[MS-OXOABKT]: Address Book User Interface Templates Protocol Specification

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft Open Specification Promise or the Community Promise. If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights.
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Preliminary Documentation. This Open Specification provides documentation for past and current releases and/or for the pre-release (beta) version of this technology. This Open Specification is final documentation for past or current releases as specifically noted in the document, as applicable; it is preliminary documentation for the pre-release (beta) versions. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. As the documentation may change between this preliminary version and the final version of this technology, there are risks in relying on preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

Revision Summary

Date	Revision History	Revision Class	Comments
04/04/2008	0.1	Major	Initial Availability.

1 Introduction

The Address Book User Interface Templates Protocol is an extension of the Name Service Provider Interface (NSPI) Protocol, as described in [MS-NSPI]. The Address Book User Interface Templates Protocol provides the following:

- A server-provided template for creating specific, single-use e-mail addresses.
- A server-provided layout specification that the client can use to display Address Book object information.

Sections 1.8, 2, and 3 of this specification are normative and contain RFC 2119 language. Sections 1.5 and 1.9 are also normative but cannot contain RFC 2119 language. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [MS-GLOS]:

Augmented Backus-Naur Form (ABNF) code page distinguished name (DN) flags handle name service provider interface (NSPI) remote procedure call (RPC)

The following terms are defined in [MS-OXGLOS]:

address book
Address Book object
address creation template
address type
display template
double-byte character set (DBCS)
entry ID
mail user
non-Unicode
recipient
Simple Mail Transfer Protocol (SMTP)

The following terms are specific to this document:

search template: A template that defines a dialog box which enables users to specify search criteria for Address Book objects.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specification documents do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information. Please check the archive site, http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624, as an additional source.

1.3 Overview

The Address Book User Interface Templates Protocol is used for the following:

- Creation of new e-mail addresses for supported e-mail address types.
- Display and updating of data for different Address Book objects.
- Collection of data to perform searches on an address book.

1.3.1 Creation of New E-Mail Addresses

The Address Book User Interface Templates Protocol enables the creation of new e-mail addresses for supported e-mail address types. By far the most common e-mail address type is the **Simple Mail Transfer Protocol (SMTP)** address type, but the server can support a number of different e-mail address types. This protocol provides a way for address book servers to expose the supported address book types to clients and provide a way for the client to create one of these addresses.

The creation of a new e-mail address is a two-step process. In the first step, the client retrieves from the server a list of available address types and the name of the corresponding creation template that will be used to create an address of that type. The client can use this list to allow the user to select which address type to create. In the second step, the client requests the creation template that is associated with the selected address type, and uses the template to display a dialog to the user and get the necessary information to create the address by using the script that is returned with the template.

1.3.2 Display and Updating of Data

The Address Book User Interface Templates Protocol displays and updates data for Address Book objects. For the purposes of this protocol, the server acts mainly as a database that stores user

interface templates and then returns them to the client when requested. The client can then use the templates to display and edit data for Address Book objects.

To display and edit data about a particular Address Book object, the client requests a **display template** from the server and uses the returned template along with data that it has retrieved from the Address Book object, as described in [MS-OXOABK], to display a dialog to the user. The client can allow the user to change this data and then update the Address Book object to reflect the user's changes.

1.3.3 Collection of Search Data

The Address Book User Interface Templates Protocol enables the collection of data that will be used to search the address book. For the purposes of this protocol, the server acts mainly as a database that stores user interface templates and simply returns them to the client when requested. The client can then use the templates to display a dialog to the user to collect data that it needs to perform search operations on the address book.

To collect data to perform search operations on the address book, the client requests a **search template** from the server and uses the returned search template to display a dialog and collect data to create a filter for the address book to locate Address Book objects.

1.4 Relationship to Other Protocols

The Address Book User Interface Templates Protocol relies on the protocols that work with Address Book objects, properties, and tables, as described in [MS-OXOAB] and [MS-OXOABK]. This protocol also relies on the Address Book Object Protocol, as described in [MS-OXOABK], which is used to communicate with the server by using the underlying **remote procedure call (RPC)** transport.

1.5 Prerequisites/Preconditions

The Address Book User Interface Templates Protocol assumes that the underlying Address Book Object Protocol transport, as described in [MS-OXOABK], has been properly initialized.

1.6 Applicability Statement

The Address Book User Interface Templates Protocol can be used to enable a user agent to create e-mail addresses for supported address types and to display, create, modicfy data associated with an Address Book object.

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

This protocol uses the Name Service Provider interface (NSPI) Protocol, as specified in [MS-NSPI], as a transport for communicating between client and server. In particular, the client will use the two RPC functions **NspiGetSpecialTable** and **NspiGetTemplateInfo**, as specified in [MS-NSPI], to retrieve data from the server.

2.2 Message Syntax

The following sections specify the format of data that are specific to the Address Book User Interface Templates Protocol that are returned from the **NspiGetSpecialTable** and **NspiGetTemplateInfo** function calls.

2.2.1 NspiGetSpecialTable PropertyRowSet_r Format

The *dwFlags* parameter that is passed to the **NspiGetSpecialTable** function, as specified in [MS-NSPI], affects the data that is returned in the *PropertyRowSet_r* output parameter. The bit **flag** values for the *dwFlags* parameter for this function are specified in [MS-NSPI]. The client MUST pass the **NspiAddressCreationTemplates** flag to retrieve the table of supported address types from the server and MUST NOT pass any of the other flags. The properties listed in the following table MUST be returned by the server in the **PropertyRow_r** structure that is contained in the *PropertyRowSet_r* return parameter of the call.

Property name	Description
PidTagAddressType ([MS- OXPROPS] section 2.654)	STRING property that indicates the type of address that is associated with the new recipient created with the template.
PidTagDisplayName ([MS- OXPROPS] section 2.754)	STRING property that contains a user-readable identification of the address type.
PidTagDisplayType([MS-OXPROPS] section 2.757)	A LONG property that contains a constant that identifies the type of Address Book object that the new recipient will be and therefore what icon the client will display for it. The values are specified in [MS-OXOABK].
PidTagEntryId [MS- OXPROPS] section 2.761)	A BINARY property that contains the entry ID of the template to be used to create the new recipient. This identifier can be parsed to get the DN to be passed to NspiGetTemplateInfo function to retrieve the template. For details about the format of permanent entry IDs, see [MS-NSPI].
PidTagDepth ([MS-OXPROPS] section 2.751)	A LONG property that MUST be ignored.
PidTagSelectable ([MS- OXPROPS] section 2.1072)	A BOOLEAN property that MUST be ignored.
PidTagInstanceKey ([MS-OXPROPS] section 2.819)	A BINARY property that contains a unique binary value.

2.2.2 NspiGetTemplateInfo PropertyRow_r Format

The *dwFlags* parameter, which is passed to the **NspiGetTemplateInfo** function, as specified in [MS-NSPI], affects what properties are returned in the *PropertyRow_r* return parameter. The flags for this function are specified in [MS-NSPI].

The following table lists the flags that are used by this protocol that can be passed in the *dwFlags* parameter of the **NspiGetTemplateInfo** function and the corresponding properties that are returned in the *PropertyRow_r* return parameter.

Flag name	Property added to PropertyRow_r parameter	Description of contents of property	
TI_TEMPLATE 0x00000001	PidTagTemplateData 0x00010102	Binary property that contains a TRowSet structure followed by data that is pointed to in the TRowSet structure (the Template format is specified in section 2.2.2.1).	
TI_SCRIPT 0x00000004	PidTagScriptData 0x00040102	Binary property that contains script instructions and data (the Script format is specified in section 2.2.2.2).	

2.2.2.1 Template Format

The dialog template consists of a set of rows that are represented by a **TRowSet** structure, as specified in section <u>2.2.2.1.1</u>, with each **TRow** structure, as specified in section <u>2.2.2.1.2</u>, describing one control in the dialog. To create the dialog from the template, each control that is described in a **TRow** structure MUST be added to a dialog in the location and with the size specified.

The **ControlFlags** field, as specified in section 2.2.2.1.2, indicates additional information about the control, including whether it is editable. The control structure will indicate which static strings are to be used for the control, and the property that can be used to initialize the control and can be updated if the user edits the value in the control. When a page control is encountered, a new tabbed page is added to the dialog, and the controls that follow the page control are placed on that page.

2.2.2.1.1 TRowSet Structure

A **TRowSet** structure is defined in the following table.

Field name	Туре	Size in Bytes	Description
Туре	ULONG	4	Type of the template. This MUST be 0x00000001.
cRows	ULONG	4	Count of TRow structures that are defined in this structure. This field MUST be followed by exactly cRows TRow structures.
Row1	TRow structure	36	TRow structure that contains data about a control.
Row2	TRow structure	36	TRow structure that contains data about a control.
RowN	TRow structure	36	Last of cRows TRow structures.

2.2.2.1.2 TRow Structure

Each **TRow** structure describes a control that MUST be presented to the user in a display area. The display area is measured in pixels.

A **TRow** structure is defined in the following table.

Field name	Туре	Size in Bytes	Description
XPos	ULONG	4	X coordinate of the upper-left corner of the control. For more details, see the text that follows this table.
DeltaX	ULONG	4	Width of the control. For more details, see the text that follows this table.
YPos	ULONG	4	Y coordinate of the upper-left corner of the control. For more details, see the text that follows this table.
DeltaY	ULONG	4	Height of the control. For more details, see the text that follows this table.
ControlType	ULONG	4	Type of the control. For more details, see the text that follows this table.
ControlFlags	ULONG	4	Flags that describe the control's attributes. For more details, see the text that follows this table.
ControlStructure	CNTRL structure	12	Structure that contains data that is relevant to a particular control type. For more details, see section 2.2.2.1.3.

XPos and **YPos** specify the X and Y coordinates of the upper-left corner of the control in pixels in the display area.

DeltaX and **DeltaY** specify the width and height of the control in pixels. The values are relative to the **XPos** and **YPos** of the control.

The other three properties describe various characteristics of the control.

The **ControlType** field indicates the type of control. The **ControlType** field MUST be one of the values listed in the following table.

Value	Meaning		
0x00000000	A label control.		
0x0000001	An edit text box control.		
0x00000002	A list box control.		
0x00000005	A check box control.		
0x0000006	A group box control.		
0x00000007	A button control.		
0x00000008	A tabbed page control.		

Value	Meaning	
0x0000000B	A multi-valued list box control that is populated by a multi-valued property.	
0×0000000C	A multi-valued drop-down list box control that is populated by a multi-valued property of type string.	

The **ControlFlags** field is a bit field that describes the attributes of the control and MUST contain any combination of the bits that are specified in the following table for all values of the **ControlType** field, except for 0x00000008 (tabbed page control), as specified in the Description column. If the value of **ControlType** is 0x00000008, then the value of the **ControlFlags** field can be any value and MUST be ignored.

Value	Meaning
0×00000001	This flag indicates that the control can contain multiple lines. This means that a $0x0D$ and $0x0A$ can be entered within the control. This flag SHOULD NOT be set if the value of the ControlType field is any other value except $0x00000001$ (edit box control). If it is set and the value of the ControlType field is not $0x00000001$, this flag MUST be ignored.
0x00000002	This flag indicates that the control can be edited, and the value that is associated with the control can be changed. When this flag is not set, the control is read-only. This value is ignored on the label, group box, button, multi-valued drop-down list box, and list box controls.
0×00000004	This flag indicates that if the control allows changes (0x00000002 attribute set), it MUST have a value before the dialog can be dismissed.
0×00000008	This flag enables immediate setting of a value. As soon as a value in the control changes, that data MUST be updated in the property that is associated with that control.
0x0000010	This flag indicates that the control is treated like a password entry control. The value MUST NOT be displayed by using the actual characters entered. This flag MUST only be set if the value of the ControlType field is 0x00000001 (edit box control).
0x00000020	If this flag is set, the edit control MUST allow double-byte character set (DBCS) characters. This flag MUST NOT be set if the value of the ControlType field is any anything except 0x00000001 (edit box control).
0x00000040	This flag indicates that when a selection is made within the list box, the index column of that list box is set as a property. This flag MUST only be set if the 0x00000008 ControlFlags bit is also set.

The **ControlStructure** field is a **CNTRL** structure that contains information that is relevant to the particular type of control. For details, see section 2.2.2.1.3.

2.2.2.1.3 Buffer Format of the CNTRL Structure

The base **CNTRL** structure is defined as follows, with each entry taking a different meaning, depending on the type of control, as shown in the following table.

Field name	Туре	Size	Description
dwType	DWORD	4	Varies depending on the control. For details, see sections $\underline{2.2.2.1.3.1}$ through $\underline{2.2.2.1.3.9}$.

Field name	Туре	Size	Description
ulSize	ULONG	4	Varies depending on the control. For details, see sections $\underline{2.2.2.1.3.1}$ through $\underline{2.2.2.1.3.9}$.
ulString	ULONG	4	The offset in BYTEs from the base of the TRowSet structure to a null-terminated non-Unicode string. This string MUST be in the code page indicated by <i>ulTemplateCodePage</i> parameter of the NspiGetTemplateInfo function call and MUST be terminated by a NULL character. In these strings, the "%" (ampersand) has special meaning and indicates that the character that immediately follows it MUST be used as a shortcut key to select this control. If the control cannot be selected, the control that follows it is selected. If an "%" needs to be in the string and it SHOULD NOT have any special meaning, a sequence of "%%" can be used to indicate this. For more details about string values, usage and limitations, see sections 2.2.2.1.3.1 through 2.2.2.1.3.9.

2.2.2.1.3.1 CNTRL Structure Describing a Label Control

dwType: MUST be 0x00000000 and MUST be ignored.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: String that contains the label text of a label control. The string MUST NOT be over 128 characters long, including the NULL-terminating character.

2.2.2.1.3.2 CNTRL Structure Describing an Edit Control

dwType: Property of data entered into the edit control.

ulSize: Number of characters allowed to be entered into the edit control.

ulString: String that contains a regular expression that describes the allowed characters that can be entered into the edit control (see the following subsection). The string MUST NOT be over 15 characters long, including the NULL-terminating character.

2.2.2.1.3.2.1 Expression Syntax for Allowed Characters

The filter string has two possible expressions. The first expression allows any character to be entered into the edit control, and this expression is simply a string that contains only the "*" (asterisk) character. The second expression lists the characters that are valid to be entered or that are invalid to be entered into the edit control. This expression is shown in **Augmented Backus-Naur Form (ABNF)** in the following format:

```
"[" *1("~") 1*(char-val / char-val "-" char-val) "]"
```

The expression MUST be included in square brackets ("[]"). When the first character inside the brackets is the tilde ("~") character, the expression represents characters that are not allowed in the edit control; otherwise, it represents only the characters that are allowed in the edit control. The rest of the characters inside the brackets are characters or ranges of characters to be allowed or disallowed from the edit control.

To represent any character that is a special character in this expression syntax with a backslash character ("\"), the backslash character can be placed in front of the character. The backslash character will be ignored, and the character that follows it will be treated as a normal character and

not as a special character. To represent a single character to allow/disallow, the character (with the leading backslash if necessary) is put in the string. To represent a range of characters to allow/disallow, the first character in the range is put in the string, followed by a dash ("-") character, followed by the final character in the range. The combination of all individual characters and character ranges is the set of characters that will be allowed or disallowed.

For example, if only the characters A, F, and T through Z are allowed to be entered into the control, the expression is:

[AFT-Z]

If all characters except the"[" (which will need the backslash character) and Z characters are allowed, the expression is:

[~\[Z]

2.2.2.1.3.3 CNTRL Structure Describing a List Box Control

dwType: Property of the table to populate this list box control from and to which the data from this list box control SHOULD be saved.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: MUST be a string that contains only the character "*"and MUST be ignored.

2.2.2.1.3.4 CNTRL Structure Describing a Check Box Control

dwType: Property of data that is represented by this check box control.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: String that contains the label text of check box control. The string MUST NOT be over 128 bytes long, including the NULL terminating character.

2.2.2.1.3.5 CNTRL Structure Describing a Group Box Control

dwType: SHOULD be 0x00000000 and MUST be ignored.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: String that contains the label text of the group box control. The string MUST NOT be over 128 bytes long, including the NULL-terminating character.

2.2.2.1.3.6 CNTRL Structure Describing a Button Control

dwType: Property that is used to perform an action. This value MUST be the **PidTagAddressBookManageDistributionList** property, as specified in [MS-OXOABK] section 2.2.10.2. If this value is anything else, it MUST be ignored.

ulSize: MUST be 0x00000000 and MUST be ignored.

ulString: String that contains the label text of the button control. The string MUST NOT be greater than 128 bytes in length, including the NULL-terminating character.

2.2.2.1.3.7 CNTRL Structure Describing a Tabbed Page Control

dwType: SHOULD be 0x00000000 and all other values MUST be ignored.

13 / 56

[MS-OXOABKT] — v20120122 Address Book User Interface Templates Protocol Specification

Copyright © 2012 Microsoft Corporation.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: String that contains the label text of the tabbed page control. The string MUST NOT be greater than 32 bytes in length, including the NULL-terminating character.

2.2.2.1.3.8 CNTRL Structure Describing a Multi-Valued List Box Control

dwType: Property for multi-valued data that is displayed in this list box control.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: MUST be a string that contains only the character "*" and MUST be ignored.

2.2.2.1.3.9 CNTRL Structure Describing a Multi-Valued Drop-Down List Box Control

dwType: Property for the multi-valued data that is displayed in this list box control.

ulSize: SHOULD be 0x00000000 and MUST be ignored.

ulString: MUST be a string that contains only the character "*" and MUST be ignored.

2.2.2.2 Script Format

A script is a set of instructions that are processed by using data collected by the template to produce a new e-mail address. The **PidTagScriptData** property ([MS-OXPROPS] section 2.1058) in the **PropertyRow_r** structure is a binary property that contains the information listed in the following table.

Parameter name	Туре	Size	Description
Size	DWORD	4	Specifies the number of DWORD types of script data that follow.
ScriptData	DWORD Array	Varies	Specifies a series of instructions and the data that accompanies them, as specified in sections $\underline{2.2.2.2.1}$ through $\underline{2.2.2.2.10}$.

This binary script data contains a series of instructions that can be executed to format an address and the data that is needed to execute those instructions. The first **DWORD** type contains the number of **DWORD** types of instructions, "N". The next N **DWORD** types are the instructions. The data that is referenced by the instructions immediately follows the instructions.

The script is used to create a string that contains the e-mail address from the data gathered from the dialog that was created from the template. To process the script, begin at the first **DWORD** type of *ScriptData* and process each instruction in turn. The result of the script is the result string. The result string MUST initially be empty and various instructions will append data to it. This string is the object's e-mail address and MUST only be used if the script does not end in error.

The instructions are specified in the following sections.

2.2.2.1 Halt Instruction

Halt instruction is one **DWORD** type, as shown in the following table.

Parameter name	Туре	Size	Value
Halt	DWORD	4	0x00000000

When this instruction is encountered, the script has finished and was successful. Processing MUST be halted and the current value of the result string is the e-mail address.

2.2.2.2 Error Instruction

Error instruction is one **DWORD** type, as shown in the following table.

Parameter name	Туре	Size	Value	
Error	DWORD	4	0x00000001	

When this instruction is encountered, the script is over and has ended in an error. Processing MUST be halted and the result string MUST NOT be used.

2.2.2.3 Emit String Instruction

Emit String instruction is a 2-DWORD type instruction, as shown in the following table.

Parameter name	Туре	Size	Value
Emit String	DWORD	4	0x80000002
First Operand	DWORD	4	See the text that follows this table.

The First Operand is an offset in BYTEs from the start of the ScriptData in the PidTagScriptData ([MS-OXPROPS] section 2.1058) property's binary data to a non-Unicode null-terminated string, which is used as the operand for this instruction. When this instruction is encountered, the script MUST append the operand string to the result string and advance to the next instruction.

2.2.2.4 Jump Instruction

Jump instruction is a 2-**DWORD** type instruction, as shown in the following table.

Parameter name	Туре	Size	Value
Jump	DWORD	4	0x00000003
Jump Offset	DWORD	4	See the text that follows this table.

The *Jump Offset* parameter is an offset in BYTEs from the start of the *ScriptData* in the **PidTagScriptData** ([MS-OXPROPS] section 2.1058) property's binary data where the next instruction to execute is located.

When this instruction is encountered, the script MUST continue its execution from the instruction at the offset indicated.

2.2.2.5 Jump If Not Exists Instruction

Jump If Not Exists instruction is a 3-DWORD type instruction, as shown in the following table.

Parameter name	Туре	Size	Value
Jump If Not Exists	DWORD	4	0x00000004
First Operand	DWORD	4	See the text that follows this table.
Jump Offset	DWORD	4	See the text that follows this table.

The *First Operand* is a parameter that indicates a property that SHOULD be retrieved from the data collected by using the template.

The *Jump Offset* parameter is an offset in BYTEs from the start of the ScriptData in the **PidTagScriptData** ([MS-OXPROPS] section 2.1058) property's binary data where the next instruction to execute is located.

When this operation is encountered, an attempt MUST be made to retrieve the property from the data collected by using the template. If the property was successfully retrieved, the script is advanced over this instruction and execution continues. If the property fails to be retrieved, the script will continue execution from the instruction at the offset indicated in the *Jump Offset* parameter.

2.2.2.6 Jump If Equal Properties Instruction

Jump If Equal Properties instruction is a 4-**DWORD** type instruction, as shown in the following table.

Parameter name	Туре	Size	Value
Jump If Equal Properties	DWORD	4	0×00000005
First Operand	DWORD	4	See the text that follows this table.
Second Operand	DWORD	4	See the text that follows this table.
Jump Offset	DWORD	4	See the text that follows this table.

The First Operand parameter indicates a property that will be retrieved from the data collected by using the template. The value of the property MUST be either a non-Unicode null-terminated string or a Boolean. The value retrieved from the data collected by using the template is used as the first operand for the instruction.

The Second Operand parameter indicates a property that will be retrieved from the data collected by using the template. The value of the property MUST be either a non-Unicode string or a Boolean and its type MUST match that of the First Operand parameter. This value retrieved from the data that is collected by the template is used as the second operand for the instruction.

The *Jump Offset* is an offset in BYTEs from the start of the ScriptData in the **PidTagScriptData** ([MS-OXPROPS] section 2.1058) property's binary data where the next instruction to execute is located.

When this operation is encountered, the first two operands are compared, and if they are not equal, the script is advanced over this instruction and execution continues. If they are equal, the script will continue execution with the instruction at the offset indicated in the *Jump Offset* parameter.

2.2.2.7 Jump If Equal Values Instruction

Jump If Equal Values instruction is a 4-**DWORD** type instruction, as shown in the following table.

Parameter name	Туре	Size	Value
Jump If Equal Values	DWORD	4	0x40000005
First Operand	DWORD	4	See the text that follows this table.
Second Operand	DWORD	4	See the text that follows this table.
Jump Offset	DWORD	4	See the text that follows this table.

The *First Operand* parameter indicates a property that will be retrieved from the data collected by using the template. The value of the property MUST be either a non-Unicode string or a Boolean. The value retrieved from the object is used as the first operand for the instruction.

The Second Operand is an offset in bytes from the start of the ScriptData in the **PidTagScriptData** ([MS-OXPROPS] section 2.1058) property's binary data where data is located, which is used as the second operand for this instruction. The type of the second operand is determined by the type of the first operand. Specifically, if the first operand is a Boolean, then the second operand is also treated as a Boolean, and if the first operand is a non-Unicode null-terminated string, then the second operand is also treated as a non-Unicode null-terminated string.

The *Jump Offset* is an offset in bytes from the start of the ScriptData in the **PidTagScriptData** property's binary data where the next instruction to execute is located.

When this operation is encountered, the values of the first two operands are compared, and if they are not equal, the script is advanced over this instruction and execution continues. If they are equal, the script will continue its execution with the instruction at the offset indicated in the *Jump Offset*.

2.2.2.2.8 Emit Property Value Instruction

Emit Property Value instruction is a 2-**DWORD** type instruction, as shown in the following table.

Parameter name	neter name Type		Value
Emit Property Value	DWORD	4	0x00000002
First Operand	DWORD	4	See the text that follows this table.

The First Operand parameter MUST be retrieved from the data collected by using the template. The value of the property MUST be a non-Unicode string and MUST be terminated by a NULL character. The value will be used as the operand for this instruction. When this instruction is encountered, the script MUST append the operand string to the result string and advance to the next instruction.

2.2.2.2.9 Emit Upper String Instruction

Emit Upper String instruction is a 2-DWORD type instruction, as shown in the following table.

	Parameter name	Туре	Size	Value
	Emit Upper String	DWORD	4	0x80000006
1	First Operand	DWORD	4	See the following text.

The First Operand parameter is an offset in BYTEs from the start of the ScriptData in the PidTagScriptData ([MS-OXPROPS] section 2.1058) property's binary data to a non-Unicode null-terminated string, which is used as the operand for this instruction. When this instruction is encountered, the script MUST first convert the operand string to all uppercase letters and then append the string to the script's result string and advance to the next instruction.

2.2.2.2.10 Emit Upper Property Instruction

Emit Upper Property instruction is a 2-DWORD type instruction, as shown in the following table.

Parameter name	Туре	Size	Value	
Emit Upper Property	DWORD	4	0x0000006	
First Operand	DWORD	4	Property of property to fetch and use as an operand.	

The First Operand parameter will be retrieved from the data collected by using the template. The value of the property MUST be a non-Unicode null-terminated string, and it is used as the operand for this instruction. When this instruction is encountered, the script MUST first convert the operand string to all uppercase letters, and then append the string to the script's result string and advance to the next instruction.

3 Protocol Details

3.1 Client Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that a client implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

3.1.1.1 Dialog Object

A dialog object is an object that can be displayed to the user and onto which control objects can be placed in specified locations in order to display information and allow the user to update that information.

3.1.1.2 Control Objects

Control objects are user interface objects that can be used to display to and receive information from the user in various forms. There are eight types of control objects, as described in the following table.

Control type name	Description
Label	Control used to display a string to the user. This control is not editable.
Edit	Control used to display a simple string to the user and to allow that string to be edited.
List Box	Control that contains a list of possible options of which one is selected. The user can change the selection.
Check Box	Control that displays a string that cannot be changed by the user and a box that can be checked and unchecked to indicate whether the option described by the string is selected.
Group Box	Control that contains other controls and around which is shown a box and a string that is the label for this group of controls.
Button	Control that displays a string to the user that performs a specified action when clicked.
Drop-Down List Box	Control similar to the list box control, except that only the currently selected item in the list is displayed to the user, and an arrow that is displayed on the end of the control causes the entire list to be displayed to the user so that a new item can be selected.
Page	Control that contains other controls. This control groups the other controls together and displays a string that describes them as a tab on the group. These controls can be placed on top of each other and the group for which the tab is selected determines the set of controls that will be shown.
Multi- Valued List Box	Control similar to the list box control, except that multiple items in the list can be selected simultaneously.

3.1.1.3 Address Creation Template Table

An **address creation template** table is a table that contains a row for each supported address type, the address type's name as it will be displayed to the user, and what creation template is associated with it. It will also contain data that describes how to display it to the user.

3.1.2 Timers

None.

3.1.3 Initialization

The underlying Address Book Object Protocol MUST be initialized. There is no initialization specific to the Address Book User Interface Templates Protocol.

3.1.4 Higher-Layer Triggered Events

The following section specifies the higher-layer triggered events and corresponding processing that the client MUST perform when those events take place.

3.1.4.1 Creating a New E-Mail Address for a Supported Address Type

When the client has to use an e-mail address that does not exist on the address book server, it can create a new e-mail address for a supported address type and use this address to identify a recipient.

When the client creates a new e-mail address, first the address creation table MUST be retrieved by calling the **NspiGetSpecialTable** function with AB_ONE_OFF as the *dwFlags* parameter. The function returns a **PropertyRowSet_r** structure that contains the data needed to create a list of creation templates for the supported address types. This list is then used to select an address type, possibly by displaying this list to the user or by selecting a type programmatically. When the address type has been selected, the data from the corresponding **PropertyRow_r** structure can be used to determine the **distinguished name (DN)** for the creation template that will be used to create the new e-mail address and its address type. The **PidTagAddressType** property ([MS-OXPROPS] section 2.654) is the property in the **PropertyRow_r** structure that indicates the e-mail address type. **PidTagEntryId** ([MS-OXPROPS] section 2.761) is the property in the **PropertyRow_r** that can be parsed to get the DN. The **PidTagEntryId** property is a Permanent Entry ID, and its format is specified in [MS-NSPI].

Next, the creation dialog template that will be used to create a new e-mail address MUST be retrieved by using the **NspiGetTemplateInfo** function call, passing in the DN value for the creation template as the pDN parameter and 0x00000000 as the ulType parameter. The dwFlags parameter contains a bitwise combination that MUST include the bits for TI_TEMPLATE (0x00000001) set so that the template will be retrieved, and TI_SCRIPT (0x00000004) set so the script to format the e-mail address is retrieved, and MAY contain the bits for TI_HELPFILE_NAME (0x000000020) and TI_HELPFILE (0x000000040) for a value of 0x00000065. <1>

The function's <code>dwCodePage</code> input parameter is the code page in which the strings in the template are stored, and in which the <code>ppData</code> return parameter is a pointer to a <code>PropertyRow_r</code> structure that contains the data needed to create and display a dialog to create the new e-mail address. When the dialog is completed and dismissed, the data from the dialog <code>MUST</code> be used to run the script and create the e-mail address for this entry. This e-mail address <code>MUST</code> be used to populate the <code>PidTagEmailAddress</code> property (<code>[MS-OXPROPS]</code> section 2.759) and the address type retrieved from the selected <code>PropertyRow_r</code> structure <code>MUST</code> be used to populate the <code>PidTagAddressType</code> property. These two properties comprise the e-mail address that can be used as an e-mail recipient.

3.1.4.2 Displaying Information about an Address Book Object

When a client or user agent wants to view or change the information contained in an address book entry, the client MUST retrieve the display template for the address book entry's display type and display the data to the user. To retrieve the display dialog template that is used to display information about a particular Address Book object, the NspiGetTemplateInfo parameter MUST be called with the ulType parameter set to the display type of the object and the pDN parameter set to 0x00000000. The dwFlags parameter contains a bitwise combination that MUST include the bit for the **TI_TEMPLATE** (0x00000001) flag set so the template will be retrieved and MAY contain the bits for the TI_HELPFILE_NAME (0x00000020) and TI_HELPFILE (0x00000040) flags for a value of 0x00000061. <2> The function's dwCodePage input parameter is the code page in which the strings in the template are stored and the ppData return parameter contains a pointer to a **PropertyRow** r structure that contains the data needed to create and display the dialog. Data to initialize the dialog MUST be retrieved from the Address Book object by using the properties specified for each control in the dialog in the PidTagTemplateData ([MS-OXPROPS] section 2.1115) property of the **PropertyRow_r** structure, as specified in [MS-NSPI]. If the dialog is updated, the data from the dialog MUST be used to update the properties that are associated with the controls and these properties MUST be updated on the Address Book object.

3.1.4.3 Collecting Data to Search the Address Book

When a client or user agent wants to search the address book for a particular Address Book object, the client MUST retrieve the search template for the address book and display the template to the user to collect the data to use to search the address book. To retrieve the search template that is used to collect information to use to search the address book, the **NspiGetTemplateInfo** function MUST be called with the *ulType* parameter set to the DT_SEARCH (as defined in [MS-NSPI]) and the *pDN* parameter set to 0x00000000. The *dwFlags* parameter contains a bitwise combination that MUST include the bit for the **TI_TEMPLATE** (0x0000001) flag set so the template will be retrieved and MAY contain the bits for the **TI_HELPFILE_NAME** (0x00000020) and **TI_HELPFILE** (0x00000040) flags for a value of 0x00000061. <3> The function's *dwCodePage* input parameter is the code page in which the strings in the template are stored and the *ppData* return parameter contains a pointer to a **PropertyRow_r** structure that contains the data needed to create and display the dialog. When the dialog is completed and dismissed, the data from the dialog can be used to create a **Restriction_r** structure, as defined in [MS-NSPI], from the controls that have been filled in. This **Restriction_r** structure can be passed to **NspiGetMatches** function in the *Filter* input parameter to locate an Address Book object, as specified in [MS-NSPI].

3.1.5 Message Processing Events and Sequencing Rules

The following events MUST be processed by a client that implements the Address Book User Interface Templates Protocol. Note that no particular sequence is required for the message processing.

3.1.5.1 Results of NspiGetSpecialTable Call to Retrieve the Address Creation Table

The results of the **NspiGetSpecialTable** function call when its *dwFlag* parameter is AB_ONE_OFF is a **PropertyRowSet_r** structure that contains the address creation table information, as specified in section <u>2.2.1</u>. These rows can be displayed as a list to show to users so that they can select the type of address to create. For each row in the **PropertyRowSet_r** structure, the **PidTagDisplayName** property (<u>IMS-OXPROPS</u>] section 2.754) can be used as the user-visible string in the list. After an address type has been selected, the **PidTagEntryId** property (<u>IMS-OXPROPS</u>] section 2.761) in the selected **PropertyRow_r** structure MUST be parsed (for details about the format, see <u>IMS-NSPI</u>) and the distinguished name (DN) found. This DN value MUST be used as the *pDN* parameter in a call to **NspiGetTemplateInfo** function to retrieve the creation template and finish the creation of the e-mail address.

3.1.5.2 Results of NspiGetTemplateInfo Call to Retrieve the Creation Template

The results of the **NspiGetTemplateInfo** function call when the distinguished name (DN) for the creation template is passed in as the *pDN* parameter of a **PropertyRow_r** structure that contains the template for the dialog to display and the creation script. The client MUST use the dialog template to create a dialog and display it to the user. The client can create a new Property Bag object that is empty and use it to initialize the dialog so that it is blank. After the user has provided values for all controls that are marked as required, and closes the dialog, the properties that are associated with the controls can be updated in the Property Bag object. Then, by using the Property Bag object to retrieve these properties when needed, the creation script MUST be executed as specified in section 2.2.2 to create the new e-mail address. This e-mail address MUST be used to set the **PidTagEmailAddress** property ([MS-OXPROPS] section 2.759) and the address type from the address creation table MUST be used to set the **PidTagAddressType** property ([MS-OXPROPS] section 2.654) to create a new address.

3.1.5.3 Results of NspiGetTemplateInfo Call to Retrieve the Display Template

The results of the **NspiGetTemplateInfo** call when the display type of an object is passed in as the *ulType* parameter is a **PropertyRow_r** structure that contains the template for the dialog to display. The client MUST use the dialog template to create a dialog and display it to the user. The client MUST use the object the type for which was passed in to initialize the dialog. If the user updates any information in the dialog and closes the dialog, the properties that are associated with the updated controls MUST be updated in the object.

3.1.5.4 Results of NspiGetTemplateInfo Call to Retrieve the Search Template

The results of the **NspiGetTemplateInfo** function call when the display type of DT_SEARCH is passed in as the *ulType* parameter is a **PropertyRow_r** structure that contains the search template for the dialog to display. The client MUST use the search template to create a dialog and display it to the user for input. If the user inputs any information into the dialog and closes the dialog, the properties associated with the controls SHOULD be used to create a **Restriction_r** structure to be used as the *Filter* input parameter in a call to the **NspiGetMatches** function. The **NspiGetMatches** function SHOULD handle filters that contain properties in the search template.

3.1.6 Timer Events

None.

3.1.7 Other Local Events

None.

3.2 Server Details

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that a server implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model, as long as their external behavior is consistent with that described in this document.

3.2.1.1 Template Objects

The server keeps a template object for each display type and for the creation template for each supported address type in the address creation table. These objects contain the template, and if needed, the script that will be returned from **NspiGetTemplateInfo** function in the **PropertyRow_r** structure.

3.2.1.2 Table of Supported Address Types and Name of Template to Use to Create Them

The server can keep a table object that contains the list of supported address types, the creation templates that are associated with the address types, and any other data that is needed to construct and return the **PropertyRowSet_r** structure when it receives a call from the **NspiGetSpecialTable** function.

3.2.2 Timers

None.

3.2.3 Initialization

None.

3.2.4 Higher-Layer Triggered Events

None.

3.2.5 Message Processing Events and Sequencing Rules

The following events MUST be processed by a server that implements the Address Book User Interface Templates Protocol. No particular sequence is required for the message processing.

3.2.5.1 NspiGetSpecialTable Call from Client

The client calls in to the server by using the **NspiGetSpecialTable** RPC function with the AB_ONE_OFF flag set in the **dwFlags** parameter to retrieve the table of supported address types. The server's handling of any other flags that can be passed to the **NspiGetSpecialTable** function are specified in [MS-NSPI]. The server retrieves the table of supported address types and MUST format the table into a **PropertyRow_r** before returning this data to the client.

3.2.5.2 NspiGetTemplateInfo Call from Client

The client calls in to the server by using the **NspiGetTemplateInfo** RPC function with the *dwFlags* parameter that contains some bitwise combination of the bit flags **TI_TEMPLATE** (0x00000001) so the template will be retrieved, and **TI_SCRIPT** (0x0000004) so the script to format the e-mail address is retrieved, as specified in section 2.2.2). The server MUST use the display type specified in the *ulType* input parameter or the template DN specified in the *pDN* input parameter to retrieve the template object. Finally, the server MUST create the **PropertyRow_r** structure return parameter by using the template object and return this data to the client.

3.2.6 Timer Events

None.

3.2.7 Other Local Events

None.

4 Protocol Examples

Starting with a connection bound to the server, the following sections include sample structures that would be returned by the **NSPI** function call.

4.1 Creating a New E-Mail Address for a Supported Address Type

To create a new e-mail address for one of the supported address types, the client has to first request the list of supported address types from the server by calling the **NspiGetSpecialTable** RPC function. The first step is to bind to the server by using the **NspiBind** function call to retrieve an RPC context **handle** for the server.

The **NspiGetSpecialTable** function is then called, passing a **AB_ONE_OFF** flag in the *dwFlags* parameter.

The following are the input parameters for the NspiGetSpecialTable function call.

Note Not all parameters are shown, only relevant information. For more information about the parameters, see [MS-NSPI].

The call returns a **PropertyRowSet_r** structure in the *HierTabrows* return parameter. The following is an example of the *HierTabRows* parameter that can be returned.

```
cRows - 0x00000005
HierTabRows:
     Row0
          cValues - 0x00000007
          ulAdrEntryPad - not used - 0x00000000
               Prop0
                    ulPropTag - PidTagDisplayName (0x3001001e)
                    ulReserved - not used - 0x00000000
                    Value - cc:Mail Address
               Prop1
                    ulPropTag - PidTagAddressType (0x3002001e)
                    ulReserved - not used - 0x00000000
                    Value - CCMAIL
                    ulPropTag - PidTagDisplayType (0x39000003)
                    ulReserved - not used - 0x00000000
                    Value - 0x00000000
                    ulPropTag - PidTagDepth (0x30050003)
                    ulReserved - not used - 0x00000000
                    Value - 0x00000000
               Prop4
```

```
ulPropTag - PidTagSelectable (0x3609000b)
                  ulReserved - not used - 0x00000000
                  Value - 0x0000001
             Prop5
                  ulPropTag - PidTagInstanceKey (0x0ff60102)
                  ulReserved - not used - 0x00000000
                  Value - 0x02957c9c
0000 d6 23 00 00
                                                 .#..
             Prop6
                  ulPropTag - PidTagEntryId (0x0fff0102)
                  ulReserved - not used - 0x00000000
                  Value - 0x02957ca0

2CACBF98DC.

These rows are then used to create a list of address types, and this list is displayed so that the user can choose which type to create. The "cc:Mail Address" row is selected and examined, and the **PidTagAddressType** ([MS-OXPROPS] section 2.654) and **PidTagEntryId** ([MS-OXPROPS] section 2.761) property values are extracted. The **PidTagEntryId** property is parsed and the DN is determined to be the following.

This value is passed to **NSPIGetTemplateInfo** function as the *pDN* parameter to retrieve the creation template. The following are the input parameters that are passed to **NspiGetTemplateInfo** function.

The **NspiGetTemplateInfo** function will return a **PropertyRow_r** structure in the *ppData* output parameter, and this **PropertyRow_r** structure will contain the template and script data. The **NspiGetTemplateInfo** function returns the following.

```
ppData

This template can be processed to create a dialog box similar to the one shown in the following figure.

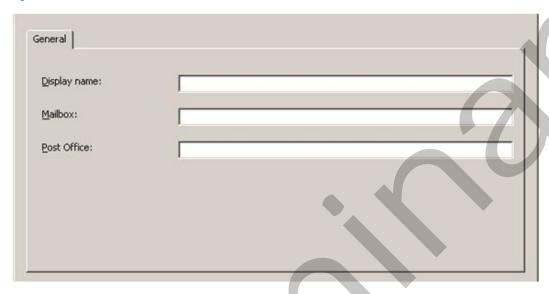

Figure 1: Address creation dialog box

The following data is then entered into the dialog box:

Display name: Bob

Mailbox: BobsMailbox

Post office: GeneralPostOffice

The script processes the data, and produces the following e-mail address:

BobsMailbox at GeneralPostOffice

Therefore, the **PidTagEmailAddress** property ([MS-OXPROPS] section 2.759) that represents this user is "BobsMailbox at GeneralPostOffice" and the **PidTagAddressType** property value is "CCMAIL."

4.2 Retrieving a Mail User's Template

To display information about an Address Book object to the user, the client has to first request the display template from the server by calling the **NspiGetTemplateInfo** RPC function. The first step is to bind to the server by using the **NspiBind** function call to retrieve an RPC context handle for the server.

32 / 56

[MS-OXOABKT] — v20120122 Address Book User Interface Templates Protocol Specification

Copyright © 2012 Microsoft Corporation.

For example, the **NspiGetTemplateInfo** function is called to get the template to display data about a **mail user** by passing the *ulType* parameter with the mail user display type (**DT_MAILUSER**).

The following are the input parameters for an example of a call to the **NspiGetTemplateInfo** function.

Note Only relevant information, and not all parameters, is shown. For more information about the parameters, see [MS-NSPI].

 dwFlags:
 0x00000061

 dwType:
 0x00000000

 pDN:
 (null)

 ulTemplateCodePage:
 0x000004e4

 ulServerTemplateLocale:
 0x00000409

The call returns a **PropertyRow_r** structure in the *ppData* return parameter. The following is an example of the *ppData* parameter that can be returned.

```

```

By processing the template in this **PropertyRow_r** structure, the dialog box shown in the following figure is created.

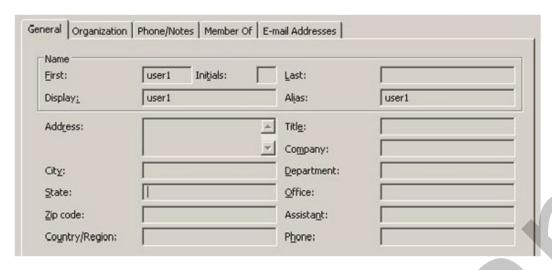

Figure 2: Address Book object display dialog box

The client then retrieves the properties specified in the template from the requested Address Book object to populate the various dialog controls.

5 Security

5.1 Security Considerations for Implementers

The execution of scripts in this protocol has to be implemented in a secure manner. The script execution checks for valid scripts, but it is also important to be aware of the possibility of infinite loops and other potential security considerations.

General security considerations that pertain to the underlying NSPI RPC-based transport also apply. For more information, see [MS-NSPI].

5.2 Index of Security Parameters

None.

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft® Exchange Server 2003
- Microsoft® Exchange Server 2007
- Microsoft® Exchange Server 2010
- Microsoft® Exchange Server 15 Technical Preview
- Microsoft® Office Outlook® 2003
- Microsoft® Office Outlook® 2007
- Microsoft® Outlook® 2010
- Microsoft® Outlook® 15 Technical Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> Section 3.1.4.1: Exchange 2003, Exchange 2007, and Exchange 2010 ignore the TI_HELPFILE_NAME and TI_HELPFILE flags. Office Outlook 2003, Office Outlook 2007, and Outlook 2010 currently pass these flags, but they have no effect on the results of the NspiGetTemplateInfo function.

<2> Section 3.1.4.2: Exchange 2003, Exchange 2007, and Exchange 2010 ignore the TI_HELPFILE_NAME and TI_HELPFILE flags. Office Outlook 2003, Office Outlook 2007, and Outlook 2010 currently pass these flags but they have no effect on the results of the NspiGetTemplateInfo function.

<3> Section 3.1.4.3: Exchange 2003, Exchange 2007, and Exchange 2010 currently ignore the TI_HELPFILE_NAME and TI_HELPFILE flags. Office Outlook 2003, Office Outlook 2007, and Outlook 2010 currently pass these flags, but they have no effect on the results of the NspiGetTemplateInfo function.

7 Change Tracking

This section identifies changes that were made to the [MS-OXOABKT] protocol document between the October 2011 and January 2012 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type Editorially updated.

Some important terms used in the change type descriptions are defined as follows:

- Protocol syntax refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- Protocol revision refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
6 Appendix A: Product Behavior	Added Exchange 15 Technical Preview and Outlook 15 Technical Preview to the list of applicable product versions.	Y	Content updated.
