

# [MS-OXCNOTIF]:

## Core Notifications Protocol

---

### Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](http://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

**Preliminary Documentation.** This Open Specification provides documentation for past and current releases and/or for the pre-release version of this technology. This Open Specification is final documentation for past or current releases as specifically noted in the document, as applicable; it is preliminary documentation for the pre-release versions. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. As the documentation may change between this preliminary version and the final version of this technology, there are risks in relying on preliminary documentation. To the extent that you incur additional

development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

Preliminary

## Revision Summary

Date	Revision History	Revision Class	Comments
4/4/2008	0.1		Initial Availability.
6/27/2008	1.0		Initial Release.
8/6/2008	1.01		Revised and edited technical content.
9/3/2008	1.02		Revised and edited technical content.
12/3/2008	1.03		Minor editorial fixes.
3/4/2009	1.04		Revised and edited technical content.
4/10/2009	2.0		Updated technical content and applicable product releases.
7/15/2009	3.0	Major	Revised and edited for technical content.
11/4/2009	3.1.0	Minor	Updated the technical content.
2/10/2010	4.0.0	Major	Updated and revised the technical content.
5/5/2010	4.1.0	Minor	Updated the technical content.
8/4/2010	5.0	Major	Significantly changed the technical content.
11/3/2010	5.0	No change	No changes to the meaning, language, or formatting of the technical content.
3/18/2011	6.0	Major	Significantly changed the technical content.
8/5/2011	6.0	No Change	No changes to the meaning, language, or formatting of the technical content.
10/7/2011	7.0	Major	Significantly changed the technical content.
1/20/2012	8.0	Major	Significantly changed the technical content.
4/27/2012	9.0	Major	Significantly changed the technical content.
7/16/2012	10.0	Major	Significantly changed the technical content.
10/8/2012	10.1	Minor	Clarified the meaning of the technical content.
2/11/2013	10.1	No Change	No changes to the meaning, language, or formatting of the technical content.
7/26/2013	10.1	No Change	No changes to the meaning, language, or formatting of the technical content.
11/18/2013	11.0	Major	Significantly changed the technical content.
2/10/2014	11.0	No Change	No changes to the meaning, language, or formatting of the technical content.
4/30/2014	12.0	Major	Significantly changed the technical content.
7/31/2014	12.0	No Change	No changes to the meaning, language, or formatting of the technical content.

<b>Date</b>	<b>Revision History</b>	<b>Revision Class</b>	<b>Comments</b>
10/30/2014	13.0	Major	Significantly changed the technical content.
3/16/2015	14.0	Major	Significantly changed the technical content.
5/26/2015	15.0	Major	Significantly changed the technical content.

# 1 Introduction

The Core Notifications Protocol transmits notifications to a client about specific events on a server. This protocol is commonly used to inform the client about changes that have occurred in folders and messages on the server.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [\[RFC2119\]](#). Sections 1.5 and 1.9 are also normative but do not contain those terms. All other sections and examples in this specification are informative.

## 1.1 Glossary

The following terms are specific to this document:

**ASCII:** The American Standard Code for Information Interchange (ASCII) is an 8-bit character-encoding scheme based on the English alphabet. ASCII codes represent text in computers, communications equipment, and other devices that work with text. ASCII refers to a single 8-bit ASCII character or an array of 8-bit ASCII characters with the high bit of each character set to zero.

**asynchronous context handle:** A **remote procedure call (RPC)** context handle that is used by a client when issuing RPCs against a server on AsyncEMSMDB interface methods. It represents a handle to a unique session context on the server.

**binary large object (BLOB):** A discrete packet of data that is stored in a database and is treated as a sequence of uninterpreted bytes.

**callback address:** An object that encapsulates an Internet address that is registered by a client and that a server can use for push notifications.

**datagram:** A style of communication offered by a network transport protocol where each message is contained within a single network packet. In this style, there is no requirement for establishing a session prior to communication, as opposed to a connection-oriented style.

**handle:** Any token that can be used to identify and access an object such as a device, file, or a window.

**Hypertext Transfer Protocol (HTTP):** An application-level protocol for distributed, collaborative, hypermedia information systems (text, graphic images, sound, video, and other multimedia files) on the World Wide Web.

**Internet Protocol version 6 (IPv6):** A revised version of the Internet Protocol (IP) designed to address growth on the Internet. Improvements include a 128-bit IP address size, expanded routing capabilities, and support for authentication (2) and privacy.

**mailbox:** A message store that contains email, calendar items, and other Message objects for a single recipient.

**message class:** A property that loosely defines the type of a message, contact, or other Personal Information Manager (PIM) object in a mailbox.

**Messaging Application Programming Interface (MAPI):** A messaging architecture that enables multiple applications to interact with multiple messaging systems across a variety of hardware platforms.

**notification subscription:** A request to receive notifications from a server when specific events occur on that server.

**outstanding RPC call:** An asynchronous **remote procedure call (RPC)** that has not been completed by a server yet.

**remote operation (ROP):** An operation that is invoked against a server. Each ROP represents an action, such as delete, send, or query. A ROP is contained in a ROP buffer for transmission over the wire.

**remote procedure call (RPC):** A context-dependent term commonly overloaded with three meanings. Note that much of the industry literature concerning RPC technologies uses this term interchangeably for any of the three meanings. Following are the three definitions: (\*) The runtime environment providing remote procedure call facilities. The preferred usage for this meaning is "RPC runtime". (\*) The pattern of request and response message exchange between two parties (typically, a client and a server). The preferred usage for this meaning is "RPC exchange". (\*) A single message from an exchange as defined in the previous definition. The preferred usage for this term is "RPC message". For more information about RPC, see [\[C706\]](#).

**ROP request:** See **ROP request buffer**.

**ROP request buffer:** A ROP buffer that a client sends to a server to be processed.

**ROP response:** See **ROP response buffer**.

**ROP response buffer:** A ROP buffer that a server sends to a client to be processed.

**search folder:** A collection of related items to be crawled by a search service.

**session context handle:** A **remote procedure call (RPC)** context handle that is used by a client when issuing RPCs against a server on EMSMDB interface methods. It represents a handle to a unique session context on the server.

**Table object:** An object that is used to view properties for a collection of objects of a specific type, such as a Message object or a Folder object. A Table object is structured in a row and column format with each row representing an object and each column representing a property of the object.

**Unicode:** A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The **Unicode** standard [\[UNICODE5.0.0/2007\]](#) provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).

**User Datagram Protocol (UDP):** The connectionless protocol within TCP/IP that corresponds to the transport layer in the ISO/OSI reference model.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the [Errata](#).

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com). We will assist you in finding the relevant information.

## 1.3 Overview

This protocol enables a client to receive notifications about specific events that occur on the messaging server. The client can subscribe to certain events on the server, and when one of the events occurs, the server sends the client a notification. The notification sent by the server is commonly a two part operation. First, the server notifies the client about pending notifications. Then the server transmits the notification details.

The server supports three methods for notifying the client of pending notifications on the server:

- Asynchronous **RPC** notifications. This method enables the client to make an asynchronous remote procedure call (RPC) call to the server; the server does not complete the RPC call until there is a notification for the session.
- Asynchronous notifications via **HTTP** extensions, as described in [\[MS-OXCMAPIHTTP\]](#).
- Push notifications. This method relies on a **callback address** being registered with the server, so that **User Datagram Protocol (UDP) datagrams** can be sent to the callback address when pending notifications exist.

- The **RopPending ROP** ([\[MS-OXCROPS\]](#) section 2.2.14.3). This **ROP** is included in the **EcDoRpcExt2** method call response if there are pending notifications on the server and the details of the notification do not fit in the response buffer.

Regardless of the means used to notify the client of the pending notification, the notification details are sent to the client by using the **RopNotify** ROP (section [2.2.1.4.1](#)).

## 1.4 Relationship to Other Protocols

This specification provides a low-level explanation of notifying a client about events on the server. For information about applying this protocol in a **Messaging Application Programming Interface (MAPI)** provider, see [\[MSDN-ENM\]](#).

This specification relies on an understanding of [\[MS-OXCRPC\]](#), [\[MS-OXCMAPIHTTP\]](#), and [\[MS-OXCROPS\]](#).

For conceptual background information and overviews of the relationships and interactions between this and other protocols, see [\[MS-OXPROTO\]](#).

## 1.5 Prerequisites/Preconditions

This specification assumes that the client has previously logged on to the server and created a session context.

## 1.6 Applicability Statement

This protocol was designed to be used for the following purposes:

- Notifying clients about specific events on the server.
- Notifying clients about notifications pending for the client on the server.

This protocol provides basic information, a high degree of efficiency, and complete preservation of data fidelity for these uses. Note, however, that it might not be appropriate for use in scenarios that do any of the following:

- Require replication of mailbox content between clients and servers.
- Require client-driven copying of data between different mailboxes on different servers.
- Require exporting or importing of data to or from a mailbox.

## 1.7 Versioning and Capability Negotiation

This specification covers versioning issues in the following areas:

- **Supported Transports:** This protocol uses the Wire Format Protocol, as described in [\[MS-OXCRPC\]](#), the Remote Operations (ROP) List and Encoding Protocol, as described in [\[MS-OXCROPS\]](#), the MAPI extensions to HTTP, as described in [\[MS-OXCMAPIHTTP\]](#), and Internet protocols as described in section [2.1](#).
- **Protocol Versions:** This protocol has only one interface version.
- **Capability Negotiation:** The protocol does not require asynchronous RPC notifications to be implemented. The client examines the server version to determine whether asynchronous RPC notifications are supported. For more information about how to determine server version, see [\[MS-OXCRPC\]](#).

- Localization: This protocol passes text strings in notification details. Localization considerations for such strings are described in [\[MS-OXCMSG\]](#) section 2.2.1.3.

## **1.8 Vendor-Extensible Fields**

None.

## **1.9 Standards Assignments**

None.

## 2 Messages

### 2.1 Transport

The commands specified by this protocol are sent to and received from the server by using the underlying **ROP request buffers** and **ROP response buffers**, respectively, as specified in [\[MS-OXCROPS\]](#).

Asynchronous calls are made on the server by using RPC transport, as specified in [\[MS-OXCRPC\]](#), and the MAPI extensions to HTTP<1>, as specified in [\[MS-OXCMAPIHTTP\]](#).

UDP datagrams are sent from server to client by using the User Datagram Protocol (UDP), as specified in [\[RFC768\]](#). For more information, see [\[MSDN-WS2\]](#).

### 2.2 Message Syntax

#### 2.2.1 Notifications

This section specifies the following:

- The server events that the client can be notified of.
- The **RopRegisterNotification** ROP, which is used to subscribe to notifications.
- The ROPs and RPCs used to notify the client of pending notifications:
  - The **EcDoAsyncConnectEx** method.
  - The **EcDoAsyncWaitEx** method.
  - The **EcRRegisterPushNotification** method.
  - The **RopPending** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.3).
  - The **NotificationWait** request type<2> ([\[MS-OXCMAPIHTTP\]](#) section 2.2.4.4).
- The **RopNotify** ROP (section [2.2.1.4.1](#)), which is used to send notification details.

##### 2.2.1.1 Server Event Types

The following table specifies the events that happen on the server. Clients can register to receive notifications about these events by using the **RopRegisterNotification** ROP (section [2.2.1.2.1](#)).

Event name	Description
<b>NewMail</b>	A new email message has been received by the server.
<b>ObjectCopied</b>	An existing object has been copied on the server.
<b>ObjectCreated</b>	A new object has been created on the server.
<b>ObjectDeleted</b>	An existing object has been deleted from the server.
<b>ObjectModified</b>	An existing object has been modified on the server.
<b>ObjectMoved</b>	An existing object has been moved to another location on the server.

Event name	Description
<b>SearchComplete</b>	A search operation has been completed on the server.
<b>TableModified</b>	A table has been modified on the server. <b>TableModified</b> event types are specified in section <a href="#">2.2.1.1.1</a> .

#### 2.2.1.1.1 TableModified Event Types

The following table specifies the table modification event types. Clients can register to receive notifications about these events by using the **RopRegisterNotification** ROP (section [2.2.1.2.1](#)).

Event name	Description
<b>TableChanged</b>	A table has been changed.
<b>TableRowAdded</b>	A new row has been added to the table.
<b>TableRowDeleted</b>	An existing row has been deleted from the table.
<b>TableRowModified</b>	An existing row has been modified in the table.
<b>TableRestrictionChanged</b>	A table restriction has been cleared, removed, or is pending. For more details about how this event type is related to the TBLSTAT_RESTRICTING value of the <b>TableStatus</b> field, as specified in <a href="#">[MS-OXCTABL]</a> section 2.2.2.1.3, of the <b>RopRestrict</b> ROP ( <a href="#">[MS-OXCROPS]</a> section 2.2.5.3), see <a href="#">[MS-OXCTABL]</a> section 3.2.5.1.

For server steps related to creating and sending **TableModified** event notifications, see section [3.1.4.3](#). For client initialization steps related to subscribing to **TableModified** event notifications, see section [3.2.4.2](#).

#### 2.2.1.2 Subscription Management

Subscription management is handled by the **RopRegisterNotification** ROP (section [2.2.1.2.1](#)). For more information about how clients subscribe to notification events, see section [3.2.4.1](#).

##### 2.2.1.2.1 RopRegisterNotification ROP

The **RopRegisterNotification** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.1) creates a subscription for specified notifications on the server and returns a **handle** of the subscription to the client.

The complete syntax of the ROP request and response buffers for this ROP is specified in [\[MS-OXCROPS\]](#). This section specifies the syntax and semantics of various fields that are not fully specified in [\[MS-OXCROPS\]](#).

##### 2.2.1.2.1.1 RopRegisterNotification ROP Request Buffer

The following descriptions define valid fields for the request buffer of the **RopRegisterNotification** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.1).

**NotificationTypes (2 bytes):** A set of bits describing notifications that the client is interested in receiving.

The following table lists the values that are available for notification types.

Value	Meaning
0x0002	The server sends notifications to the client when <b>NewMail</b> events occur within the scope of interest.
0x0004	The server sends notifications to the client when <b>ObjectCreated</b> events occur within the scope of interest.
0x0008	The server sends notifications to the client when <b>ObjectDeleted</b> events occur within the scope of interest.
0x0010	The server sends notifications to the client when <b>ObjectModified</b> events occur within the scope of interest.
0x0020	The server sends notifications to the client when <b>ObjectMoved</b> events occur within the scope of interest.
0x0040	The server sends notifications to the client when <b>ObjectCopied</b> events occur within the scope of interest.
0x0080	The server sends notifications to the client when <b>SearchComplete</b> events occur within the scope of interest.
0x0100	The server sends notifications to the client when <b>TableModified</b> events occur within the scope of interest.
0x0400	The server sends notifications to the client when the <b>Extended</b> flag is set.

For details about server events, see section [2.2.1.1](#).

**Reserved (1 byte):** This field is reserved. The field value MUST be 0x00. The server behavior is undefined if the value is not 0x00. This field is optional and is present only if the **Extended** (0x0400) flag is set in the **NotificationTypes** field.

**WantWholeStore (1 byte):** A value of **TRUE** (0x01) if the scope for notifications is the entire **mailbox**; otherwise, **FALSE** (0x00).

### 2.2.1.3 Pending Notifications

Pending notifications rely on transmission of one or more of the following methods:

- The **EcDoAsyncConnectEx** method, which is used in asynchronous RPC notifications.
- The **EcDoAsyncWaitEx** method, which is also used in asynchronous RPC notifications.
- The **EcRRegisterPushNotification** method, which is used for push notifications.
- The **EcDoRpcExt2** method and the **RopPending** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.3).
- The **NotificationWait** request type as described in [\[MS-OXCMAPIHTTP\]](#) section 2.2.4.4. [<3>](#)

#### 2.2.1.3.1 EcDoAsyncConnectEx Method

The **EcDoAsyncConnectEx**[<4>](#) RPC method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4, is used to acquire an **asynchronous context handle** on the server to use in subsequent **EcDoAsyncWaitEx** method calls, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1. The **EcDoAsyncConnectEx** method is used to support asynchronous RPC notifications. For more information about how the client sends **EcDoAsyncConnectEx** method to initialize the notification process, see section [3.2.5.2](#). For more information about how the server receives the **EcDoAsyncConnectEx** method, see section [3.1.5.2](#).

#### 2.2.1.3.2 EcDoAsyncWaitEx Method

The **EcDoAsyncWaitEx**<5> asynchronous RPC method, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1, is used to inform a client about pending notifications on the server. The **EcDoAsyncWaitEx** method is used to support asynchronous RPC notifications. For more information about how the client sends and receives **EcDoAsyncWaitEx** method calls, see section [3.2.5.5.1](#). For more information about how the server receives and completes **EcDoAsyncWaitEx** method calls, see section [3.1.5.3](#).

### 2.2.1.3.3 EcRRegisterPushNotification Method

The **EcRRegisterPushNotification**<6> RPC method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.5, is used to register a callback address of a client on the server. The callback address is required in order to receive UDP datagrams from the server, and is used to support push notifications, which is one way in which the server can notify clients of pending notifications. The UDP datagrams inform the client that notifications are pending on the server for the session.

### 2.2.1.3.4 RopPending ROP

The **RopPending** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.3) notifies the client that there are pending notifications on the server for the client. This ROP MUST appear only in response buffers of either the **EcDoRpcExt2** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, or the **Execute** request type, <7> as specified in [\[MS-OXCMAPIHTTP\]](#) section 2.2.4.2.2. For more information about how the server sends this **ROP response**, see section [3.1.5.6](#). For more information about how the client receives this ROP response, see section [3.2.5.5.3](#).

### 2.2.1.4 Notification Details

Notification details are transmitted by using the **RopNotify** ROP (section [2.2.1.4.1](#)).

#### 2.2.1.4.1 RopNotify ROP

The **RopNotify** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.2) provides the client with the details of notifications that are sent by server. This ROP MUST appear only in response buffers of the **EcDoRpcExt2** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, or in the **Execute** request type success response body<8>, as specified in [\[MS-OXCMAPIHTTP\]](#) section 2.2.4.2.2.

The complete syntax of the ROP response buffer for this ROP is specified in [\[MS-OXCROPS\]](#). This section specifies the syntax and semantics of various fields that are not fully specified in [\[MS-OXCROPS\]](#).

For more information about how the server sends notification details using the **RopNotify** ROP, see section [3.1.5.7](#). For more information about how the client receives notification details using the **RopNotify** ROP, see section [3.2.5.7](#).

#### 2.2.1.4.1.1 RopNotify ROP Response Buffer

The following descriptions define valid fields for the response buffer of the **RopNotify** ROP ([\[MS-OXCROPS\]](#) section 2.2.14.2).

**NotificationHandle (4 bytes):** The 32-bit server object handle of the target object for the notification. The target object can be a **notification subscription** or a table.

**LogonId (1 byte):** An unsigned integer that specifies the logon associated with the notification event.

**NotificationData (variable):** This field contains a **NotificationData** structure, as specified in section [2.2.1.4.1.2](#).

#### 2.2.1.4.1.2 NotificationData Structure

The **NotificationData** structure specifies details about the notification. The contents of this structure are as follows.

0	1	2	3	4	5	6	7	8	9	10	1	2	3	4	5	6	7	8	9	20	1	2	3	4	5	6	7	8	9	30	1

UnreadMessageCount	
MessageFlags	
UnicodeFlag	MessageClass (variable)
...	

**NotificationFlags (2 bytes):** A combination of an enumeration and flags that describe the type of the notification and the availability of the notification data fields.

The least significant 12 bits of the **NotificationFlags** field contain the **NotificationType** enumeration, which defines the type of the notification. The possible values for this enumeration are listed in the following table.

Bit	Meaning
0x0002	The notification is for a <b>NewMail</b> event.
0x0004	The notification is for an <b>ObjectCreated</b> event.
0x0008	The notification is for an <b>ObjectDeleted</b> event.
0x0010	The notification is for an <b>ObjectModified</b> event.
0x0020	The notification is for an <b>ObjectMoved</b> event.

Bit	Meaning
0x0040	The notification is for an <b>ObjectCopied</b> event.
0x0080	The notification is for a <b>SearchCompleted</b> event.
0x0100	The notification is for a <b>TableModified</b> event.
0x0400	This value is reserved. It is not used by the server and <b>MUST</b> be ignored by the client.

The most significant four bits of the **NotificationFlags** field are flags that specify the availability of the notification data fields.

Bit	Flag	Meaning
0x1000	T	The notification contains information about a change in the total number of messages in a folder triggering the event. If this bit is set, the <b>NotificationType</b> value MUST be 0x0010.
0x2000	U	The notification contains information about a change in the number of unread messages in a folder triggering the event. If this bit is set, the <b>NotificationType</b> value MUST be 0x0010.
0x4000	S	The notification is caused by an event in a <b>search folder</b> . If this bit is set, bit 0x8000 MUST be set.
0x8000	M	The notification is caused by an event on a message.

**TableEventType (2 bytes):** A subtype of the notification for a **TableModified** event. This field is available only if the **NotificationType** value in the **NotificationFlags** field is 0x0100.

The following table lists the values that are available for event types. For more details, see section [2.2.1.1.1](#).

Value	Meaning
0x0001	The notification is for <b>TableChanged</b> events.
0x0003	The notification is for <b>TableRowAdded</b> events.

Value	Meaning
0x0004	The notification is for <b>TableRowDeleted</b> events.
0x0005	The notification is for <b>TableRowModified</b> events.
0x0007	The notification is for <b>TableRestrictionChanged</b> events.

**TableRowFolderID (8 bytes):** The value of the **Folder ID** structure, as specified in [\[MS-OXCDATA\]](#) section 2.2.1.1, of the item triggering the notification. This field is available only if the **TableEventType** field is available and is 0x0003, 0x0004, or 0x0005.

**TableRowMessageID (8 bytes):** The value of the **Message ID** structure, as specified in [\[MS-OXCDATA\]](#) section 2.2.1.2, of the item triggering the notification. This field is available only if bit 0x8000 is set in the **NotificationFlags** field and if the **TableEventType** field is available and is 0x0003, 0x0004, or 0x0005.

**TableRowInstance (4 bytes):** An identifier of the instance of the previous row in the table. This field is available only if bit 0x8000 is set in the **NotificationFlags** field and if the **TableEventType** field is available and is 0x0003, 0x0004, or 0x0005.

**InsertAfterTableRowFolderID (8 bytes):** The old value of the **Folder ID** structure of the item triggering the notification. This field is available only if the **TableEventType** field is available and is 0x0003 or 0x0005.

**InsertAfterTableRowID (8 bytes):** The old value of the **Message ID** structure of the item triggering the notification. This field is available only if bit 0x8000 is set in the **NotificationFlags** field and if the **TableEventType** field is available and is 0x0003 or 0x0005.

**InsertAfterTableRowInstance (4 bytes):** An unsigned 32-bit identifier of the instance of the row where the modified row is inserted. This field is available only if bit 0x8000 is set in the **NotificationFlags** field and if the **TableEventType** field is available and is 0x0003 or 0x0005.

**TableRowDataSize (2 bytes):** An unsigned 16-bit integer that indicates the length of the table row data. This field is available only if the **TableEventType** field is available and is 0x0003 or 0x0005.

**TableRowData (variable):** The table row data, which contains a list of property values in a **PropertyRow** structure, as specified in [\[MS-OXCDATA\]](#) section 2.8, for the row that was added or modified in the table. The property values to be included are determined by a previous **RowSetColumns** ROP, as specified in [\[MS-OXCTABL\]](#) section 2.2.2.2. This field is available only if the **TableEventType** field is available and is 0x0003 or 0x0005.

**FolderId (8 bytes):** The **Folder ID** structure of the item triggering the event. This field is available only if the **NotificationType** value in the **NotificationFlags** field is not 0x0100 or 0x0400.

**MessageId (8 bytes):** The **Message ID** structure, as specified in [\[MS-OXCDATA\]](#) section 2.2.1.2, of the item triggering the event. This field is available only if the **NotificationType** value in the **NotificationFlags** field is not 0x0100 or 0x0400, and bit 0x8000 is set in the **NotificationFlags** field.

**ParentFolderId (8 bytes):** The **Folder ID** structure of the parent folder of the item triggering the event. This field is available only if the value of the **NotificationType** in the **NotificationFlags**

field is 0x0004, 0x0008, 0x0020, or 0x0040, and it is sent for either a message in a search folder (both bit 0x4000 and bit 0x8000 are set in the **NotificationFlags** field) or a folder (both bit 0x4000 and bit 0x8000 are not set in the **NotificationFlags** field).

**OldFolderId (8 bytes):** The old **Folder ID** structure of the item triggering the event. This field is available only if the **NotificationType** value in the **NotificationFlags** field is 0x0020 or 0x0040.

**OldMessageId (8 bytes):** The old **Message ID** structure of the item triggering the event. This field is available only if the value of the **NotificationType** in the **NotificationFlags** field is 0x0020 or 0x0040 and bit 0x8000 is set in the **NotificationFlags** field.

**OldParentFolderId (8 bytes):** The old parent **Folder ID** structure of the item triggering the event. This field is available only if the value of the **NotificationType** in the **NotificationFlags** field is 0x0020 or 0x0040 and bit 0x8000 is not set in the **NotificationFlags** field.

**TagCount (2 bytes):** An unsigned 16-bit integer that specifies the number of property tags in the **Tags** field. This field is available only if the value of the **NotificationType** in the **NotificationFlags** field is 0x0004 or 0x0010. If the value of the **NotificationType** in the **NotificationFlags** field is 0x0010, the value of this field SHOULD [<9>](#) be set to 0x0000.

**Tags (variable):** An array of unsigned 32-bit integers that identifies the IDs of properties that have changed. This field is available only if the **TagCount** field is available and the value of the **TagCount** field is not 0x0000 or 0xFFFF.

**TotalMessageCount (4 bytes):** An unsigned 32-bit integer that specifies the total number of items in the folder triggering this event. This field is available only if bit 0x1000 is set in the **NotificationFlags** field.

**UnreadMessageCount (4 bytes):** An unsigned 32-bit integer that specifies the number of unread items in a folder triggering this event. This field is available only if bit 0x2000 is set in the **NotificationFlags** field.

**MessageFlags (4 bytes):** An unsigned 32-bit integer that specifies the message flags of new mail that has been received. [<10>](#) This field is available only if the value of the **NotificationType** in the **NotificationFlags** field is 0x0002. For details, see [\[MS-OXCMSG\]](#) section 2.2.1.6.

**UnicodeFlag (1 byte):** A value of **TRUE** (0x01) indicates the value of the **MessageClass** field is in **Unicode**; otherwise, **FALSE** (0x00) indicates the value of the **MessageClass** is in **ASCII**. A value of **FALSE** is returned if the client is working in cached mode, as specified by the **ClientMode** field in [\[MS-OXCRPC\]](#) section 2.2.2.2.4. This field is available only if the value of the **NotificationType** field in the **NotificationFlags** field is 0x0002.

**MessageClass (variable):** A null-terminated string containing the **message class** of the new mail. The string is in Unicode if the **UnicodeFlag** field is set to **TRUE** (0x01). The string is in ASCII if **UnicodeFlag** is set to **FALSE** (0x00). This field is available only if the value of the **NotificationType** in the **NotificationFlags** field is 0x0002.

## 3 Protocol Details

### 3.1 Server Details

#### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This specification does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

This protocol includes the following abstract data model (ADM) elements:

**Global.Handle**, as specified in [\[MS-OXCRPC\]](#) section 3.1.1.

**Global.AsynchronousHandle**, as specified in [\[MS-OXCRPC\]](#) section 3.3.1.

**cookies**, as specified in [\[MS-OXCMAPIHTTP\]](#) section 3.2.1. [<11>](#)

The following ADM types are defined in this section:

**NotificationSubscriptionObject**: An object on the server associated with the session context that manages event notifications and notification subscriptions.

#### 3.1.2 Timers

If push notifications are supported by the server, as specified in [section 3.1.5.4](#), the server SHOULD allow for a 60-second interval between UDP datagrams until the client has retrieved all event information for the session. The server MUST provide server administrators a means to configure the time interval between the UDP datagrams.

#### 3.1.3 Initialization

None.

#### 3.1.4 Higher-Layer Triggered Events

##### 3.1.4.1 Sending Pending Notifications

The server notifies the client of pending notifications in one of three ways: by completing an asynchronous **EcDoAsyncWaitEx** RPC method call, by using push notifications and sending a UDP datagram to a callback address, or by sending a **RopPending** ROP response ([\[MS-OXCROPS\]](#) section 2.2.14.3). For more details about responding to an asynchronous RPC call, see [section 3.1.5.3](#). For more details about using push notifications and sending a UDP datagram, see [section 3.1.5.4](#). For more details about sending a **RopPending** ROP response, see [section 3.1.5.6](#).

##### 3.1.4.2 Sending Notification Details

The server sends notification details to the client by sending the **RopNotify** ROP response ([section 2.2.1.4.1](#)). The **RopNotify** command is the only method to transmit notification details to the client,

so it is used regardless of the method used to notify the client of the pending notification. For more details about sending the **RopNotify** ROP, see section [3.1.5.7](#).

### 3.1.4.3 Creating and Sending TableModified Event Notifications

If the client has subscribed to **TableModified** event notifications, by using the **RopRegisterNotification** ROP (section [2.2.1.2.1](#)), the server SHOULD [<12>](#) require that a table view is created in order to send the **TableModified** event notifications, as specified in section [2.2.1.1.1](#). If a table view is required on the server, the server MUST receive a request from one of the following ROPs, each of which cause a table view to be created on the server: **RopCollapseRow** ([MS-OXCROPS] section 2.2.5.17), **RopExpandRow** ([MS-OXCROPS] section 2.2.5.16), **RopFindRow** ([MS-OXCROPS] section 2.2.5.13), **RopQueryColumnsAll** ([MS-OXCROPS] section 2.2.5.12), **RopQueryPosition** ([MS-OXCROPS] section 2.2.5.7), **RopQueryRows** ([MS-OXCROPS] section 2.2.5.4), **RopSeekRow** ([MS-OXCROPS] section 2.2.5.8), **RopSeekRowFractional** ([MS-OXCROPS] section 2.2.5.10), and **RopSeekRowBookmark** ([MS-OXCROPS] section 2.2.5.9). The server SHOULD then create a subscription to **TableModified** event notifications automatically for every table created on the server. The server MUST NOT create a subscription to table notifications for the tables that were created with a **NoNotifications** flag. For more details about the **NoNotifications** flag, see [\[MS-OXCFCOLD\]](#) section 2.2.1.14.1 and [\[MS-OXCFCOLD\]](#) section 2.2.1.13.1.

When a **TableModified** event occurs, the server generates a notification using one of the following three methods, listed in descending order of usefulness to the client.

1. The server generates an informative notification that specifies the nature of the change (content or hierarchy), the value of the **Folder ID** structure, as specified in [\[MS-OXCDATA\]](#) section 2.2.1.1, the value of the **Message ID** structure, as specified in [\[MS-OXCDATA\]](#) section 2.2.1.2, and new table values. The **TableRowAdded**, **TableRowDeleted**, and **TableRowModified** events each produce informative notifications.
2. The server generates a basic notification that does not include specifics about the change made. The **TableChanged** and **TableRestrictionChanged** events produce basic notifications.
3. The server does not generate a notification at all.

The notification level is server implementation-specific; however, the server SHOULD generate informative notifications whenever possible and only generate a basic notification when it is not feasible to generate an informative notification.

The server SHOULD [<13>](#) stop sending notifications if the **RopResetTable** ROP ([MS-OXCROPS] section 2.2.5.15) is received, until a new table view is created using one of the following ROPs: **RopCollapseRow**, **RopExpandRow**, **RopFindRow**, **RopQueryColumnsAll**, **RopQueryPosition**, **RopQueryRows**, **RopSeekRow**, **RopSeekRowFractional**, or **RopSeekRowBookmark**.

## 3.1.5 Message Processing Events and Sequencing Rules

### 3.1.5.1 Receiving a RopRegisterNotification ROP Request

When a **RopRegisterNotification** ROP (section [2.2.1.2.1](#)) message is received by the server, the server SHOULD create a new Notification Subscription object and associate it with the session context. The server SHOULD save the information provided in the **RopRegisterNotification ROP request** fields for future use.

The server SHOULD allow multiple Notification Subscription objects to be created and associated with the same session context.

For details about how the client sends the **RopRegisterNotification** ROP request, see section [3.2.5.1](#).

### 3.1.5.2 Receiving an EcDoAsyncConnectEx Method Call

The server SHOULD [<14>](#) support the **EcDoAsyncConnectEx** method call, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4.

When a call to the **EcDoAsyncConnectEx** RPC, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4, is received by the server, the server MUST create an asynchronous context handle and MUST bind it to the **session context handle** used to make the call.

### 3.1.5.3 Receiving an EcDoAsyncWaitEx Method Call

The server SHOULD [<15>](#) support the **EcDoAsyncWaitEx** method call, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1.

Whenever an asynchronous **EcDoAsyncWaitEx** method call, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1, on the **AsyncEMSMDB** interface is received by the server, the server MUST validate that the asynchronous context handle provided is a valid asynchronous context handle that was returned from the **EcDoAsyncConnectEx** method call, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4. The server SHOULD NOT complete the call until there is a notification for the client session, or the call has been outstanding on the server 5 minutes. If the server already has a call outstanding for the same session context handle, the server SHOULD complete the new call and set the **ErrorCode** field to **Rejected**, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1, if another asynchronous RPC call is currently in progress on the server.

If the server completes the **outstanding RPC call** when there is a notification for the client session, the server MUST return the value **NotificationPending** in the **pulFlagsOut** field. The server MUST return 0x00000000 in the **pulFlagsOut** field if the call was completed when there is no notification for the client session.

### 3.1.5.4 Receiving an EcRRegisterPushNotification Method Call

The server MAY [<16>](#) support the **EcRRegisterPushNotification** method call, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.5.

When a call to the **EcRRegisterPushNotification** method is received by the server, a valid callback address in the **rgbCallbackAddress** field and buffer with opaque client data in the **rgbContext** field MUST be present. The server MUST fail the call and MUST NOT take any actions if the callback address is not a valid **SOCKADDR** structure. For more information, see [\[MSDN-WS2\]](#).

The server SHOULD support at a minimum the AF\_INET address type for IP support and the AF\_INET6 address type for **IPv6** support.

The server MUST save the callback address and opaque context data on the session context for future use.

After the callback address has been successfully registered with the server, the server SHOULD send a UDP datagram containing the client's opaque data, from the **rgbContext** field, when a notification becomes available for the client.

If the server supports sending push notification UDP datagrams, the server MUST continue sending a UDP datagram to the callback address at 60-second intervals if event details are still queued for the client. The server SHOULD stop sending UDP datagrams only when all of the notifications have been retrieved from the server through **EcDoRpcExt2** method calls, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2.

### 3.1.5.5 Receiving an EcDoRpcExt2 Method Call

When the server receives an **EcDoRpcExt2** method call, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, if there are pending notifications on the server, the server SHOULD send a **RopNotify** ROP response (section [2.2.1.4.1](#)) for each pending notification on the session context that is associated with the client. If all the **RopNotify** ROP responses do not fit in the response buffer, the server SHOULD include as many **RopNotify** ROP responses as will fit in the response, and then include a **RopPending** ROP response ([\[MS-OXCROPS\]](#) section 2.2.14.3) to indicate that additional notifications are available on the server. For more details, see section [3.1.5.6](#) and section [3.1.5.7](#).

The server does not require that the **EcDoRpcExt2** method call include a ROP request.

### 3.1.5.6 Sending a RopPending ROP Response

The server SHOULD send a **RopPending** ROP response (section [2.2.1.3.4](#)) to the client whenever there are pending notifications on the session context associated with the client and the **RopNotify** ROP response (section [2.2.1.4.1](#)) for the associated notification does not fit in the response buffer. The server sends a **RopPending** ROP response to the client whenever there are pending notifications on any linked session contexts.

### 3.1.5.7 Sending a RopNotify ROP Response

The server SHOULD send a **RopNotify** ROP response (section [2.2.1.4.1](#)) to the client for each pending notification on the session context that is associated with the client. The server SHOULD send as many **RopNotify** ROP responses as the response buffer allows. If the server was not able to fit the details for all pending notifications into the response buffer using **RopNotify** ROP responses, it SHOULD include a **RopPending** ROP response (section [2.2.1.3.4](#)) to indicate there are additional notifications available on the server, if the **RopPending** ROP response fits in the response buffer.

## 3.1.6 Timer Events

None.

## 3.1.7 Other Local Events

The server events and table events specified in section [2.2.1.1](#) and section [2.2.1.1.1](#) that occur on the server cause the pending notifications and notification detail messages to be sent. How the server triggers each of these events is implementation dependent and external to this protocol.

## 3.2 Client Details

### 3.2.1 Abstract Data Model

None.

### 3.2.2 Timers

None.

### 3.2.3 Initialization

Protocol initialization occurs when a client sends a request to the server to subscribe to notifications from the server, as specified in section [3.2.4.1](#).

### 3.2.4 Higher-Layer Triggered Events

The following sections specify the client-side higher-layer triggered events for this protocol.

#### 3.2.4.1 Subscribing to Notifications

The client sends the **RopRegisterNotification** ROP request (section [2.2.1.2.1](#)) to the server to subscribe to all notifications specified in section [2.2.1.1](#).

For more details about sending the **RopRegisterNotification** ROP request, see section [3.2.5.1](#).

#### 3.2.4.2 Subscribing to TableModified Event Notifications

For a client to receive **TableModified** event notifications, in addition to sending the **RopRegisterNotification** ROP request, the client SHOULD [<17>](#) also send the one of the following ROPs to the server, which causes a table view to be created: **RopCollapseRow** ([\[MS-OXCROPS\]](#) section 2.2.5.17), **RopExpandRow** ([\[MS-OXCROPS\]](#) section 2.2.5.16), **RopFindRow** ([\[MS-OXCROPS\]](#) section 2.2.5.13), **RopQueryColumnsAll** ([\[MS-OXCROPS\]](#) section 2.2.5.12), **RopQueryPosition** ([\[MS-OXCROPS\]](#) section 2.2.5.7), **RopQueryRows** ([\[MS-OXCROPS\]](#) section 2.2.5.4), **RopSeekRow** ([\[MS-OXCROPS\]](#) section 2.2.5.8), **RopSeekRowFractional** ([\[MS-OXCROPS\]](#) section 2.2.5.10), and **RopSeekRowBookmark** ([\[MS-OXCROPS\]](#) section 2.2.5.9). Once a table view has been created, the client will receive **TableModified** event notifications so long as the **NoNotifications** flag has not been set on the table. The **NoNotifications** flag is specified in [\[MS-OXCFOLD\]](#) section 2.2.1.14.1 and [\[MS-OXCFOLD\]](#) section 2.2.1.13.1.

If the client sends the **RopResetTable** ROP ([\[MS-OXCROPS\]](#) section 2.2.5.15), the client SHOULD [<18>](#) stop receiving table notifications until one of the following ROPs is sent: **RopCollapseRow**, **RopExpandRow**, **RopFindRow**, **RopQueryColumnsAll**, **RopQueryPosition**, **RopQueryRows**, **RopSeekRow**, **RopSeekRowFractional**, or **RopSeekRowBookmark**.

#### 3.2.4.3 Initializing Asynchronous RPC Notifications

The client SHOULD [<19>](#) support the use of asynchronous RPCs as means to notify the client of pending notifications. To initialize asynchronous RPC notifications on the server, the client sends the **EcDoAsyncConnectEx** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4, followed by the **EcDoAsyncWaitEx** method, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1. For more details about sending these two methods, see section [3.2.5.2](#) and section [3.2.5.3](#) respectively.

#### 3.2.4.4 Initializing Push Notifications

As an alternate to polling, the client MAY [<20>](#) support receiving push notifications from the server. Push notifications use UDP datagrams as a means to notify the client of pending notifications. To initialize push notifications and register a callback address on the server, the client sends the **EcRRegisterPushNotification** method, as specified in section [3.2.5.4](#).

Clients that do not support push notifications SHOULD use either the basic polling method or the asynchronous RPC notification method.

#### 3.2.4.5 Polling the Server for Notifications

In cases where neither push notifications nor asynchronous RPC notifications are being used, and the client is not actively calling the **EcDoRpcExt2** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, or the **Execute** request type [<21>](#), as specified in [\[MS-OXCMAPIHTTP\]](#) section 2.2.4.2, the client MUST poll the server for pending notifications. To poll the server for pending notifications, the client

MUST make **EcDoRpcExt2** method calls as specified in section [3.2.5.6, or the \*\*Execute\*\* request type](#). The **EcDoRPCExt2** method call does not require a ROP request is included in the call.

If the client is polling the server, the client SHOULD poll at a regular interval, as specified by the value of the **pcmsPollsMax** field returned on the **EcDoConnectEx** method call, as specified in [MS-OXCRPC] section 3.1.4.1.

If the client is polling the server, the client SHOULD NOT poll more frequently than the interval specified by the value of the **pcmsPollsMax** field. If the client is required to respond to notifications at a rate that is more frequent than the polling interval, then the polling method SHOULD NOT be used for retrieving notifications.

### 3.2.5 Message Processing Events and Sequencing Rules

The following sections specify the client-side message processing events and sequencing rules for this protocol.

#### 3.2.5.1 Sending a RopRegisterNotification ROP Request

If the client is required to receive notifications from the server, the client SHOULD send a **RopRegisterNotification** ROP (section [2.2.1.2.1](#)) message to the server to subscribe to notifications. The client MUST provide specific details about the notifications it needs to receive and the scope of the notifications, as specified in section 2.2.1.2.1. Upon receiving the **RopRegisterNotification** ROP response from the server, the client MUST save the returned handle to the Notification Subscription object. When the client no longer needs to receive notifications, the handle of the Notification Subscription object MUST be released by using the **RopRelease** ROP ([\[MS-OXCROPS\]](#) section 2.2.15.3).

The client can send the **RopRegisterNotification** ROP message multiple times to the server.

#### 3.2.5.2 Sending an EcDoAsyncConnectEx Method Call

The client sends the **EcDoAsyncConnectEx** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4, to initialize the server for asynchronous RPC notifications.

The client SHOULD determine whether the server supports the **EcDoAsyncConnectEx** method by examining the server version information that is returned from the **EcDoConnectEx** method call, as specified in [MS-OXCRPC] section 3.1.4.1. For details about which minimum server version is required for using the asynchronous RPC notification method, see section [1.7](#).

The client can call the **EcDoAsyncConnectEx** method after a successful **EcDoConnectEx** method call. The client MUST save the returned asynchronous context handle after the **EcDoAsyncConnectEx** method call completes. The client MUST use the asynchronous context handle in the subsequent **EcDoAsyncWaitEx** method calls to the server, as specified in [MS-OXCRPC] section 3.3.4.1.

#### 3.2.5.3 Sending an EcDoAsyncWaitEx Method Call

The client determines whether the server supports the asynchronous RPC notification method by examining the server version information that is returned from the **EcDoConnectEx** method call, as described in [\[MS-OXCRPC\]](#) section 3.1.4.1. To determine which minimum server version is required for using the asynchronous RPC notification method, see section [1.7](#).

If the server supports asynchronous RPC notifications, and the client successfully created asynchronous context handle by calling the **EcDoAsyncConnectEx** method, as specified in [MS-OXCRPC] section 3.1.4.4, the client SHOULD call the **EcDoAsyncWaitEx** method, as specified in [MS-OXCRPC] section 3.3.4.1, to determine whether notifications are pending on the server.

For more details about receiving an **EcDoAsyncWaitEx** method response from the server, see section [3.2.5.5.1](#).

### 3.2.5.4 Sending an **EcRRegisterPushNotification** Method Call

The client MAY [<22>](#) make an **EcRRegisterPushNotification** method call, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.5, to register a callback address for the session context with the server. The callback address is required in order to receive push notification UDP datagrams from the server. In addition to the callback address, the client MUST provide a buffer of opaque data to the server.

The client can register a variety of different callback address types if the server supports the address type. A client SHOULD register a callback address by using an address type that corresponds to the protocol being used to communicate with the server. For example, if the client makes an RPC call to **EcDoConnectEx**, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.1, by using the TCP/IP protocol, it registers an AF\_INET callback address in the **EcRRegisterPushNotification** method call.

Because of network conditions such as firewalls or the use of RPC/HTTP connections by the client, it is not always possible for the UDP datagram that is sent from the server to the client's callback address to be successful. To overcome this problem, the client SHOULD poll the server by using the polling method, even after registering a callback address with the server through an **EcRRegisterPushNotification** method call, until it receives a UDP datagram from the server. When the client receives a UDP datagram from the server at the specified callback address, it SHOULD stop polling the server and rely on datagrams pushed from the server to know when to call the **EcDoRpcExt2** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, to retrieve event information.

### 3.2.5.5 Receiving Pending Notifications

This section specifies the following actions performed by the client to receive pending notifications:

- Receiving the **RopPending** ROP response (section [2.2.1.3.4](#)).
- Receiving push notification UDP datagrams.
- Sending and receiving asynchronous RPC calls.

#### 3.2.5.5.1 Sending and Receiving **EcDoAsyncWaitEx** Method Calls

When a call to the **EcDoAsyncWaitEx** method completes, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1, the client MUST examine its return value and the value of the **pulFlagsOut** field. If the return value is 0x00000000 and bit 0x00000001 is set in the **pulFlagsOut** field, the client SHOULD make **EcDoRpcExt2** method calls, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.2, to receive notification details from the server. After the successful results of the **EcDoAsyncWaitEx** method call are processed, the client SHOULD make another **EcDoAsyncWaitEx** method call to continue to listen for more notifications.

If the **EcDoAsyncWaitEx** method returns a non-zero result code, it indicates that an error occurred. In this case, the client SHOULD NOT retry an **EcDoAsyncWaitEx** method call, and SHOULD instead use the push notification method specified in section [3.2.4.4](#). If the push notification method is not supported, the client SHOULD instead use the polling method specified in section [3.2.4.5](#).

#### 3.2.5.5.2 Receiving Push Notification UDP Datagrams

Upon receiving a UDP datagram on the callback address that was previously registered by the client by means of the **EcRRegisterPushNotification** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.5, the client MUST verify that the content of the UDP datagram is valid by matching it with the content of the opaque data **binary large object (BLOB)** that was provided to the server by means of the **EcRRegisterPushNotification** method. If the content of the UDP datagram is valid, the client

SHOULD make **EcDoRpcExt2** method calls, as specified in [MS-OXCRPC] section 3.1.4.2, to receive notification details from the server. Otherwise, the client MUST NOT take any actions on the UDP datagram.

### 3.2.5.5.3 Receiving the RopPending ROP

Upon receiving the **RopPending** ROP response (section 2.2.1.3.4) either in the buffer of the **EcDoRpcExt2** method response, as specified in [MS-OXCRPC] section 3.1.4.2, or in the **Execute** request type response body, <23> as specified in [MS-OXCMAPIHTTP] section 2.2.4.2.2, the client MUST determine whether the session index provided in the **RopPending** ROP response matches any of the sessions created by the client. If the session index matches, the client SHOULD make an **EcDoRpcExt2** method call or send an **Execute** request type to receive notification details from the server by using the session context handle that is associated with the session specified by the session index. If the session index in **RopPending** ROP does not match the index of any session created by the client, the client MUST NOT take any actions.

### 3.2.5.6 Sending an EcDoRpcExt2 Method Call

The client can send the **EcDoRpcExt2** method, as specified in [MS-OXCRPC] section 3.1.4.2, as part of client polling as specified in section 3.2.4.5 with no ROP request operation included in the method call. Or, the client can send the **EcDoRpcExt2** method as part of a communication pattern unrelated to notifications. In either case, if any pending notifications exist on the server, the client receives either a **RopNotify** (section 2.2.1.4.1) or **RopPending** ([MS-OXCROPS] section 2.2.14.3) ROP in response to their **EcDoRpcExt2** method call, as specified in section 3.1.5.5.

### 3.2.5.7 Receiving Notification Details By Using the RopNotify ROP

After the client is notified of pending notifications by any of the methods described in section 3.2.5.5 the client calls the **EcDoRpcExt2** method, as described in [MS-OXCRPC] section 3.1.4.2, or sends an **Execute** request type <24>, as specified in [MS-OXCMAPIHTTP] section 2.2.4.2, to retrieve the notification details. In response to the **EcDoRpcExt2** method or the **Execute** request, the client receives a **RopNotify** ROP response (section 2.2.1.4.1).

Upon receiving a **RopNotify** ROP response, the client MUST verify that the value of the **NotificationHandle** field is a valid handle to a notification subscription or a **Table object** that was previously created by the client. If the value of the **NotificationHandle** field is valid, the client can update its internal state by using the details provided in the **RopNotify** ROP response. Otherwise, the client MUST ignore the **RopNotify** ROP response.

When the client subscribes to **TableModified** event notifications, the client MUST NOT make any assumptions about the level of notifications that it will receive and the client MUST be able to handle any of the three response types specified in section 3.1.4.3.

### 3.2.6 Timer Events

None.

### 3.2.7 Other Local Events

None.

## 4 Protocol Examples

The examples in this section are XML fragments that contain various notifications. The type of notification in each case is identified by the **name** attribute of the **Data** element.

[XML]

```
<Data name="NewMailNotification">
  <Buffer>
    02 // NotificationType is NewMail

```

## 5 Security

### 5.1 Security Considerations for Implementers

There are no special security considerations specific to this protocol. However, general security considerations pertaining to the underlying ROP transport protocol described in [\[MS-OXCROPS\]](#) do apply to this protocol.

### 5.2 Index of Security Parameters

None.

## 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

- Microsoft Exchange Server 2003
- Microsoft Exchange Server 2007
- Microsoft Exchange Server 2010
- Microsoft Exchange Server 2013
- Microsoft Exchange Server 2016 Preview
- Microsoft Office Outlook 2003
- Microsoft Office Outlook 2007
- Microsoft Outlook 2010
- Microsoft Outlook 2013
- Microsoft Outlook 2016 Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 2.1](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the MAPI extensions to HTTP. The MAPI extensions to HTTP were introduced in Microsoft Outlook 2013 Service Pack 1 (SP1) and Microsoft Exchange Server 2013 Service Pack 1 (SP1).

[<2> Section 2.2.1](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **NotificationWait** request type. The **NotificationWait** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

[<3> Section 2.2.1.3](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **NotificationWait** request type. The **NotificationWait** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

[<4> Section 2.2.1.3.1](#): Exchange 2003 and Office Outlook 2003 do not support the **EcDoAsyncConnectEx** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.4.

[<5> Section 2.2.1.3.2](#): Exchange 2003 and Office Outlook 2003 do not support the **EcDoAsyncWaitEx** method, as specified in [\[MS-OXCRPC\]](#) section 3.3.4.1.

[<6> Section 2.2.1.3.3](#): Exchange 2003, Exchange 2007, Office Outlook 2003, Office Outlook 2007, and Outlook 2010 support the **EcRRegisterPushNotification** method, as specified in [\[MS-OXCRPC\]](#)

section 3.1.4.5. The initial release version of Exchange 2010, and Microsoft Exchange Server 2010 Service Pack 1 (SP1), do not support the **EcRRegisterPushNotification** method, and the returned value is always **ecNotSupported** (0x80040102). Microsoft Exchange Server 2010 Service Pack 2 (SP2) does support the **EcRRegisterPushNotification** method if a registry key is created to support push notifications, as described in [\[MSFT-ConfigStaticUDPPort\]](#). Outlook 2013 and Outlook 2016 Preview do not send the **EcRRegisterPushNotification** RPC method call. Exchange 2013 and Exchange 2016 Preview do not support the **EcRRegisterPushNotification** method, and the returned value is always **ecNotSupported** (0x80040102).

<7> [Section 2.2.1.3.4](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **Execute** request type. The **Execute** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

<8> [Section 2.2.1.4.1](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **Execute** response type. The **Execute** response type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

<9> [Section 2.2.1.4.1.2](#): Exchange 2003, Exchange 2007, and Exchange 2010 do not set the value of the **TagCount** field to 0x0000; they set the value of the field to the number of property tags in the **Tags** field.

<10> [Section 2.2.1.4.1.2](#): In Exchange 2013 the value of **MessageFlags** is zero.

<11> [Section 3.1.1](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support **cookies**. The **cookies** element was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

<12> [Section 3.1.4.3](#): Exchange 2003 and Exchange 2007 do not require that a table view is created in order to send table notifications.

<13> [Section 3.1.4.3](#): Exchange 2003 and Exchange 2007 do not stop sending notifications if the **RopResetTable** ROP ([\[MS-OXCROPS\]](#) section 2.2.5.15) is received.

<14> [Section 3.1.5.2](#): Exchange 2003 does not support the **EcDoAsyncConnectEx** method call or asynchronous RPC notifications.

<15> [Section 3.1.5.3](#): Exchange 2003 does not support the **EcDoAsyncWaitEx** method call or asynchronous RPC notifications.

<16> [Section 3.1.5.4](#): Exchange 2003 and Exchange 2007 support push notifications and the **EcRRegisterPushNotification** method, as specified in [\[MS-OXCRPC\]](#) section 3.1.4.5. The initial release version of Exchange 2010, and Exchange 2010 SP1 do not support push notifications or the **EcRRegisterPushNotification** method. Exchange 2010 SP2 does support push notifications and the **EcRRegisterPushNotification** method if a registry key is created, as described in [\[MSFT-ConfigStaticUDPPort\]](#). Microsoft Exchange Server 2010 Service Pack 3 (SP3) and Exchange 2013 do not support push notifications of the **EcRRegisterPushNotification** method.

<17> [Section 3.2.4.2](#): Exchange 2003 and Exchange 2007 do not require that the client send any ROPs to the server in order to receive **TableModified** event notifications, as specified in section [2.2.1.1.1](#). In Exchange 2003 and Exchange 2007, the subscription is created automatically when the client creates a Table object on the server.

<18> [Section 3.2.4.2](#): The client will continue to receive table notifications even if the **RopResetTable** ROP ([\[MS-OXCROPS\]](#) section 2.2.5.15) is sent, if the server is Exchange 2003 or Exchange 2007.

<19> [Section 3.2.4.3](#): Office Outlook 2003 does not support the asynchronous RPC notification method. Office Outlook 2007, Outlook 2010, Outlook 2013, and Outlook 2016 Preview do support the asynchronous RPC notification method.

<20> [Section 3.2.4.4](#): Office Outlook 2003, Office Outlook 2007 and Outlook 2010 do support the push notification method. Outlook 2013 and Outlook 2016 Preview do not support the push notification method.

<21> [Section 3.2.4.5](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **Execute** request type. The **Execute** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

<22> [Section 3.2.5.4](#): Outlook 2013 and Outlook 2016 Preview do not support the push notification method and does not send the **EcRRRegisterPushNotification** RPC method call.

<23> [Section 3.2.5.5.3](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **Execute** request type. The **Execute** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

<24> [Section 3.2.5.7](#): Exchange 2003, Exchange 2007, Exchange 2010, the initial release of Exchange 2013, Office Outlook 2003, Office Outlook 2007, Outlook 2010, and the initial release of Outlook 2013 do not support the **Execute** request type. The **Execute** request type was introduced in Outlook 2013 SP1 and Exchange 2013 SP1.

## 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">2</a> Messages	Updated product behavior notes for the "Messages" section to include behavior of Exchange 2016 and Outlook 2016.	Y	Product behavior note updated.
<a href="#">2.2.1.2.1.1</a> RopRegisterNotification ROP Request Buffer	Specified that Values are 2 bytes. Added TableModified and Extended values.	N	Content update.
<a href="#">2.2.1.4.1.2</a> NotificationData Structure	Updated description of TableRowData.	N	Content update.
<a href="#">3</a> Protocol Details	Updated product behavior notes for the "Protocol Details" section to include behavior of Exchange 2016 and Outlook 2016.	Y	Product behavior note updated.
<a href="#">3.1.5.6</a> Sending a RopPending ROP Response	Removed note stating that Exchange 2007 sends a RopPending ROP response whenever there are pending notifications on any linked session contexts. All versions support this behavior.	Y	Product behavior note removed.
<a href="#">6</a> Appendix A: Product Behavior	Added Exchange 2016 and Outlook 2016 to the list of applicable products.	Y	Content update.
