Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Preliminary Documentation. This particular Open Specifications document provides documentation for past and current releases and/or for the pre-release version of this technology. This document provides final documentation for past and current releases and preliminary documentation, as applicable and specifically noted in this document, for the pre-release version. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. Because this documentation might change between the pre-release version and the final

version of this technology, there are risks in relying on this preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

1 Introduction

The Office Web Extensibility Manifest Format specifies the schema for **Office Add-ins** manifest files.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

add-in: Supplemental functionality that is provided by an external application or macro to extend the capabilities of an application.

application identifier: A globally unique identifier (GUID) that uniquely identifies a game.

application programming interface (API): A set of routines used by an application program to direct the performance of procedures used by the computer's operating system. Also called application program interface.

claim: A statement that one subject makes about itself or another subject. For example, the statement can be about a name, identity, key, group, privilege, or capability. Claims have a provider that issues them, and they are given one or more values. They are also defined by a claim value type and, possibly, associated metadata.

contact: A person, company, or other entity that is stored in a directory and is associated with one or more unique identifiers and attributes, such as an Internet message address or login name.

content add-in: An **Office Add-in** that appears within the content of a **document**.

culture name: A part of a language identification tagging system, as described in [\[RFC1766\]](#). Culture names adhere to the format "<languagecode2>-<country/regioncode2>." If a two-letter language code is not available, a three-letter code that is derived from [\[ISO-639\]](#) is used.

dictionary: A collection of key/value pairs. Each pair consists of a unique key and an associated value. Values in the dictionary are retrieved by providing a key for which the dictionary returns the associated value.

docked: A condition where a toolbar is attached to the docking area of an application window.

document: An object in a content database such as a file, folder, list, or site. Each object is identified by a **URI**.

endpoint: A communication port that is exposed by an application server for a specific shared service and to which messages can be addressed.

globally unique identifier (GUID): A term used interchangeably with **universally unique identifier (UUID)** in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [\[RFC4122\]](#) or [\[C706\]](#) must be used for generating the **GUID**. See also **universally unique identifier (UUID)**.

Hypertext Markup Language (HTML): An application of the Standard Generalized Markup Language (SGML) that uses tags to mark elements in a document, as described in [\[HTML\]](#).

localization: The process of adapting an application or documentation, including text and non-text elements, to meet the language, cultural, and political expectations and requirements of a specific geographic country or region.

mail add-in: An **Office Add-in** that enhances an email or appointment item.

manifest: A file that stores metadata about an expansion pack, such as the name of the expansion pack, the files and resources that are included in the expansion pack, and the dependencies that it has on other files and components.

Office Add-in: A cloud-enabled app that integrates rich, scenario-focused content and services into an Office application or equivalent protocol client.

Office Web Extension: See **Office Add-in**.

resource: Any component that a computer can access where data can be read, written, or processed. This resource could be an internal component such as a disk drive, or another computer on a network that is used to access a file.

task pane add-in: An **Office Add-in** that appears docked in a task pane.

Uniform Resource Identifier (URI): A string that identifies a resource. The URI is an addressing mechanism defined in Internet Engineering Task Force (IETF) Uniform Resource Identifier (URI): Generic Syntax [\[RFC3986\]](#).

Uniform Resource Locator (URL): A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [\[RFC1738\]](#).

Uniform Resource Name (URN): A string that identifies a persistent Internet resource, as described in [\[RFC2141\]](#). A URN can provide a mechanism for locating and retrieving a schema file that defines a specific namespace. Although a URL can provide similar functionality, a URN can refer to more than one URL and is not location-dependent.

universally unique identifier (UUID): A 128-bit value. UUIDs can be used for multiple purposes, from tagging objects with an extremely short lifetime, to reliably identifying very persistent objects in cross-process communication such as client and server interfaces, manager entry-point vectors, and RPC objects. UUIDs are highly likely to be unique. UUIDs are also known as **globally unique identifiers (GUIDs)** and these terms are used interchangeably in the Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the UUID. Specifically, the use of this term does not imply or require that the algorithms described in [\[RFC4122\]](#) or [\[C706\]](#) must be used for generating the UUID.

web application: A software application that uses HTTP as its core communication protocol and delivers information to the user by using web-based languages such as **HTML** and **XML**.

XML: The Extensible Markup Language, as described in [\[XML1.0\]](#).

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the [Errata](#).

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

The structures specified in this format provide an **XML** vocabulary for **Office Add-ins manifest** files. The elements and attributes specified in this format enable the implementer to provide the information required to enable implementations of the Office Add-ins Framework to activate Office Add-ins.

The XML vocabulary is ordered around a base definition of an Office Add-in with syntax extensions specific to each of three extension types (section [1.3.1](#), section [1.3.2](#) and section [1.3.3](#))

The following sections provide an overview of the functionality supported by these extensions.

1.3.1 Task Pane Apps

A **task pane add-in** provides the implementer with a Task Pane user interface with a fixed initial width that is **docked** in the task pane area. Additional elements enable the implementer to specify an extension source location **Uniform Resource Locator (URL)** by **culture names** for the extension's start page; to create **Office Add-ins** that extend **dictionary** functionality if implemented in the **document** host; and to indicate the capabilities requested by the extension.

1.3.2 Content Apps

A **content add-in** provides the implementer with a user interface with a specifiable initial height and width that appears within the content of the **document**. Additional elements enable the implementer to specify an extension source location **Uniform Resource Locator (URL)** by **culture names** for the source locations for the extension's start page; and to indicate the capabilities requested by the extension.

1.3.3 Mail Apps

A **mail add-in** for Office provides the implementer with a user interface that has specifiable initial height that is sensitive to the form factor being used by the user. Additional elements enable the implementer to specify content-based activation rules, an extension source location **Uniform Resource Locator (URL)** by **culture names** for the source locations for the extension's start page, and to indicate the capabilities requested by the extension.

1.4 Relationship to Protocols and Other Structures

None.

1.5 Applicability Statement

This document specifies the schema used by **Office Add-ins manifest** files. These files are not persisted into documents and as such are independent of application file formats. Manifest files are created by implementers and distributed through Office Add-ins catalogs.

1.6 Versioning and Localization

The **Office Add-ins manifest** file supports versioning and **localization** through explicit definition using pre-defined schema elements.

Versioning information is explicitly specified through the **Version** element in the **OfficeApp** type documented in section [2.2.21](#).

Localization information can be specified for any element that is defined with the **LocaleAwareSetting** type, documented in section [2.2.5](#) and throughout this **document**.
