1 Introduction

This document specifies the Office VBA File Format Structure. This file format applies to VBA projects. VBA projects are a collection of embedded macros and custom forms for use in Office documents that can be used to extend a host application to provide custom behavior. This specification describes a storage that contains a VBA project.

Sections 1.7 and 2 of this specification are normative and contain RFC 2119 language. All other sections and examples in this specification are informative.

The following terms are specific to this document:

aggregatable server: A Component Object Model (COM) server that can be contained by another COM server and that allows its interfaces to be used as if they were defined by the server that contains it.

extended type library: A component that contains Automation standard descriptions of exposed objects, properties, and methods that are implemented by an aggregatable server and supplemented by another Automation server.

Help file: A file that contains the documentation for a specific product or technology.

host extender: An Automation type that is provided by a host application to extend the functionality of an Automation server.

parent window: A primary window that provides window management functionality for a set of child windows.

run length encoding: A lossless compression method that replaces a contiguous series (run) of identical values in a data stream with a pair of values that represent the length of the series and the value itself. For example, a data stream that contains 57 consecutive entries with the value "10" could replace them all with the shorter pair of values "57", "10".

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Structure Overview (Synopsis)

This file format defines an instance of a **VBA project**. The file format structure is a collection of records that define the VBA project. Each record defines part of one of three aspects of the project: project information, project **references (1)**, and project items.

1.3.1 Project Information

Records providing project information about the VBA project itself are contained within the following five **streams (1)**:

- The `_VBA_PROJECT` Stream (section [2.3.4.1](#)) provides basic information about the VBA project, including the version information required to load the remainder of the structure.
- Project Information (section [2.3.4.2.1](#)) in the `dir` Stream (section [2.3.4.2](#)) contains information such as the name of the VBA project and help information.
- Project Properties (section [2.3.1.1](#)) in the `PROJECT` Stream (section [2.3.1](#)) contain additional information about the VBA project.
- The `PROJECTwm` Stream (section [2.3.3](#)) contains information for mapping **module** names between **multibyte character set (MBCS)** and **UTF-16**.
- The `PROJECTlk` Stream (section [2.3.2](#)) contains information about **ActiveX controls** used throughout the VBA project.

1.3.2 Project References

Records within Reference Information (section [2.3.4.2.2](#)) in the dir Stream (section [2.3.4.2](#)) define references (1) to external resources that are used by the VBA project. Each **REFERENCE** (section [2.3.4.2.2.1](#)) in Reference Information (section [2.3.4.2.2](#)) corresponds to a reference (1) to an external resource that can interact via OLE Automation as described in [\[MS-OAUT\]](#).

The three types of external references are as follows:

- A **REFERENCECONTROL** (section [2.3.4.2.2.3](#)) specifies a reference (1) to external ActiveX controls that are used by the VBA project.
- A **REFERENCEREGISTERED** (section [2.3.4.2.2.5](#)) specifies a reference (1) to external **Automation type libraries** that are used by the VBA project.
- A **REFERENCEPROJECT** (section [2.3.4.2.2.6](#)) specifies a reference (1) to external VBA projects that are used by the VBA project.

1.3.3 Project Items

The VBA project contains a series of project items for **embedded macros**. Each project item is defined by a combination of records. The five types of project items are as follows:

- A **project package** specifies a **designer** class that can be extended in a **designer module**.
- A **document module** specifies a module for embedded macros and programmatic access associated with a document.
- A **procedural module** specifies a module for embedded macros.
- A **class module** that specifies a module that defines a class.
- A designer module specifies a module for extending a designer.

The **PROJECT** Stream (section [2.3.1](#)) provides the type of every project item.

Document modules, procedural modules, class modules, and designer modules are items that can contain source code as described in [\[MS-VBAL\]](#) section [4.2](#) and other user-configurable settings. Within the dir Stream (section [2.3.4.2](#)), a **MODULE** Record (section [2.3.4.2.3.2](#)) exists for each such project item, where the **MODULENAME** (section [2.3.4.2.3.2.1](#)) is the same as each **<ModuleIdentifier>** in the **PROJECT** Stream (section [2.3.1](#)).

ProjectDesignerModule (section [2.3.1.7](#)) specifies a project item that extends a designer. In addition to the source code, a Designer Storage (section [2.2.10](#)) named **MODULESTREAMNAME** (section [2.3.4.2.3.2.3](#)) will be present in the Project Root Storage (section [2.2.1](#)) which contains additional, designer-specific information about the project item. The **VBFrame** Stream (section [2.3.5](#)) specifies the **VBA**-specific information about the designer.

1.3.4 Byte Ordering

Some computer architectures number bytes in a binary word from left to right, which is referred to as **big-endian**. The byte numbering used for packet diagrams in this specification is big-endian. Other architectures number the bytes in a binary word from right to left, which is referred to as **little-endian**. The byte numbering used for enumerations, objects, and records in this specification is little-endian.

Using big-endian and little-endian methods, the number 0x12345678 would be stored as shown in the following table:

| Byte order | Byte 0 | Byte 1 | Byte 2 | Byte 3 |
|---------------|--------|--------|--------|--------|
| Big-endian | 0x12 | 0x34 | 0x56 | 0x78 |
| Little-endian | 0x78 | 0x56 | 0x34 | 0x12 |

1.4 Relationship to Protocols and Other Structures

This file format specifies several streams and storages in an **OLE compound file** as described in [\[MS-CFB\]](#). It is related to the structures defined in the following references:

- [\[MS-DOC\]](#) includes an application of Microsoft® Visual Basic® for Applications (VBA) for embedded macros.
- [\[MS-XLS\]](#) includes an application of VBA for embedded macros.
- [\[MS-XLSB\]](#) includes an application of VBA for embedded macros.
- [\[MS-OSHARED\]](#) contains an application of the hashing algorithm specified in section [2.4.2](#) for securing VBA for embedded macros.
- [\[MS-OFORMS\]](#) specifies ActiveX controls that can be embedded in VBA as designers.
- OLE Automation Protocol, as described in [\[MS-OAUT\]](#), that can be used to execute embedded macros in VBA.
- The VBA language, as described in [\[MS-VBAL\]](#), specifies the source code language that is used for embedded macros in this format.

1.5 Applicability Statement

This document specifies a persistence format for embedded macros within a host document, and is not appropriate for stand-alone use. Embedded macros permit programmatic customization for the applications that use this structure.

This persistence format provides interoperability with applications that create or read documents conforming to this structure [<1>](#).

1.6 Versioning and Localization

This document covers versioning issues in the following areas:

- **Structure Versions:** There is only one version of the Office VBA File Format Structure.
- **Localization:** This structure defines no locale-specific processes or data.

This file format contains performance caches that are not interoperable between versions. A version identifier (`_VBA_PROJECT_Stream.Version`, section [2.2.3](#)) is defined to keep track of the exact version that saved a VBA project. When this version number matches the version used by Office, performance caches, specified by `_VBA_PROJECT.PerformanceCache` (section [2.2.3](#)), SRP Streams (section [2.2.6](#)), and Module Stream.PerformanceCache (section [2.3.4.3](#)), will be used instead of the interoperable representation within the file. To be interoperable, this version number must be set to 0xFFFF so that performance caches are ignored.

1.7 Vendor-Extensible Fields

This file format provides a mechanism for vendor extension through custom designers. For details on using designers, see VBFrame Stream (section [2.3.5](#)). No mechanism is provided for generating a unique **class identifier (CLSID)** for a designer.

2.4 Algorithms

2.4.1 Compression and Decompression

To preserve space, VBA uses data compression on a contiguous sequence of records on various streams (1). The data compression technique is **run length encoding**.

The compression algorithm repeatedly reads 4096 bytes from the decompressed buffer into an array. Each group of 4096 bytes is called a chunk. The compression algorithm writes each 4096 byte chunk in an encoded and compressed format. Each output chunk is preceded by a two byte header which denotes the number of bytes in the chunk and the format of the chunk.

The compression algorithm searches for series of bytes that are repeated within the chunk. When series with multiple occurrences are found, the bytes in the first occurrence are encoded as literal tokens and the remaining occurrences are encoded as copy tokens which reference the first occurrence. The encoding for a repeated series of bytes is two bytes in length, thus matches of three bytes or more are required for encoding to be beneficial. Tokens are organized into groups of eight called a Token Sequence, which includes a flag byte. The flag byte is written in advance of the eight tokens. Each bit in the flag byte is used to identify the type of one of the token.

If the compression algorithm fails in producing enough copy tokens to compensate for the space overhead of the copy tokens and the flag bytes, the 4096 byte input chunk is written to the output chunk without any encoding.

The decompression algorithm reads one compressed chunk at a time. Each compressed chunk is decoded into 4096 bytes of uncompressed data which is written to output. For each chunk, the size and format style are extracted from the chunk header. The chunk is then read and decoded according to the format specified in the header.

When the chunk header format specifies that the chunk contains no copy tokens, the 4096 remaining bytes are copied to output. When the chunk header format specifies that copy tokens exist in the chunk, the Token Sequences are decoded. Literal tokens are copied to output. Copy tokens are decoded to find the first occurrence of the byte sequence the copy token represents which is then copied to output.

The pseudocode and record specifications for Compression and Decompression use the following conventions.

- LEFT SHIFT: Bits in the operand are moved from the least significant to the most significant positions. High order bits are truncated. Low order bits become zero.
- RIGHT SHIFT: Bits in the operand are moved from the most significant position to the least significant positions. Low order bits are truncated. High order bits become zero.
- A literal bit sequence is denoted with the initial characters 0b. For example, the literal constant 0xB721 would appear as the binary literal 0b1011011100100001.

2.4.1.1 Structures

2.4.1.3.7 Compressing a DecompressedChunk

The pseudocode to compress a **DecompressedChunk** (section [2.4.1.1.3](#)) to a **CompressedChunk** (section [2.4.1.1.4](#)) uses the state variables described in State Variables (section [2.4.1.2](#)): **CompressedChunkStart**, **CompressedCurrent**, **DecompressedChunkStart**, **DecompressedBufferEnd**, and **DecompressedCurrent**.

The **TokenSequence** is written to the **CompressedChunk** (section [2.4.1.1.4](#)). The location of the **FlagByte** of the **TokenSequence** (section [2.4.1.1.7](#)) is reserved and then the Compressing a Token algorithm (section [2.4.1.3.9](#)) is called to manufacture the individual **Tokens**. After the encoding of each **Token** has been computed, the **FlagByte** is updated.

The number of bytes in a **CopySequence** MUST be greater than or equal to three. The number of bytes in a **CopySequence** MUST be less than 4096.

2.4.2 Contents Hash

The Contents Hash is a cryptographic **digest** of a subset of the information stored in the [VBA Storage](#) (section [2.3.4](#)).

```
VersionEnc = Seed XOR Version
```

Version MUST be 2.

- SET **ProjKey** TO 0.
- FOR each **CharacterByte** IN the string [ProjectId](#).ProjectCLSID (section [2.3.1.2](#)).
 - ADD **CharacterByte** TO **ProjKey**.
- END FOR

ProjKeyEnc is calculated using the following formula:

```
ProjKeyEnc = Seed XOR ProjKey
```

Initialize states for the rest of the encoding:

- SET **UnencryptedByte1** TO **ProjKey**.
- SET **EncryptedByte1** TO **ProjKeyEnc**.

- SET **EncryptedByte2** TO **VersionEnc** .

 - SET **ByteEnc** TO (Byte XOR (EncryptedByte2 + UnencryptedByte1)).
 - APPEND **DataLengthEnc** WITH **ByteEnc**.

2.4.3.3 Decryption

This decryption algorithm accepts an [Encrypted Data Structure](#) (section [2.4.3.1](#)) as input and will yield:

Length (4 bytes): An unsigned integer that specifies the length of **Data**.

Data (variable): An array of unencrypted bytes.

To decrypt **Data** from an Encrypted Data Structure (section [2.4.3.1](#)), an implementation MUST maintain the following states:

UnencryptedByte1 (1 byte): Specifies the last unencrypted byte read or written.

EncryptedByte1 (1 byte): Specifies the last encrypted byte read or written.

EncryptedByte2 (1 byte): Specifies the next-to-last encrypted byte read or written.

Version (1 byte): Specifies the encryption version.

ProjKey (1 byte): Specifies a project-specific encryption key.

IgnoredLength (1 byte): Specifies the length in bytes of **IgnoredEnc**.

MUST decrypt in order as follows.

Version is calculated using the following formula.

```
Version = Seed XOR VersionEnc
```

Version MUST be 2.

ProjKey is calculated using the following formula.

```
ProjKey = Seed XOR ProjKeyEnc
```

To initialize states for the rest of the encoding:

- SET **UnencryptedByte1** TO **ProjKey**.
- SET **EncryptedByte1** TO **ProjKeyEnc**.
- SET **EncryptedByte2** TO **VersionEnc**.

The length of **IgnoredEnc** is computed as follows.

```
IgnoredLength = (Seed BAND 6) / 2
```

Decrypting of **IgnoredEnc** MUST be as follows.

- FOR each **ByteEnc** IN **IgnoredEnc**:
 - SET **Byte** TO (ByteEnc XOR (EncryptedByte2 + UnencryptedByte1)).
 - SET **EncryptedByte2** TO **EncryptedByte1**.
 - SET **EncryptedByte1** TO **ByteEnc**.
 - SET **UnencryptedByte1** TO Byte.
- END FOR

Length is computed by the following pseudocode.

- SET **ByteIndex** TO zero.
- FOR each **ByteEnc** IN **DataLengthEnc**:
 - SET **Byte** TO (ByteEnc XOR (EncryptedByte2 + UnencryptedByte1)).
 - SET **TempValue** TO 256 raised to the power of **ByteIndex**.
 - MULTIPLY **TempValue** by **Byte**.
 - ADD **TempValue** TO **Length**.
 - SET **EncryptedByte2** TO **EncryptedByte1**.
 - SET **EncryptedByte1** TO **ByteEnc**.
 - SET **UnencryptedByte1** TO **Byte**.
 - INCREMENT **ByteIndex**
- END FOR

Length is equal to the length of **DataEnc**.

Data is computed using the following pseudocode.

- FOR each **ByteEnc** IN **DataEnc**:
 - SET **Byte** TO (ByteEnc XOR (EncryptedByte2 + UnencryptedByte1)).
 - APPEND **Data** WITH **Byte**.
 - SET **EncryptedByte2** TO **EncryptedByte1**.
 - SET **EncryptedByte1** TO **ByteEnc**.
 - SET **UnencryptedByte1** TO **Byte**.
- END FOR

2.4.4 Password Hash

VBA employs a custom format for storing a password hash, obfuscating the password with random data. That random data is stored with the VBA project so the hash can be verified without the need to store the original password string.

2.4.4.1 Password Hash Data Structure

The password data structure specifies a password hash and additional random byte data to obfuscate the hash.

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|---|---|---|---|---|---|---|---|---|----------|---|---|---|---|---|---|---|---|---|---------------|---|---|---|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 | 1 |
| Reserved | | | | | | | | | | GrbitKey | | | | | | | | | | GrbithashNull | | | | | | | | | | | |

| | | |
|-----|---------------------|------------|
| ... | KeyNoNulls | |
| ... | PasswordHashNoNulls | Terminator |

Reserved (1 byte): MUST be 0xFF. MUST be ignored.

GrbitKey (4 bits): Each bit specifies a corresponding null byte of **Key** as specified by [Encode Nulls](#) (section [2.4.4.2](#)).

GrbitHashNull (20 bits): Each bit specifies a corresponding null byte of **PasswordHash** as specified by [Encode Nulls](#) (section [2.4.4.2](#)).

KeyNoNulls (4 bytes): Specifies the **Key** for the [Password Hash Algorithm](#) (section [2.4.4.4](#)) with null bytes removed as specified by [Encode Nulls](#) (section [2.4.4.2](#)). **Key** is any value.

Key is encoded into **KeyNoNulls** as specified by the following pseudocode:

- CALL [Encode Nulls](#) (section [2.4.4.2](#)) with **Key** RETURNING **GrbitKey** and **KeyNoNulls**

Decoding is specified by the following pseudocode:

- CALL [Decode Nulls](#) (section [2.4.4.3](#)) with **KeyNoNulls** and **GrbitKey** RETURNING **Key**

PasswordHashNoNulls (20 bytes): Specifies the **PasswordHash** result of the [Password Hash Algorithm](#) (section [2.4.4.4](#)) with null bytes removed as specified by [Encode Nulls](#) (section [2.4.4.2](#)).

PasswordHash is the 160-bit cryptographic digest of a password combined with **Key** as specified by [Password Hash Algorithm](#) (section [2.4.4.4](#)).

Encoding is specified by the following pseudocode:

- CALL [Encode Nulls](#) (section [2.4.4.2](#)) with **PasswordHash** RETURNING **GrbitHashNull** and **PasswordHashNoNulls**

Decoding is specified by the following pseudocode:

- CALL [Decode Nulls](#) (section [2.4.4.3](#)) with **PasswordHashNoNulls** and **GrbitHashNull** RETURNING **PasswordHash**

Terminator (1 byte): MUST be 0x00.

2.4.4.2 Encode Nulls

The [Password Hash](#) stores **Key** and **PasswordHash** with null bytes removed. The fields are encoded by replacing 0x00 bytes with 0x01 and setting a bit on the bit-fields **GrbitKey** and **GrbitHashNull**, respectively.

This algorithm accepts the following as parameters:

InputBytes (variable): An input array of bytes to be encoded.

GrbitNull (variable): An output array of bits specifying null bytes in **InputBytes**.

EncodedBytes (variable): An output array of encoded bytes.

Encoding is computed by the following pseudocode:

- FOR each **Byte** IN **InputBytes**:
 - IF **Byte** EQUALS 0x00 THEN:
 - APPEND **EncodedBytes** WITH 0x01.
 - APPEND **GrbitNull** WITH one bit set to FALSE.
 - ELSE:
 - APPEND **EncodedBytes** WITH **Byte**.
 - APPEND **GrbitNull** WITH one bit set to TRUE.
 - END IF
- END FOR

2.4.4.3 Decode Nulls

The Password Hash stores **Key** and **PasswordHash** with null bytes removed as specified by [Encode Nulls](#) (section 2.4.4.2). The fields are decoded by reading bit-fields **GrbitKey** and **GrbitHashNull**, and replacing corresponding bytes in **Key** and **PasswordHash** with 0x00.

This algorithm accepts the following as parameters:

EncodedBytes (variable): An input array of bytes to be encoded.

GrbitNull (variable): An input array of bits specifying null bytes in **DecodedBytes**.

DecodedBytes (variable): An output array of encoded bytes.

Decoding is computed by the following pseudocode:

- SET **Index** TO 0.
- FOR each **Bit** IN **GrbitNull**:
 - IF **Bit** EQUALS FALSE THEN:
 - APPEND **DecodedBytes** WITH 0x00.
 - ELSE:
 - APPEND **DecodedBytes** WITH `EncodedBytes[Index]`.
 - END IF
 - INCREMENT **Index**.
- END FOR

2.4.4.4 Password Hash Algorithm

This Password Hash Algorithm accepts the following as parameters:

Password (Variable): An array of bytes to be obfuscated. MUST contain MBCS characters encoded using the code page specified by [PROJECTCODEPAGE](#) (section [2.3.4.2.1.4](#)).

Key (4 Bytes): An array of 4 bytes of any value.

When comparing a new password to an old cryptographic digest, MUST be the same value as stored in the old password's [Password Hash Data Structure.Key](#) (section [2.4.4](#)).

The algorithm will yield **PasswordHash**, an array of 20 bytes.

The pseudocode for computing the hash is as follows:

- LET **BytesToHash** be a variable array of bytes.
- APPEND **BytesToHash** WITH **Password**.
- APPEND **BytesToHash** WITH **Key**.
- SET **PasswordHash** TO the **SHA-1** cryptographic digest of **BytesToHash**, as specified by [\[RFC3174\]](#).

2.4.4.5 Password Hash Validation

To verify a password against the stored hash, a new password hash MUST be generated using the same **Key** as the existing password. The new hash can then be compared to the hash in the VBA project.

Validation accepts the following as parameters:

NewPassword (Variable): An array of bytes specifying a password to validate. MUST contain MBCS characters encoded using the code page specified by [PROJECTCODEPAGE](#) (section [2.3.4.2.1.4](#)).

Key (4 bytes): An array of 4 bytes. MUST be the value stored in [Password Hash Data Structure.Key](#) (section [2.4.4](#)).

OldPasswordHash (20 bytes): A cryptographic digest. MUST be the value stored in Password Hash Data Structure.**PasswordHash** (section [2.4.4](#)).

The algorithm yields a Boolean value, **Valid**, specifying that **NewPassword** is valid.

Validation is computed by the following pseudocode:

- LET **NewHash** be an array of 20 bytes.
- CALL [Password Hash Algorithm](#) (section [2.4.4.4](#)) with **NewPassword** and Key RETURNING **NewHash**.
- IF **NewHash** EQUALS **OldPasswordHash** THEN:
 - SET **Valid** TO TRUE.
- ELSE:
 - SET **Valid** TO FALSE.
- END IF

4 Security Considerations

4.1 Project Integrity Verification

Visual Basic for Applications (VBA) uses the **MD5** algorithm to create a cryptographic digest for the VBA project – see [Contents Hash](#) (section [2.4.2](#)). This cryptographic digest can be stored externally and used to verify the integrity of the VBA project.

4.2 Encryption Method

When data in a VBA project, such as a password, is encrypted, the information necessary to decrypt the data is stored with the encrypted data. The design of this encryption is to obfuscate sensitive information, not to secure it. For more information, see [Data Encryption](#) (section [2.4.3](#)). Following is a list of encrypted items:

- Project password – see [ProjectPassword](#) (section [2.3.1.16](#))
- Project protection state – see [ProjectProtectionState](#) (section [2.3.1.15](#))
- Project visibility state – see [ProjectVisibilityState](#) (section [2.3.1.17](#))

5 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft Office 97
- Microsoft Office 2000
- Microsoft Office XP
- Microsoft Office 2003
- the 2007 Microsoft Office system
- Microsoft Office 2010 suites
- Microsoft Office 2013

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 1.5:](#) This persistence format provides interoperability with applications that create or read documents conforming to this structure, including Word 97, Word 2000, Word 2002, Office Word 2003, Office Word 2007, Word 2010, Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, PowerPoint 97, PowerPoint 2000, PowerPoint 2002, Office PowerPoint 2003, Office PowerPoint 2007, and PowerPoint 2010.

[<2> Section 2.1.1.9:](#) VBA 5.0 does not require the name to be an identifier.

[<3> Section 2.3.1.11:](#) VBA 5.0 uses the file name of the containing document.

[<4> Section 2.3.1.14:](#) VBA 5.0 does not write this record.

[<5> Section 2.3.1.15:](#) VBA 5.0 will save 0x00000000 regardless of protection state.

[<6> Section 2.3.1.16:](#) VBA 5.0 will save the encrypted plain text password.

[<7> Section 2.3.2.1:](#) Can be 0x00000000 even though **SizeOfLicenseKey** is not zero. This happens when a document is originally created with an ActiveX control that requires license-aware object creation, and then resaved after the ActiveX control removes that requirement.

[<8> Section 2.3.4.2.1.11:](#) VBA will write user-specified values between -32768 and 32767. However, VBA will only read values between -9999 and 32767.

[<9> Section 2.3.4.2.2.3:](#) VBA 5.0 does not use **OriginalRecord**.

[<10> Section 2.3.4.2.2.3:](#) VBA 5.0 uses **LibidTwiddled** to specify a twiddled type library

[<11> Section 2.4.1.3.10:](#) The 0x00 byte padding is indistinguishable from bytes in the original **DecompressedChunk**. Thus, it is possible for an application of the **Compression algorithm**

followed by an application of the **Decompression algorithm** to result in a **DecompressedBuffer** that contains more bytes than the original.

6 Change Tracking

This section identifies changes that were made to the [MS-OVBA] protocol document between the April 2014 and July 2014 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.

- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.
