SeverSigningKey: The key generated to be used by the server as part of [\[MS-SIPAE\]](#).

3.3.4.4.3.2 tns:SAReturnData

Describes the SA return data type.

```
<xs:complexType name="SAReturnData">
  <xs:complexContent mixed="false">
    <xs:extension base="tns:AuthReturnValuePair">
      <xs:sequence>
        <xs:element minOccurs="0" name="MaxSignature" type="xs:unsignedInt" />
      </xs:sequence>
    </xs:extension>
  </xs:complexContent>
</xs:complexType>
```

For more information on **tns:AuthReturnValuePair** see section [3.3.4.4.3.3](#).

MaxSignature: The maximum size of the security token in bytes. This value is 0 unless **ClientSigningKey** and **ServerSigningKey** are populated.

3.3.4.4.3.3 tns:AuthReturnValuePair

Describes the base for the SA return data type.

```
<xs:complexType name="AuthReturnValuePair">
  <xs:sequence>
    <xs:element minOccurs="0" name="OutString" nillable="true" type="xs:string" />
    <xs:element minOccurs="0" name="SecurityStatus" type="xs:int" />
  </xs:sequence>
</xs:complexType>
```

OutString: The value of the gssapi-data challenge. For more details on how this is computed see section [3.3](#).

SecurityStatus: The status of the request. Once OK is returned, negotiation is complete and **ClientSigningKey**, **ServerSigningKey**, and **MaxSignature** of **NegotiateSaResponse** will be populated. The table below describes possible values of this field.

Success/Informational Values

SecurityStatus	Description
0x00090312	OK
0x00090313	ContinueNeeded
0x00090314	CompAndContinue
0x00090317	ContentExpired

SecurityStatus	Description
0x00090320	CredentialsNeeded
0x00090321	Renegotiate

Error Values

SecurityStatus	Description
0x80090300	OutOfMemory
0x80090301	InvalidHandle
0x80090302	Unsupported
0x80090303	TargetUnknown
0x80090304	InternalError
0x80090305	PackageNotFound
0x80090306	NotOwner
0x80090307	CannotInstall
0x80090308	InvalidToken
0x80090309	CannotPack
0x8009030A	QopNotSupported
0x8009030B	NoImpersonation
0x8009030C	LogonDenied
0x8009030D	UnknownCredentials
0x8009030E	NoCredentials
0x8009030F	MessageAltered
0x80090310	OutOfSequence
0x80090311	NoAuthenticatingAuthority
0x80090318	IncompleteMessage
0x80090320	IncompleteCredentials
0x80090321	BufferNotEnough
0x80090322	WrongPrincipal
0x80090324	TimeSkew
0x80090325	UntrustedRoot
0x80090326	IllegalMessage

SecurityStatus	Description
0x80090327	CertUnknown
0x80090328	CertExpired
0x80090331	AlgorithmMismatch
0x80090332	SecurityQosFailed
0x8009033E	SmartcardLogonRequired
0x80090343	UnsupportedPreauth

5 Security

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Full WSDL

WSDL name	Prefix	Section
http://schemas.microsoft.com/OCS/AuthWebServices/	tns	section 6.1
http://tempuri.org/	tns	section 6.2
http://tempuri.org/	tns	section 6.3

For ease of implementation, the full WSDLs are provided in the following sections.

6.1 Certificate Provisioning Service WSDL

```
<?xml version="1.0" encoding="utf-8" ?>

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft Lync Server 2010
- Microsoft Lync 2010
- Microsoft Lync Server 2013
- Microsoft Lync 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

8 Change Tracking

This section identifies changes that were made to the [MS-OCAUTHWS] protocol document between the July 2014 and October 2014 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.

- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
1.3.3 Authentication Broker Service	Added a sentence to indicate where details of the call flows can be found.	N	Content updated.
2.2.1 Namespaces	Updated references in the table for the namespaces represented by the soap and soap12 prefixes.	N	Content updated.
4.3 CreateAuthBrokerSession	Added new section.	N	New content added.
4.4 TerminateAuthBrokerSession	Added new section.	N	New content added.
4.5 AuthBrokerAcquireCredential	Added new section.	N	New content added.
4.6 AuthBrokerNegotiateSecurityAssociation	Added new section.	N	New content added.
6 Appendix A: Full WSDL	Updated WSDL.	N	Content updated.
