1 Introduction

This document specifies extensions to the DrawingML ([\[ISO/IEC29500-1:2016\]](#)) Office Open XML File Formats structure, which is used in WordprocessingML, SpreadsheetML, and PresentationML ([\[ISO/IEC29500-1:2016\]](#)) documents.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

3D Model: A mathematical representation of a 3-Dimensional surface of an object. This includes geometry, applied textures, and lighting.

ActiveX control: A reusable software control, such as a check box or button, that uses ActiveX technology and provides options to users or runs macros or scripts that automate a task. See also ActiveX object.

binary large image or picture (BLIP): A binary data structure that stores information about a metafile image or bitmap picture.

cell reference: A set of coordinates that a cell occupies on a worksheet. For example, "B3" is the reference of a cell that appears at the intersection of column "B" and row "3".

comment: An annotation that is associated with a cell, text, or other object to provide context-specific information or reviewer feedback.

control: A graphical user interface object that users interact with when working with applications, forms, documents, webpages, and other types of files.

drawing canvas: See canvas and drawing space.

English Metric Unit (EMU): A measurement in computer typography. There are 635 EMUs per twip, 6,350 EMUs per half-point, 12,700 EMUs per point, and 914,400 EMUs per inch. These units are used to translate on-screen layouts to printed layouts for specified printer hardware.

globally unique identifier (GUID): A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [\[RFC4122\]](#) or [\[C706\]](#) must be used for generating the **GUID**. See also universally unique identifier (UUID).

group shape: A shape that contains a group of shapes.

hue-saturation-luminance (HSL): A color model that defines a color by using three dimensions: hue, the color itself; saturation, the purity of the color; and luminance, the amount of light that is either reflected or absorbed by the color. See also color scheme and color space.

hyperlink: A relationship between two anchors, as described in [\[RFC1866\]](#).

Hypertext Markup Language (HTML): An application of the Standard Generalized Markup Language (SGML) that uses tags to mark elements in a document, as described in [\[HTML\]](#).

ink: A process of entering text in handwritten form. Instead of converting handwritten text to typed text, ink is converted to an object and displayed exactly as it was written.

Object Linking and Embedding (OLE): A technology for transferring and sharing information between applications by inserting a file or part of a file into a compound document. The inserted file can be either embedded or linked. See also embedded object and linked object.

red-green-blue (RGB): A color model that describes color information in terms of the red (R), green (G), and blue (B) intensities in a color.

shape: A collection of qualifiers, such as names, and quantifiers, such as coordinates, that is used to represent a geometric object. A shape can be contained in a document, file structure, run-time structure, or other medium.

style: A set of formatting options that is applied to text, tables, charts, and other objects in a document.

text box story: An element that contains a set of text that is associated with one or more shapes.

worksheet: A single logical container for a set of tabular data and other objects in a workbook.

XML: The Extensible Markup Language, as described in [\[XML1.0\]](#).

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Overview

The structures specified in this format provide an extended XML vocabulary for the DrawingML file format structure. The extended elements and attributes enable the format to indicate further information about a document, or content and formatting of parts of the document beyond the elements and attributes of the Office Open XML File Formats as described in [\[ISO/IEC29500-1:2016\]](#). Because these elements and attributes are meant as extensions, their intent and usage varies.

The extensions specified in this format are integrated into Office Open XML file formats by means of the Markup Compatibility and Extensibility features described in [\[ISO/IEC29500-3:2015\]](#). Specifically, the **Ignorable** attribute, the **AlternateContent** element, and application-defined extension elements maintain compatibility with Office Open XML File Formats implementations when integrating the extensions from this format. Using these extensions as specified in this document results in Office Open XML file formats conformance.

The following sections provide an overview of the functionality supported by these extensions.

1.3.1 Charts

1.3.2 Content Parts and Ink

Ink is stored in documents as an extension by using a part referenced by the relationship **id** attribute of a content part element. Some content part elements are described in [\[ISO/IEC29500-1:2016\]](#) section 17.3.3.2, 19.3.1.14, and 20.5.2.12. Other content part elements are themselves extensions ([2.2.2](#)). The content of the part contains XML that conforms to a subset of the syntax and semantics for the Ink Markup Language as described in [\[InkML\]](#), the W3C EMMA recommendation specification [\[EMMA\]](#), and other extended elements ([2.1.4](#)).

1.3.3 Pictures

Embedded raster images (bitmaps) can be edited and replaced by the processed results. Unless the document author disables storing image editing data, the original bitmap and the processing parameters applied are stored in the **imgProps** extension ([2.3.1.9](#)) to enable non-destructive editing of the bitmap. For backward compatibility and performance, applications do not display changes made to the image-editing data for the embedded bitmaps unless the user edits them with the application UI or through the Object Model.

Bitmap pictures are resampled and compressed when inserted and saved based on document DPI. Individual bitmaps can be set to override the default document compression setting by using the **useLocalDpi** extension ([2.3.1.13](#)).

A user can insert embedded **HTML**, including online videos, into Word by storing the embedded HTML and related data into the **webVideoPr** extension (section [2.19.1.1](#)).

A user can insert a Scalable Vector Graphics (SVG) illustration into Office documents by storing the relationship id(s) of the embedded and/or linked SVG data in the **svgBlip** extension (section [2.26.1.1](#)). Embedded data is to be stored within an image part ([\[ISO/IEC29500-1:2016\]](#) section 15.2.14). For backward compatibility, Office applications embed a rasterized version of the SVG image (whether linked or embedded) in Portable Network Graphics (PNG) format and refer to the rasterized version from within the main blip.

A user can insert embedded web content into Word by storing a URL and associated data into the **oembed** extension (section [2.40.1.1](#)).

1.3.4 Diagrams

The last successful layout for a diagram is stored in documents as an extension by using a Diagram Layout part. The part is referenced by the relationship id attribute of a **DataModelExt** extension to the Data Model. For more information, see [\[ISO/IEC29500-1:2016\]](#) section 21.4.2.10. The content of the part contains XML as defined by Diagram Layout (section [2.1.3](#)).

The DataModelExt contains a version URI that represents the minimum version required to run the layout. If an application version is insufficient to perform layout, the Diagram Layout can be used to display the diagram.

The **recolorImg** extension specifies recoloring images in the diagram according to the color style currently applied. This gives images a more integrated look.

The **cNvPr** extension adds non-visual drawing properties to points in the diagram. This enables adding **hyperlinks** and alternative text for use by assistive technologies or applications that do not display the diagram shapes.

The Diagram Layout captures the correct layout and shape properties of the last successful diagram rendering but does not capture all the text formatting for the individual shapes in the diagram. When a shape contains text, its style is determined by combining the information from the semantic elements in data.xml with the layout definition in layout.xml. Each semantic element can have zero or more presentation elements, which are defined in layout.xml. For any shape in drawing.xml, the corresponding **presAssocID** attribute ([\[ISO/IEC29500-1:2016\]](#) section L.4.15.2.1) can be found in data.xml. For a **presAssocID** attribute, all the corresponding **presName** ([\[ISO/IEC29500-1:2016\]](#) section 21.4.3.4) attributes are searched for the one which has a text algorithm `<dgm:alg type="tx">` associated with it. The **StyleLbl** element ([\[ISO/IEC29500-1:2016\]](#) section 21.4.4.10) for this text node determines the final text format of this shape node.

1.3.5 Math

Math extensions represent mathematical expressions in DrawingML content. Mathematical equations in objects represented in DrawingML are stored in **AlternateContent** elements. These **AlternateContent** elements contain DrawingML and the math-specific element, **m**. The expression of mathematical content in DrawingML objects is similar to the representation of math in WordprocessingML ([\[ISO/IEC29500-1:2016\]](#) section 22.1) with the distinction that the math content in DrawingML is modified by properties specified in the DrawingML namespace, rather than in WordprocessingML.

1.3.6 SpreadsheetML Drawing

ActiveX control objects, Embedded **Object Linking and Embedding (OLE)** and form **control** embedded objects in SpreadsheetML are each associated with a **shape** in DrawingML. The shape in DrawingML is a placeholder that specifies the position of the embedded object in the worksheet drawing tree that in turn specifies the embedded object z-order and grouping information in relation to other drawing objects.

Visible text and visible text-related properties of form control embedded objects are specified by the **txBody** element of the placeholder shape. For more information, see [\[ISO/IEC29500-1:2016\]](#) section 20.5.2.34.

An implementing application can replace this shape with any other placeholder shape when saving.

1.3.7 WordprocessingML Drawing

WordprocessingML drawing extensions integrate graphical objects into WordprocessingML documents. See [2.2.7](#) for a discussion of how these objects are integrated and how interoperability with clients that conform to the Office Open XML file formats, as described in [\[ISO/IEC29500-1:2016\]](#), is achieved.

The primary graphical objects introduced are the following:

- **Shapes** are represented by the **wsp** element of type **CT_WordprocessingShape** (section [2.13.3.3](#)).
- Groups of graphical objects are represented by the **wgp** element of type **CT_WordprocessingGroup** (section [2.16.3.2](#)).
- Canvases are represented by the **wpc** element of type **CT_WordprocessingCanvas** (section [2.17.3.1](#)).
- **Ink** objects are represented by the **contentPart** element of type **CT_WordContentPart** (section [2.15.3.1](#)).

Groups and canvases are similar in structure, but have different behavior. Both groups and canvases can contain any graphical object as a **graphic** element as described in [ISO/IEC29500-1:2016] section 20.1.2.2.16 in addition to other shapes, pictures, groups, and ink.

Additionally, the picture type defined for WordprocessingML as described in [ISO/IEC29500-1:2016] section 20.2.2.5 has been extended to enable styling information to be applied.

Moreover, the picture non-visual picture properties represented by the element **cNvPicPr** of type **CT_NonVisualPictureProperties** (as specified in [ISO/IEC29500-1:2016] section 19.3.1.11) was extended to represent properties for a control or object using a **CT_ObjectPr** element defined as **objectPr**.

1.3.8 Legacy Objects

The picture non visual picture properties represented by the element **cNvPicPr** of type **CT_NonVisualPictureProperties** (as specified in [\[ISO/IEC29500-1:2016\]](#) section 19.3.1.11) was extended to represent properties for a legacy signature line object using a **CT_SignatureLine** element defined as **signatureLine**.

Additionally, the non-visual group drawing shape properties represented by the element **cNvGrpSpPr** of type **CT_NonVisualGroupDrawingShapeProps** (as specified in [ISO/IEC29500-1:2016] section 19.3.1.10) was extended to specify if a group was originally a legacy group object using a **CT_NonVisualGroupProps** element defined as **nonVisualGroupProps**.

1.3.9 Common Algorithms

1.3.9.1 Non-Null-Terminated Unicode String to Unsigned Integer Hash

Given a non-null-terminated Unicode string and the length of the string, a 4-byte unsigned integer hash value can be obtained by performing the following algorithm:

1. Given an **input string** and length of the **input string** (**cch**).
2. Set a 4-byte unsigned integer value **nHash** equal to 0x00000000.
3. For each character from position 0 to the end of the **input string** perform the following steps.

Example:

```
for (i=0; ich<cch; ++ich)
    nHash = (nHash<<5) + nHash + inputString[ich];
```

1. Set **nHash**, equal to itself bitwise shifted left 5 times, added unto itself, and then added to the value of the character of **input string** at **ich**.
2. **nHash** will be stored and used again in the next iteration of the loop until the last character of **input string**.

4. The result of the algorithm is the value **nHash**.

1.4 Relationship to Protocols and Other Structures

The Office Drawing extensions to Office Open XML file formats are a specified set of extensions to Office Open XML DrawingML, as described in [\[ISO/IEC29500-1:2016\]](#). This specification is dependent on the structures and concepts defined in the following references:

- [\[ISO/IEC29500-1:2016\]](#) for baseline DrawingML persistence format
- [\[ISO/IEC29500-2:2012\]](#) for open packaging conventions
- [\[ISO/IEC29500-3:2015\]](#) for markup compatibility and extensibility
- [\[ISO/IEC29500-4:2016\]](#) for backward-compatibility considerations

1.5 Applicability Statement

This document specifies a persistence format for extensions, as described in [\[ISO/IEC29500-1:2016\]](#), to the Office Open XML file formats for DrawingML ([\[ISO/IEC29500-1:2016\]](#)) content in WordprocessingML, SpreadsheetML, and PresentationML ([\[ISO/IEC29500-1:2016\]](#)) documents. The extensions specified in this document enable expressing additional content and properties, and are not applicable as a stand-alone file format. Each structure specified in this document is integrated with the Office Open XML file formats as described in [\[ISO/IEC29500-1:2016\]](#) for DrawingML content as specified in the section for that structure. All structures are integrated into DrawingML content to maintain compatibility with implementations of the Office Open XML file formats as described in [\[ISO/IEC29500-1:2016\]](#).

The extensions specified in this document do not require any other extensions to be used and do not prohibit any other extensions from being used in the same document.

An entry of this type **MUST** contain exactly one **sqref** element followed by one or more child elements.

Child Elements:

sqref: A **string** element ([\[XMLSCHEMA2/2\]](#) section 3.2.1) that specifies the cell reference of the data corresponding to this data point in the chart series ([\[ISO/IEC29500-1:2016\]](#) section 21.2). This element is required. This reference **MUST** follow the ABNF grammar rules defined in the Formulas section ([\[MS-XLSX\]](#) section 2.2.2) with the following restrictions:

- **MUST** follow the single-sheet-reference rule.
- **MUST NOT** use the A1-area, A1-relative-column and A1-relative-row rules.
- **MUST** use only A1-cell, A1-absolute-column, and A1-absolute-row (since a data point in a series can correspond to only one cell, it **SHOULD NOT** use area references).

An application can adjust this **cell reference** when the **worksheet** layout changes, even when the containing **ext** element ([\[ISO/IEC29500-1:2016\]](#) section 18.2.7) is not recognized by the application.

2.8.3.2 CT_ColorStyle

Target namespace: <http://schemas.microsoft.com/office/drawing/2012/chartStyle>

Referenced by: [colorStyle](#)

The complex type specifies colors used to resolve **CT_StyleColor** (section [2.8.3.6](#)) colors in a **CT_ChartStyle** (section [2.8.3.1](#)).^{<91>} The color style consists of a list of colors, a list of variations and a method for iterating the total set of colors.

The total set of colors is all contained colors repeated each time with each variation applied. A color style can contain 6 colors and 7 variations. This yields a total of 42 colors with the first 6 having the first variation applied, the second 6 having the second variation applied and so on. If no variations are present, then the total color set is just the contained colors with no extra variations.

To retrieve a color given an index, a method is applied to map that index into the total set of colors.

2.36.1 Elements

2.36.1.1 posterFrame

Target namespace: <http://schemas.microsoft.com/office/drawing/2018/animation/model3d>

A [CT PosterFrame](#) element that specifies what frame of an animatable 3D model is to be used in cases where animation is disabled or unavailable. 3D Models with Embedded Animations animate continuously in many application display modes. Some modes cannot or are not supposed to honor animation – e.g. printer output cannot animate, and the window showing a print preview is also not supposed to animate the model, to present a faithful depiction of the printout. In these and other cases, the application will draw the part of the model described by the poster frame element, instead of an animated model.

The following W3C XML Schema ([\[XMLSCHEMA1/2\]](#) section 2.1) fragment specifies the contents of this element.

```
<xsd:element name="posterFrame" type="CT_PosterFrame"/>
```

See section [5.34](#) for the full W3C XML Schema ([\[XMLSCHEMA1/2\]](#) section 2.1).

Target namespace: <http://schemas.microsoft.com/office/drawing/2018/animation/model3d>

Referenced by: [embedAnim](#)

This complex type specifies information that defines animation properties for a 3D model that contains embedded animations: core animation properties, and the embedded animation used to animate (3D models can contain multiple animations).

Child Elements:

animPr: A [CT_AnimationProperties](#) element that specifies the animation properties that are shared across multiple types of animated objects.

extLst: A CT_OfficeArtExtensionList ([\[ISO/IEC29500-1:2016\]](#) section A.4.1) element that specifies the extension list in which all future extensions of element type ext are defined. The extension list, along with corresponding future extensions, is used to extend the storage capabilities of the DrawingML framework. This enables various new types of data to be stored natively in the framework.

Attributes:

animId: An [ST_EmbeddedAnimationID](#) attribute that specifies which animation in the model is supposed to be used to animate. 3D models might contain multiple embedded animations, and this is a zero-based index indicating which of those animations is the one to use for a particular instance of a model.

```
<xsd:complexType name="CT_EmbeddedAnimation">

Referenced by: [posterFrame](#)

This complex type specifies an index for animation and a time frame within that animation, to be used as a poster frame image, which visually represents an animatable object at times when it is not actively animating.

Attributes:

animId: An [ST_EmbeddedAnimationID](#) attribute that specifies which animation in the model is used to animate. 3D models might contain multiple embedded animations, and this is a zero-based index indicating which of those animations is the one to use for a particular instance of a model.

frame: An ST_PositiveFixedPercentage ([\[ISO/IEC29500-1:2016\]](#) section A.4.1) attribute that specifies which time to use to draw the poster frame of an animated object. This simple type specifies a particular embedded animation inside of a 3D model. A 3D model might contain zero or more embedded animations. If the 3D model does contain embedded animations, this type can be used to refer to the zero-based index of one of the available embedded animations.

The following W3C XML Schema ([\[XMLSCHEMA1/2\]](#) section 2.1) fragment specifies the contents of this simple type.

2.37.3.1 CT_AnimationProperties

Target namespace: <http://schemas.microsoft.com/office/drawing/2018/animation>

Referenced by: [animPr](#), [CT_EmbeddedAnimation](#)

This complex type specifies animation properties that are common to multiple types of animated objects, to control the way in which they are animated.

Child Elements:

extLst: A [CT_OfficeArtExtensionList](#) ([\[ISO/IEC29500-1:2016\]](#) section A.4.1) element that specifies the extension list in which all future extensions of element type ext are defined. The extension list, along with corresponding future extensions, is used to extend the storage capabilities of the DrawingML framework. This enables various new types of data to be stored natively in the framework.

Attributes:

name: An [ST_AnimationName](#) attribute that specifies a custom name by which to refer to the animation. This name is not required and does not modify animation behavior, but can be used to describe the intention of the animation.

length: An [ST_UniversalTimeOffset](#) attribute that specifies how much time the animation is supposed to take to complete a single sequence.

count: An [ST_PlayCount](#) attribute that specifies how many times the animation is supposed to play through its sequence before it stops animating. This can be 0 (meaning do not animate), a positive integral value, or a special value of [ST_Indefinite](#) (meaning do not stop animating).

auto: A boolean ([\[XMLSCHEMA2/2\]](#) section 3.2.2) attribute that specifies whether the animation is supposed to begin playing as soon as possible (e.g., immediately after a document containing the animated object is opened).

offset: An [ST_UniversalTimeOffset](#) attribute that specifies an offset time before the animation begins. This attribute allows otherwise similarly animated objects to stagger their timing sequence relative to each other. The default value is 0, meaning no offset.

st: An [ST_UniversalTimeOffset](#) attribute that specifies the starting position of the animation sequence, effectively trimming from the beginning of the animation. The default is zero, meaning the animation plays from the beginning of its defined sequence. The attributes st and end can be used together to play any continuous subset of the original sequence. If the specified start time is later than the

specified end time, this means that the specified range of the animation is supposed to be played backwards.

end: An ST_UniversalTimeOffset attribute that specifies the amount of time to trim from the end of the animation sequence. The default is zero, meaning the animation plays to the end of its defined sequence.

The following W3C XML Schema ([\[XMLSCHEMA1/2\]](#) section 2.1) fragment specifies the contents of this complex type.

```
<xsd:complexType name="CT_AnimationProperties">

3.3 Pictures

In the binary large image or picture (BLIP) element ([\[ISO/IEC29500-1:2016\]](#) section 20.1.8.13) is an extension list that enables applications to store the original image and processing parameters for corrections and artistic effects applied to a picture. The following code example shows the XML specifying that an artistic effect, sharpen and soften effect, color temperature effect, saturation effect, and brightness and contrast effect are applied to a picture.

The part specified by the relationship **rId2** of the **blip** element is embedded. (This does not apply to linked BLIPs.) This bitmap is the result of performing operations on the original image specified by the related part **rId3** in JPEG XR format. (This does not apply to metafile BLIPs.)

3.4 Diagrams

3.4.1 Diagram Layout

The **spTree** element is comprised of multiple pieces. The **nvGrpSpPr** element defines non-visual **shape** properties that are applied to the entire group. The **grpSpPr** element defines visual shape properties that are applied to the group. The individual shapes and their properties are defined in the **sp** element.

```

3.4.2 Image Recoloring

3.6 SpreadsheetML Drawing

3.6.1 Camera Tool

The following code example shows usage of an extended element to specify that a picture is a camera tool and is linked to a cell range. See [2.2.6.1](#) for more information. The following XML shows the contents of a camera tool object specified by a **pic** element ([\[ISO/IEC29500-1:2016\]](#) section 20.5.2.25).

  </xdr:blipFill>
  <xdr:spPr bwMode="auto">

</xdr:pic>
```

The camera tool properties are specified by the **cameraTool** element as an extension of the **nvPicPr** element ([ISO/IEC29500-1:2016] section 20.5.2.22). The value of the **cellRange** attribute in the **cameraTool** element is in the A1 cell range reference style, not the R1C1 cell range reference style.

3.6.2 Legacy Object Wrapper

The following code example shows usage of an extended element to specify a legacy VML drawing object. See [2.2.6.2](#) for more information. The following XML shows the contents of a legacy object wrapper specified by an **sp** element ([\[ISO/IEC29500-1:2016\]](#) section 20.5.2.29).

```

The linked legacy object is specified by the **compatExt** element as an extension of the **cNvPr** element ([ISO/IEC29500-1:2016] section 20.5.2.8).

6 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- The 2007 Microsoft Office system
- Microsoft Office 2010 suites
- Microsoft Office 2013
- Microsoft Office Online
- Microsoft Office 2016
- Microsoft Office 2019
- Microsoft Office 2021

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.
