Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft Open Specification Promise or the Community Promise. If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

1 Introduction

The OneNote Revision Store File Format (.one and .onetoc2) is a collection of structures that specify a revision store and is organized into cross-referenced object spaces (section 2.1.4) that contain objects (section 2.1.5) with property sets (section 2.1.1) and a transaction log (section 2.3.3) to ensure file integrity across asynchronous writes.

Sections 1.7 and 2 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [MS-GLOS]:

curly braced GUID string
cyclic redundancy check (CRC)
GUID
little-endian
Unicode
universally unique identifier (UUID)

The following terms are defined in [MS-OFCGLOS]:

file data object
onefiles folder

The following terms are specific to this document:

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the technical documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information. Please check the archive site, http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624, as an additional source.

1.3 Structure Overview (Synopsis)

This file format is a revision-based file format created to be an effective way to store changes with revisions instead of needing to rewrite the entire file whenever a change is written to the file. Additionally, the revision store is transactional to ensure data integrity as clients read and write data to the revision store. The revision store is used for .one and .onetoc2 files.

1.3.1 File Structure

A revision store file is divided into the structures in the following diagram.

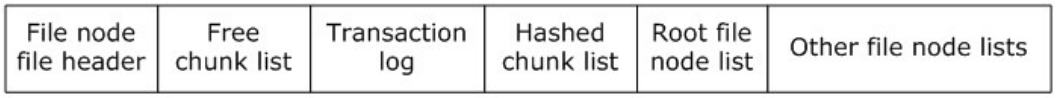

Figure 1: File structure

The header (section 2.3.1) is the first 1024 bytes of the file. It contains references to the other structures in the file as well as metadata about the file.

The free chunk list (section 2.3.2) defines where there are free spaces in the file where data can be written.

The transaction log (section 2.3.3) stores the state and length of each file node list (section 2.4) in the file.

The hashed chunk list (section 2.3.4) stores read-only objects in the file that can be referenced by multiple revisions (section 2.1.8).

The root file node list (section 2.1.14) is the file node list that is the root of the tree of all file node lists in the file.

All of the file node lists that contain user data.

Copyright © 2013 Microsoft Corporation.

1.3.2 File Node Lists

File node lists are the building blocks organizing all of the data in the file. There are multiple file node lists that form a tree hierarchy beginning with the root file node list (section 2.1.14), as shown in the following diagram.

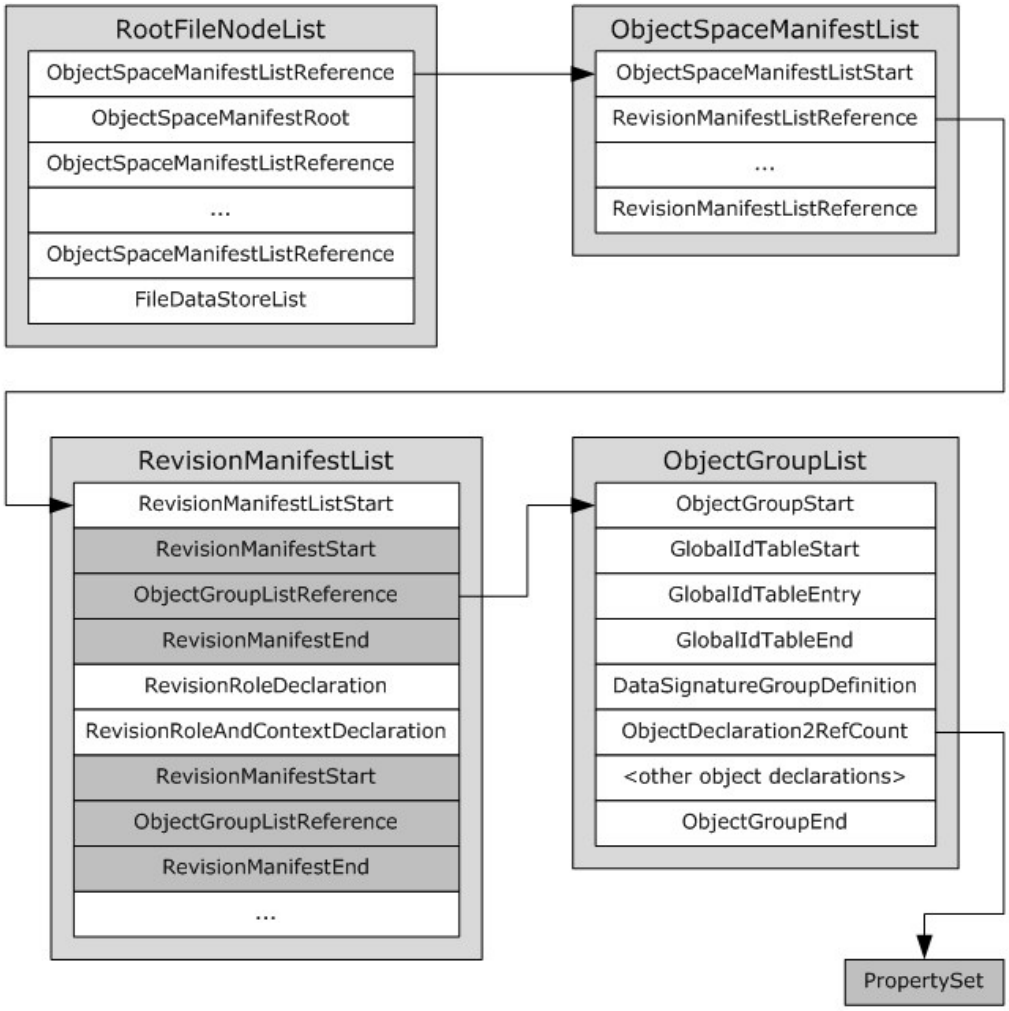

Figure 2: File node list structure

The root file node list enumerates all of the object spaces (section 2.1.4) in the revision store, and the file data store list, if present. It also identifies the root object spaces, as shown in the following diagram.

Copyright © 2013 Microsoft Corporation.

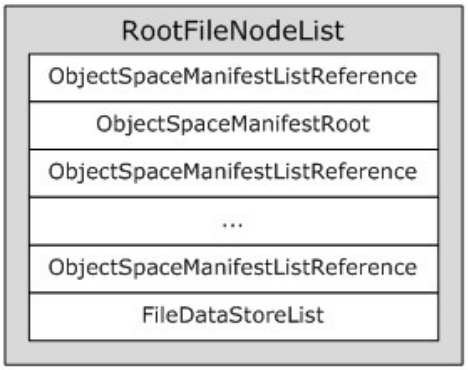

Figure 3: Root file node list

1.3.3 Object Space Manifest List

An object space manifest list (section 2.1.6) references the set of revisions that make up an object space (section 2.1.4). An object space is a collection of objects (section 2.1.5) and their properties, as shown in the following diagram.

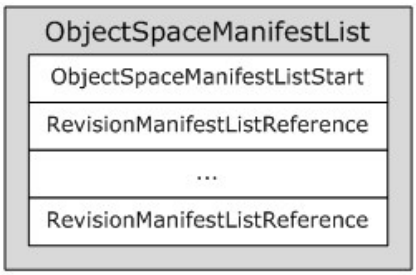

Figure 4: Object space manifest list

1.3.4 Revision Manifest List

A revision store tracks the state of an object space over time. A revision (section 2.1.8) is a snapshot of the state of an object space at a specific point in time. A revision manifest (section 2.1.9) defines a single revision (section 2.1.8), either as a full set of objects (section 2.1.5) or as a set of changes from another revision (section 2.1.8). A revision manifest list (section 2.1.10) is the collection of all revisions (section 2.1.8) that have been saved for this object space.

In the following figure each of the shaded sequences of boxes represents a revision manifest.

Copyright © 2013 Microsoft Corporation.

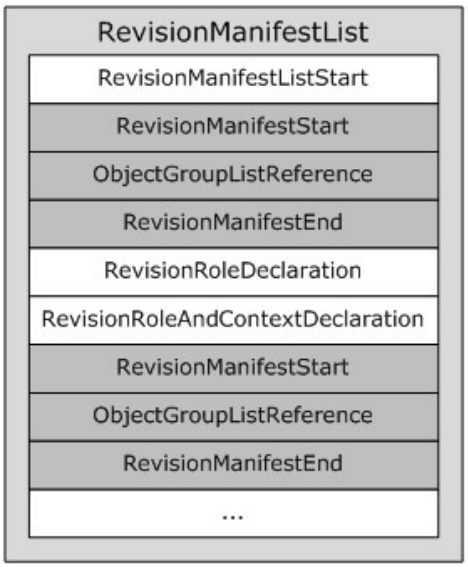

Figure 5: Revision manifest list

1.3.5 Object Group

An object group (section 2.1.13) enumerates a set of objects (section 2.1.5), each of which has an identity and optionally a property set (section 2.1.1), as shown in the following diagram.

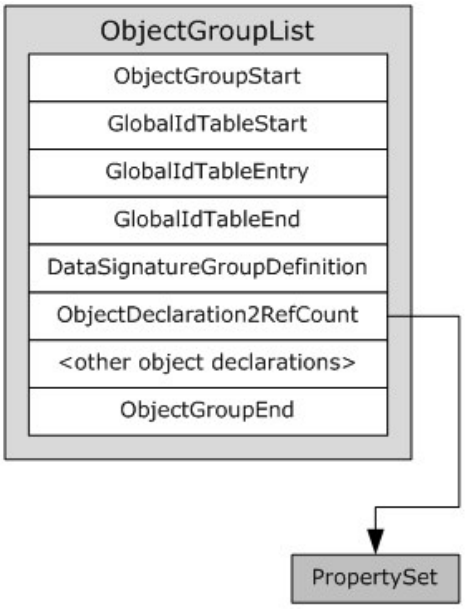

Figure 6: Object group

1.3.6 Transaction Log

The transaction log is used to keep track of each file node list (section 2.4) and how much of the list ought to be read. Each file node list can continue for any length, but the transaction log defines the

Copyright © 2013 Microsoft Corporation.

active length. Content past the end represents incomplete transactions. A complete transaction begins with data appended to the file node lists, followed by new entries in the transaction log to reflect the updated state of the file node lists. The final operation for the transaction is to update the transaction count in the header to activate the new transaction entries.

1.4 Relationship to Protocols and Other Structures

This file format is dependent on the structures defined in the following references:

- [MS-ONE] for specific object type (section 2.6.14) and property identifier (section 2.6.6) values.
- [MS-OSHARED] for the algorithm to compute a **cyclic redundancy check (CRC)** (section 2.1.2).
- [MS-DTYP] for the persistence format for **GUIDs**.
- [MS-FSSHTTP] for data transmission protocol.
- [MS-FSSHTTPB] for transmission protocol data structures and types.

1.5 Applicability Statement

This document specifies a persistence format for a revision store organized into cross-referenced object spaces (section 2.1.4), containing objects (section 2.1.5) with property sets (section 2.1.1), and containing a transaction log (section 2.3.3) to ensure file integrity across asynchronous writes. This persistence format is applicable when the primary presentation format for the contained information is electronic.

This persistence format is applicable for use as a stand-alone document, and for transmission via the File Synchronization via SOAP over HTTP Protocol as described in [MS-FSSHTTP] and [MS-FSSHTTPB].

This persistence format provides interoperability with applications that create or read documents conforming to this structure<1>.

1.6 Versioning and Localization

This document covers versioning issues in the following areas:

Structure versions: The revision store supports the introduction of new **FileNode** structure (section 2.4.3) types, **Object** types (section 2.6.14), and **PropertyIDs** (section 2.6.6) by future implementers or this specification. Programs that implement this structure specification that encounter data that identifies itself as a type that is unknown to the application will ignore that data and leave it unchanged when persisting the file again.

If the value of the **Header.ffvOldestCodeThatMayReadThisFile** field is greater than 0x0000002A, programs that implement this structure specification ignore all other data in the file.

Localization: This structure defines no general locale-specific processes or data.

1.7 Vendor-Extensible Fields

None.

Copyright © 2013 Microsoft Corporation.

2 Structures

2.1 Fundamental Concepts

2.1.1 Property Set

A property set is a collection of properties that specify the attributes of an object (section 2.1.5). The **PropertySet** structure specifies the format of a property set and is contained by an **ObjectSpaceObjectPropSet** structure (section 2.6.1). The meaning of each property in the set is specified in [MS-ONE] section 2.1.12. A **PropertySet** structure can contain references to other objects.

The data for a property that is not an object reference is contained in the **PropertySet.rgData** stream field. The **rgData** stream is read sequentially beginning with the first property in a **PropertySet.rgPrids** array until every property has been read. The number of bytes read for each property is specified by the **PropertyID.type** field.

The data for a property that is a reference to one or more objects (section 2.1.5) is contained in the streams within an **ObjectSpaceObjectPropSet** structure (**OIDs.body**, **OSIDs.body**, **ContextIDs.body**). The streams are read sequentially beginning with the first property in a **PropertySet.rgPrids** array. If the **PropertyID.type** field specifies a single object (0x8, 0xA, 0xC), a single **CompactID** (4 bytes) is read from the corresponding stream in the **ObjectSpaceObjectPropSet** structure. If the **PropertyID.type** field specifies an array of objects (0x9, 0xB, 0xD), an unsigned integer (4 bytes) is read from the **PropertySet.rgData** stream and specifies the number of **CompactID** structures (section 2.2.2) to read from the corresponding stream in the **ObjectSpaceObjectPropSet** structure. The streams for each **PropertyID.type** field are given by the following table.

Value	Stream
0x8 (ObjectID, section 2.6.6)	ObjectSpaceObjectPropSet.OIDs.body
0x9 (ArrayOfObjectIDs, section 2.6.6)	ObjectSpaceObjectPropSet.OIDs.body
0xA (ObjectSpaceID, section 2.6.6)	ObjectSpaceObjectPropSet.OSIDs.body
0xB (ArrayOfObjectSpaceIDs, section 2.6.6)	ObjectSpaceObjectPropSet.OSIDs.body
0xC (ContextID, section 2.6.6)	ObjectSpaceObjectPropSet.ContextIDs.body
0xD (ArrayOfContextIDs, section 2.6.6)	ObjectSpaceObjectPropSet.ContextIDs.body

2.1.2 Cyclic Redundancy Check (CRC) Algorithms

A revision store file contains cyclic redundancy check (CRC) values that are used to ensure the integrity of the file. The algorithm used is given by the type of the revision store file.

File format	Algorithm
.one	The CRC is calculated using the algorithm specified by [RFC3309]. The CRC polynomial is: $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$ Normal representation for the polynomial is 0x04C11DB7.

Copyright © 2013 Microsoft Corporation.

File format	Algorithm
	For the purpose of ordering, the least significant bit of the 32-bit CRC is defined to be the coefficient of the x^{31} term. The 32-bit CRC register is initialized to all 1's and once the data is processed, the CRC register is inverted. (1's complement.)
.onetoc2	The CRC is calculated using the algorithm specified by MsoCrc32Compute, as specified in [MS-OSHARED] section 2.4.3.2.

2.1.3 Global Identification Table

A global identification table is an optimization mechanism for compacting a set of **ExtendedGUID** structures (section 2.2.1). Each unique **ExtendedGUID.guid** field in the set is added to the global identification table with a unique index. **CompactID** structures (section 2.2.2) are used after that to represent the **ExtendedGUID** structure by retrieving the value of the **ExtendedGUID.guid** field from the table.

The global identification table MUST have the structure described in the following table.

File format	Valid structure
.one	▪ A **FileNode** structure (section 2.4.3) with a **FileNodeID** field value equal to 0x022 (**GlobalIdTableStart2FND** structure, section 2.4.3). ▪ Zero or more **FileNode** structures with **FileNodeID** field value equal to 0x024 (**GlobalIdTableEntryFNDX** structure, section 2.5.10). ▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x028 (**GlobalIdTableEndFNDX** structure, section 2.4.3).

.onetoc2	▪ A **FileNode** structure (section 2.4.3) with a **FileNodeID** field value equal to 0x021 (**GlobalIdTableStartFNDX** structure, section 2.5.9).
	▪ Zero or more **FileNode** structures with **FileNodeID** field values equal to one of the following values:
	  ▪ 0x024 (**GlobalIdTableEntryFNDX** structure, section 2.5.10)
	  ▪ 0x025 (**GlobalIdTableEntry2FNDX** structure, section 2.5.11)
	  ▪ 0x026 (**GlobalIdTableEntry3FNDX** structure, section 2.5.12)
	▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x028 (**GlobalIdTableEndFNDX** structure, section 2.4.3).

A global identification table applies to all **FileNode** structures specified immediately following the table until a **FileNode** structure with one of the following **FileNodeID** field values is encountered:

- 0x01C (**RevisionManifestEndFND** structure, section 2.4.3)
- 0x021 (**GlobalIdTableStartFNDX** structure, section 2.5.9)
- 0x022 (**GlobalIdTableStart2FND** structure, section 2.4.3)

Copyright © 2013 Microsoft Corporation.

2.1.4 Object Space

An object space is a collection of objects (section 2.1.5). The objects in an object space can be revised independently of objects in other object spaces.

Object spaces MUST be referenced from the root file node list (section 2.1.14) by a **FileNode** structure (section 2.4.3) with a **FileNodeID** field value equal to 0x08 (ObjectSpaceManifestListReferenceFND structure, section 2.5.2). Object spaces MUST have a unique identifier (OSID), specified by the **ObjectSpaceManifestListReferenceFND.gosid** field. Every revision store file MUST have exactly one root object space whose OSID is specified by the **ObjectSpaceManifestRootFND.gosidRoot** field.

The content of an object space is specified by the **ObjectSpaceManifestList** structure (section 2.1.6).

2.1.5 Object Space Object

An object space object (object) is a collection of data. Every object's identity is specified by an **ExtendedGUID** structure (section 2.2.1).

When an object with the same identity is declared multiple times, the later declarations are said to revise the object. The following **FileNode** structures can declare or revise an object:

- 0x041 (**ObjectRevisionWithRefCountFNDX** structure, section 2.5.13)
- 0x042 (**ObjectRevisionWithRefCount2FNDX** structure, section 2.5.14)
- 0x02D (**ObjectDeclarationWithRefCountFNDX** structure, section 2.5.23)
- 0x02E (**ObjectDeclarationWithRefCount2FNDX** structure, section 2.5.24)
- 0x0A4 (**ObjectDeclaration2RefCountFND** structure, section 2.5.25)
- 0x0A5 (**ObjectDeclaration2LargeRefCountFND** structure, section 2.5.26)
- 0x0C4 (**ReadOnlyObjectDeclaration2RefCountFND** structure, section 2.5.29)
- 0x0C5 (**ReadOnlyObjectDeclaration2LargeRefCountFND** structure, section 2.5.30)
- 0x072 (**ObjectDeclarationFileData3RefCountFND** structure, section 2.5.27)
- 0x073 (**ObjectDeclarationFileData3LargeRefCountFND** structure, section 2.5.28)

The identity and data for an object is specified by a **FileNode** structure (section 2.4.3). The data specified by the **FileNode.fnd** field MUST contain a **JCID** (section 2.6.14) or an unsigned integer that specifies the value of **JCID.index**. When only index is specified, the other fields of **JCID** MUST be implied as set to: `JCID.IsBinary = "false"`, `JCID.IsPropertySet = "true"`, `JCID.IsGraphNode = "false"`, `JCID.IsFileData = "false"`, and `JCID.IsReadOnly = "false"`.

The meaning of the **JCID** structure is specified by the property set (as defined in [MS-ONE]) for objects whose data is a property set (section 2.1.1), or file data object (as defined in [MS-ONE]) for objects whose data is a **file data object**. The **JCID** structure of an object MUST NOT be changed when the object is revised.

If the value of the **JCID.IsPropertySet** field is "true" or if only JCID.index is specified, then the data for the **Object Space Object** structure MUST be an **ObjectSpaceObjectPropSet** structure

Copyright © 2013 Microsoft Corporation.

(section 2.6.1), and the value of the **FileNode.FileNodeID** field MUST be one of the following values:

- 0x02D (**ObjectDeclarationWithRefCountFNDX** structure, section 2.5.23)
- 0x02E (**ObjectDeclarationWithRefCount2FNDX** structure, section 2.5.24)
- 0x0A4 (**ObjectDeclaration2RefCountFND** structure, section 2.5.25)
- 0x0A5 (**ObjectDeclaration2LargeRefCountFND** structure, section 2.5.26)
- 0x0C4 (**ReadOnlyObjectDeclaration2RefCountFND** structure, section 2.5.29)
- 0x0C5 (**ReadOnlyObjectDeclaration2LargeRefCountFND** structure, section 2.5.30)

Objects whose data is an **ObjectSpaceObjectPropSet** structure can contain references to the following:

- Objects in the same object space (section 2.1.4), specified by the **ObjectSpaceObjectPropSet.OIDs** field. Object references MUST NOT form a cycle.
- Object spaces specified by the **ObjectSpaceObjectPropSet.OSIDs** field. Objects MUST NOT reference the object space that contains them. Object space references specifically reference the revision (section 2.1.8) of the object space that is associated with the default context and revision role 0x00000001. Object space references MUST NOT form a cycle.
- Contexts (section 2.1.11) of the same object space, specified by the **ObjectSpaceObjectPropSet.ContextIDs** field. Context references specifically reference the revision that is associated with the identified context and revision role 0x00000001. Context references can form a cycle.

If the value of the **JCID.IsReadOnly** field is "true" then the value of the **FileNode.FileNodeID** field MUST be 0x0C4 (**ReadOnlyObjectDeclaration2RefCountFND** structure, section 2.5.29) or 0x0C5 (**ReadOnlyObjectDeclaration2LargeRefCountFND** structure, section 2.5.30). If an object with **JCID.IsReadOnly** set to "true" is revised, all declarations of this object MUST specify identical data.

If the value of the **JCID.IsFileData** field is "true" then the value of the **FileNode.FileNodeID** field MUST be 0x072 (**ObjectDeclarationFileData3RefCountFND** structure, section 2.5.27) or 0x073 (**ObjectDeclarationFileData3LargeRefCountFND** structure, section 2.5.28). If an object with **JCID.IsFileData** set to "true" is revised, all declarations of this object MUST specify identical data.

All objects in a revision contain a reference count. The reference count for any object that is not a root object (section 2.1.7) is the number of objects that directly reference this object, where the referencing object is reachable from a root object within the revision or is itself a root object. The reference count for a root object is the count calculated by the previous algorithm for non-root objects, plus 1.

The current reference count of an object in a revision is specified by the last **FileNode** structure that revised the object or by a **FileNode** structure with **FileNodeID** equal to 0x84, (**ObjectInfoDependencyOverridesFND**, section 2.5.20) that updates the reference count without revising the object.

2.1.6 Object Space Manifest List

An object space manifest list is a file node list (section 2.4) that specifies the revision manifest lists (section 2.1.10) that exist for the object space (section 2.1.4).

Copyright © 2013 Microsoft Corporation.

An object space manifest list MUST consist of the following sequence of **FileNode** structures (section 2.4.3):

1. A **FileNode** structure with **FileNodeID** field value equal to 0x00C (**ObjectSpaceManifestListStartFND** structure, section 2.5.3).

2. One or more **FileNode** structures with **FileNodeID** field values equal to 0x010 (**RevisionManifestListReferenceFND** structure, section 2.5.4). If more than one is present, all but the last MUST be ignored.

2.1.7 Root Object

A root object is an object (section 2.1.5) within an object space (section 2.1.4) that is directly referenced by a revision (section 2.1.8). All other objects within the revision MUST be reachable from a root object via object references.

A root object is specified for a revision by either of the following **FileNode** structures (section 2.4.3) within a revision manifest:

FileNode structures with **FileNodeID** field values equal to 0x059 (**RootObjectReference2FNDX** structure, section 2.5.15)

FileNode structures with **FileNodeID** field values equal to 0x05A (**RootObjectReference3FND** structure, section 2.5.16)

A revision can specify more than one root object. Different root objects in a revision MUST specify different values for **RootRole** ([MS-ONE] section 2.1.8). A root object MUST NOT specify more than one **RootRole**.

2.1.8 Revision

A revision specifies the state of an object space (section 2.1.4), which is comprised of a choice of root objects (section 2.1.7), a set of objects (section 2.1.5) reachable from the root objects via object references, and the state of each object.

A revision is identified by an **ExtendedGUID** structure (section 2.2.1). A revision is immutable. Revisions that specify the same **ExtendedGUID** structure identity MUST resolve to an identical set of objects, object states, and root object choices.

2.1.9 Revision Manifest

A revision manifest specifies a set of objects (section 2.1.5), the object states, the choice of root objects (section 2.1.7) for an object space (section 2.1.4), and an identity. Together, these resolve to a revision (section 2.1.8). The revision manifest can also specify the identity of another revision as a dependency. When a dependency revision is specified, the objects, object states, and root object of the dependency revision are also included in this revision, except where they are specified by this revision manifest.

A revision manifest is specified by a sequence of **FileNode** structures (section 2.4.3) within a revision manifest list (section 2.1.10).

The sequence MUST begin with one of the **FileNode** structures described in the following table.

File format	Valid structures
.one	0x01E (**RevisionManifestStart6FND** structure, section 2.5.7)

Copyright © 2013 Microsoft Corporation.

File format	Valid structures
	0x01F (**RevisionManifestStart7FND** structure, section 2.5.8)
.onetoc2	0x01B (**RevisionManifestStart4FND** structure, section 2.5.6)

If the object space is encrypted, then the second **FileNode** in the sequence MUST be a **FileNode** structure with a **FileNodeID** equal to 0x07C (**ObjectDataEncryptionKeyV2FNDX** structure, section 2.5.19).

The remainder of the sequence can contain the **FileNode** structures described in the following table, and MUST NOT contain any other **FileNode** structures.

File format	Valid contents
.one	Zero or more sequences of object group **FileNode** structures: ▪ 0x0B0 (**ObjectGroupListReferenceFND** structure, section 2.5.31) ▪ 0x084 (**ObjectInfoDependencyOverridesFND** structure, section 2.5.20) Where each **ObjectGroupListReferenceFND** structure MUST either be followed by an **ObjectInfoDependencyOverridesFND** structure, or else all **ObjectGroupListReferenceFND** structures MUST NOT be Zero or one sequence of global identification table **FileNode** structures: ▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x022 (**GlobalIdTableStart2FND** structure, section 2.4.3) ▪ Zero or more **FileNode** structures with a **FileNodeID** field value equal to 0x024 (**GlobalIdTableEntryFNDX** structure, section 2.5.10) ▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x028 (**GlobalIdTableEndFNDX** structure, section 2.4.3) Where the global identification table sequence of **FileNode** structures MUST NOT be followed by any object group sequences of **FileNode** structures. Zero or more **FileNode** structures with **FileNodeID** field values equal to any of: ▪ 0x05A (**RootObjectReference3FND** structure section 2.5.16) ▪ 0x084 (**ObjectInfoDependencyOverridesFND** structure, section 2.5.20)
.onetoc2	Zero or more **FileNode** structures with **FileNodeID** field values equal to any of the following: ▪ 0x059 (**RootObjectReference2FNDX** structure, section 2.5.15) ▪ 0x084 (**ObjectInfoDependencyOverridesFND** structure) Zero or one sequence of global identification table **FileNode** structures: ▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x021 (**GlobalIdTableStartFNDX** structure, section 2.5.9) ▪ Zero or more **FileNode** structures with **FileNodeID** field values equal to one of: ▪ 0x024 (**GlobalIdTableEntryFNDX** structure, section 2.5.10)

Copyright © 2013 Microsoft Corporation.

File format	Valid contents
	▪ 0x025 (**GlobalIdTableEntry2FNDX** structure, section 2.5.11) ▪ 0x026 (**GlobalIdTableEntry3FNDX** structure, section 2.5.12) ▪ A **FileNode** structure with a **FileNodeID** field value equal to 0x028 (**GlobalIdTableEndFNDX** structure, section 2.4.3) Zero or more **FileNode** structures with **FileNodeID** field values equal to the following: ▪ 0x08C (**DataSignatureGroupDefinitionFND** structure, section 2.5.33) ▪ 0x02D (**ObjectDeclarationWithRefCountFNDX** structure, section 2.5.23) ▪ 0x02E (**ObjectDeclarationWithRefCount2FNDX** structure, section 2.5.24) ▪ 0x041 (**ObjectRevisionWithRefCountFNDX** structure, section 2.5.13) ▪ 0x042 (**ObjectRevisionWithRefCount2FNDX** structure, section 2.5.14) that MUST follow a global identification table sequence.

The sequence MUST end with a **FileNode** structure with a **FileNodeID** field value equal to 0x01C (RevisionManifestEndFND structure, section 2.4.3).

2.1.10 Revision Manifest List

A revision manifest list is a file node list (section 2.4) that specifies the revisions (section 2.1.8) of an object space (section 2.1.4), and the revision roles (section 2.1.12) and contexts (section 2.1.11) that label those revisions.

All of the revision manifests (section 2.1.9) for an object space MUST appear in a single revision manifest list. An object space manifest list (section 2.1.6) can specify multiple revision manifest lists. In that case, all but the last revision manifest list referenced by the object space manifest list MUST be ignored.

The first **FileNode** structure (section 2.4.3) in a revision manifest list MUST have the **FileNodeID** field value equal to 0x14 (**RevisionManifestListStartFND** structure, section 2.5.5). The remainder of the revision manifest list MUST contain zero or more of the following structures, and MUST NOT contain any others:

- Revision manifests (section 2.1.9).
- **FileNode** structures with a **FileNodeID** field value equal to 0x5C (**RevisionRoleDeclarationFND** structure, section 2.5.17).
- **FileNode** structures with a **FileNodeID** field value equal to 0x5D (**RevisionRoleAndContextDeclarationFND** structure, section 2.5.18).

2.1.11 Context

A context is a label for a revision (section 2.1.8) of an object space (section 2.1.4). It is specified by an **ExtendedGUID** (section 2.2.1). The context with **ExtendedGUID** equal to {{00000000-0000-0000-0000-000000000000}, 0} is called the default context of the object space.

Copyright © 2013 Microsoft Corporation.

The following **FileNode** structures (section 2.4.3) associate a context and revision role (section 2.1.12) label pair with a specific revision:

- **FileNode** structures with **FileNodeID** field values equal to 0x01B (**RevisionManifestStart4FND** structure, section 2.5.6).
- **FileNode** structures with **FileNodeID** field values equal to 0x01E (**RevisionManifestStart6FND** structure, section 2.5.7).
- **FileNode** structures with **FileNodeID** field values equal to 0x01F (**RevisionManifestStart7FND** structure, section 2.5.8).
- **FileNode** structures with **FileNodeID** field values equal to 0x05C (**RevisionRoleDeclarationFND** structure, section 2.5.17).
- **FileNode** structures with **FileNodeID** field values equal to 0x05D (**RevisionRoleAndContextDeclarationFND** structure, section 2.5.18).

FileNode structures that specify a revision role but not a context use the default context in their label pair. When a **FileNode** structure associates a context and revision role label pair with a revision, that revision is the current revision of that context and revision role label pair. All associations made by **FileNode** structures earlier in the revision manifest list (section 2.1.10) for the same label pair MUST be ignored.

2.1.12 Revision Role

A revision role is a label for a revision (section 2.1.8) of an object space (section 2.1.4). It is specified by a 4-byte integer where the high 2 bytes MUST be set to zero. Revision role SHOULD<2> be 0x00000001, which specifies that the revision applies to the active view of the current object space.

The following **FileNode** structures (section 2.4.3) associate a context (section 2.1.11) and revision role label pair with a specific revision:

- **FileNode** structures with **FileNodeID** field values equal to 0x01B (**RevisionManifestStart4FND** structure, section 2.5.6).
- **FileNode** structures with **FileNodeID** field values equal to 0x01E (**RevisionManifestStart6FND** structure, section 2.5.7).
- **FileNode** structures with **FileNodeID** field values equal to 0x01F (**RevisionManifestStart7FND** structure, section 2.5.8).
- **FileNode** structures with **FileNodeID** field values equal to 0x05C (**RevisionRoleDeclarationFND** structure, section 2.5.17).
- **FileNode** structures with **FileNodeID** field values equal to 0x05D (**RevisionRoleAndContextDeclarationFND** structure, section 2.5.18).

When a **FileNode** structure associates a context and revision role label pair with a revision, all associations made by **FileNode** structures earlier in the revision manifest list (section 2.1.10) for the same label pair MUST be ignored.

2.1.13 Object Group

An object group specifies a subset of objects in a revision manifest (section 2.1.9). An object group MUST NOT be referenced by more than one revision manifest.

Copyright © 2013 Microsoft Corporation.

An object group MUST be contained within a single file node list (section 2.4). This file node list MUST have the following structure:

- **FileNode** structure (section 2.4.3) with a **FileNodeID** field value equal to 0x0B4 (**ObjectGroupStartFND** structure, section 2.5.32).
- Global identification table (section 2.1.3).
- Zero or more **FileNode** structures with any of the following **FileNodeID** field values:
  - 0x08C (**DataSignatureGroupDefinitionFND** structure, section 2.5.33).
  - 0x0A4 (**ObjectDeclaration2RefCountFND** structure, section 2.5.25).
  - 0x0A5 (**ObjectDeclaration2LargeRefCountFND** structure, section 2.5.26).
  - 0x0C4 (**ReadOnlyObjectDeclaration2RefCountFND** structure, section 2.5.29).
  - 0x0C5 (**ReadOnlyObjectDeclaration2LargeRefCountFND** structure, section 2.5.30).
  - 0x072 (**ObjectDeclarationFileData3RefCountFND** structure, section 2.5.27).
  - 0x073 (**ObjectDeclarationFileData3LargeRefCountFND** structure, section 2.5.28).
- **FileNode** structure with a **FileNodeID** field value equal to 0x0B8 (**ObjectGroupEndFND** structure, section 2.4.3).

2.1.14 Root File Node List

The root file node list is a file node list (section 2.4) that specifies the set of all object spaces (section 2.1.4) contained in this file. It also specifies which object space is the root.

The root file node list MUST begin with the **FileNodeListFragment** structure (section 2.4.1) specified by the **Header.fcrFileNodeListRoot** field.

The root file node list MUST consist of the following **FileNode** structures (section 2.4.3), and MUST NOT contain any others:

- One or more **FileNode** structures with **FileNodeID** field values equal to 0x008 (**ObjectSpaceManifestListReferenceFND** structure, section 2.5.2).
- One **FileNode** structure with a **FileNodeID** field value equal to 0x004 (**ObjectSpaceManifestRootFND** structure, section 2.5.1).
- Zero or one **FileNode** structure with **FileNodeID** field values equal to 0x094 (**FileDataStoreListReferenceFND** structure, section 2.5.21).

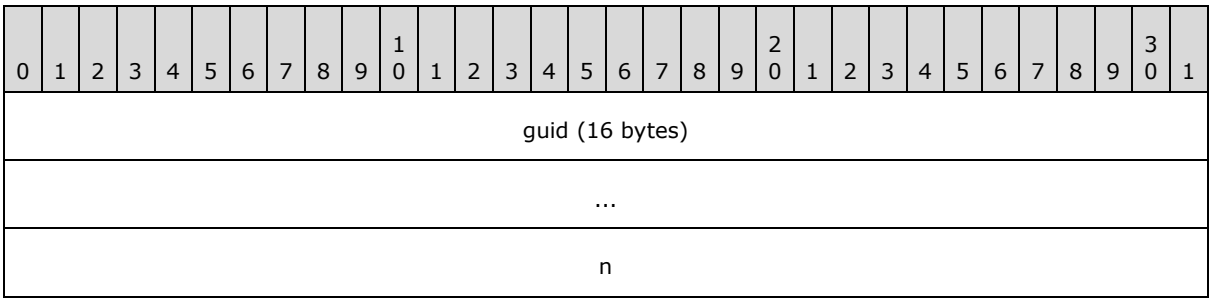
2.2 Common Types

2.2.1 ExtendedGUID

The **ExtendedGUID** structure is a combination of a **GUID**, as specified by [MS-DTYP], and an unsigned integer. Two **ExtendedGUID** structures specify the same identifier if the values of their **guid** fields are the same and the values of their **n** fields are the same.

This structure has the following format.

Copyright © 2013 Microsoft Corporation.



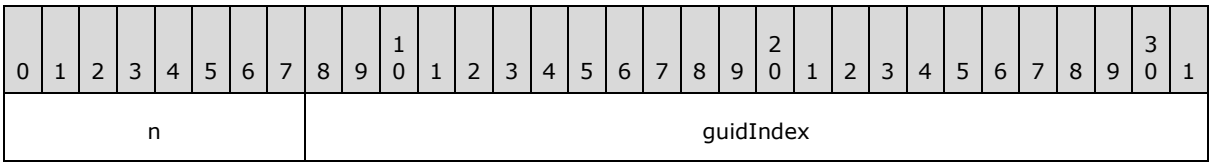
guid (16 bytes): Specifies a GUID, as specified by [MS-DTYP].

n (4 bytes): An unsigned integer that MUST be zero when the **guid** field value is {00000000-0000-0000-0000-000000000000}.

2.2.2 CompactID

The **CompactID** structure is a combination of two unsigned integers. A **CompactID** structure together with a global identification table (section 2.1.3) specifies an **ExtendedGUID** structure (section 2.2.1).

This structure has the following format.



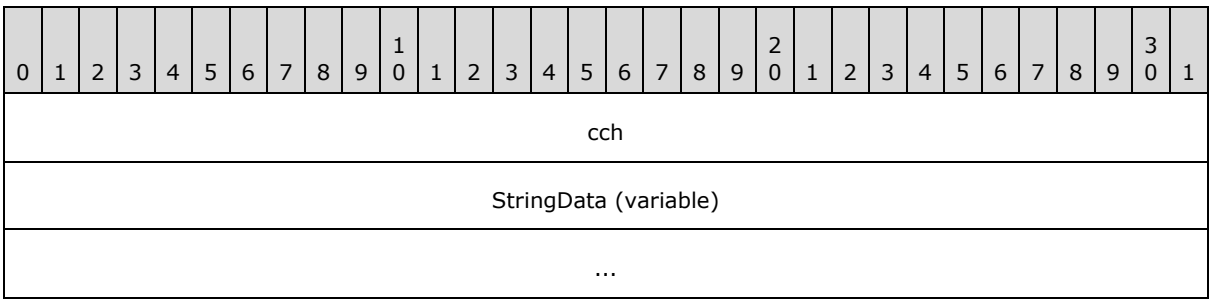
n (8 bits): An unsigned integer that specifies the value of the **ExtendedGUID.n** field.

guidIndex (24 bits): An unsigned integer that specifies the index in the global identification table. The GUID that corresponds to this index provides the value for the **ExtendedGUID.guid** field.

2.2.3 StringInStorageBuffer

The **StringInStorageBuffer** structure is a variable-length **Unicode** string.

This structure has the following format.



cch (4 bytes): An unsigned integer that specifies the number of characters in the string.

Copyright © 2013 Microsoft Corporation.

StringData (variable): An array of UTF-16 Unicode characters. The length of the array MUST be equal to the value specified by the **cch** field.

2.2.4 File Chunk Reference

A file chunk reference specifies a reference to data in the file. Each file chunk reference contains an **stp** field and a **cb** field. The **stp** field is a stream pointer that specifies the offset, in bytes, from the beginning of the file where the referenced data is located. The **cb** field specifies the size, in bytes, of the referenced data. The sizes, in bytes, of the **stp** and **cb** fields are specified by the structures in this section.

Special values:

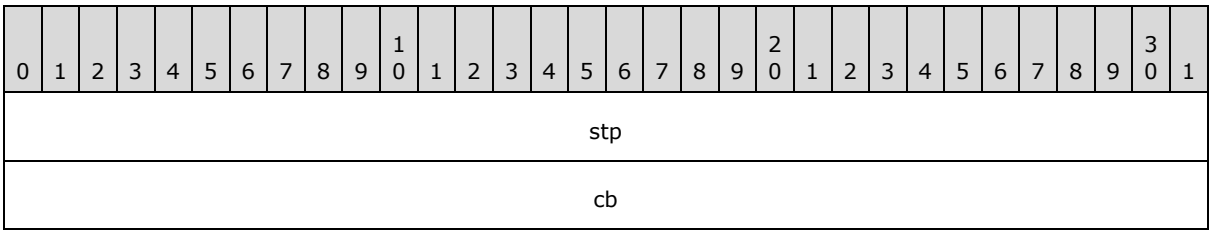
fcrNil: Specifies a file chunk reference where all bits of the **stp** field are set to 1, and all bits of the **cb** field are set to zero.

fcrZero: Specifies a file chunk reference where all bits of the **stp** and **cb** fields are set to zero.

2.2.4.1 FileChunkReference32

A **FileChunkReference32** structure is a file chunk reference (section 2.2.4) where both the **stp** field and the **cb** field are 4 bytes in size.

This structure has the following format.



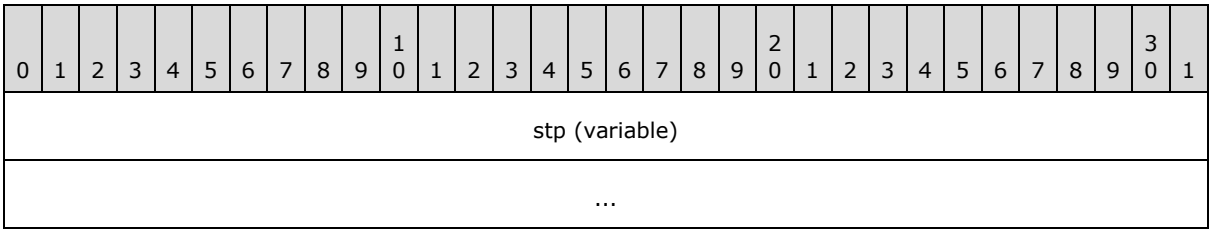
stp (4 bytes): An unsigned integer that specifies the location of the referenced data in the file.

cb (4 bytes): An unsigned integer that specifies the size, in bytes, of the referenced data.

2.2.4.2 FileNodeChunkReference

A **FileNodeChunkReference** structure is a file chunk reference (section 2.2.4) that specifies the location in the file and the size of data referenced by a **FileNode** structure (section 2.4.3). The size of the file chunk reference (section 2.2.4) is specified by the **FileNode.StpFormat** and **FileNode.CbFormat** fields of the **FileNode** structure that contains the **FileNodeChunkReference** structure. The meaning of the referenced data is specified by the **FileNode** structure that contains the **FileNodeChunkReference** structure.

This structure has the following format.



Copyright © 2013 Microsoft Corporation.

cb (variable)
...

stp (variable): An unsigned integer that specifies the location of the referenced data in the file. The size and meaning of the **stp** field is specified by the value of the **FileNode.StpFormat** field.

cb (variable): An unsigned integer that specifies the size, in bytes, of the data. The size and meaning of the **cb** field is specified by the value of **FileNode.CbFormat** field.

2.2.4.3 FileChunkReference64

A **FileChunkReference64** structure is a file chunk reference (section 2.2.4) where both the **stp** field and the **cb** field are 8 bytes in size.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1
stp																															
...																															
cb																															
...																															

stp (8 bytes): An unsigned integer that specifies the location of the referenced data in the file.

cb (8 bytes): An unsigned integer that specifies the size, in bytes, of the referenced data.

2.2.4.4 FileChunkReference64x32

A **FileChunkReference64x32** structure is a file chunk reference (section 2.2.4) where the **stp** field is 8 bytes in size and the **cb** field is 4 bytes in size.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1
stp																															
...																															
cb																															

stp (8 bytes): An unsigned integer that specifies the location of the referenced data in the file.

Copyright © 2013 Microsoft Corporation.

cb (4 bytes): An unsigned integer that specifies the size, in bytes, of the referenced data.

2.3 File Structure

A revision store file MUST begin with a **Header** structure (section 2.3.1). The remainder of the file is partitioned into blocks of bytes, where the size and structure of each block is specified by the field that references it. A block is reachable if it is referenced by the **Header** structure, or if it is referenced by a field in another reachable block. Data outside the **Header** structure and any reachable blocks MUST be ignored.

All structures are aligned on 1-byte boundaries. All integers are signed unless otherwise specified. All fields are **little-endian** unless otherwise specified.

2.3.1 Header

The **Header** structure MUST be at the beginning of the file.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

guidFileType (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the type of the revision store file. MUST be one of the values from the following table.

File format	Value
.one	{7B5C52E4-D88C-4DA7-AEB1-5378D02996D3}
.onetoc2	{43FF2FA1-EFD9-4C76-9EE2-10EA5722765F}

guidFile (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the identity of this revision store file. SHOULD be globally unique.

guidLegacyFileVersion (16 bytes): MUST be "{00000000-0000-0000-0000-000000000000}" and MUST be ignored.

guidFileFormat (16 bytes): A GUID, as specified by [MS-DTYP], that specifies that the file is a revision store file. MUST be "{109ADD3F-911B-49F5-A5D0-1791EDC8AED8}".

ffvLastCodeThatWroteToThisFile (4 bytes): An unsigned integer. MUST be one of the values in the following table, depending on the file type.

File format	Value
.one	0x0000002A
.onetoc2	0x0000001B

ffvOldestCodeThatHasWrittenToThisFile (4 bytes): An unsigned integer. MUST be one of the values in the following table, depending on the file format of this file.

File format	Value
.one	0x0000002A
.onetoc2	0x0000001B

ffvNewestCodeThatHasWrittenToThisFile (4 bytes): An unsigned integer. MUST be one of the values in the following table, depending on the file format of this file.

File format	Value
.one	0x0000002A
.onetoc2	0x0000001B

ffvOldestCodeThatMayReadThisFile (4 bytes): An unsigned integer. MUST be one of the values in the following table, depending on the file format of this file.

Copyright © 2013 Microsoft Corporation.

File format	Value
.one	0x0000002A
.onetoc2	0x0000001B

fcrLegacyFreeChunkList (8 bytes): A **FileChunkReference32** structure (section 2.2.4.1) that MUST have a value of "fcrZero" (see section 2.2.4).

fcrLegacyTransactionLog (8 bytes): A **FileChunkReference32** structure that MUST be "fcrNil" (see section 2.2.4).

cTransactionsInLog (4 bytes): An unsigned integer that specifies the number of transactions in the transaction log (section 2.3.3). MUST NOT be zero.

cbLegacyExpectedFileLength (4 bytes): An unsigned integer that MUST be zero, and MUST be ignored.

rgbPlaceholder (8 bytes): An unsigned integer that MUST be zero, and MUST be ignored.

fcrLegacyFileNodeListRoot (8 bytes): A **FileChunkReference32** structure that MUST be "fcrNil".

cbLegacyFreeSpaceInFreeChunkList (4 bytes): An unsigned integer that MUST be zero, and MUST be ignored.

fNeedsDefrag (1 byte): MUST be ignored.

fRepairedFile (1 byte): MUST be ignored.

fNeedsGarbageCollect (1 byte): MUST be ignored.

fHasNoEmbeddedFileObjects (1 byte): An unsigned integer that MUST be zero, and MUST be ignored.

guidAncestor (16 bytes): A GUID that specifies the **Header.guidFile** field of the table of contents file, as specified by [MS-ONE] section 2.1.15, given by the following table:

Table of contents file format	Location of table of contents file
Section file (.one)	Table of contents file is located in the same directory as this file.
Table of contents file (.onetoc2)	Table of contents file is located in the parent directory of this file.

If the GUID is {00000000-0000-0000-0000-000000000000}, this field does not reference a table of contents file.

crcName (4 bytes): An unsigned integer that specifies the CRC value (section 2.1.2) of the name of this revision store file. The name is the Unicode representation of the file name with its extension and an additional null character at the end. This **CRC** is always calculated using the CRC algorithm for the .one file (section 2.1.2), regardless of this revision store file format.

fcrHashedChunkList (12 bytes): A **FileChunkReference64x32** structure (section 2.2.4.4) that specifies a reference to a hashed chunk list (section 2.3.4). If the value of the **FileChunkReference64x32** structure is "fcrZero" or "fcrNil", the hashed chunk list does not exist.

Copyright © 2013 Microsoft Corporation.

fcrTransactionLog (12 bytes): A **FileChunkReference64x32** structure that specifies a reference to the first **TransactionLogFragment** structure (section 2.3.3.1) in a transaction log (section 2.3.3). The value of the **fcrTransactionLog** field MUST NOT be "fcrZero" and MUST NOT be "fcrNil".

fcrFileNodeListRoot (12 bytes): A **FileChunkReference64x32** structure that specifies a reference to a root file node list (section 2.1.14). The value of the **fcrFileNodeListRoot** field MUST NOT be "fcrZero" and MUST NOT be "fcrNil".

fcrFreeChunkList (12 bytes): A **FileChunkReference64x32** structure that specifies a reference to a **FreeChunkListFragment** structure (section 2.3.2.1). If the value of the **FileChunkReference64x32** structure is "fcrZero" or "fcrNil", then the free chunk list (section 2.3.2) does not exist.

cbExpectedFileLength (8 bytes): An unsigned integer that specifies the size, in bytes, of this revision store file.

cbFreeSpaceInFreeChunkList (8 bytes): An unsigned integer that SHOULD<3> specify the size, in bytes, of the free space specified by the free chunk list.

guidFileVersion (16 bytes): A GUID, as specified by [MS-DTYP]. When either the value of **cTransactionsInLog** field or the **guidDenyReadFileVersion** field is being changed, **guidFileVersion** MUST be changed to a new GUID.

nFileVersionGeneration (8 bytes): An unsigned integer that specifies the number of times the file has changed. MUST be incremented when the **guidFileVersion** field changes.

guidDenyReadFileVersion (16 bytes): A GUID, as specified by [MS-DTYP]. When the existing contents of the file are being changed, excluding the **Header** structure of the file and unused storage blocks, **guidDenyReadFileVersion** MUST be changed to a new GUID.

grfDebugLogFlags (4 bytes): MUST be zero. MUST be ignored.

fcrDebugLog (12 bytes): A **FileChunkReference64x32** structure that MUST have a value "fcrZero". MUST be ignored.

fcrAllocVerificationFreeChunkList (12 bytes): A **FileChunkReference64x32** structure that MUST be "fcrZero". MUST be ignored.

bnCreated (4 bytes): An unsigned integer that specifies the build number of the application that created this revision store file. SHOULD<4> be ignored.

bnLastWroteToThisFile (4 bytes): An unsigned integer that specifies the build number of the application that last wrote to this revision store file. SHOULD<5> be ignored.

bnOldestWritten (4 bytes): An unsigned integer that specifies the build number of the oldest application that wrote to this revision store file. SHOULD<6> be ignored.

bnNewestWritten (4 bytes): An unsigned integer that specifies the build number of the newest application that wrote to this revision store file. SHOULD<7> be ignored.

rgbReserved (728 bytes): MUST be zero. MUST be ignored.

2.3.2 Free Chunk List

The free chunk list specifies a list of unused storage blocks in the file. The free chunk list consists of a sequence of one or more **FreeChunkListFragment** structures (section 2.3.2.1). The location of

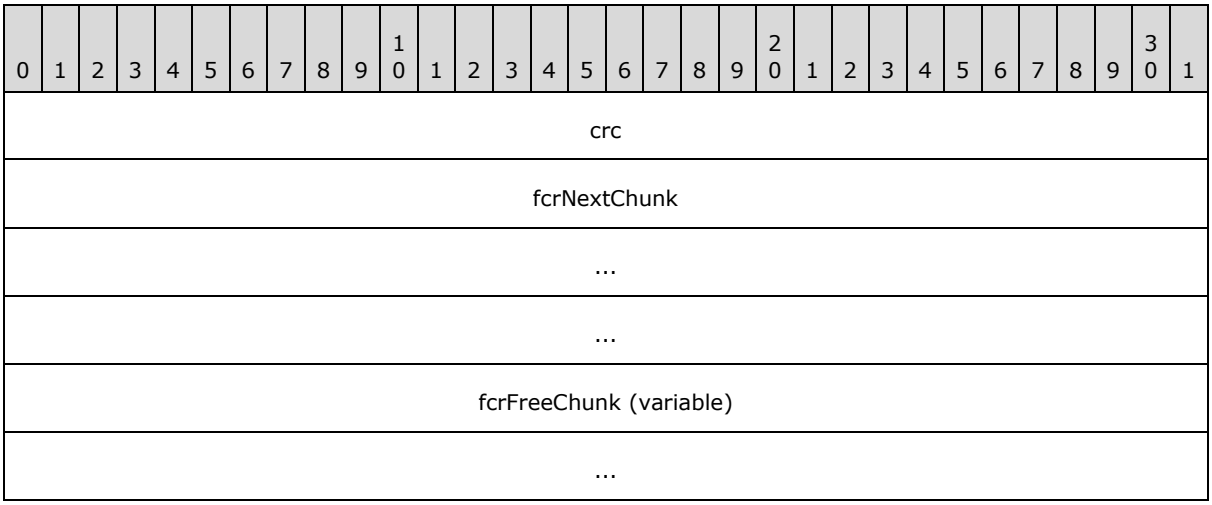
Copyright © 2013 Microsoft Corporation.

the first **FreeChunkListFragment** structure is specified by a **Header.fcrFreeChunkList** field. When writing into any of the storage blocks specified by **fcrFreeChunk** the free chunk list MUST be updated to reflect the change.

2.3.2.1 FreeChunkListFragment

The **FreeChunkListFragment** structure specifies a fragment in the free chunk list (section 2.3.2).

This structure has the following format.



crc (4 bytes): An unsigned integer that specifies the CRC (section 2.1.2) of a **fcrFreeChunk** field.

fcrNextChunk (12 bytes): A **FileChunkReference64x32** structure (section 2.2.4.4) that specifies a reference to another **FreeChunkListFragment** structure. If the value of the **fcrNextChunk** field is "fcrNil" (see section 2.2.4), then this is the last **FreeChunkListFragment** structure.

fcrFreeChunk (variable): An array of **FileChunkReference64** structures (section 2.2.4.3) where each element in the array specifies a reference to unused parts of the file. The number of elements is given by (*cb* – 16) / 16 where *cb* is the size, in bytes, of this **FreeChunkListFragment** structure; *cb* is specified by the file chunk reference (section 2.2.4) that references this **FreeChunkListFragment** structure.

2.3.3 Transaction Log

To ensure integrity of the files, each write to a file is structured as a transaction.

A transaction consists of the following types of data:

- The **FileNode** structures (section 2.4.3) and file node lists (section 2.4) that specify the actual user data.

New file node lists can be added by the transaction. **FileNode** structures in existing file node lists MUST NOT be modified or removed. New **FileNode** structures can be added to existing file node lists.

Copyright © 2013 Microsoft Corporation.

- A set of **TransactionEntry** structures (section 2.3.3.2) that specify which file node lists are added or modified by this transaction and the new number of **FileNode** structures in those file node lists.

The **TransactionEntry** structures for all transactions are stored sequentially in **TransactionLogFragment.sizeTable**. The last entry for a transaction MUST be a special sentinel entry with the value of the **TransactionEntry.srcID** field set to 0x00000001.

- A **Header.cTransactionsInLog** field that maintains the total number of transactions that have occurred. The transaction's number is defined by the order of the transaction in the transaction log.

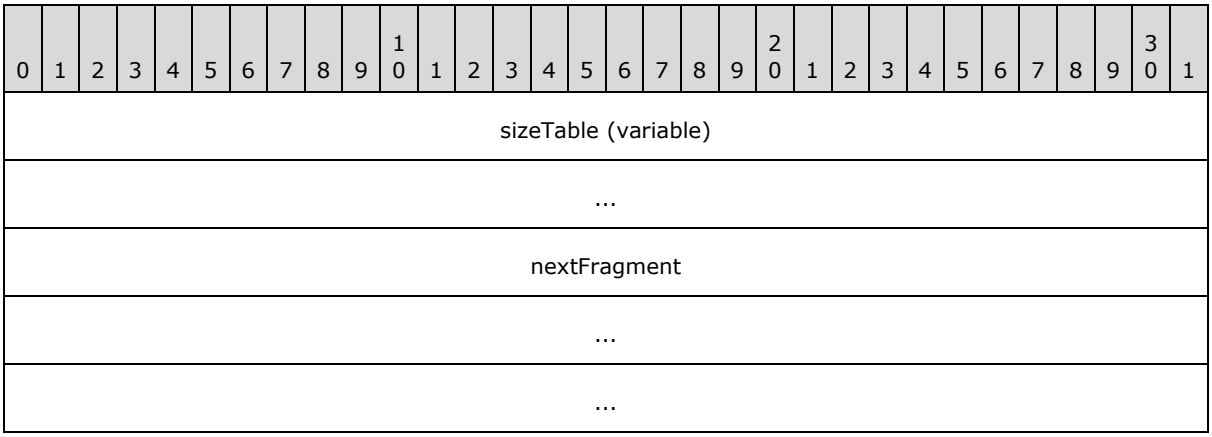
A transaction is committed only after the **Header.cTransactionsInLog** field is updated to match the number of the transaction. All **TransactionEntry** structures for transactions with higher numbers and **FileNode** structures added by them MUST be ignored.

The **Header.fcrTransactionLog** field references the first **TransactionLogFragment** structure (section 2.3.3.1) in the log.

2.3.3.1 TransactionLogFragment

The **TransactionLogFragment** structure specifies an array of **TransactionEntry** structures (section 2.3.3.2) and a reference to the next **TransactionLogFragment** structure if it exists.

This structure has the following format.



sizeTable (variable): An array of **TransactionEntry** structures. A transaction MUST add all of its entries to the array sequentially and MUST terminate with a sentinel entry with **TransactionEntry.srcID** set to 0x00000001.

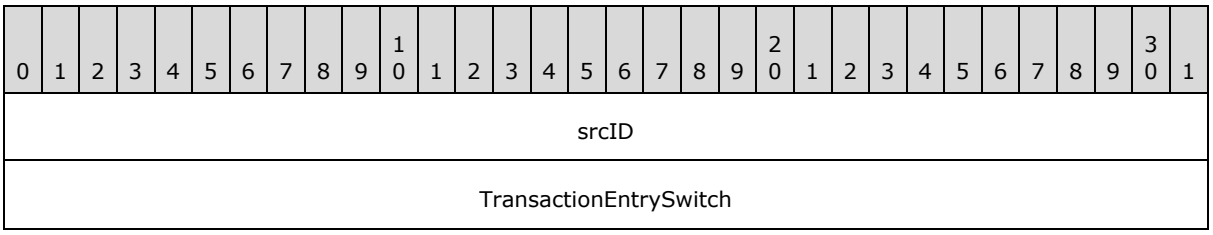
nextFragment (12 bytes): A **FileChunkReference64x32** structure (section 2.2.4.4) that specifies the location and size of the next **TransactionLogFragment** structure. If this fragment contains the last transaction as specified by the **Header.cTransactionsInLog** field, **nextFragment** is undefined and MUST be ignored.

2.3.3.2 TransactionEntry

The **TransactionEntry** structure specifies either the file node list (section 2.4) included in the current transaction and the number of **FileNode** structures (section 2.4.3) in the list, or the sentinel entry of the current transaction.

Copyright © 2013 Microsoft Corporation.

This structure has the following format.



srcID (4 bytes): An unsigned integer that specifies the identity of the file node list modified by this transaction, or the sentinel entry for the transaction. A value of 0x00000001 specifies the sentinel entry. Otherwise, MUST be equal to the value of the **FileNodeListFragment.header.FileNodeListID** field of a file node list in the file.

TransactionEntrySwitch (4 bytes): An unsigned integer of 4 bytes in size. The meaning depends on the value of **srcID**.

Value of srcID	Value of TransactionEntrySwitch
0x00000001	MUST be equal to CRC (section 2.1.2) of all **TransactionEntry** structures in the current transaction.
other	MUST be equal to the new number of **FileNode** structures in the file node list with a **FileNodeListFragment.header.FileNodeListID** field value equal to the value of the **srcID** field after the file node list is added or modified by the transaction.

A non-sentinel **TransactionEntry** structure MUST add one or more **FileNode** structures to the file node list it adds or modifies.

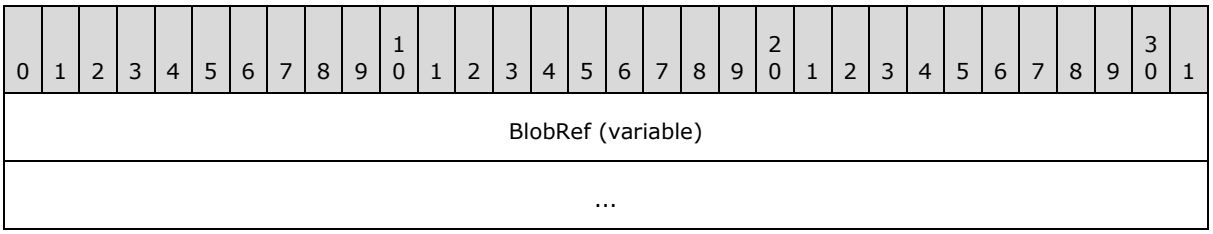
2.3.4 Hashed Chunk List

A hashed chunk list is an optional file node list (section 2.4) that specifies a collection of **FileNode** structures (section 2.4.3) with **FileNodeID** field values equal to "0x0C2" (**HashedChunkDescriptor2FND** structure, section 2.3.4.1). The **Header.fcrHashedChunkList** field references the first **FileNodeListFragment** structure (section 2.4.1) in the hashed chunk list, if it exists.

2.3.4.1 HashedChunkDescriptor2FND

The data for a **FileNode** structure (section 2.4.3) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

This structure has the following format.



Copyright © 2013 Microsoft Corporation.

guidHash (16 bytes)
...

BlobRef (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies the location and size of an **ObjectSpaceObjectPropSet** structure.

guidHash (16 bytes): An unsigned integer that specifies an MD5 checksum, as specified in [RFC1321], of data referenced by the **BlobRef** field.

2.4 File Node List

A file node list is the basic logical structure used to organize data in the file. Each list logically consists of a sequence of **FileNode** structures (section 2.4.3) that can contain data, references to data, or references to other file node lists.

For storage purposes a file node list can be divided into one or more **FileNodeListFragment** structures (section 2.4.1). Each fragment can specify whether there are more fragments in the list and the location of the next fragment. Each fragment specifies a sub-sequence of **FileNode** structures from the file node list.

When specifying the structure of a specific file node list in this document, the division of the list into fragments is ignored and **FileNode** structures with **FileNode.FileNodeID** field values equal to 0x0FF ("ChunkTerminatorFND") are not specified.

All file node list fragments in a file MUST form a tree. The **Header.fcrFileNodeListRoot** field specifies the first fragment of the file node list that is the root of the tree.

2.4.1 FileNodeListFragment

The **FileNodeListFragment** structure specifies a sequence of file nodes from a file node list (section 2.4). The size of the **FileNodeListFragment** structure is specified by the structure that references it. All fragments in the same file node list MUST have the same **FileNodeListFragment.header.FileNodeListID** field.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1
header (16 bytes)																															
...																															
rgFileNodes (variable)																															
...																															
padding (variable)																															
...																															

Copyright © 2013 Microsoft Corporation.

nextFragment
...
...
footer
...

header (16 bytes): A **FileNodeListHeader** structure (section 2.4.2).

rgFileNodes (variable): A stream of bytes that contains a sequence of **FileNode** structures (section 2.4.3). The stream is terminated when any of the following conditions is met:

- The number of bytes between the end of the last read **FileNode** and the **nextFragment** field is less than 4 bytes.
- A **FileNode** structure with a **FileNodeID** field value equal to 0x0FF (**ChunkTerminatorFND** structure, section 2.4.3) is read. If a **ChunkTerminatorFND** structure is present, the value of the **nextFragment** field MUST be a valid **FileChunkReference64x32** structure (section 2.2.4.4) to the next **FileNodeListFragment** structure.
- The number of **FileNode** structures read for the containing file node list is equal to the number of nodes specified for the list by the transaction log (section 2.3.3) in the last **TransactionEntry** (section 2.3.3.2) that modified the list. In this case the **nextFragment** field MUST be ignored.

padding (variable): An optional array of bytes between the last **FileNode** structure in the **rgFileNodes** field and the **nextFragment** field. Undefined and MUST be ignored.

nextFragment (12 bytes): A **FileChunkReference64x32** structure (section 2.2.4.4) that specifies whether there are more fragments in this file node list, and if so, the location and size of the next fragment.

If this is the last fragment, the value of the **nextFragment** field MUST be "fcrNil" (see section 2.2.4). Otherwise the value of the **nextFragment.stp** field MUST specify the location of a valid **FileNodeListFragment** structure, and the value of the **nextFragment.cb** field MUST be equal to the size of the referenced fragment including the **FileNodeListFragment.header** field and the **FileNodeListFragment.footer** field.

The location of the **nextFragment** field is calculated by adding the size of this **FileNodeListFragment** structure minus the size of the **nextFragment** and **footer** fields to the location of this **FileNodeListFragment** structure.

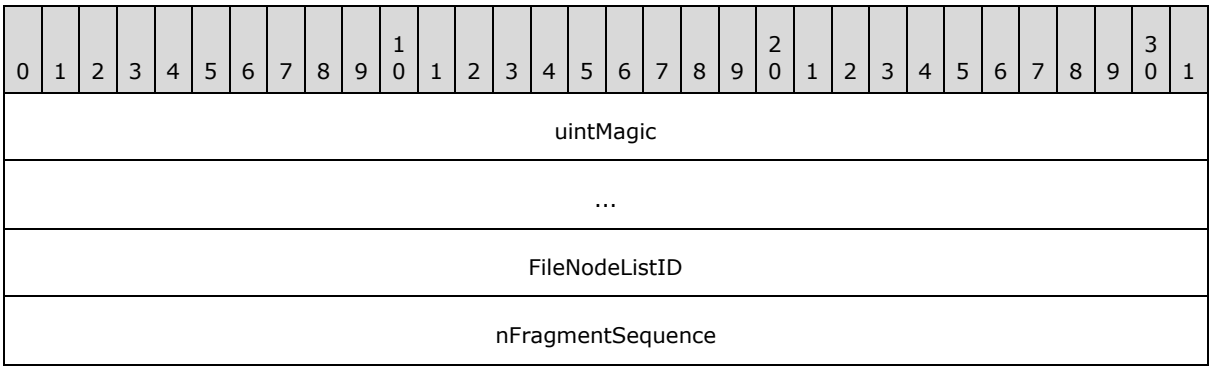
footer (8 bytes): An unsigned integer; MUST be "0x8BC215C38233BA4B". Specifies the end of the **FileNodeListFragment** structure.

2.4.2 FileNodeListHeader

The **FileNodeListHeader** structure specifies the beginning of a **FileNodeListFragment** structure (section 2.4.1).

Copyright © 2013 Microsoft Corporation.

This structure has the following format.



uintMagic (8 bytes): An unsigned integer; MUST be "0xA4567AB1F5F7F4C4".

FileNodeListID (4 bytes): An unsigned integer that specifies the identity of the file node list (section 2.4) this fragment belongs to. MUST be equal to or greater than 0x00000010. The pair of **FileNodeListID** and **nFragmentSequence** fields MUST be unique relative to other **FileNodeListFragment** structures in the file.

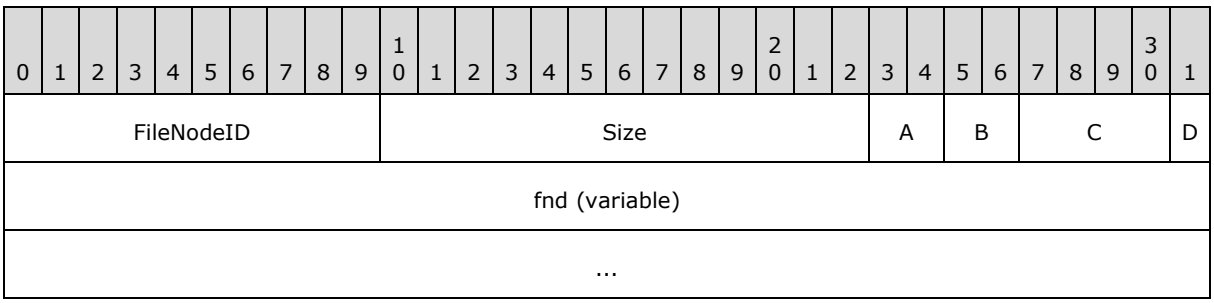
nFragmentSequence (4 bytes): An unsigned integer that specifies the index of the fragment in the file node list containing the fragment. The **nFragmentSequence** field of the first fragment in a given file node list MUST be 0 and the **nFragmentSequence** fields of all subsequent fragments in this list MUST be sequential.

2.4.3 FileNode

A **FileNode** structure is the basic unit for holding and referencing data in the file. **FileNode** structures are organized into file node lists (section 2.4).

A **FileNode** structure is divided into header fields and a data field, **fnd**. The header fields specify what type of **FileNode** structure it is, and what format the **fnd** field is in. The **fnd** field can be empty, or it can contain data directly, or it can contain a reference to another block of the file by byte position and byte count, or it can contain both data and a reference.

This structure has the following format.



FileNodeID (10 bits): An unsigned integer that specifies the type of this **FileNode** structure. The meaning of this value is specified by the **fnd** field.

Size (13 bits): An unsigned integer that specifies the size, in bytes, of this **FileNode** structure.

Copyright © 2013 Microsoft Corporation.

A - StpFormat (2 bits): An unsigned integer that specifies the size and format of the **FileNodeChunkReference.stp** field specified by the **fnd** field if this **FileNode** structure has a value of the **BaseType** field equal to 1 or 2. MUST be ignored if the value of the **BaseType** field of this **FileNode** structure is equal to 0. The meaning of the **StpFormat** field is given by the following table.

Value	Meaning
0	8 bytes, uncompressed.
1	4 bytes, uncompressed.
2	2 bytes, compressed.
3	4 bytes, compressed.

The value of an uncompressed file pointer specifies a location in the file. To uncompress a compressed file pointer, multiply the value by 8.

B - CbFormat (2 bits): An unsigned integer that specifies the size and format of the **FileNodeChunkReference.cb** field specified by the **fnd** field if this **FileNode** structure has a **BaseType** field value equal to 1 or 2. MUST be 0 and MUST be ignored if **BaseType** of this **FileNode** structure is equal to 0. The meaning of **CbFormat** is given by the following table.

Value	Meaning
0	4 bytes, uncompressed.
1	8 bytes, uncompressed.
2	1 byte, compressed.
3	2 bytes, compressed.

The value of an uncompressed byte count specifies the size, in bytes, of the data referenced by a **FileNodeChunkReference** structure (section 2.2.4.2). To uncompress a compressed byte count, multiply the value by 8.

C - BaseType (4 bits): An unsigned integer that specifies whether the structure specified by **fnd** contains a **FileNodeChunkReference** structure (section 2.2.4.2). MUST be one of the values described in the following table.

Value	Meaning
0	This **FileNode** structure does not reference other data. The data structure specified by **fnd** MUST NOT contain a **FileNodeChunkReference** structure. The **StpFormat** and **CbFormat** fields MUST be ignored.
1	This **FileNode** structure contains a reference to data. The first field in the data structure specified by an **fnd** field MUST be a **FileNodeChunkReference** structure that specifies the location and size of the referenced data. The type of the **FileNodeChunkReference** structure is specified by the **StpFormat** and **CbFormat** fields.
2	This **FileNode** structure contains a reference to a file node list. The first field in the data structure specified by the **fnd** field MUST be a **FileNodeChunkReference** structure that specifies the location and size of a file node list. The type of the **FileNodeChunkReference** is specified by the **StpFormat** and **CbFormat** fields.

Copyright © 2013 Microsoft Corporation.

D - Reserved (1 bit): MUST be 1, and MUST be ignored.

fnd (variable): A field that specifies additional data for this **FileNode** structure, if present. The type of structure is specified by the value of the **FileNodeID** field. Some **FileNodeID** field values and their corresponding structures are valid for .one or .onetoc2 only. The meaning of the **FileNodeID** field value is given by the following table.

Value of FileNodeID	Basetype	Fnd structure	Allowed file formats
0x004	0	ObjectSpaceManifestRootFND (section 2.5.1)	one onetoc2
0x008	2	ObjectSpaceManifestListReferenceFND (section 2.5.2)	one onetoc2
0x00C	0	ObjectSpaceManifestListStartFND (section 2.5.3)	one onetoc2

0x0C5	1	ReadOnlyObjectDeclaration2LargeRefCountFND (section 2.5.30)	one
0x0FF		ChunkTerminatorFND Specifies the end of the stream of **FileNode** structures in a **FileNodeListFragment** structure (section 2.4.1). MUST contain no data. MUST NOT be used in **FileNodeListFragment** structure that is the last fragment in the containing file node list.	one onetoc2

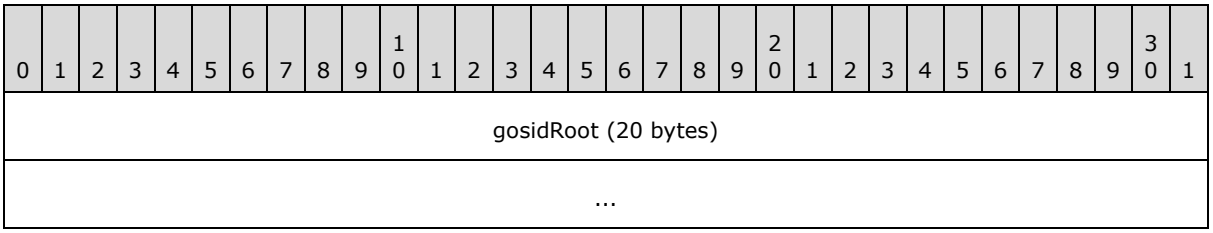
Copyright © 2013 Microsoft Corporation.

2.5 File Node Types

2.5.1 ObjectSpaceManifestRootFND

The data for a **FileNode** structure (section 2.4.3) that specifies the root object space (section 2.1.4) in a revision store file. There MUST be only one **ObjectSpaceManifestRootFND** structure (section 2.5.1) in the revision store file. This **FileNode** structure MUST be in the root file node list (section 2.1.14).

This structure has the following format.

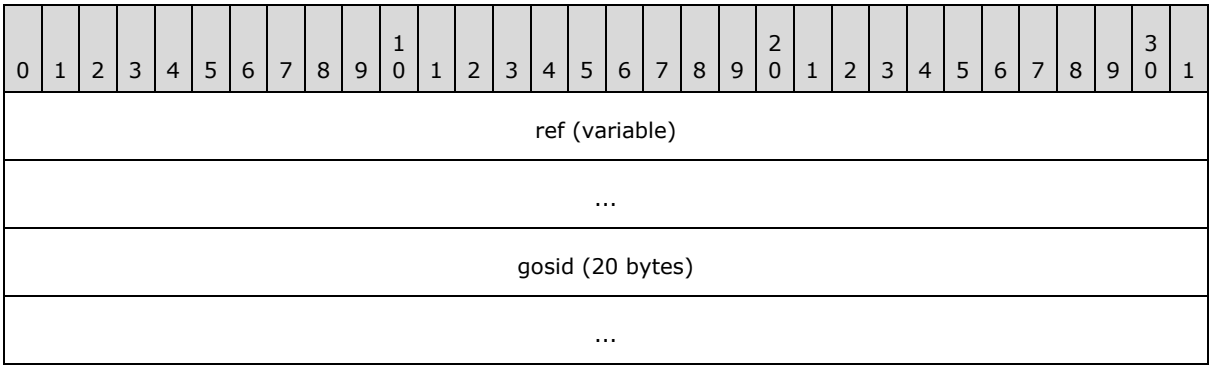


gosidRoot (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of the root object space. This value MUST be equal to the **ObjectSpaceManifestListReferenceFND.gosid** field of an object space within the object space manifest list (section 2.1.6).

2.5.2 ObjectSpaceManifestListReferenceFND

The data for a **FileNode** structure (section 2.4.3) that specifies the reference to an object space manifest list (section 2.1.6).

This structure has the following format.



ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies the location and size of the first **FileNodeListFragment** structure (section 2.4.1) in the object space manifest list.

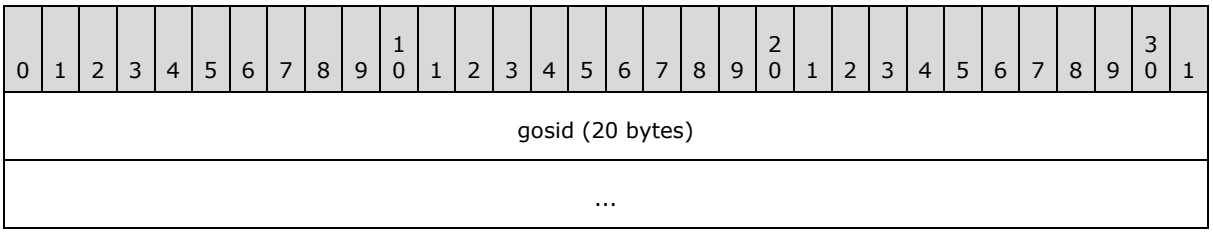
gosid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of the object space (section 2.1.4) specified by the object space manifest list. MUST NOT be {{00000000-0000-0000-0000-000000000000},0} and MUST be unique relative to the other **ObjectSpaceManifestListReferenceFND.gosid** fields in this file.

Copyright © 2013 Microsoft Corporation.

2.5.3 ObjectSpaceManifestListStartFND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of an object space manifest list (section 2.1.6).

This structure has the following format.

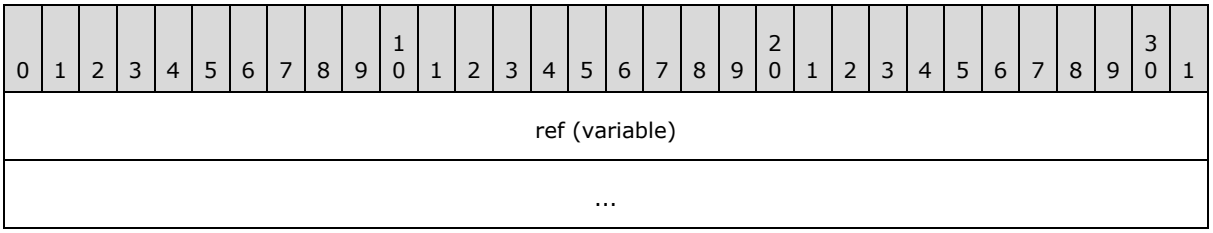


gosid (20 bytes): An **ExtendedGUID** structure that specifies the identity of the object space (section 2.1.4) being specified by this object space manifest list. MUST match the **ObjectSpaceManifestListReferenceFND.gosid** field of the **FileNode** structure that referenced this file node list (section 2.4).

2.5.4 RevisionManifestListReferenceFND

The data for a **FileNode** structure (section 2.4.3) that specifies the reference to a revision manifest list (section 2.1.10) for the current object space (section 2.1.4).

This structure has the following format.

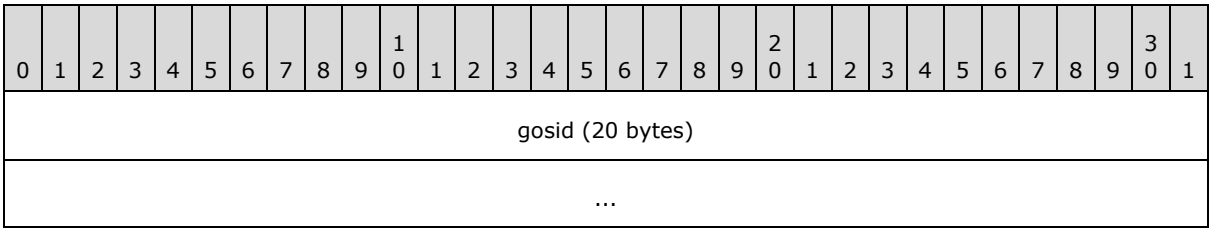


ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies the location and size of the first **FileNodeListFragment** structure (section 2.4.1) in the revision manifest list.

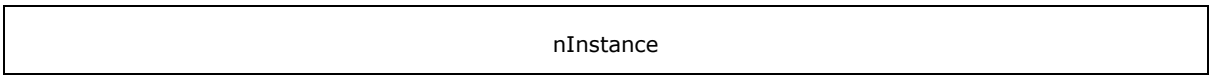
2.5.5 RevisionManifestListStartFND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of a revision manifest list (section 2.1.10).

This structure has the following format.



Copyright © 2013 Microsoft Corporation.



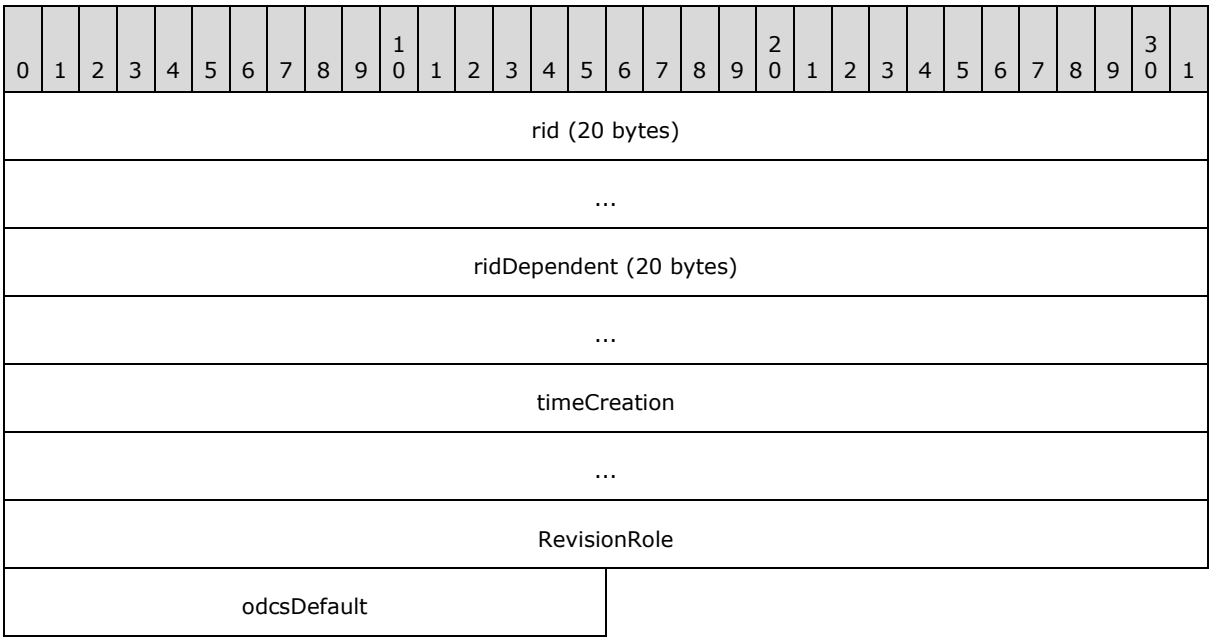
gosid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of the object space (section 2.1.4) being revised by the revisions (section 2.1.8) in this list.

nInstance (4 bytes): MUST be ignored.

2.5.6 RevisionManifestStart4FND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of a revision manifest (section 2.1.9). This revision manifest applies to the default context (section 2.1.11) of the containing object space (section 2.1.4).

This structure has the following format.



rid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of this revision (section 2.1.8). MUST NOT be "{{00000000-0000-0000-0000-000000000000}, 0}" and MUST be unique among **RevisionManifestStart4FND.rid** fields within the containing revision manifest list (section 2.1.10).

ridDependent (20 bytes): An **ExtendedGUID** structure that specifies the identity of a dependency revision.

If the value is "{{00000000-0000-0000-0000-000000000000}, 0}", then this revision manifest has no dependency revision. Otherwise, this value MUST be equal to the **RevisionManifestStart4FND.rid** field of a previous revision manifest within this (section 2.1.8) revision manifest list.

timeCreation (8 bytes): Undefined and MUST be ignored.

RevisionRole (4 bytes): An integer that specifies the revision role that labels this revision (section 2.1.8).

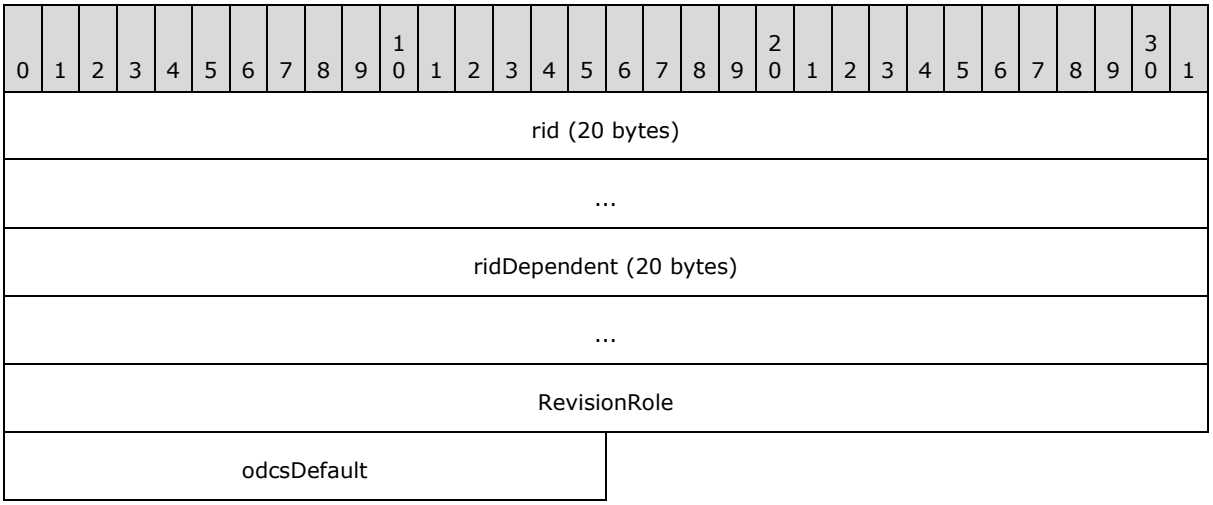
Copyright © 2013 Microsoft Corporation.

odcsDefault (2 bytes): An unsigned integer that specifies whether the data contained by this revision manifest is encrypted. MUST be 0 and MUST be ignored.

2.5.7 RevisionManifestStart6FND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of a revision manifest (section 2.1.9) for the default context (section 2.1.11) of an object space (section 2.1.4).

This structure has the following format.



rid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of this revision (section 2.1.8). MUST NOT be "{{00000000-0000-0000-0000-000000000000}, 0}" and MUST be unique among **RevisionManifestStart6FND.rid** and **RevisionManifestStart7FND.base.rid** fields within the containing revision manifest list (section 2.1.10).

ridDependent (20 bytes): An **ExtendedGUID** structure that specifies the identity of a dependency revision. If the value is "{{00000000-0000-0000-0000-000000000000}, 0}", then this revision manifest has no dependency revision. Otherwise, this value MUST be equal to the **RevisionManifestStart6FND.rid** field or the **RevisionManifestStart7FND.base.rid** field of a previous revision manifest within this revision manifest list.

RevisionRole (4 bytes): An integer that specifies the revision role (section 2.1.12) that labels this revision (section 2.1.8).

odcsDefault (2 bytes): An unsigned integer that specifies whether the data contained by this revision manifest is encrypted. MUST be one of the values described in the following table.

Value	Meaning
0x0000	No encryption.
0x0002	Encrypted. Property sets within this revision manifest MUST be ignored and MUST NOT be altered.

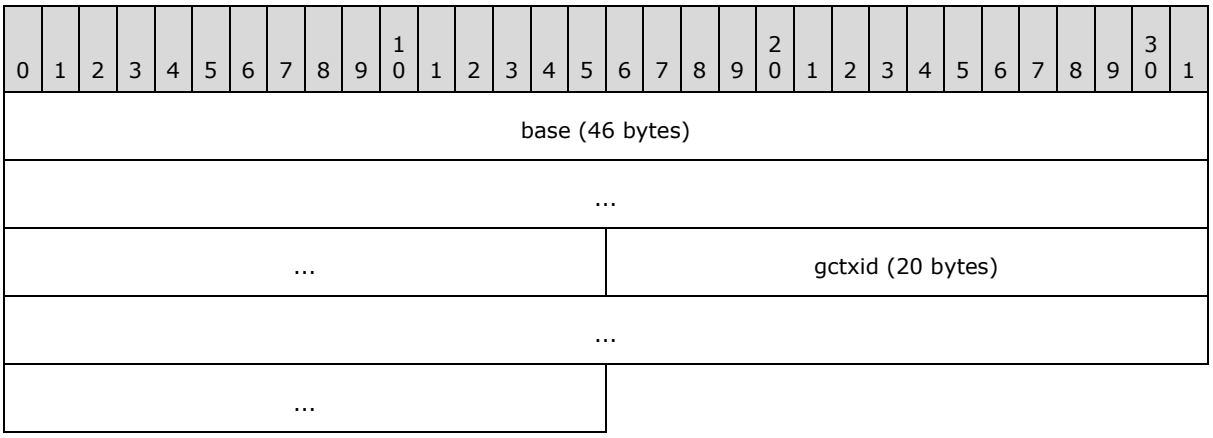
MUST specify the same type of data encoding as used in the dependency revision (section 2.1.8), if one was specified in the **ridDependent** field.

Copyright © 2013 Microsoft Corporation.

2.5.8 RevisionManifestStart7FND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of a revision manifest (section 2.1.9) for a context (section 2.1.11) of an object space (section 2.1.4).

This structure has the following format.



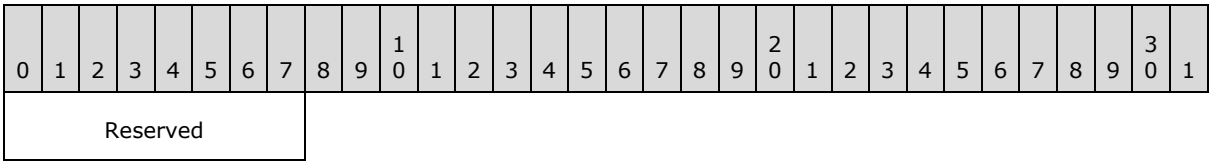
base (46 bytes): A **RevisionManifestStart6FND** structure (section 2.5.7) that specifies the identity and other attributes of this revision (section 2.1.8).

gctxid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the context that labels this revision (section 2.1.8).

2.5.9 GlobalIdTableStartFNDX

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of a global identification table (section 2.1.3). The value of the **FileNode.FileNodeID** field MUST be 0x021.

This structure has the following format.

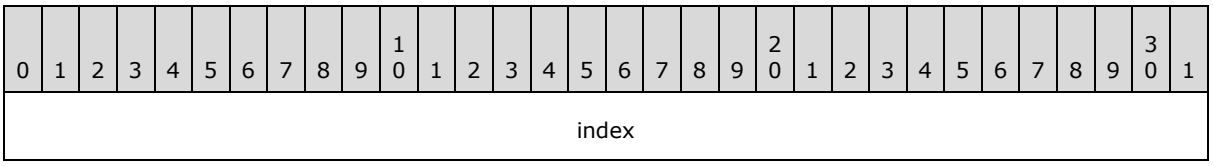


Reserved (1 byte): MUST be 0, and MUST be ignored.

2.5.10 GlobalIdTableEntryFNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an entry in the current global identification table (section 2.1.3). The value of the **FileNode.FileNodeID** field MUST be 0x024.

This structure has the following format.



Copyright © 2013 Microsoft Corporation.

guid (16 bytes)
...

index (4 bytes): An unsigned integer that specifies the index of the entry. MUST be less than 0xFFFFFF. MUST be unique relative to the other indexes in this global identification table specified by **FileNode** structures with the values of the **FileNode.FileNodeID** fields equal to 0x024 (**GlobalIdTableEntryFNDX** structure), 0x25 (**GlobalIdTableEntry2FNDX** structure), and 0x26 (**GlobalIdTableEntry3FNDX** structure).

guid (16 bytes): A GUID, as specified by [MS-DTYP]. MUST NOT be {00000000-0000-0000-0000-000000000000} and MUST be unique relative to the other **GlobalIDTableEntryFNDX.guid** fields in this global identification table (section 2.1.3).

2.5.11 GlobalIdTableEntry2FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an entry in the current global identification table (section 2.1.3) by referring to an entry in the global identification table of the dependency revision (section 2.1.8) of the revision manifest (section 2.1.9) that contains this global identification table. The value of the **FileNode.FileNodeID** field MUST be 0x025.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
iIndexMapFrom																															
iIndexMapTo																															

iIndexMapFrom (4 bytes): An unsigned integer that specifies the index of the entry in the dependency revision's global identification table that is used to define this entry. The index MUST be present in the global identification table of the dependency revision (section 2.1.8).

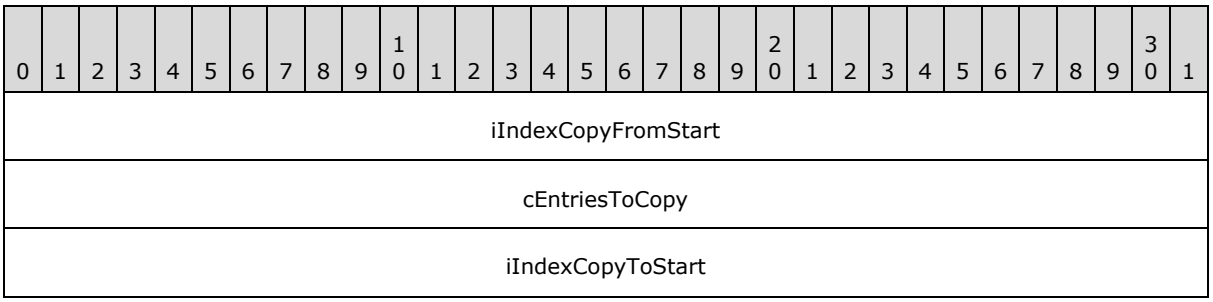
iIndexMapTo (4 bytes): An unsigned integer that specifies the index of the entry in the current global identification table. MUST be less than 0xFFFFFF. MUST be unique relative to the other indices in this global identification table specified by **FileNode** structures with the value of the **FileNode.FileNodeID** field equal to 0x024 (**GlobalIdTableEntryFNDX** structure), 0x25 (**GlobalIdTableEntry2FNDX** structure), and 0x26 (**GlobalIdTableEntry3FNDX** structure).

2.5.12 GlobalIdTableEntry3FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies a range of entries in the current global identification table (section 2.1.3) by referring to a range of entries in the global identification table of the dependency revision (section 2.1.8) of the revision manifest (section 2.1.9) that contains this global identification table. The value of the **FileNode.FileNodeID** field MUST be 0x026.

This structure has the following format.

Copyright © 2013 Microsoft Corporation.



iIndexCopyFromStart (4 bytes): An unsigned integer that specifies the index of the first entry in the range of entries in global identification table of the dependency revision (section 2.1.8). The index MUST be present in the global identification table of the dependency revision.

cEntriesToCopy (4 bytes): An unsigned integer that specifies the number of entries in the range. All indices from the value of the **iIndexCopyFromStart** field to the value of (`iIndexCopyFromStart + cEntriesToCopy – 1`) inclusive MUST be present in the global identification table of the dependency revision.

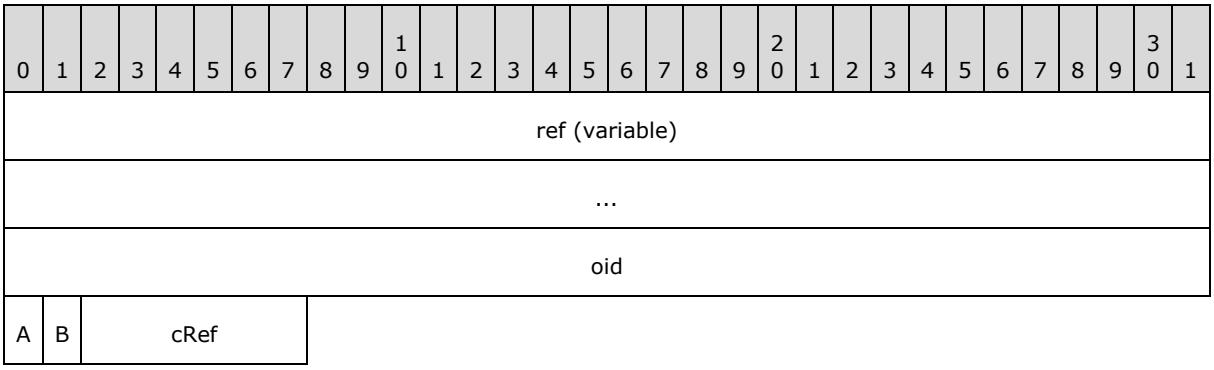
iIndexCopyToStart (4 bytes): An unsigned integer that specifies the index of the first entry in the range in the current global identification table. Other entries assume the consecutive indices.

All indices from the value of **iIndexCopyToStart** to the value of (`iIndexCopyToStart + cEntriesToCopy – 1`) inclusive MUST be less than 0xFFFFFF and MUST be unique relative to the other indices in this global identification table specified by **FileNode** structures with the values of the **FileNode.FileNodeID** field equal to 0x024 (**GlobalIdTableEntryFNDX** structure), 0x025 (**GlobalIdTableEntry2FNDX** structure), and 0x026 (**GlobalIdTableEntry3FNDX** structure).

2.5.13 ObjectRevisionWithRefCountFNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an object (section 2.1.5) that has been revised. The value of the **FileNode.FileNodeID** field MUST be 0x041. The revised object is identified by the **oid** field, and the revised data is at the location specified by the **ref** field.

This structure has the following format.



ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1) containing the revised data for the object referenced by the **oid** field.

Copyright © 2013 Microsoft Corporation.

oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the object that has been revised.

A - fHasOidReferences (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure referenced by the **ref** field contains references to other objects.

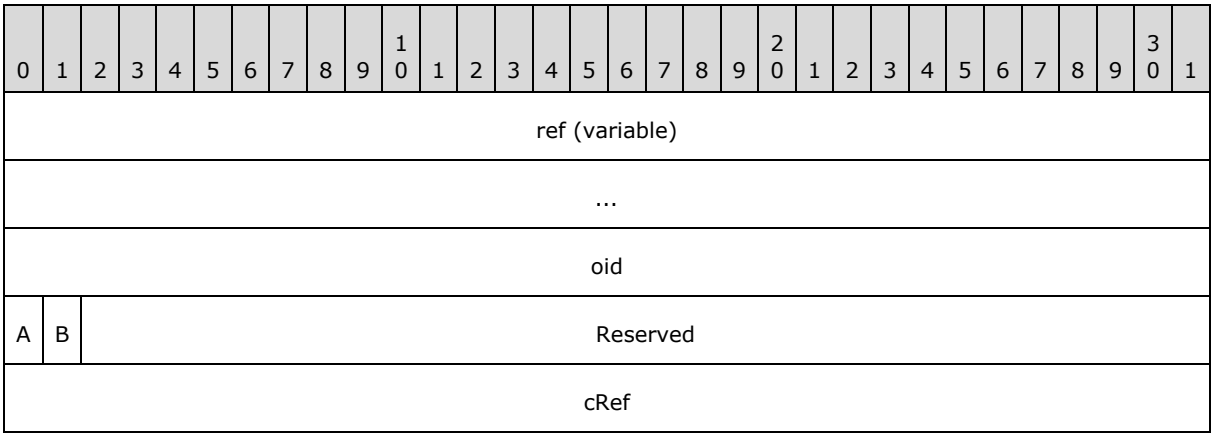
B - fHasOsidReferences (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure referenced by the **ref** field contains references to object spaces (section 2.1.4).

cRef (6 bits): An unsigned integer that specifies the reference count for this object.

2.5.14 ObjectRevisionWithRefCount2FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an object (section 2.1.5) that has been revised. The value of the **FileNode.FileNodeID** field MUST be 0x042. The revised object is identified by the **oid** field, and the revised data is at the location specified by the **ref** field.

This structure has the following format.



ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.13) containing the revised data for the object referenced by the **oid** field.

oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the object that has been revised.

A - fHasOidReferences (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure referenced by the **ref** field contains references to other objects.

B - fHasOsidReferences (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure referenced by the **ref** field contains references to object spaces (section 2.1.4).

Reserved (30 bits): MUST be zero, and MUST be ignored.

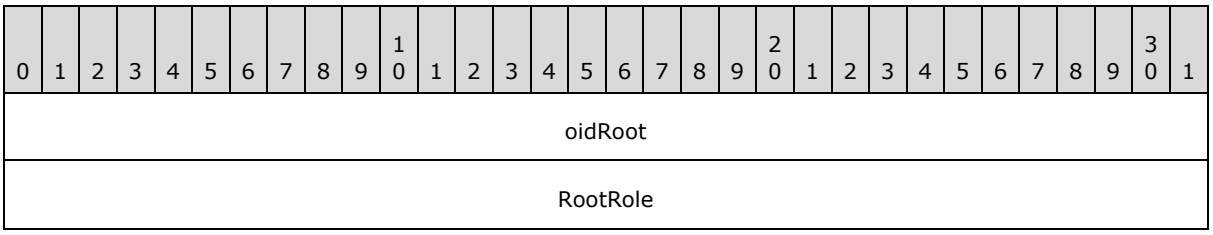
cRef (4 bytes): An unsigned integer that specifies the reference count for this object.

2.5.15 RootObjectReference2FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies the root object (section 2.1.7) of a revision (section 2.1.8) for a particular root role. The value of the **FileNode.FileNodeID** field MUST be 0x059.

Copyright © 2013 Microsoft Corporation.

This structure has the following format.



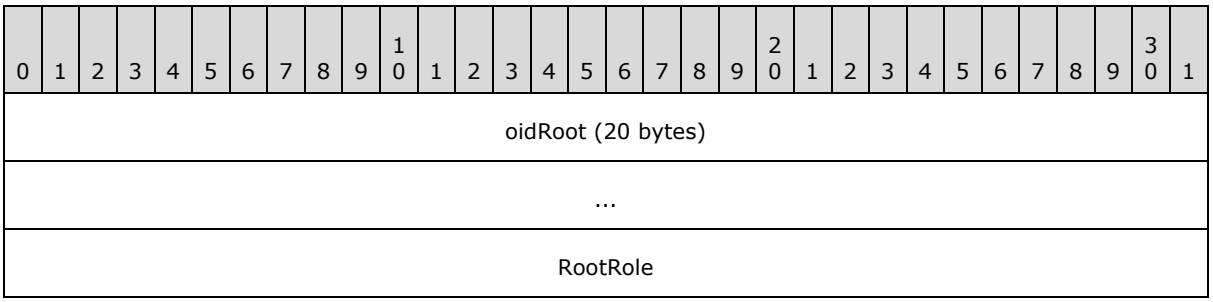
oidRoot (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of the root object of the containing revision for the role specified by the **RootRole** field.

RootRole (4 bytes): An unsigned integer that specifies the role of the root object.

2.5.16 RootObjectReference3FND

The data for a **FileNode** structure (section 2.4.3) that specifies the root object (section 2.1.7) of a revision (section 2.1.8) for a particular root role. The value of the **FileNode.FileNodeID** field MUST be 0x05A.

This structure has the following format.



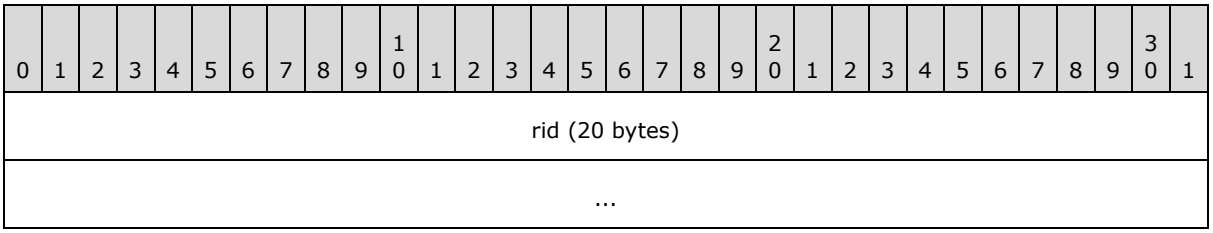
oidRoot (20 bytes): An **ExtendedGUID** (section 2.2.1) that specifies the identity of the root object of the containing revision for the role specified by the **RootRole** field.

RootRole (4 bytes): An unsigned integer that specifies the role of the root object.

2.5.17 RevisionRoleDeclarationFND

The data for a **FileNode** structure (section 2.4.3) that specifies a new additional revision role (section 2.1.12) value to associate with a revision (section 2.1.8). The revision role label is in the default context (section 2.1.11).

This structure has the following format.



Copyright © 2013 Microsoft Corporation.

RevisionRole

rid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of the revision to add the revision role to. MUST match the value of the **RevisionManifestStart4FND.rid** field, **RevisionManifestStart6FND.rid** field or **RevisionManifestStart7FND.base.rid** field of one of preceding revision manifests (section 2.1.9) in the current revision manifest list (section 2.1.10).

RevisionRole (4 bytes): Specifies a revision role for the default context.

2.5.18 RevisionRoleAndContextDeclarationFND

The data for a **FileNode** structure (section 2.4.3) that specifies a new additional revision role (section 2.1.12) and context (section 2.1.11) pair to associate with a revision (section 2.1.8).

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1
base (24 bytes)																															
...																															
gctxid (20 bytes)																															
...																															

base (24 bytes): A **RevisionRoleDeclarationFND** structure (section 2.5.17) that specifies the revision and revision role.

gctxid (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the context.

2.5.19 ObjectDataEncryptionKeyV2FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies that the object space (section 2.1.4) is encrypted. If any revision manifest (section 2.1.9) for an object space contains this **FileNode** structure, all other revision manifests for this object space MUST contain this **FileNode** structure, and these **FileNode** structures MUST point to structures with identical encryption data.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1
ref (variable)																															
...																															

ref (variable): Specifies a **FileNodeChunkReference** structure (section 2.2.4.2) that refers to the following structure.

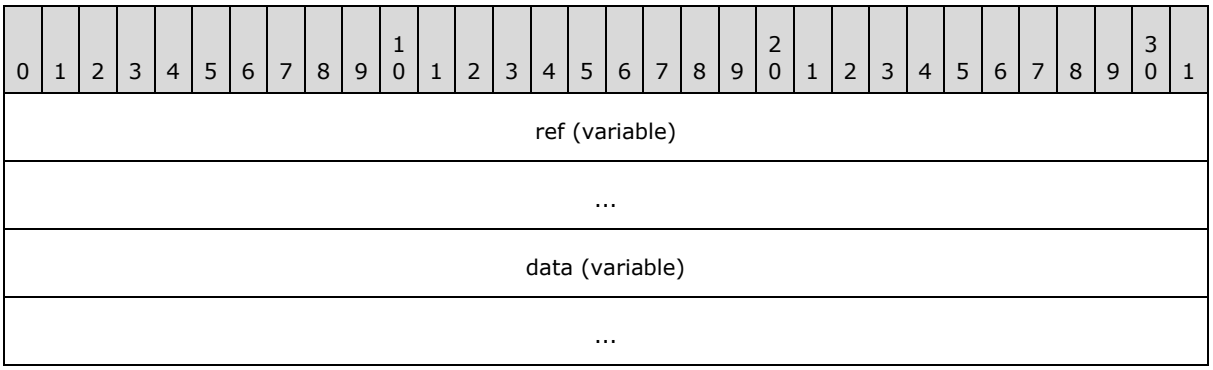
Copyright © 2013 Microsoft Corporation.

Field	Meaning
Header	A 64-bit unsigned integer that MUST be 0xFB6BA385DAD1A067.
Encryption Data	A variable sized array of bytes. MUST be ignored.
Footer	A 64-bit unsigned integer that MUST be 0x2649294F8E198B3C.

2.5.20 ObjectInfoDependencyOverridesFND

The data for a **FileNode** structure (section 2.4.3) that specifies updated reference counts for objects (section 2.1.5). The override data is specified by the **ref** field if the value of the **ref** field is not "fcrNil" (section 2.2.4); otherwise, the override data is specified by the **data** field. The total size of the **data** field, in bytes, MUST be less than 1024; otherwise, the override data MUST be in the location referenced by the **ref** field.

This structure has the following format.



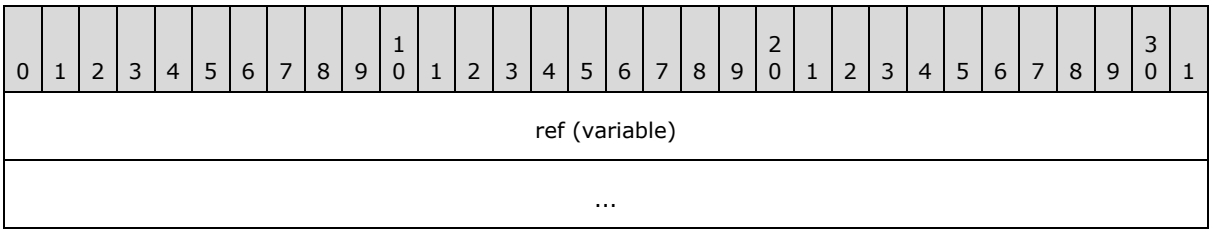
ref (variable): A **FileNodeChunkReference** structure that specifies the location of an **ObjectInfoDependencyOverrideData** structure (section 2.6.10) if the value of the **ref** field is not "fcrNil".

data (variable): An optional **ObjectInfoDependencyOverrideData** structure (section 2.6.10) that specifies the updated reference counts for objects (section 2.1.5). MUST exist if the value of the **ref** field is "fcrNil".

2.5.21 FileDataStoreListReferenceFND

The data for a **FileNode** structure (section 2.4.3) that specifies a file node list (section 2.4) containing references to file data objects. The referenced file node list MUST contain only **FileNode** structures with a **FileNodeID** field value equal to 00x094 (**FileDataStoreObjectReferenceFND** structure). The value of the **FileNode.FileNodeID** field MUST be 0x090.

This structure has the following format.



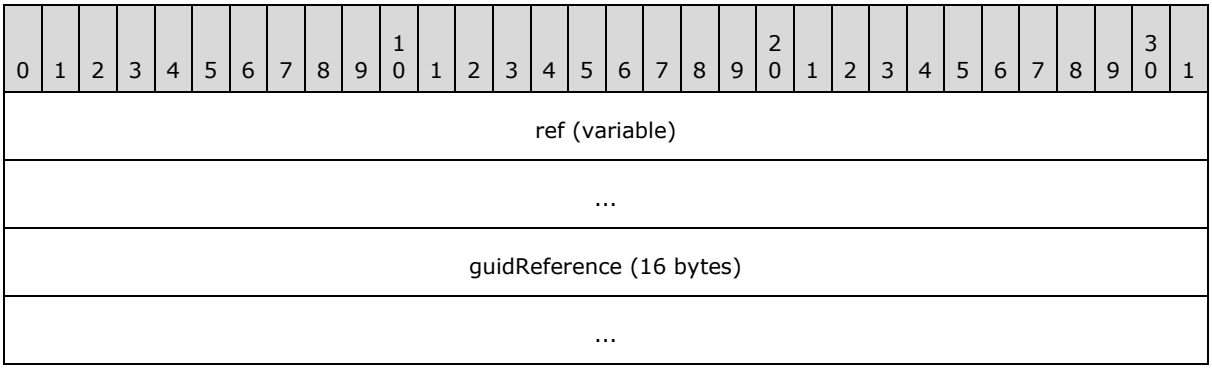
Copyright © 2013 Microsoft Corporation.

ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to a **FileNodeListFragment** structure (section 2.4.1).

2.5.22 FileDataStoreObjectReferenceFND

The data for a **FileNode** structure (section 2.4.3) that specifies a reference to a file data object. All such **FileNode** structures MUST be contained in the file node list (section 2.4) specified by a **FileDataStoreListReferenceFND** structure (section 2.5.21).

This structure has the following format.



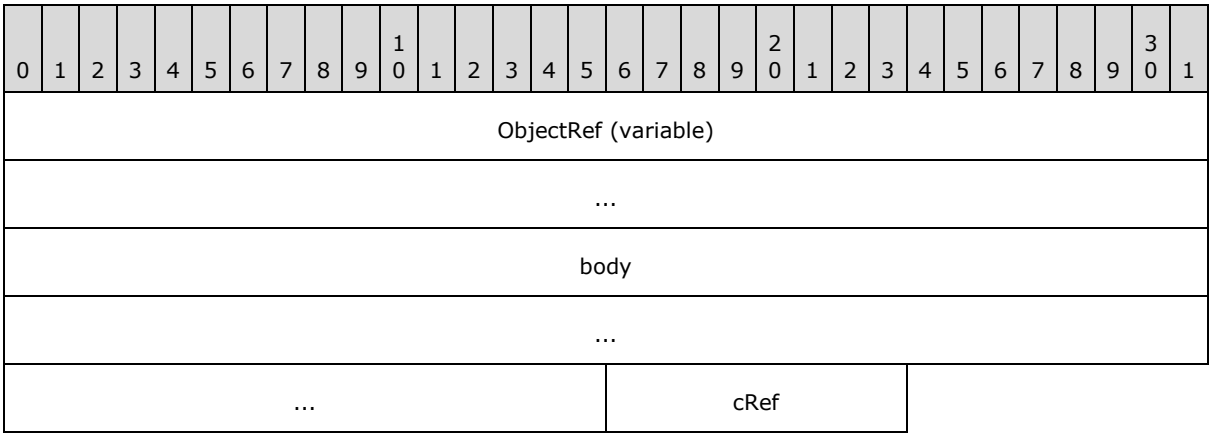
ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to a **FileDataStoreObject** structure (section 2.6.13).

guidReference (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the identity of this file data object. MUST be unique with respect to all **FileDataStoreObjectReferenceFND** structures.

2.5.23 ObjectDeclarationWithRefCountFNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an object (section 2.1.5) with a reference count. The value of the **FileNode.FileNodeID** field MUST be 0x02D.

This structure has the following format.



ObjectRef (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

Copyright © 2013 Microsoft Corporation.

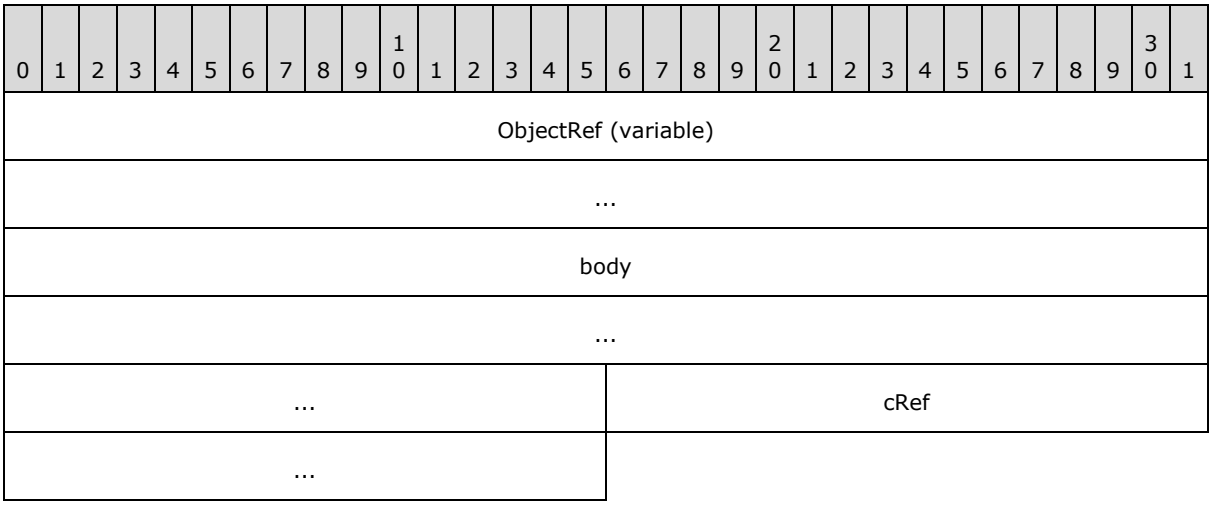
body (10 bytes): An **ObjectDeclarationWithRefCountBody** structure (section 2.6.15) that specifies the identity and other attributes of this object.

cRef (1 byte): An unsigned integer that specifies the number of objects that reference this object.

2.5.24 ObjectDeclarationWithRefCount2FNDX

The data for a **FileNode** structure (section 2.4.3) that specifies an object with a reference count. The value of the **FileNode.FileNodeID** field MUST be 0x02E.

This structure has the following format.



ObjectRef (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

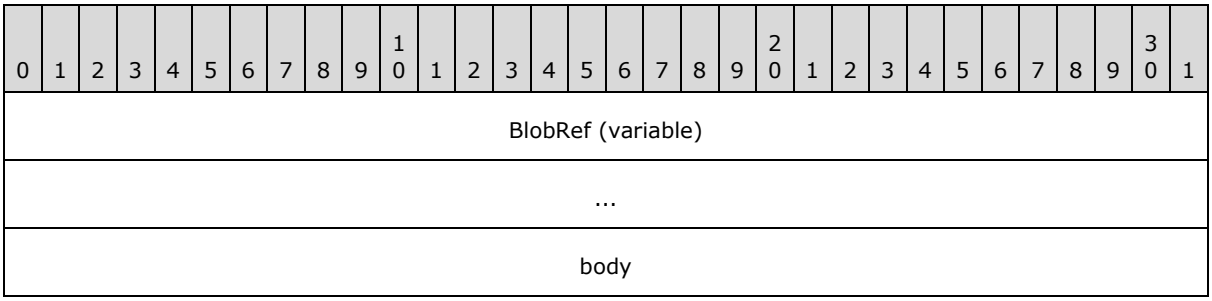
body (10 bytes): An **ObjectDeclarationWithRefCountBody** structure (section 2.6.15) that specifies the identity and other attributes of this object (section 2.1.5).

cRef (4 bytes): An unsigned integer that specifies the reference count for this object.

2.5.25 ObjectDeclaration2RefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object (section 2.1.5) with a reference count. The value of the **FileNode.FileNodeID** field MUST be 0x0A4.

This structure has the following format.



Copyright © 2013 Microsoft Corporation.

BlobRef (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

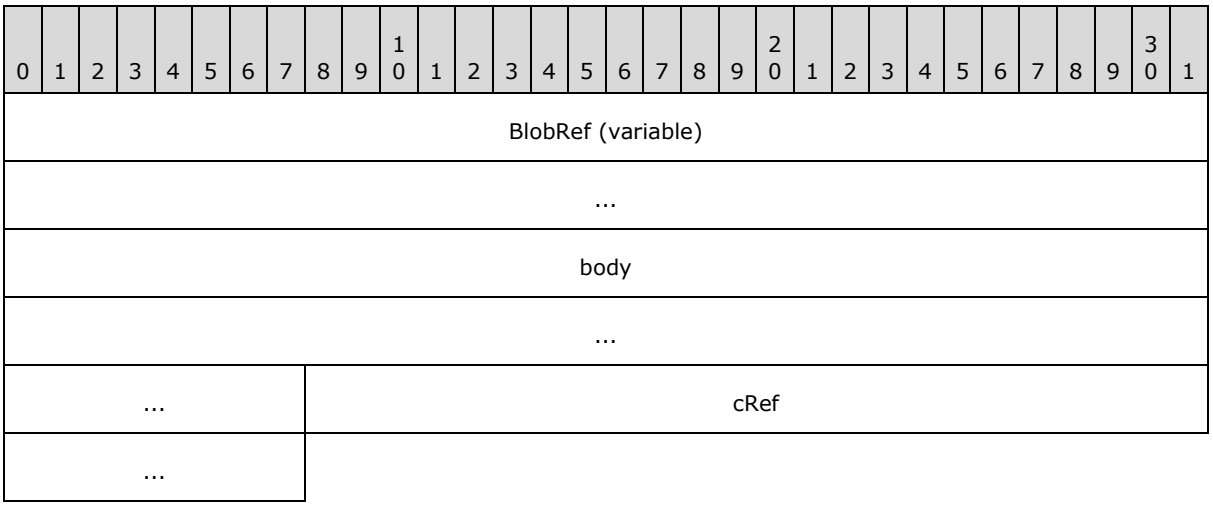
body (9 bytes): An **ObjectDeclaration2Body** structure (section 2.6.16) that specifies the identity and other attributes of this object.

cRef (1 byte): An unsigned integer that specifies the reference count for this object (section 2.1.5).

2.5.26 ObjectDeclaration2LargeRefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object (section 2.1.5) with a reference count. The value of the **FileNode.FileNodeID** field MUST be 0x0A5.

This structure has the following format.



BlobRef (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies a reference to an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

body (9 bytes): An **ObjectDeclaration2Body** structure (section 2.6.16) that specifies the identity and other attributes of this object.

cRef (4 bytes): An unsigned integer that specifies the reference count for this object (section 2.1.5).

2.5.27 ObjectDeclarationFileData3RefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object that references data for a file data object. If this object is revised, all declarations of this object MUST specify identical data. The value of the **FileNode.FileNodeID** field MUST be 0x072. This structure has the following format.

Copyright © 2013 Microsoft Corporation.

This structure has the following format.

oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of this object.

jcid (4 bytes): A **JCID** structure (section 2.6.14) that specifies the type of this object and the type of the data the object contains.

cRef (1 byte): An unsigned integer that specifies the reference count for this object (section 2.1.5).

FileDataReference (variable): A **StringInStorageBuffer** structure (section 2.2.3) that specifies the type and the target of the reference. The value of the **FileDataReference.StringData** field MUST begin with one of the following strings: "<file>"; "<ifndf>"; "<invfdo>". The prefix specifies the type of the reference and the remaining part of the string specifies the target of the reference:

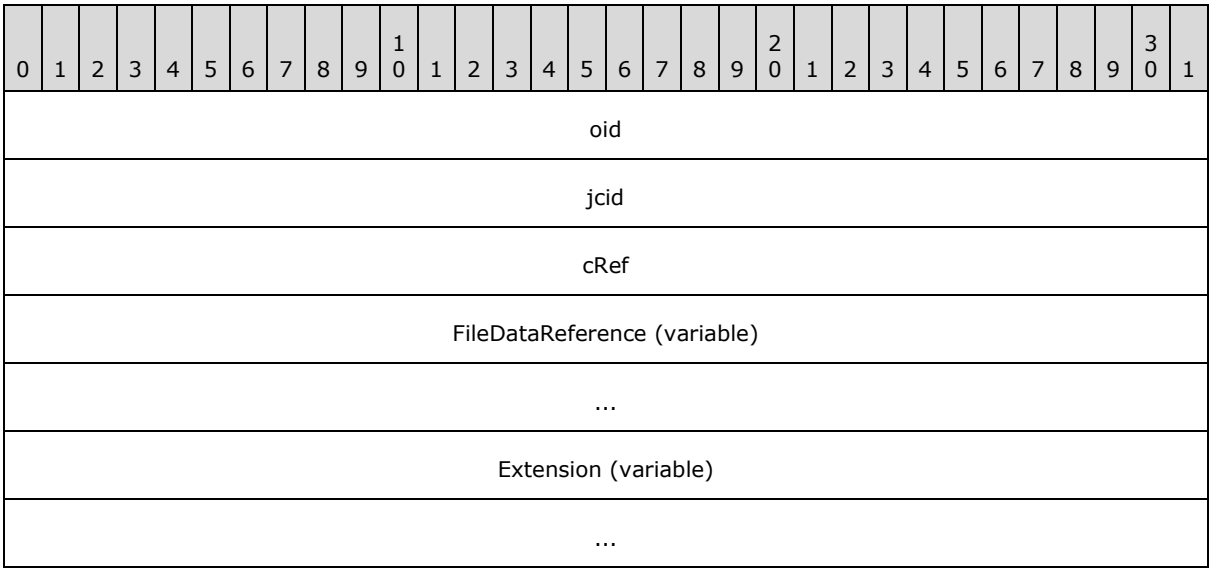
Prefix	Type of the reference	Remaining part of the string
<file>	A file in the **onefiles folder**	SHOULD<8> specify a file name, including the file extension, of an existing file in the onefiles folder. The name portion of the file name MUST be a string form of a **UUID**, as specified in [RFC4122] section 3. The extension MUST be "onebin".
<ifndf>	**FileDataStoreObject** (section 2.6.13)	Specifies a **curly braced GUID string** that MUST represent one of the **FileDataStoreObjectReferenceFND.guidReference** fields.
<invfdo>	Invalid	Specifies that the reference is not valid. MUST be followed by an empty string.

Extension (variable): A **StringInStorageBuffer** (section 2.2.3) that specifies the file extension including period.

Copyright © 2013 Microsoft Corporation.

2.5.28 ObjectDeclarationFileData3LargeRefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object that references data for a file data object. If this object is revised, all declarations of this object MUST specify identical data. The value of the **FileNode.FileNodeID** field MUST be 0x073.



oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of this object.

jcid (4 bytes): A **JCID** structure (section 2.6.14) that specifies the type of this object and the type of the data the object contains.

cRef (4 bytes): An unsigned integer that specifies the reference count for this objects (section 2.1.5).

FileDataReference (variable): A **StringInStorageBuffer** structure (section 2.2.3) that specifies the type and the target of the reference. The value of the **FileDataReference.StringData** field MUST begin with one of the following strings: "<file>"; "<ifndf>"; "<invfdo>". The prefix specifies the type of the reference and the remaining part of the string specifies the target of the reference:

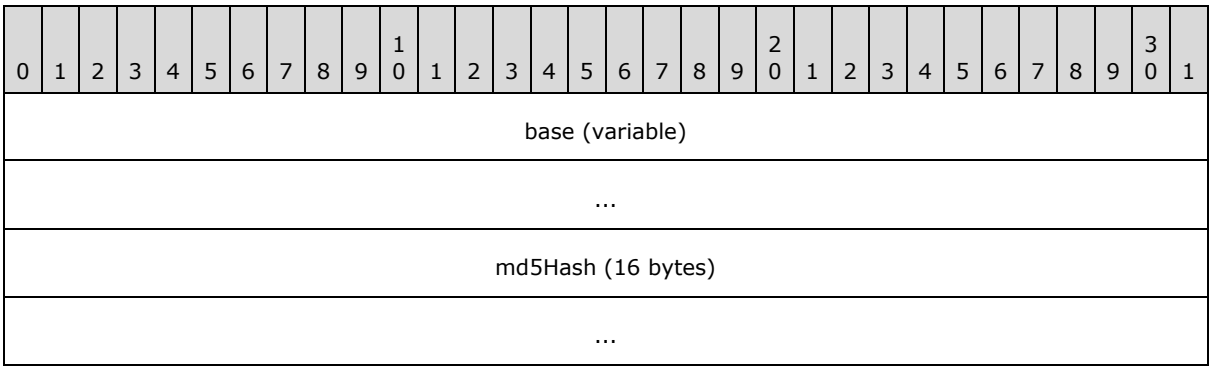
Prefix	Type of the reference	Remaining part of the string
<file>	A file in the onefiles folder	SHOULD<9> specify a file name, including the file extension, of an existing file in the onefiles folder. The name portion of the file name MUST be a string form of a UUID, as specified in [RFC4122] section 3. The extension MUST be "onebin".
<ifndf>	**FileDataStoreObject** (section 2.6.13)	Specifies a curly braced GUID string that MUST represent one of the **FileDataStoreObjectReferenceFND.guidReference** fields.
<invfdo>	Invalid	Specifies that the reference is not valid. MUST be followed by an empty string.

Copyright © 2013 Microsoft Corporation.

Extension (variable): A **StringInStorageBuffer** (section 2.2.3) that specifies the file extension including period.

2.5.29 ReadOnlyObjectDeclaration2RefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object with a reference count. If this object is revised, all declarations of this object MUST specify identical data. The value of the **FileNode.FileNodeID** field MUST be 0x0C4.

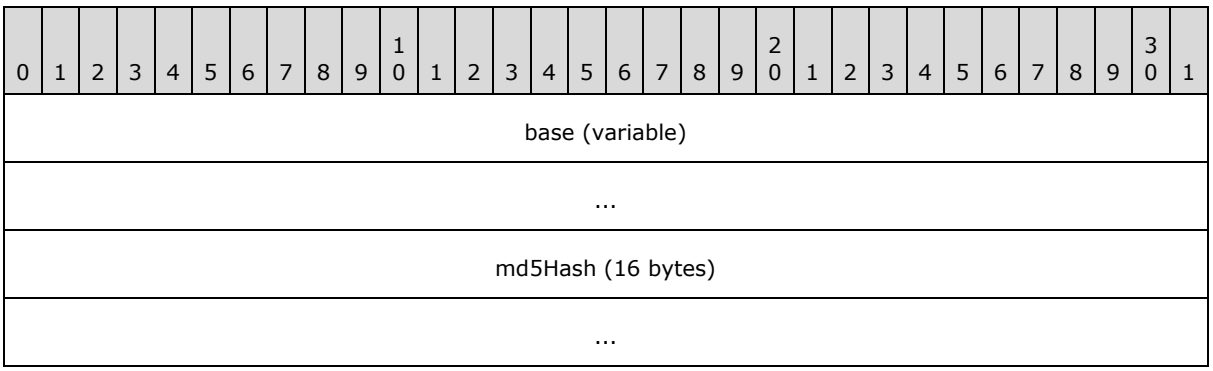


base (variable): An **ObjectDeclaration2RefCountFND** structure (section 2.5.25) that specifies the identity and other attributes of this object (section 2.1.5). The values of the **base.body.jcid.IsPropertySet** and **base.body.jcid.IsReadOnly** fields MUST be **true**.

md5Hash (16 bytes): An unsigned integer that specifies an MD5 checksum, as specified in [RFC1321], of the data referenced by the **base.BlobRef** field. If the referenced data is encrypted, the data MUST be decrypted and padded with zeros to an 8-byte boundary before calculating the checksum of the data.

2.5.30 ReadOnlyObjectDeclaration2LargeRefCountFND

The data for a **FileNode** structure (section 2.4.3) that specifies an object with a reference count. If this object is revised, all declarations of this object MUST specify identical data. The value of the **FileNode.FileNodeID** field MUST be 0x0C5.



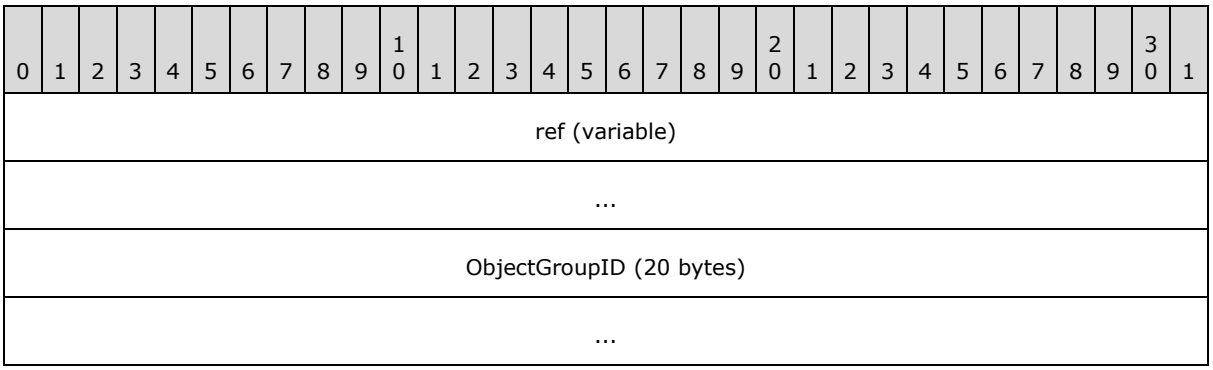
base (variable): An **ObjectDeclaration2LargeRefCountFND** structure (section 2.5.26) that specifies the identity and other attributes of this object (section 2.1.5). The values of the **base.body.jcid.IsPropertySet** and **base.body.jcid.IsReadOnly** fields MUST be **true**.

Copyright © 2013 Microsoft Corporation.

md5Hash (16 bytes): An unsigned integer that specifies an MD5 checksum, as specified in [RFC1321], of the data referenced by the **base.BlobRef** field. If the referenced data is encrypted, the data MUST be decrypted and padded with zeros to an 8-byte boundary before calculating the checksum of the data.

2.5.31 ObjectGroupListReferenceFND

The data for a **FileNode** structure (section 2.4.3) that specifies a reference to an object group (section 2.1.13). The value of the **FileNode.FileNodeID** field MUST be set to 0x0B0.

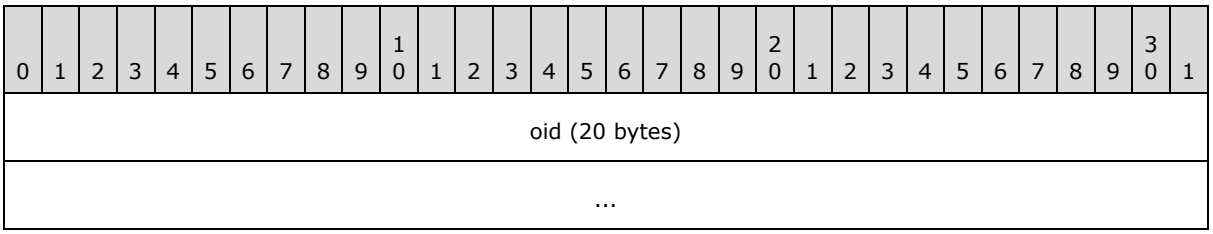


ref (variable): A **FileNodeChunkReference** structure (section 2.2.4.2) that specifies the location and size of the first **FileNodeListFragment** structure (section 2.4.1) in the file node list (section 2.4) of the object group.

ObjectGroupID (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the identity of the object group that the **ref** field value points to. MUST be the same value as the **ObjectGroupStartFND.oid** field value of the object group that the **ref** field points to.

2.5.32 ObjectGroupStartFND

The data for a **FileNode** structure (section 2.4.3) that specifies the beginning of an object group (section 2.1.13).



oid (20 bytes): An **ExtendedGUID** (section 2.2.1) that specifies the identity of the object group.

2.5.33 DataSignatureGroupDefinitionFND

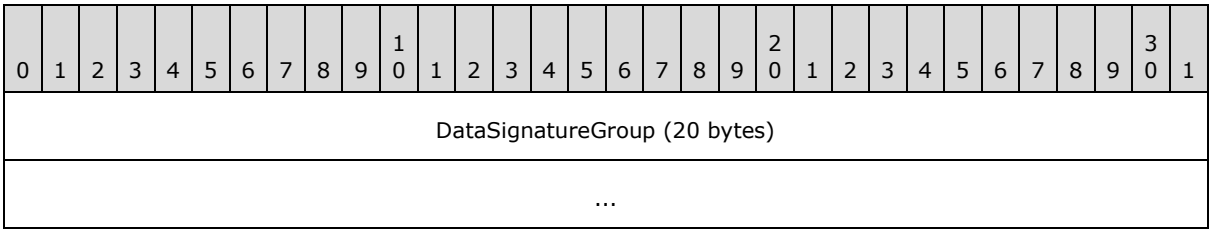
The data for a **FileNode** structure (section 2.4.3) that specifies a signature for data of objects declared by **FileNode** structures that follow this **FileNode** structure. The signature's effect terminates when a **FileNode** structure with **FileNodeID** field values equal to one of the following is encountered:

1. 0x0B8 (**ObjectGroupEndFND** structure, section 2.4.3)

Copyright © 2013 Microsoft Corporation.

2. 0x08C (**DataSignatureGroupDefinitionFND** structure, section 2.5.33)

3. 0x01C (**RevisionManifestEndFND** structure, section 2.4.3)

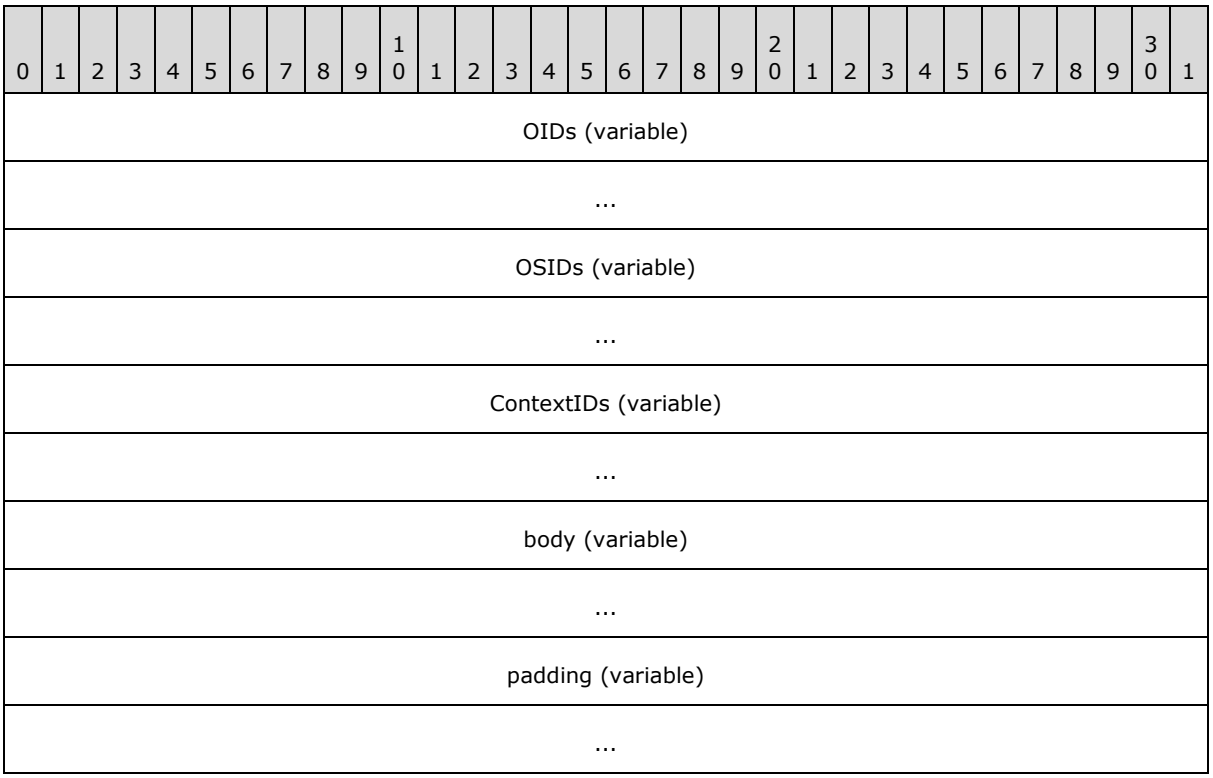


DataSignatureGroup (20 bytes): An **ExtendedGUID** structure (section 2.2.1) that specifies the signature. All declarations of an object (section 2.1.5) with the same identity and the same **DataSignatureGroup** field not equal to {{00000000-0000-0000-0000-000000000000}, 0} MUST have the same data.

2.6 Other Structures

2.6.1 ObjectSpaceObjectPropSet

The **ObjectSpaceObjectPropSet** structure specifies the data for an object, including a property set (section 2.1.1) and references to other objects, object spaces (section 2.1.4), and contexts (section 2.1.11).



OIDs (variable): An **ObjectSpaceObjectStreamOfOIDs** (section 2.6.2) that specifies the count and list of objects that are referenced by this **ObjectSpaceObjectPropSet**. The count

Copyright © 2013 Microsoft Corporation.

of referenced objects is calculated as the number of properties specified by the **body** field, with **PropertyID** equal to 0x8 plus the number of referenced objects specified by properties with **PropertyID** equal to 0x9, 0x10, and 0x11. This count MUST be equal to the value of **OIDs.header.Count** field. Properties that reference other objects MUST be matched with the **CompactID** structures from **OIDs.body** field in the same order as the properties are listed in the **body.rgPrids** field.

OSIDs (variable): An optional **ObjectSpaceObjectStreamOfOSIDs** structure (section 2.6.3) that specifies the count and list of object spaces referenced by this **ObjectSpaceObjectPropSet** structure. MUST be present if the value of the **OIDs.header.OsidStreamNotPresent** field is **false**; otherwise, the **OSIDs** field MUST NOT be present. The count of referenced object spaces is calculated as the number of properties specified by the **body** field with **PropertyID** equal to 0xA plus the number of referenced object spaces specified by properties with **PropertyID** equal to 0xB, 0x10, and 0x11. This count MUST be equal to the value of **OSIDs.header.Count** field. Properties that reference other object spaces MUST be matched with the **CompactID** structures from **OSIDs.body** field in the same order as the properties are listed in the **body.rgPrids** field.

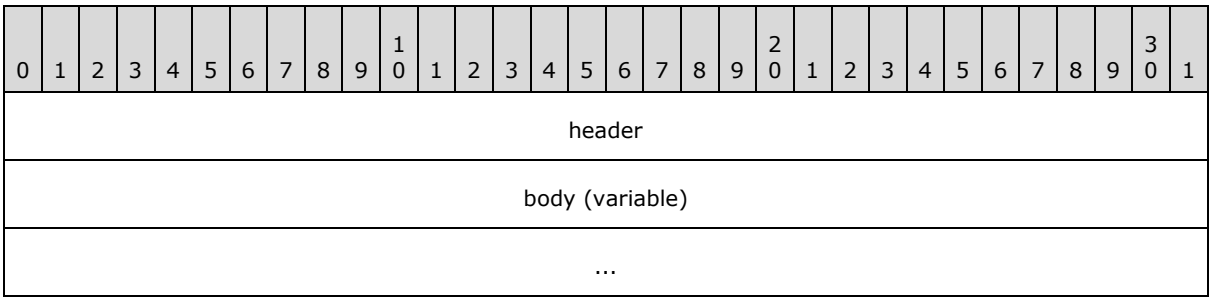
ContextIDs (variable): An optional **ObjectSpaceObjectStreamOfContextIDs** (section 2.6.4) that specifies the count and list of contexts referenced by this **ObjectSpaceObjectPropSet** structure. MUST be present if **OSIDs** is present and the value of the **OSIDs.header.ExtendedStreamsPresent** field is **true**; otherwise, the **ContextIDs** field MUST NOT be present. The count of referenced contexts is calculated as the number of properties specified by the **body** field with **PropertyID** equal to 0xC plus the number of referenced contexts specified by properties with **PropertyID** equal to 0xD, 0x10, and 0x11. This count MUST be equal to the value of **ContextIDs.header.Count** field. Properties that reference other contexts MUST be matched with the **CompactID** structures from **ContextIDs.body** field in the same order as the properties are listed in the **body.rgPrids** field.

body (variable): A **PropertySet** structure (section 2.6.7) that specifies properties that modify this object, and how other objects relate to this object.

padding (variable): An optional array of bytes that, if present, MUST be zero and MUST be ignored. The total size, in bytes, of an **ObjectSpaceObjectPropSet** structure MUST be a multiple of 8; the size of the **padding** field is the number of bytes necessary to ensure the total size of **ObjectSpaceObjectPropSet** structure is a multiple of 8. The size of the **padding** field MUST NOT exceed 7 bytes. If the sum of the sizes of the **OIDs**, **OSIDs**, **ContextIDs**, and **body** fields is a multiple of 8, then the **padding** field is not present.

2.6.2 ObjectSpaceObjectStreamOfOIDs

The **ObjectSpaceObjectStreamOfOIDs** structure specifies the count and list of objects referenced by an **ObjectSpaceObjectPropSet** structure (section 2.6.1).



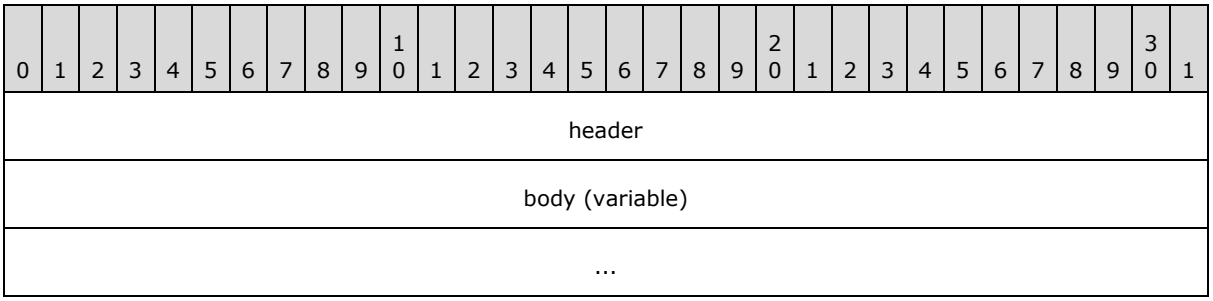
Copyright © 2013 Microsoft Corporation.

header (4 bytes): An **ObjectSpaceObjectStreamHeader** structure (section 2.6.5) that specifies the number of elements in the **body** field and whether the **ObjectSpaceObjectPropSet** structure contains an **OSIDs** field and **ContextIDs** field. If the **OSIDs** field is present, the value of the **header.OsidStreamNotPresent** field MUST be **false**; otherwise, it MUST be **true**. If the **ContextIDs** field is present the value of the **header**.**ExtendedStreamsPresent** field MUST be **true**; otherwise, it MUST be **false**.

body (variable): An array of **CompactID** structures (section 2.2.2) where each element in the array specifies the identity of an object. The number of elements is equal to the value of the **header.Count** field.

2.6.3 ObjectSpaceObjectStreamOfOSIDs

The **ObjectSpaceObjectStreamOfOSIDs** structure specifies the count and list of object spaces (section 2.1.4) referenced by an **ObjectSpaceObjectPropSet** structure (section 2.6.1).

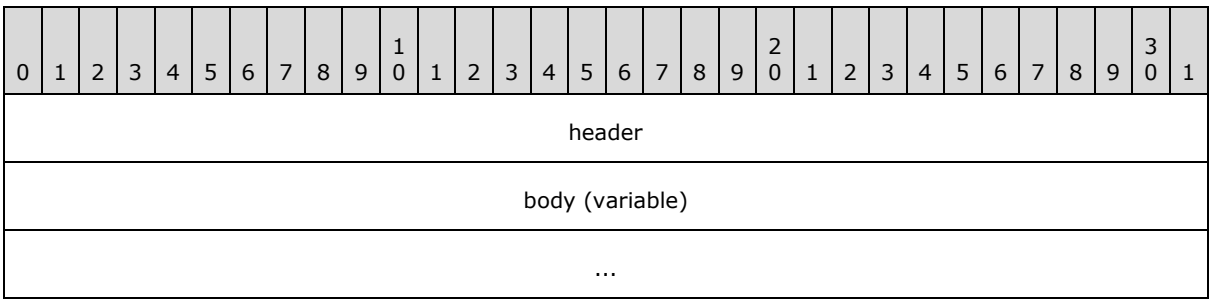


header (4 bytes): An **ObjectSpaceObjectStreamHeader** structure (section 2.6.5) that specifies the number of elements in the **body** field and whether the **ObjectSpaceObjectPropSet** structure contains **ContextIDs** field. The value of the **header.OsidStreamNotPresent** field MUST be "false". If the **ContextIDs** field is present, the value of the **header**.**ExtendedStreamsPresent** field MUST be **true**; otherwise, it MUST be **false**.

body (variable): An array of **CompactID** structures (section 2.2.2) where each element in the array specifies the identity of an object space. The number of elements is equal to the value of the **header.Count** field.

2.6.4 ObjectSpaceObjectStreamOfContextIDs

The **ObjectSpaceObjectStreamOfContextIDs** structure specifies the count and list of contexts (section 2.1.11) referenced by an **ObjectSpaceObjectPropSet** structure (section 2.6.1).



header (4 bytes): An **ObjectSpaceObjectStreamHeader** structure (section 2.6.5) that specifies the number of elements in the **body** field. The value of

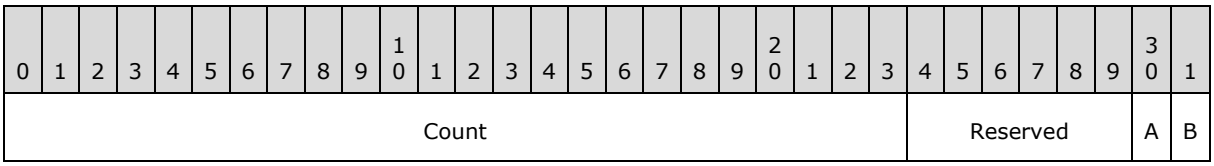
Copyright © 2013 Microsoft Corporation.

header.OsidStreamNotPresent field and **header**.**ExtendedStreamsPresent** field MUST be **false**.

body (variable): An array of **CompactID** structures (section 2.2.2) where each element in the array specifies a context (section 2.1.11). The number of elements is equal to the value of the **header.Count** field.

2.6.5 ObjectSpaceObjectStreamHeader

The **ObjectSpaceObjectStreamHeader** structure specifies the number of objects (see section 2.1.5) in a stream and whether there are more streams following the stream that contains this **ObjectSpaceObjectStreamHeader** structure.



Count (24 bits): An unsigned integer that specifies the number of **CompactID** structures (section 2.2.2) in the stream that contains this **ObjectSpaceObjectStreamHeader** structure.

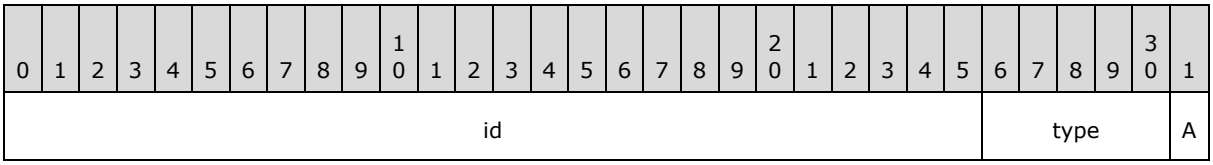
Reserved (6 bits): MUST be zero, and MUST be ignored.

A - ExtendedStreamsPresent (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure (section 2.6.1) contains any additional streams of data following this stream of data.

B - OsidStreamNotPresent (1 bit): A bit that specifies whether the **ObjectSpaceObjectPropSet** structure does not contain **OSIDs** or **ContextIDs** fields.

2.6.6 PropertyID

The **PropertyID** structure specifies the identity of a property and the size and location of the data for the property. The meaning of the data contained by a property is specified in [MS-ONE] section 2.1.12.



id (26 bits): An unsigned integer that specifies the identity of this property. The meanings of the **id** field values are specified in [MS-ONE] section 2.1.12.

type (5 bits): An unsigned integer that specifies the property type and the size and location of the data for this property. MUST be one of the following values:

Value	Name	Meaning
0x1	NoData	The property contains no data.
0x2	Bool	The property is a Boolean value specified by

Copyright © 2013 Microsoft Corporation.

Value	Name	Meaning
		boolValue.
0x3	OneByteOfData	The property contains 1 byte of data in the **PropertySet.rgData** stream field.
0x4	TwoBytesOfData	The property contains 2 bytes of data in the **PropertySet.rgData** stream field.
0x5	FourBytesOfData	The property contains 4 bytes of data in the **PropertySet.rgData** stream field.
0x6	EightBytesOfData	The property contains 8 bytes of data in the **PropertySet.rgData** stream field.
0x7	FourBytesOfLengthFollowedByData	The property contains a **prtFourBytesOfLengthFollowedByData** (section 2.6.8) in the **PropertySet.rgData** stream field.
0x8	ObjectID	The property contains one **CompactID** (section 2.2.2) in the **ObjectSpaceObjectPropSet.OIDs.body** stream field.
0x9	ArrayOfObjectIDs	The property contains an array of **CompactID** structures in the **ObjectSpaceObjectPropSet.OIDs.body** stream field. The property contains an unsigned integer of size 4 bytes in the **PropertySet.rgData** stream field that specifies the number of **CompactID** structures this property contains.
0xA	ObjectSpaceID	The property contains one **CompactID** structure in the **ObjectSpaceObjectPropSet.OSIDs.body** stream field.
0xB	ArrayOfObjectSpaceIDs	The property contains an array of **CompactID** structures in the **ObjectSpaceObjectPropSet.OSIDs.body** stream field. The property contains an unsigned integer of size 4 bytes in the **PropertySet.rgData** stream field that specifies the number of **CompactID** structures this property contains.
0xC	ContextID	The property contains one **CompactID** in the **ObjectSpaceObjectPropSet.ContextIDs.body** stream field.
0xD	ArrayOfContextIDs	The property contains an array of **CompactID** structures in the **ObjectSpaceObjectPropSet.ContextIDs.body** stream field. The property contains an unsigned integer of size 4 bytes in the **PropertySet.rgData** stream field that specifies the number of **CompactID** structures this property contains.
0x10	ArrayOfPropertyValues	The property contains a **prtArrayOfPropertyValues** (section 2.6.9) structure in the **PropertySet.rgData** stream field.

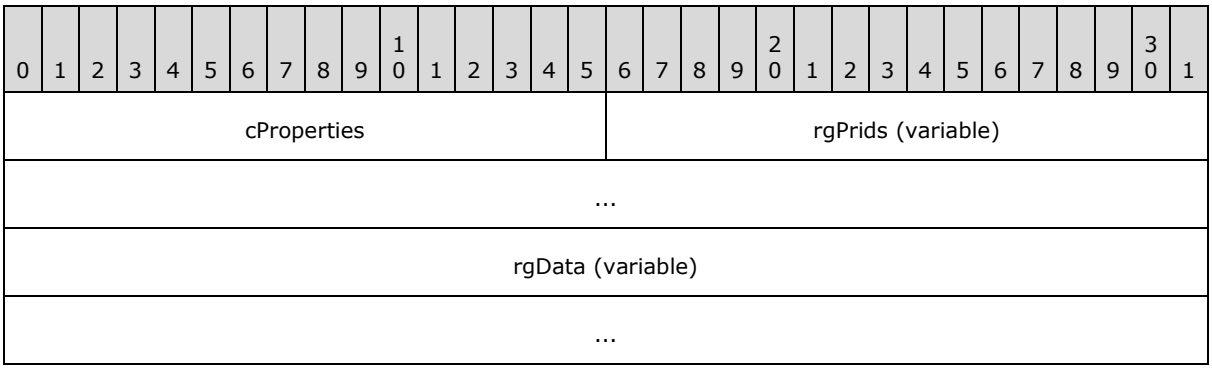
Copyright © 2013 Microsoft Corporation.

Value	Name	Meaning
0x11	PropertySet	The property contains a child **PropertySet** (section 2.6.7) structure in the **PropertySet.rgData** stream field of the parent **PropertySet**.

A - boolValue (1 bit): A bit that specifies the value of a Boolean property. MUST be **false** if the value of the **type** field is not equal to 0x2.

2.6.7 PropertySet

The **PropertySet** structure specifies the format of a property set (section 2.1.1).



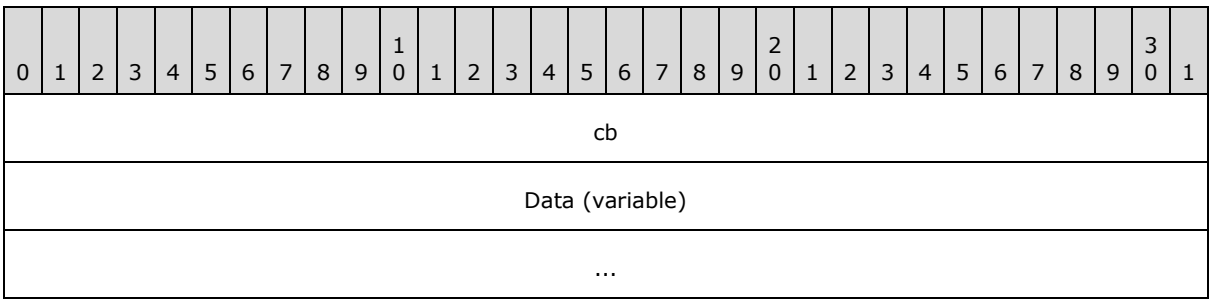
cProperties (2 bytes): An unsigned integer that specifies the number of properties in this **PropertySet** structure.

rgPrids (variable): An array of **PropertyID** structures (section 2.6.6). The number of elements in the array is equal to the value of the **cProperties** field.

rgData (variable): A stream of bytes that specifies the data for each property specified by a **rgPrids** array. The total size, in bytes, of the **rgData** field is the sum of the sizes specified by the **PropertyID.type** field for each property in a **rgPrids** array. The total size of **rgData** MUST be zero if no property in a **rgPrids** array specifies that it contains data in the **rgData** field.

2.6.8 prtFourBytesOfLengthFollowedByData

The **prtFourBytesOfLengthFollowedByData** structure specifies a container of variable-sized data used by properties in a **PropertySet** structure (section 2.6.7). The total size, in bytes, of **prtFourBytesOfLengthFollowedByData** is equal to **cb** + 4.



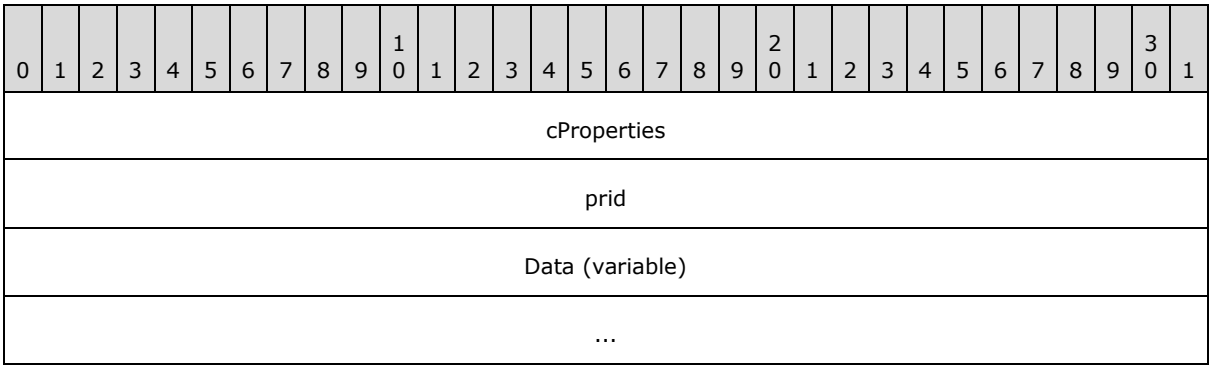
Copyright © 2013 Microsoft Corporation.

cb (4 bytes): An unsigned integer that specifies the size, in bytes, of the **Data** field. MUST be less than 0x40000000.

Data (variable): A stream of bytes that specifies the data for the property.

2.6.9 prtArrayOfPropertyValues

The **prtArrayOfPropertyValues** structure specifies a container of variable-sized data that stores an array of properties with the same **PropertyID.type** value.



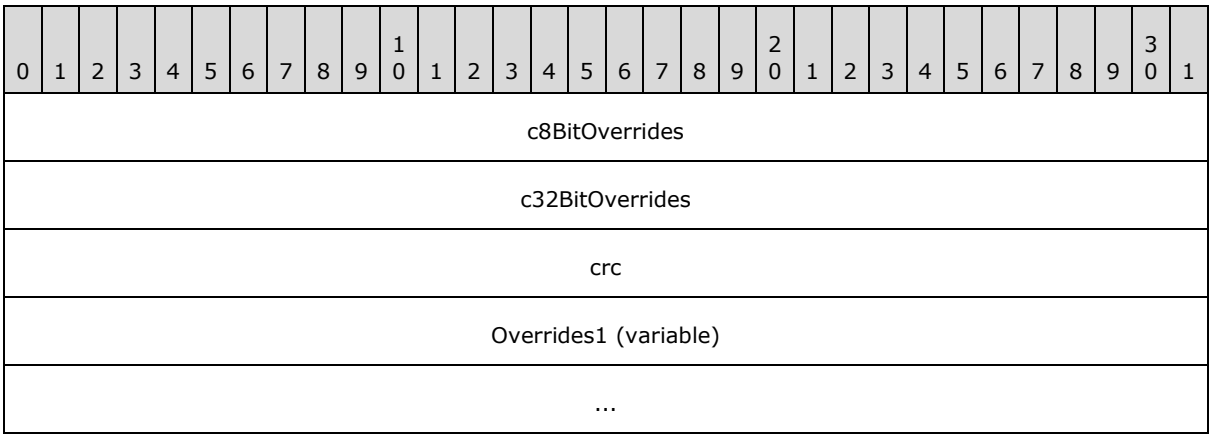
cProperties (4 bytes): An unsigned integer that specifies the number of properties in **Data**.

prid (4 bytes): An optional PropertyID structure (section 2.6.6) that specifies the type of each property in the array. **PropertyID.type** MUST be 0x11 ("PropertySet"). Values of **PropertyID.id** and **PropertyID.boolValue** are undefined and MUST be ignored. MUST NOT be present if **cProperties** is zero; otherwise, MUST be present.

Data (variable): A stream of bytes that specifies the data for each property in the array. The total size, in bytes, of the **Data** field is the sum of the sizes specified by the **prid.type** field for each property in the array, if **prid** is present. Otherwise, the total size of **Data** is zero if **cProperties** is zero.

2.6.10 ObjectInfoDependencyOverrideData

The **ObjectInfoDependencyOverrideData** structure specifies updated reference counts for objects (section 2.1.5).



Copyright © 2013 Microsoft Corporation.

Overrides2 (variable)
...

c8BitOverrides (4 bytes): An unsigned integer that specifies the number of elements in **Overrides1**.

c32BitOverrides (4 bytes): An unsigned integer that specifies the number of elements in **Overrides2**.

crc (4 bytes): An unsigned integer that specifies a **CRC** (section 2.1.2) of the reference counts. The **crc** field is computed as follows:

1. **crc** is initialized to zero.
2. If this **FileNode** structure (section 2.4.3) follows an object group (section 2.1.13) in the revision manifest, the **crc** field is calculated cumulatively on every reference count of every object declared in the group in the order they appear in the group. The following reference counts are used:
   - The **ObjectDeclarationFileData3RefCountFND.cRef** field, extended to an unsigned integer of size 4 bytes.
   - The **ObjectDeclarationFileData3LargeRefCountFND.cRef** field.
   - The **ObjectDeclaration2RefCountFND.cRef** field, extended to an unsigned integer of size 4 bytes.
   - The **ObjectDeclaration2LargeRefCountFND.cRef** field.
   - The **ReadOnlyObjectDeclaration2RefCountFND.cRef** field, extended to an unsigned integer of size 4 bytes.
   - The **ReadOnlyObjectDeclaration2LargeRefCountFND.cRef** field.
3. The **crc** field is calculated cumulatively on each element in the **Overrides1** field, where each element is treated as an array of 5 bytes.
4. The **crc** field is calculated cumulatively on each element in the **Overrides2** field, where each element is treated as an array of 8 bytes.

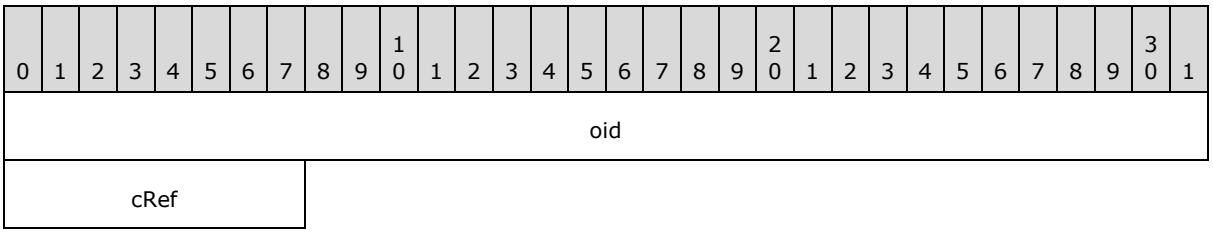
Overrides1 (variable): An array of **ObjectInfoDependencyOverride8** structures (section 2.6.11) that specifies the updated reference counts for objects (section 2.1.5) if the updated reference count is less than or equal to 255.

Overrides2 (variable): An array of **ObjectInfoDependencyOverride32** structures (section 2.6.12) that specifies the updated reference counts for objects if the updated reference count is greater than 255.

2.6.11 ObjectInfoDependencyOverride8

The **ObjectInfoDependencyOverride8** structure specifies the updated reference count for an object (section 2.1.5).

Copyright © 2013 Microsoft Corporation.

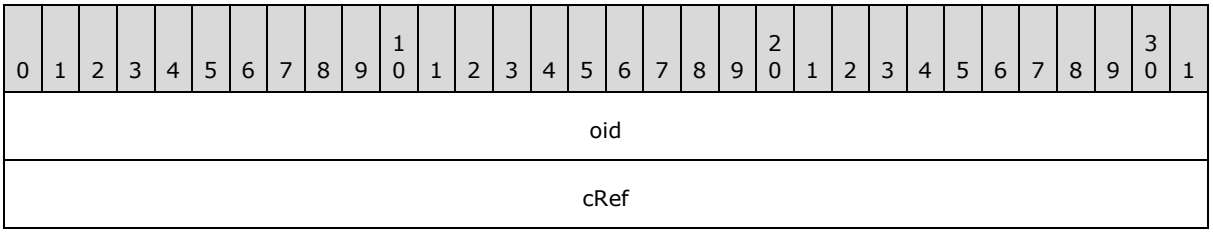


oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of the object with the updated reference count. The object MUST already be defined in the current revision (section 2.1.8).

cRef (1 byte): An unsigned integer that specifies the updated reference count for the **oid** field.

2.6.12 ObjectInfoDependencyOverride32

The **ObjectInfoDependencyOverride32** structure specifies the updated reference count for an object (section 2.1.5).

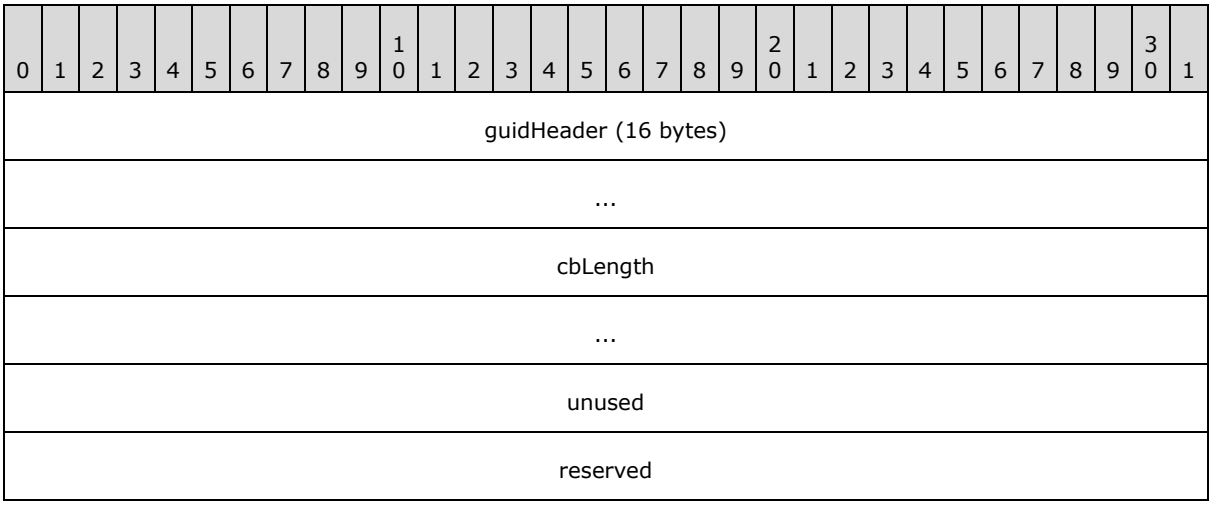


oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of the object with the updated reference count. The object MUST already be defined in the current revision (section 2.1.8).

cRef (4 bytes): An unsigned integer that specifies the updated reference count for an **oid** field.

2.6.13 FileDataStoreObject

The **FileDataStoreObject** structure specifies the data for a file data object.



Copyright © 2013 Microsoft Corporation.

...
FileData (variable)
...
guidFooter (16 bytes)
...

guidHeader (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the beginning of a **FileDataStoreObject**. MUST be {BDE316E7-2665-4511-A4C4-8D4D0B7A9EAC}.

cbLength (8 bytes): An unsigned integer that specifies the size, in bytes, of the **FileData** field.

unused (4 bytes): MUST be zero, and MUST be ignored.

reserved (8 bytes): MUST be zero, and MUST be ignored.

FileData (variable): A stream of bytes that specifies the data for the file data object.

guidFooter (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the end of a **FileDataStoreObject** structure. MUST be {71FBA722-0F79-4A0B-BB13-899256426B24}.

2.6.14 JCID

The **JCID** structure specifies the type of object (section 2.1.5) and the type of data the object contains. A **JCID** structure can be considered to be an unsigned integer of size four bytes as specified by property set (as specified in [MS-ONE]) and file data object (as specified in [MS-ONE]).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
index																A	B	C	D	E	Reserved										

index (2 bytes): An unsigned integer that specifies the type of object.

A - IsBinary (1 bit): Specifies whether the object contains encryption data transmitted over the File Synchronization via SOAP over HTTP Protocol, as specified in [MS-FSSHTTP].

B - IsPropertySet (1 bit): Specifies whether the object contains a property set (section 2.1.1).

C - IsGraphNode (1 bit): Undefined and MUST be ignored.

D - IsFileData (1 bit): Specifies whether the object is a file data object. If the value of **IsFileData** is "true", then the values of the **IsBinary**, **IsPropertySet**, **IsGraphNode**, and **IsReadOnly** fields MUST all be **false**.

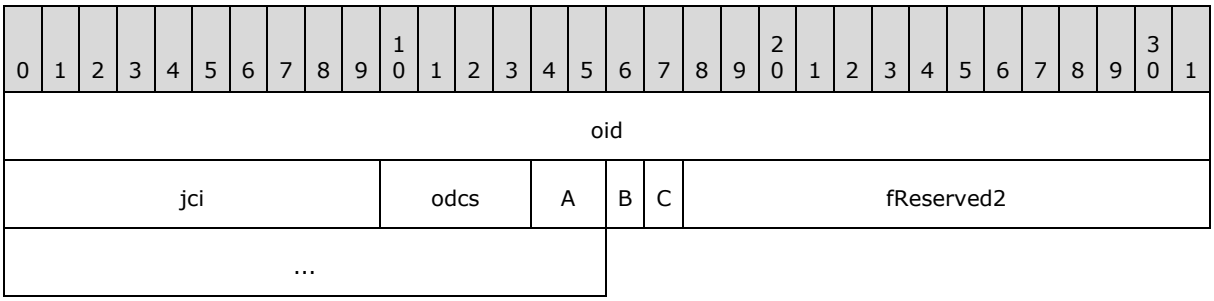
E - IsReadOnly (1 bit): Specifies whether the object's data MUST NOT be changed when the object is revised.

Reserved (11 bits): MUST be zero, and MUST be ignored.

Copyright © 2013 Microsoft Corporation.

2.6.15 ObjectDeclarationWithRefCountBody

The **ObjectDeclarationWithRefCountBody** structure specifies the identity of an object (section 2.1.5) and the type of data the object contains.



oid (4 bytes): A **CompactID** structure (section 2.2.2) that specifies the identity of this object.

jci (10 bits): An unsigned integer that specifies the value of the **JCID.index** field of the object. MUST be 0x01.

odcs (4 bits): An unsigned integer that specifies whether the data contained by this object is encrypted. MUST be zero.

A - fReserved1 (2 bits): An unsigned integer that MUST be zero, and MUST be ignored.

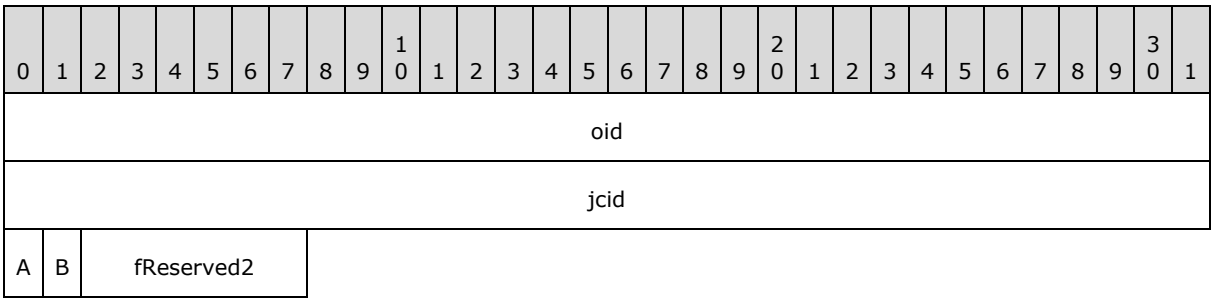
B - fHasOidReferences (1 bit): Specifies whether this object contains references to other objects.

C - fHasOsidReferences (1 bit): Specifies whether this object contains references to object spaces (section 2.1.4). MUST be zero.

fReserved2 (30 bits): An unsigned integer that MUST be zero, and MUST be ignored.

2.6.16 ObjectDeclaration2Body

The **ObjectDeclaration2Body** structure specifies the identity of an object (section 2.1.5) and the type of data the object contains.



oid (4 bytes): A **CompactID** (section 2.2.2) that specifies the identity of this object.

jcid (4 bytes): A **JCID** (section 2.6.14) that specifies the type of data this object contains.

A - fHasOidReferences (1 bit): A bit that specifies whether this object contains references to other objects.

Copyright © 2013 Microsoft Corporation.

B - fHasOsidReferences (1 bit): A bit that specifies whether this object contains references to object spaces (section 2.1.4) or contexts (section 2.1.11).

fReserved2 (6 bits): MUST be zero, and MUST be ignored.

2.7 Transmission by Using the File Synchronization via SOAP Over HTTP Protocol

Revision store files can be transmitted using the File Synchronization via SOAP over HTTP Protocol, as specified in [MS-FSSHTTP]. The following sections specify the elements specific to revision store files when transmitted over this protocol.

2.7.1 Storage Manifest

When a revision store file is transmitted over the File Synchronization via SOAP over HTTP Protocol, as specified in [MS-FSSHTTP], the following **Storage Manifest Data Element** structure (as specified in [MS-FSSHTTPB] section 2.2.1.12.3) MUST be used:

- **GUID** (storage manifest schema GUID)**:** A GUID, as specified in [MS-DTYP], that specifies the file type. MUST be one of the following values, depending on the file type.

File type	Value
.one	{1F937CB4-B26F-445F-B9F8-17E20160E461}
.onetoc2	{E4DBFD38-E5C7-408B-A8A1-0E7B421E1F5F}

The following root context and cell pairs are used:

Header cell (section 2.7.2) root specified by the following **Root Extended GUID** and **Cell ID:**

- **Root Extended GUID:** An **ExtendedGUID** structure used to contain the root identifier of the header cell (section 2.7.2). MUST be "{{ 1A5A319C-C26b-41AA-B9C5-9BD8C44E07D4 } , 1}".
- **Cell ID:** A **Cell ID** structure (as specified in [MS-FSSHTTPB] section 2.2.1.10) where the **EXGUID1** field MUST be equal to "{{ 84DEFAB9-AAA3-4A0D-A3A8-520C77AC7073} , 1}" and the **EXGUID2** field MUST be equal to "{{ 111E4CF3-7FEF-4087-AF6A-B9544ACD334D } , 1}".

Data root specified by the following **Root Extended GUID** and **Cell ID:**

- **Root Extended GUID:** An **ExtendedGUID** structure used to contain the root identifier of the root object space (section 2.1.4). MUST be the default root "{{ 84DEFAB9-AAA3-4A0D-A3A8-520C77AC7073} , 2}".
- **Cell ID:** A **Cell ID** structure (as specified in [MS-FSSHTTPB] section 2.2.1.10) where **EXGUID1** MUST be equal to "{{ 84DEFAB9-AAA3-4A0D-A3A8-520C77AC7073} , 1}", and **EXGUID2** MUST be equal to the revision store root object space identifier.

2.7.2 Header Cell

When a revision store file is transmitted using the File Synchronization via SOAP over HTTP Protocol, as specified in [MS-FSSHTTP], the revision store header (section 2.3.1) is transmitted as a single cell which MUST be referenced from the storage manifest of this revision store file (section 2.7.1).

The **Cell Manifest Current Revision Extended GUID** field of the cell's **Cell Manifest Data Element** structure, as specified in[MS-FSSHTTPB] section 2.2.1.12.4, SHOULD<10> be derived from the header (section 2.3.1) using the following method:

Copyright © 2013 Microsoft Corporation.

1. An **ExtendedGUID** structure (eguid1) is created with the **ExtendedGUID.guid** field value equal to the **Header.guidFile** field value and the **ExtendedGUID.n** field value equal to **Header.crcName** field value.

2. An **ExtendedGUID** structure (eguid2) is created with the **ExtendedGUID.guid** field value equal to the **Header.guidAncestor** field value and the **ExtendedGUID.n** field value equal to the **Header.ffvLastCodeThatWroteToThisFile** field value.

3. The value of the **Cell Manifest Current Revision Extended GUID** is "eguid1 XOR eguid2 XOR {{ F5367D2F- F167-4830-A9C3-68F8336A2A9 } , 0 }".

The **Revision Manifest Data Element** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.5, for this cell MUST be specified as follows:

- **Root Extended GUID**: MUST be "{{ 4A3717F8- 1C14-49E7-9526-81D942DE1741 }, 1}".
- **Object Extended GUID**: MUST be "{{ B4760B1A- FBDF- 4AE3-9D08-53219D8A8D21 }, 1}".
- **Object Group Extended GUID**: MUST be calculated as **Cell Manifest Current Revision Extended GUID** specified previously XOR "{{ 26402DF1-68C7-43C0-A37C-04B9100893CE }, 0x80000000 }".

The root object specified by the **Object Extended GUID** field (described earlier) MUST be transmitted as a pair of **Object Declaration** and **Object Data** structures:

Object Declaration.PartitionID	Object Data.Data	Object Data.Object extended GUID array	Object Data.Cell ID array
1 (Object Data)	MUST be an **ObjectSpaceObjectPropSet** structure (section 2.6.1) with properties specified later in this section.	None	None

The **ObjectSpaceObjectPropSet** structure contained by the **Object Data.Data** field for the root object MUST contain the properties described in the following table.

Name	PropertyID	Value
FileIdentityGuid	0x1C001D94	A GUID, as specified by [MS-DTYP]. MUST be the value specified by the **Header.guidFile** field.
FileAncestorIdentityGuid	0x1C001D95	A GUID, as specified by [MS-DTYP]. MUST be the value specified by the Header**.guidAncestor** field.
FileLastCodeVersionThatWroteToIt	0x14001D99	An unsigned integer. MUST be the value specified by the **Header.ffvLastCodeThatWroteToThisFile** field.
FileNameCRC	0x14001D93	MUST be the **Header.crcName** field.

2.7.3 Cells

When a revision store file is transmitted using the File Synchronization via SOAP over HTTP Protocol, object spaces (section 2.1.4) are transmitted as cells as specified in [MS-FSSHTTP] section 1.3.

Copyright © 2013 Microsoft Corporation.

The **Cell ID** structure, as specified in [MS-FSSHTTPB] section 2.2.1.10, for this cell MUST be specified as follows:

- **EXGUID1**: MUST be equal to the identity of the context (section 2.1.11) of the active revision (section 2.1.8) of this object space except for the default context. The value of the default context data element of a revision store file is {{00000000-0000-0000-0000-000000000000}, 0}". This value is converted to "{{ 84DEFAB9-AAA3-4A0D-A3A8-520C77AC7073} , 1 }" when transmitted using the File Synchronization via SOAP over HTTP Protocol.
- **EXGUID2**: MUST be equal to the object space identifier (section 2.5.2).

2.7.4 Revisions

When a revision store file is transmitted using the File Synchronization via SOAP over HTTP Protocol, revision manifests (section 2.1.9) are transmitted as **Revision Manifest Data Element** structures, as specified in [MS-FSSHTTPB] section 2.2.1.12.5.

- **Revision ID:** MUST be equal to the revision store file revision identifier (section 2.1.8).
- **Base Revision ID:** MUST be equal to the revision store file dependency revision identifier (section 2.1.9).

The value of **RootObjectReference3FND.rootRole** field of a root object (section 2.1.7) from a revision in a revision store specifies **Root Extended GUID** field in the **Revision Manifest Data Element** structure:

Value of RootObjectReference3FND.rootRole	Meaning	Root extended GUID
0x00000001	Default content root	{ { 4A3717F8- 1C14-49E7-9526-81D942DE1741 }, 1}
0x00000002	Metadata root	{ { 4A3717F8- 1C14-49E7-9526-81D942DE1741 }, 2}
0x00000003	Encryption Key root	{ 4A3717F8- 1C14-49E7-9526-81D942DE1741 }, 3}
0x00000004	Version metadata root	{ { 4A3717F8- 1C14-49E7-9526-81D942DE1741 }, 4}

The root object with **RootObjectReference3FND.rootRole** value set to 0x00000003 MUST be present only when the file is encrypted. (see section 2.7.7).

The **Object Extended GUID** field in the **Revision Manifest Data Element** structure MUST be equal to the identity of the corresponding root object in the revision in the revision store.

2.7.5 Object Groups

When a revision store file is transmitted using the File Synchronization via SOAP over HTTP Protocol, revision store object groups (section 2.1.13) are transmitted as **Object Group Data Element** structures, as specified in [MS-FSSHTTPB] section 2.2.1.12.6.

The **Revision Manifest Data Element** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.5, that references an object group MUST specify the object group extended GUID to be equal to the revision store object group identifier.

Copyright © 2013 Microsoft Corporation.

2.7.6 Objects

When a revision store file is transmitted using the File Synchronization via SOAP over HTTP Protocol, revision store objects (section 2.1.5) are transmitted as the following structures:

- The **Object Declaration** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.6.1.
- The **Object Data BLOB Declaration** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.6.2.
- The **Object Data** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.6.4
- The **Object Data BLOB Reference** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.6.5.

The **Object Extended GUID** field in the object declaration structures MUST be equal to the object identifier of the corresponding revision store object.

Objects that have the **JCID.IsFileData** field value equal to **false** are transmitted as two pairs of **Object Declaration** and **Object Data** structures in the specified order:

Object Declaration.PartitionID	Object Data.Data	Object Data.Object Extended GUID array	Object Data.Cell ID array
4 (Static Object MetaData)	An unsigned integer that specifies the **JCID** (section 2.6.14) of the object.	None.	None.
1 (Object Data)	MUST be an **ObjectSpaceObjectPropSet** structure (section 2.6.1).	Identifiers of the referenced objects in the revision store.	Identifiers of the referenced object spaces in the revision store.

Objects that have the **JCID.IsFileData** field value equal to **true** are transmitted as two pairs of **Object Declaration** and **Object Data** structures and one pair of **Object Data BLOB Declaration** and **Object Data BLOB Reference** structures in the specified order:

Object Declaration.PartitionID	Object Data.Data	Object Data.Object Extended GUID array	Object Data.Cell ID array
4 (Static Object MetaData)	An unsigned integer that specifies the **JCID** (section 2.6.14) of the object.	None	None
1 (Object Data)	MUST be an **ObjectSpaceObjectPropSet** structure (section 2.6.1) with properties specified later in this section.	None	None

Copyright © 2013 Microsoft Corporation.

Object Data BLOB Declaration.PartitionID	Object Data BLOB Reference. BLOB Extended GUID	Object Data BLOB Reference.Object Extended GUID array	Object Data BLOB Reference.Cell ID array
2 (File Data)	MUST have a reference to an **Object Data BLOB Data Element** structure, as specified in [MS-FSSHTTPB] section 2.2.1.12.8, used to transmit the data of the file data object.	None	None

The **ObjectSpaceObjectPropSet** structure contained by the **Object Data.Data** field for an object with **JCID.IsFileData** field equal to "true" MUST contain the following properties:

Name	PropertyID	Value
FileDataObject_GUID	0x1C00343E	A GUID, as specified by [MS-DTYP]. This property MUST be set only if the prefix specified by the **ObjectDeclarationFileData3RefCountFND.FileDataReference** field or **ObjectDeclarationFileData3LargeRefCountFND.FileDataReference** field is not <invfdo>. This property MUST be the GUID value of the remaining part of the curly braced GUID string in the **FileDataReference** field.
FileDataObject_InvalidData	0x0800343D	A Boolean value that specifies whether this file data object is not valid. MUST be **true** if the prefix specified by the **ObjectDeclarationFileData3RefCountFND.FileDataReference** field or the **ObjectDeclarationFileData3LargeRefCountFND.FileDataReference** field is <invfdo>.
FileDataObject_Extension	0x1C003424	A Unicode string that specifies the extension of the file data object. MUST be the value specified by the **ObjectDeclarationFileData3RefCountFND.Extension** field or the **ObjectDeclarationFileData3LargeRefCountFND.Extension** field.

2.7.7 Encryption

When a revision store file is transmitted by using the File Synchronization via SOAP over HTTP Protocol, a revision store file object space encryption data (see section 2.5.19) is transmitted as an object specified by a pair of **Object Declaration** ([MS-FSSHTTPB] section 2.2.1.12.6.1) and **Object Data** ([MS-FSSHTTPB] section 2.2.1.12.6.4) structures:

Object Declaration.PartitionID	Object Data.Data	Object Data.Object extended GUID array	Object Data.Cell ID array
1 (Object Data)	MUST be encryption data	None	None

Every transmitted base revision of a revision store MUST contain an object group (see section 2.7.5) with this object. The object MUST be the only one in the object group, and the value of the object

Copyright © 2013 Microsoft Corporation.

group identifier MUST be set to the revision identifier XOR "{{ FE4F06F- BB18,-4F79-B3D6-BC157D533D23 }, 0x00000000 }".

The value of the object identifier MUST be the set to the value of the revision identifier XOR "{{ 06357FE8-CBC7-4DD1-AA81-09BC1695B19B }, 0x00000000 }".

2.8 Alternative Encoding Using the File Synchronization via SOAP Over HTTP Protocol

When a revision store file is encoded using the File Synchronization via SOAP Over HTTP Protocol, specified in [MS-FSSHTTPB], the encoded file contains a packaging structure that contains a **data element package**, as specified in [MS-FSSHTTPB] section 2.2.1.12, that specifies the serialized data elements that comprise the revision store file as specified in section 2.7.

2.8.1 Packaging Structure

The **Packaging** structure MUST be at the beginning of the file.

This structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
guidFileType (16 bytes)																															
...																															
guidFile (16 bytes)																															
...																															
guidLegacyFileVersion (16 bytes)																															
...																															
guidFileFormat (16 bytes)																															
...																															
rgbReserved (4 bytes)

Packaging End (2 bytes)

guidFileType (16 bytes): A GUID, as specified by [MS-DTYP], MUST be "{7B5C52E4-D88C-4DA7-AEB1-5378D02996D3}".

guidFile (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the identity of this package store file. SHOULD be globally unique.

guidLegacyFileVersion (16 bytes): A GUID, as specified by [MS-DTYP], that specifies the version of this package store file. SHOULD be globally unique.<11>

guidFileFormat (16 bytes): A GUID, as specified by [MS-DTYP], that specifies that the file is a package store file. MUST be "{638DE92F-A6D4-4bc1-9A36-B3FC2511A5B7}".

rgbReserved (4 bytes): MUST be zero. MUST be ignored.

Packaging Start (4 bytes): A 32-bit stream object header, as specified in [MS-FSSHTTPB] section 2.2.1.5.2, with a **Header Type** of 0x00, **Compound** of 0x1, **Type** of 0x7A, and **Length** of 0x00.

Storage Index Extended GUID (variable): An **extended GUID**, as specified in [MS-FSSHTTPB] section 2.2.1.7) that specifies the storage index.

guidCellSchemaId (16 bytes): A GUID, as specified in [MS-DTYP], that specifies the file type. MUST be one of the following values, depending on the file type.

File type	Value
.one	{1F937CB4-B26F-445F-B9F8-17E20160E461}
.onetoc2	{E4DBFD38-E5C7-408B-A8A1-0E7B421E1F5F}

Data Element Package (variable): A **data element package**, as specified in [MS-FSSHTTPB] section 2.2.1.12, that specifies the serialized data elements.

Packaging End (2 byte): An 16-bit stream object header end, as specified in [MS-FSSHTTPB] section 2.2.1.5.3, that specifies a stream object of type 0x7A. The value of this field MUST be 0x1EB.

3 Structure Examples

The following examples illustrate a typical of a OneNote Revision Store. All data is taken from a single .one file containing the data for a section, with a single page with two lines of text and an embedded file.

To navigate through the file, and to see how the pieces fit together, read it in the following order:

1. Read the file header (section 2.3.1) to determine if it is a .one section file or a .onetoc2 table of contents file. Inside the file header, find the locations in the file of the root file node list and of the transaction log (section 2.3.3).
2. Read the root file node list to find the identity and location of the section and page Object Spaces (section 2.1.4), as well as the file data store in which embedded file data objects (section 2.6.13) are stored, if any.
3. Starting with the root object space, read the object space manifest list (section 2.1.6) to get the location of the object space revision manifest list (section 2.1.10).
4. Read the revision manifest list to find the current revision (section 2.1.8) of the object space, including the choices of root objects (section 2.1.7), and either the set of objects (section 2.1.5) directly, or the locations of object group lists (section 2.1.13).
5. Read the object group lists to enumerate each of the objects, and to get the locations of the objects property sets (section 2.6.7).
6. Read each of the objects' properties. Discover the relationships between objects, and between objects and child object spaces and contexts (section 2.1.11).
7. Return to the root file node list to find the locations of those other Object Spaces, and repeat the process.
8. Finally, steps 2 through 7 require consulting the transaction log, to make sure that only the active portions of each file node list are read.

For brevity, several simplifications have been made when describing these examples. Some structures are expanded and described in fine detail in the first or second example, and then are merely summarized when they appear again in later examples.<12>

3.1 File Header

The following is an example of a **Header** structure (section 2.3.1) for a .one file.

Offset	Size	Structure	Value
000001F8	0400	FileNodeHeader **- FileNodeHeader**	
00000000	0010	GUID **- guidFileType**	{7B5C52E4-D88C-4DA7-AEB1-5378D02996D3}

guidFileType: "{7B5C52E4-D88C-4DA7-AEB1-5378D02996D3}" specifies that the file format is .one, rather than .onetoc2.

guidFile: This GUID provides a unique identity for each file.

guidFileFormat: {109ADD3F-911B-49F5-A5D0-1791EDC8AED8} identifies this file as a OneNote Revision Store.

ffvLastCodeThatWroteToThisFile: 42 specifies that the file format is from Microsoft OneNote 2010.

ffvOldestCodeThatHasWrittenToThisFile: 42 specifies that the file format is from OneNote 2010.

ffvNewestCodeThatHasWrittenToThisFile: 42 specifies that the file format is from OneNote 2010.

ffvOldestCodeThatMayReadThisFile: 42 specifies that versions of OneNote older than OneNote 2010 cannot read this file.

cTransactionsInLog: 15 specifies that the first 15 entries in the transaction log are complete. Any additional entries are not yet ready and are ignored.

fHasNoEmbeddedFileObjects: Always set to 0, even when the file indeed contains no embedded file objects.

guidAncestor: This GUID matches the **guidFile** field of the .onetoc2 file in the same directory as this .one file.

crcName: 0xCEBE8422 is the CRC that is derived from the section name "Example.one".

fcrHashedChunkList: Specifies that the hashed chunk list is located at offset 0x12a8 in the file, and is 0x400 bytes in length.

fcrTransactionLog: Specifies that the first fragment of the transaction log is located at offset 0x800 in the file, and is 0x400 bytes in length.

fcrFileNodeListRoot: Specifies that the first fragment of the root file node list is located at offset 0x400 in the file, and is 0x400 bytes in length.

fcrFreeChunkList: "fcrNil" specifies that there is no free chunk list in this file.

cbExpectedFileLength: 0x3190 -- matches the byte size of this file.

cbFreeSpaceInFreeChunkList: This field is zero, because the file contains no free chunk list.

guidFileVersion: This is a unique GUID, created when this file was last modified.

nFileVersionGeneration: 15 indicates the number of times this file has been modified. It coincides with **cTransactionsInLog**, so each modification adds a new log entry, but the two numbers do not need to be in sync.

guidDenyReadFileVersion: This is a unique GUID, created during a recent modification to the file.

Copyright © 2013 Microsoft Corporation.

bnCreated: 0x0FA129B4 indicates OneNote 2010 build number 14.0.4763.1000.

bnLastWroteToThisFile: 0x0FA129B4 indicates OneNote 2010 build number 14.0.4763.1000.

bnOldestWritten: 0x0FA129B4 indicates OneNote 2010 build number 14.0.4763.1000.

bnNewestWritten: 0x0FA129B4 indicates OneNote 2010 build number 14.0.4763.1000.

3.2 Root File Node List

Using the **fcrFileNodeListRoot** field from the preceding file header example, 0x400 bytes can be read from the file at offset 0x400. Those bytes can be read as a file node list. In this example, the list includes only four **FileNodes**:

- Two **ObjectSpaceManifestListReferences**, one for the section object space, and one for the page object space.
- One **ObjectSpaceManifestRoot**, which identifies the section object space as the root object space.
- One **FileDataStoreListReference**, which specifies where the data for embedded files is stored.

000007F8	0008	UINT64 **- footer**	10070635646201084491

header.FileNodeListID: 0x00000010 specifies that an identifier for this file node list. All **FileNodeListFragments** that are part of this list need to share this identifier.

header.nFragmentSequence: Zero specifies that this is the first fragment in this file node list.

fnd[0]: This **FileNode** establishes that there is an object space and gives the location in the file in which the object space's revision manifest list resides.

fnd[0].header.FileNodeID: 0x008 specifies that this **FileNode** is of type "ObjectSpaceManifestListReferenceFND".

fnd[0].header.Size: 27 specifies that in addition to the 4 bytes of **FileNodeHeader**, there are 23 bytes of data. The next **FileNode**, if any, occurs immediately afterwards.

fnd[0].header.StpFormat: 2 specifies that if this FileNode type contains a file offset reference to another part of the file, the reference is compressed into 2 bytes, and the actual byte offset is 8 times that value.

fnd[0].header.CbFormat: 2 specifies that if this **FileNode** type contains a file offset reference to another part of the file, the size is compressed into 1 byte, and the actual byte length is 8 times that value.

Copyright © 2013 Microsoft Corporation.

fnd[0].header.BaseType: 2 specifies that this **FileNode** does indeed contain a file offset reference to another part of the file, and that a file node list is found at that offset.

fnd[0].fnd.ref: Specifies that the first fragment of the object space manifest file node list is located at offset 0xC00 in the file (0x180 ×8), and is 0x120 bytes in length (0x24 ×8).

fnd[0].fnd.gosid: {CFDC64CA-6425-4223-903F-0B7D8A6690F9},1} specifies the identity of the object space.

fnd[1]: This **FileNode** identifies the object space specified in **fnd**[0] as the root object space for this file.

fnd[1].header: Specifies that the **FileNode** is of type **ObjectSpaceManifestRootFND**, that it contains 20 bytes of data beyond the header, and that it does not contain a reference to another part of the file.

fnd[1].fnd.gosid: {{CFDC64CA-6425-4223-903F-0B7D8A6690F9},1} specifies that the object space identified by this gosid is the root object space for the entire file. This identity matches the gosid in the previous **ObjectSpaceManifestListReferenceFND** FileNode.

fnd[2]: This **FileNode** establishes that there is another object space, and gives the location in the file where the object space's revision manifest list resides.

fnd[2].header: Specifies that the **FileNode** is of type "ObjectSpaceManifestListReferenceFND", that it contains 23 bytes of data beyond the header, that the data begins with a compressed reference to another part of the file, and that a file node list can be found at that other file location.

fnd[2].fnd.ref: Specifies that the first fragment of the object space manifest file node list is located at offset 0x1068 in the file, and is 0x120 bytes in length.

fnd[2].fnd.gosid: {{418BCA1D-C31E-4342-966B-B7949DA56A9F},1} specifies the identity of this second object space.

fnd[3]: This **FileNode** establishes that there is file data store in the file, and gives its location in the file.

fnd[3].header: Specifies that the **FileNode** is of type "FileDataStoreListReferenceFND", that it contains 3 bytes of data beyond the header, that the data begins with a compressed reference to another part of the file, and that a file node list can be found at that other file location.

fnd[3].fnd.ref: Specifies that the first fragment of the file data store list is located at offset 0x2848 in the file, and is 0x120 bytes in length.

nextFragment: "fcrNil" specifies that there are no additional fragments in this file node list.

3.3 Root Object Space

In the preceding Root File Node List example, the root object space was identified as **gosid** set to "{{CFDC64CA-6425-4223-903F-0B7D8A6690F9},1}". Because this is a .one file, the root object space is the data for a Microsoft OneNote 2010 section.

To gather the data for this section, read the object space manifest list for that object space. That indicates the location of the active revision manifest list. The revision manifest list, in turn, indicates a collection of revision manifests, including references to object group lists that contain all the object nodes in the section. Finally, the objects have references to their properties.

Copyright © 2013 Microsoft Corporation.

The object space manifest list starts with an **ObjectSpaceManifestListStartFND** file node, which confirms the **gosid** of the object space. It then contains one or more **RevisionManifestListReferenceFND** file nodes. If there is more than one, ignore all but the last one. In this example, there is only one.

Offset	Size	Structure	Value
00000C00	0120	FileNodeListFragment **- FileNodeListFragment**	
00000C00	0010	FileNodeListHeader **- header**

00000C2C	0002	USHORT **- stp**	0x01A4
00000C2E	0001	BYTE **- cb**	0x24
00000C2F	00F1	Blob **- padding and footer**	...

fnd[0].header: 0x0880600C specifies that the **FileNode** is of type "ObjectSpaceListStartFND", that it contains 20 bytes of data beyond the header, and that it does not contain a reference to another part of the file.

fnd[0].fnd.gosid: {{CFDC64CA-6425-4223-903F-0B7D8A6690F9},1} specifies the identity of the object space. It matches the **gosid** specified by the **ObjectSpaceManifestListReferenceFND** that directed it here.

fnd[1].header: 0x95001C10 specifies that the **FileNode** is of type "RevisionManifestListReferenceFND", that it contains 3 bytes of data beyond the header, that the data begins with a compressed reference to another part of the file, and that a file node list can be found at that other file location.

fnd[1].fnd.ref: Specifies that the first fragment of the revision manifest list is located at offset 0xD20 in the file, and is 0x120 bytes in length.

Copyright © 2013 Microsoft Corporation.

Following the file offset to the object space's revision manifest list, there is potentially a long list of **FileNodes** that create and manage multiple revisions of the object space. Some of the **FileNodes** might be grouped into sequences that together specify a revision. Other **FileNodes** might modify or extend an existing revision. In this example, there is just one sequence, which specifies a single revision for the section object space.

00000DB5	0004	FileNodeHeader **- header**	0x8080705A
00000DB9	0018	RootObjectReference3FND **- fnd**	
00000DB9	0014	ExtendedGUID **- oidRoot**	{{9A416C35-236A-49A1-91FE-BD73076400A4},10}
00000DCD	0004	ULONG **- RootRole**	1
00000DD1	0004	FileNode **- fnd[5]**	
00000DD1	0004	FileNodeHeader **- header**	0x8080101C
00000DD5	006B	Blob **- padding and footer**	...

fnd[0].header: 0x80807014 specifies that the **FileNode** is of type "RevisionManifestListStartFND", that it contains 24 bytes of data beyond the header, and that it does not contain a reference to another part of the file.

fnd[0].fnd.gosid: {{CFDC64CA-6425-4223-903F-0B7D8A6690F9},1} specifies yet again the identity of the object space. It matches the **gosid** specified by the **ObjectSpaceManifestListReferenceFND** and **ObjectSpaceManifestListStartFND** that directed it here.

fnd[1].header: 0x8080C81E specifies that the **FileNode** is of type "RevisionManifestStart6FND", that it contains 46 bytes of data beyond the header, and that it does not contain a reference to another part of the file.

fnd[1].fnd.rid: {{082ED24F-9AA5-4DB8-875D-3E1FEE0AD4F4},1} specifies the identity of the revision formed by this revision manifest.

fnd[1].fnd.ridDependent: "{{00000000-0000-0000-0000-000000000000},0" specifies that there is no dependent revision. All of the objects needed to make a valid object space revision are declared in this **FileNode** sequence.

fnd[1].fnd.RevisionRole: 1 specifies that the revision created from this manifests labels itself the active content for this object space. It is all right if other revision manifests also specify **RevisionRole** 1. In that case, the actual active content is the last revision in the revision manifest list which receives that label.

fnd[1].fnd.odcsDefault: 0x0000 specifies that the object properties for objects declared by this revision manifest are not encrypted.

Copyright © 2013 Microsoft Corporation.

fnd[2].header: 0x95006CB0 specifies that the **FileNode** is of type "ObjectGroupListReferenceFND", that it contains 23 bytes of data beyond the header, that the data begins with a compressed reference to another part of the file, and that a file node list can be found at that other file location.

fnd[2].fnd.ref: Specifies that the first fragment of the object group list is located at offset 0xF48 in the file, and is 0x120 bytes in length

fnd[2].fnd.ObjectGroupID: {{2A83AE62-6754-4383-8E2B-4033FF3CFBA1},1} specifies the identity of the object group.

fnd[3].header: 0x8080705A specifies that the **FileNode** is of type "RootObjectReference3FND", that it contains 24 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[3].fnd.oidRoot: {{9A416C35-236A-49A1-91FE-BD73076400A4},11} specifies the identity of one of the root objects of this revision. The object might or might not be declared in this revision, because it could be declared in a dependent revision. In this example, the object is declared in the object group list referenced previously.

fnd[3].fnd.RootRole: 2 specifies that the object is the metadata root.

fnd[4].header: 0x8080705A specifies that the **FileNode** is of type "RootObjectReference3FND", that it contains 24 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[4].fnd.oidRoot: {{9A416C35-236A-49A1-91FE-BD73076400A4},10} specifies the identity of another root object for this revision.

fnd[4].fnd.RootRole: 2 specifies that the object is the default content root.

fnd[5].header: 0x8080101C specifies that the **FileNode** is of type "RevisionManifestEndFND", and that it contains zero bytes of data beyond the header. If there were more **FileNodes** in the list after this one, they would not be considered part of the revision manifest declared by **fnd[1]**.

3.4 Section Object Space Objects

An object group list contains two types of **FileNodes**: those that define a Global ID Table, and those that declare Object Space Objects.

The section (root) object space in this example contains four objects. They are not declared directly within the revision manifest list, although they could be, and are in .onetoc2 files. Instead, they are declared in a separate object group list.

The four objects are:

- The Section node, which is the content root. It is responsible for tracking the set of page series and their relative ordering.
- A Page Series node, which corresponds to one top-level page. A page series can also track additional lower-level pages, but this example does not contain any.
- A Section metadata, which is the metadata root. The metadata tracks the schema version that was used to serialize this object space, as well section properties such as color that are commonly frequently by higher levels such as notebooks.

Copyright © 2013 Microsoft Corporation.

- A Page metadata, which ought to be a clone of the page metadata found in the actual page object space. Microsoft OneNote 2010 caches copies of the metadata of child object spaces in parent object spaces.

00001020	0048	Blob **- padding and footer**	...

fnd[0].header: 0x808060B4 specifies that the **FileNode** is of type "ObjectGroupStartFND", that it contains 20 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[0].fnd.oid: {{2A83AE62-6754-4383-8E2B-4033FF3CFBA1},1} specifies the identity of the object group. It matches the **ObjectGroupID** field in the **ObjectGroupListReferenceFND FileNode** in the previous example.

fnd[1].header: 0x80801022 specifies that the **FileNode** is of type "GlobalIdTableStart2FND", and that it contains zero bytes of data beyond the header.

Copyright © 2013 Microsoft Corporation.

fnd[2].header: 0x80806024 specifies that the **FileNode** is of type "GlobalIdTableEntryFNDX", that it contains 20 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[2].fnd.index: 0 specifies that **CompactIDs** in this object group that specify 0x0 for their index are to be matched with this.

fnd[2].fnd.guid: {63230A2C-F51E-01AC-217F-603847815F77} specifies that **CompactIDs** that specify 0x0 as their **guidIndex** can be converted to **ExtendedGUIDs** using this GUID.

fnd[3].header: 0x80806024 specifies that the **FileNode** is of type "GlobalIdTableEntryFNDX", that it contains 20 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[3].fnd.index: 1 specifies that **CompactIDs** in this object group that specify 0x1 for their index are to be matched with this.

fnd[3].fnd.guid: {418BCA1D-C31E-4342-966B-B7949DA56A9F} specifies that **CompactIDs** that specify 0x1 as their **guidIndex** can be converted to **ExtendedGUIDs** using this GUID.

fnd[4].header: 0x80806024 specifies that the **FileNode** is of type "GlobalIdTableEntryFNDX", that it contains 20 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[4].fnd.index: 2 specifies that **CompactIDs** in this object group that specify 0x2 for their index are to be matched with this.

fnd[4].fnd.guid: {9A416C35-236A-49A1-91FE-BD73076400A4} specifies that **CompactIDs** that specify 0x2 as their **guidIndex** can be converted to **ExtendedGUIDs** using this GUID.

fnd[5].header: 0x80801028 specifies that the **FileNode** is of type "GlobalIdTableEndFNDX", and that it contains zero bytes of data beyond the header.

fnd[6].header: 0x8080608C specifies that the **FileNode** is of type "DataSignatureGroupDefinitionFND", that it contains 20 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[6].fnd.DataSignatureGroup: {{7257E098-D9C8-4F9F-9EE1-E41D6AEF9D46},1} specifies a signature for each object in this group. Subsequent occurrences of the same objects in other object groups will have a different signature if their data changes in any way. In this way, a client that already has a local copy of the object can tell if it needs to fetch a new copy or not, based on the signature of the copy it has and the signature in the newer object group.

fnd[7].header: 0x8D0044A4 specifies that the **FileNode** is of type "ObjectDeclaration2RefCountFND", that it contains 13 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[7].fnd.ref: Specifies that the property set for this object is located at offset 0xF28 in the file, and is 0x20 bytes in length.

fnd[7].fnd.body.oid: By using the guidIndex to look up the GUID in the **GlobalIdTable** declared previously, the **ExtendedGUID** identity for this object is "{{9A416C35-236A-49A1-91FE-BD73076400A4}, 11}". Note that this is the ExtendedGUID that was identified as the metadata root of this object space by one of the **RootObjectReference3FND FileNodes** in the previous example.

Copyright © 2013 Microsoft Corporation.

fnd[7].fnd.body.jcid: The flags field specifies that this object is a basic property set. The index field specifies that the properties are for the section metadata.

fnd[7].fnd.body.fHasOidReferences: 0 specifies that this object does not have references to other objects in this object space.

fnd[7].fnd.body.fHasOsidReferences: 0 specifies that this object does not have references to other object spaces.

fnd[7].fnd.cRef: 1 specifies that one other item references this object. That item is the object space itself, because this is a root.

fnd[8].header: 0x8D0044A4 specifies that the **FileNode** is of type "ObjectDeclaration2RefCountFND", that it contains 13 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[8].fnd.ref: Specifies that the property set for this object is located at offset 0xEF0 in the file, and is 0x38 bytes in length.

fnd[8].fnd.body.oid: By using the guidIndex to look up the GUID in the **GlobalIdTable** declared previously, the **ExtendedGUID** identity for this object is "{{9A416C35-236A-49A1-91FE-BD73076400A4}, 10}". Note that this is the ExtendedGUID that was identified as the default content root of this object space by one of the **RootObjectReference3FND** FileNodes in the previous example.

fnd[8].fnd.body.jcid: The flags field specifies that this object is a property set as well as a graph node. The index field specifies that it is a section node.

fnd[8].fnd.body.fHasOidReferences: 1 specifies that the properties of this object contain references to other objects in this object space. Specifically, the **ElementChildNodes** property refers to the **PageSeries** object.

fnd[8].fnd.body.fHasOsidReferences: Zero specifies that this object does not have references to other object spaces.

fnd[8].fnd.cRef: 1 specifies that 1 other item references this object. That item is the object space itself, because this is a root.

fnd[9].header: 0x8D0044A4 specifies that the **FileNode** is of type "ObjectDeclaration2RefCountFND", that it contains 13 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[9].fnd.ref: Specifies that the property set for this object is located at offset 0xE88 in the file, and is 0x68 bytes in length.

fnd[9].fnd.body.oid: By using the guidIndex to look up the GUID in the **GlobalIdTable** declared previously, the **ExtendedGUID** identity for this object is "{{63230A2C-F51E-01AC-217F-603847815F77}, 1}".

fnd[9].fnd.body.jcid: The flags field specifies that this object is a basic property set. The index field specifies that it is a page metadata.

fnd[9].fnd.body.fHasOidReferences: Zero specifies that this object does not have references to other objects in this object space.

fnd[9].fnd.body.fHasOsidReferences: Zero specifies that this object does not have references to other object spaces.

Copyright © 2013 Microsoft Corporation.

fnd[9].fnd.cRef: 1 specifies that 1 other item references this object. That item is the page series node.

fnd[10].header: 0x8D0044A4 specifies that the **FileNode** is of type "ObjectDeclaration2RefCountFND", that it contains 13 bytes of data beyond the header, and that the data does not contain a reference to another part of the file.

fnd[10].fnd.ref: Specifies that the property set for this object is located at offset 0xE40 in the file, and is 0x48 bytes in length.

fnd[10].fnd.body.oid: By using the guidIndex to look up the GUID in the **GlobalIdTable** declared previously, the **ExtendedGUID** identity for this object is "{{9A416C35-236A-49A1-91FE-BD73076400A4}, 12}".

fnd[10].fnd.body.jcid: The flags field specifies that this object is a property set as well as a graph node. The index field specifies that it is a page series node.

fnd[10].fnd.body.fHasOidReferences: 1 specifies that the properties of this object contain references to other objects in this object space. Specifically, the **MetaDataObjectsAboveGraphSpace** property refers to the **PageMetaData** object.

fnd[10].fnd.body.fHasOsidReferences: 1 specifies that this object does have references to other object spaces. Specifically, the **ChildGraphSpaceElementNodes** property refers to the object space of the page.

fnd[10].fnd.cRef: 1 specifies that 1 other item references this object. That item is the section node.

fnd[11].header: 0x808010B8 specifies that the **FileNode** is of type "ObjectGroupEndFND", and that it contains zero bytes of data beyond the header.

5 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft OneNote 2010
- Microsoft OneNote 2013
- Microsoft SharePoint Foundation 2010
- Microsoft SharePoint Foundation 2013
- Microsoft SharePoint Server 2010
- Microsoft SharePoint Server 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> Section 1.5: This persistence format provides interoperability with applications that create or read documents conforming to this structure, including OneNote 2010.

<2> Section 2.1.12: OneNote 2010 also specifies Revision Role 0x00000004 in some revision manifests. Until the revision is also associated with Revision Role 0x00000001, it is not the active content of the object space.

<3> Section 2.3.1: Sometimes OneNote 2010 writes an incorrect sum of the total size of the free space in the Free Chunk List.

<4> Section 2.3.1: OneNote 2010 writes its own application build number.

<5> Section 2.3.1: OneNote 2010 writes its own application build number.

<6> Section 2.3.1: OneNote 2010 writes its own application build number.

<7> Section 2.3.1: OneNote 2010 writes its own application build number.

<8> Section 2.5.27: The referenced file might not exist in the Thicket Folder.

<9> Section 2.5.28: The referenced file might not exist in the Thicket Folder.

<10> Section 2.7.2: OneNote Web App generates an Extended GUID not following this algorithm.

<11> Section 2.8.1: This field is ignored by OneNote 2013.

<12> Section 3: In cases, where this document specifies that a field can only have one value, or that its value can be ignored, the examples might show the actual value written by OneNote 2010, but will not further explain them.
