Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.

- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.

- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.

- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.

- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.

- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.

- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact dochelp@microsoft.com.

1 Introduction

The Journal Object Protocol is used to track activity related to a meeting, task, contact, or application file. This protocol extends the Message and Attachment Object Protocol, which is described in [MS-OXCMSG].

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

Attachment object: A set of properties that represents a file, Message object, or structured storage that is attached to a Message object and is visible through the attachments table for a Message object.

contact: A person, company, or other entity that is stored in a directory and is associated with one or more unique identifiers and attributes, such as an Internet message address or login name.

Coordinated Universal Time (UTC): A high-precision atomic time standard that approximately tracks Universal Time (UT). It is the basis for legal, civil time all over the Earth. Time zones around the world are expressed as positive and negative offsets from UTC. In this role, it is also referred to as Zulu time (Z) and Greenwich Mean Time (GMT). In these specifications, all references to UTC refer to the time at UTC-0 (or GMT).

EntryID: A sequence of bytes that is used to identify and access an object.

Folder object: A messaging construct that is typically used to organize data into a hierarchy of objects containing Message objects and folder associated information (FAI) Message objects.

handle: Any token that can be used to identify and access an object such as a device, file, or a window.

Journal object: A Message object that represents an entry in a journal or log and adheres to the property descriptions that are described in in [MS-OXOJRNL].

Mail User Agent (MUA): A client application that is used to compose and read email messages.

Message object: A set of properties that represents an email message, appointment, contact, or other type of personal-information-management object. In addition to its own properties, a Message object contains recipient properties that represent the addressees to which it is addressed, and an attachments table that represents any files and other Message objects that are attached to it.

metafile: A file that stores an image as graphical objects, such as lines, circles, and polygons, instead of pixels. A metafile preserves an image more accurately than pixels when an image is resized.

named property: A property that is identified by both a GUID and either a string name or a 32-bit identifier.

property ID: A 16-bit numeric identifier of a specific attribute. A property ID does not include any property type information.

recipient: An entity that can receive email messages.
remote operation (ROP): An operation that is invoked against a server. Each ROP represents an action, such as delete, send, or query. A ROP is contained in a ROP buffer for transmission over the wire.

Rich Text Format (RTF): Text with formatting as described in [MSFT-RTF].

ROP request: See ROP request buffer.

ROP response: See ROP response buffer.

special folder: One of a default set of Folder objects that can be used by an implementation to store and retrieve user data objects.

storage: An element of a compound file that is a unit of containment for one or more storages and streams, analogous to directories in a file system, as described in [MS-CFB].

stream: An element of a compound file, as described in [MS-CFB]. A stream contains a sequence of bytes that can be read from or written to by an application, and they can exist only in storages.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

[MS-OXCDATA] Microsoft Corporation, "Data Structures".

[MS-OXCFOLD] Microsoft Corporation, "Folder Object Protocol".

[MS-OXCPRPT] Microsoft Corporation, "Property and Stream Object Protocol".

[MS-OXOMSG] Microsoft Corporation, "Email Object Protocol".

[MS-OXOSFLD] Microsoft Corporation, "Special Folders Protocol".

1.2.2 Informative References

1.3 Overview

The Journal Object Protocol allows a user to track activity on a meeting, task, or contact. Activity on a file such as a spreadsheet or word-processing document can also be tracked. This protocol defines a Journal object to represent a journal entry that contains a log of the activity. The properties of a Journal object specify the name of the activity, the duration, any contacts that are associated with the activity, and other details. The Journal object is stored in a Folder object.

The Journal Object Protocol extends the Message and Attachment Object Protocol, described in [MS-OXCMMSG], in that it defines new properties on the Message object and adds constraints to the existing properties of the Message object.

1.4 Relationship to Other Protocols

The Journal Object Protocol has the same dependencies as the Message and Attachment Object Protocol, which it extends. For information about the Message and Attachment Object Protocol, see [MS-OXCMMSG].

For conceptual background information and overviews of the relationships and interactions between this and other protocols, see [MS-OXPROTO].

1.5 Prerequisites/Preconditions

The Journal Object Protocol has the same prerequisites and preconditions as the Message and Attachment Object Protocol, as specified in [MS-OXCMMSG].

1.6 Applicability Statement

A client can use this protocol to record the user's activities on various items.

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

This protocol provides no vendor extensibility beyond what is already specified in [MS-OXCMMSG].

1.9 Standards Assignments

None.
2 Messages

2.1 Transport

The Journal Object Protocol uses the same underlying transport as that used by the Message and Attachment Object Protocol, as specified in [MS-OXCMSG].

2.2 Message Syntax

A Journal object can be created and modified by clients and servers. Except where noted, this section defines constraints under which both clients and servers operate.

Clients operate on a Journal object by using the Message and Attachment Object Protocol, as specified in [MS-OXCMSG]. How a server operates on a Journal object is implementation-dependent, but the results of any such operations MUST be exposed to clients in a manner that is consistent with the Journal Object Protocol.

Unless otherwise specified, a Journal object adheres to all property constraints specified in [MS-OXPROPS] and [MS-OXCMSG].

2.2.1 Journal Object Properties

2.2.1.1 PidLidLogType Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidLidLogType property ([MS-OXPROPS] section 2.168) specifies the name of the activity that is being recorded.

2.2.1.2 PidLidLogTypeDesc Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidLidLogTypeDesc property ([MS-OXPROPS] section 2.169) describes the activity that is being recorded.

2.2.1.3 PidLidLogStart Property

Type: PtypTime ([MS-OXCDATA] section 2.11.1)

The PidLidLogStart property ([MS-OXPROPS] section 2.167) specifies the time, in Coordinated Universal Time (UTC), at which the activity began. The value of this property MUST be equal to the value of the PidLidCommonStart property ([MS-OXCMSG] section 2.2.1.18).

2.2.1.4 PidLidLogEnd Property

Type: PtypTime ([MS-OXCDATA] section 2.11.1)

The PidLidLogEnd property ([MS-OXPROPS] section 2.165) specifies the time, in UTC, at which the activity ended. The value of this property MUST be equal to the value of the PidLidCommonEnd property ([MS-OXCMSG] section 2.2.1.19) and therefore greater than or equal to the PidLidLogStart property (section 2.2.1.3).
2.2.1.5 PidLidLogDuration Property

Type: PtypInteger32 ([MS-OXCDATA] section 2.11.1)

The **PidLidLogDuration** property ([MS-OXPROPS] section 2.164) specifies the duration, in minutes, of the activity. The value of this property is the difference between the values of the **PidLidLogEnd** (section 2.2.1.4) and **PidLidLogStart** (section 2.2.1.3) properties.

2.2.1.6 PidLidLogFlags Property

Type: PtypInteger32 ([MS-OXCDATA] section 2.11.1)

The **PidLidLogFlags** property ([MS-OXPROPS] section 2.166) contains bits that specify whether the **Journal object** has a journal-associated attachment. This property MUST be set to one of the values in the following table.

<table>
<thead>
<tr>
<th>Bit value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00000000</td>
<td>This Journal object has no journal-associated attachment (section 2.2.6).</td>
</tr>
<tr>
<td>0x40000000</td>
<td>This Journal object has a journal-associated attachment (section 2.2.6).</td>
</tr>
</tbody>
</table>

2.2.1.7 PidLidLogDocumentPrinted Property

Type: PtypBoolean ([MS-OXCDATA] section 2.11.1)

The **PidLidLogDocumentPrinted** property ([MS-OXPROPS] section 2.161) indicates whether the file, on which activity is being tracked, was printed during the tracking of the activity. <1> If printing occurred, this property is set to 0x01.

2.2.1.8 PidLidLogDocumentSaved Property

Type: PtypBoolean ([MS-OXCDATA] section 2.11.1)

The **PidLidLogDocumentSaved** property ([MS-OXPROPS] section 2.163) indicates whether the file, on which activity is being tracked, was saved during the tracking of the activity. <2> If the document was saved, this property is set to 0x01.

2.2.1.9 PidLidLogDocumentRouted Property

Type: PtypBoolean ([MS-OXCDATA] section 2.11.1)

The **PidLidLogDocumentRouted** property ([MS-OXPROPS] section 2.162) indicates whether the file, on which activity is being tracked, was sent to a recipient during the tracking of the activity. <3> If the document was sent, this property is set to 0x01.

2.2.1.10 PidLidLogDocumentPosted Property

Type: PtypBoolean ([MS-OXCDATA] section 2.11.1)

The **PidLidLogDocumentPosted** property ([MS-OXPROPS] section 2.160) indicates whether the file, on which activity is being tracked, was sent by e-mail or posted to a server’s folder during the tracking of the activity. <4> If the document was posted, this property is set to 0x01. If the document was sent by e-mail, it is set to 0x00.
2.2.2 Additional Property Constraints

This protocol places additional constraints on properties beyond what is specified in [MS-OXCMSG]. These constraints are specified in section 2.2.2.1 through section 2.2.2.6.

2.2.2.1 PidTagMessageClass Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagMessageClass property ([MS-OXCMSG] section 2.2.1.3) specifies the type of the Message object. The value of this property MUST be "IPM.Activity" or MUST begin with "IPM.Activity.", in addition to meeting the criteria specified in [MS-OXCMSG].

2.2.2.2 Best Body Properties

The main text of the Journal object MUST be stored in the PidTagRtfCompressed property ([MS-OXCMSG] section 2.2.1.58.4), as specified in [MS-OXRTFCP].

2.2.2.3 PidTagIconIndex Property

Type: PtypInteger32 ([MS-OXCDATA] section 2.11.1)

The PidTagIconIndex property ([MS-OXOMSG] section 2.2.1.10) specifies which icon is to be used by a user interface when displaying the Journal object. The valid values for this property are specified in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00000601</td>
<td>Conversation</td>
</tr>
<tr>
<td>0x00000612</td>
<td>Document</td>
</tr>
<tr>
<td>0x00000602</td>
<td>E-mail message</td>
</tr>
<tr>
<td>0x00000609</td>
<td>Fax</td>
</tr>
<tr>
<td>0x0000060C</td>
<td>Letter</td>
</tr>
<tr>
<td>0x00000613</td>
<td>Meeting</td>
</tr>
<tr>
<td>0x00000614</td>
<td>Meeting cancellation</td>
</tr>
<tr>
<td>0x00000603</td>
<td>Meeting request</td>
</tr>
<tr>
<td>0x00000604</td>
<td>Meeting response</td>
</tr>
<tr>
<td>0x00000610</td>
<td>A database application file</td>
</tr>
<tr>
<td>0x0000060E</td>
<td>A spreadsheet application file</td>
</tr>
<tr>
<td>0x0000060F</td>
<td>A slide-show presentation application file</td>
</tr>
<tr>
<td>0x0000060D</td>
<td>A word processing application file</td>
</tr>
<tr>
<td>0x00000608</td>
<td>Note</td>
</tr>
<tr>
<td>0x0000060A</td>
<td>Phone call</td>
</tr>
<tr>
<td>0x00000615</td>
<td>Remote session</td>
</tr>
<tr>
<td>0x0000060B</td>
<td>Task</td>
</tr>
</tbody>
</table>
### 2.2.2.4 PidLidCompanies Property

Type: PtypMultipleString ([MS-OXCDATA] section 2.11.1)

The PidLidCompanies property ([MS-OXPROPS] section 2.64) contains a list of company names, each of which is associated with a contact that is specified in the PidLidContacts property ([MS-OXCMSG] section 2.2.1.59.2).

### 2.2.2.5 Recipients

A Journal object MUST NOT have recipients.

### 2.2.2.6 Journal-Associated Attachments

A journal-associated attachment links a Journal object with another object, such as a document. A Journal object MUST NOT have more than one journal-associated attachment.

The properties of a journal-associated attachment follow the requirements specified in [MS-OXCMSG] section 2.2.2 for Attachment objects, except that certain properties on the Attachment object MUST be set as specified in the following table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PidTagAttachmentLinkId</td>
<td>0x00000004</td>
</tr>
<tr>
<td>PidTagAttachMethod</td>
<td>0x00000006</td>
</tr>
<tr>
<td>PidTagRenderingPosition</td>
<td>0xFFFFFFFF</td>
</tr>
<tr>
<td>PidTagAttachmentFlags</td>
<td>0x00000000</td>
</tr>
<tr>
<td>PidTagAttachmentHidden</td>
<td>0x00</td>
</tr>
<tr>
<td>PidTagAccess</td>
<td>0x00000002</td>
</tr>
</tbody>
</table>

The content of the PidTagAttachDataBinary property ([MS-OXCMSG] section 2.2.2.7) is formatted as a structured storage that comprises eight streams, the names and contents of which are detailed in the following table.

<table>
<thead>
<tr>
<th>Stream name</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOlePres000</td>
<td>A metafile that contains the icon to be used when rendering the attachment.</td>
</tr>
<tr>
<td>.3MailStream*</td>
<td>Binary contents: 04 00 00 00 00 00 00 00 00 00 00 00 00 00 00</td>
</tr>
<tr>
<td>MailMsgAttFld</td>
<td>The EntryID of the folder of the linked Message object.</td>
</tr>
<tr>
<td>MailMsgAttMdb</td>
<td>The EntryID of the store of the linked Message object.</td>
</tr>

3 Protocol Details

3.1 Client Details

The client creates and manipulates a Journal object and in all other ways operates within the client role as specified in [MS-OXCMSG].

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as the external behavior of the implementation is consistent with the behavior described in this document.

This protocol uses the abstract data model that is specified in [MS-OXCMSG] section 3.1.1 with the following adaptations:

- The Journal object is an extension of the Message object.
- A Journal object is created in the Journal special folder unless the end user or Mail User Agent (MUA) explicitly specifies another folder. For details about special folders, see [MS-OXOSFLD].

3.1.2 Timers

None.

3.1.3 Initialization

None.

3.1.4 Higher-Layer Triggered Events

3.1.4.1 Creating a Journal Object

When the user creates a journal entry, the client creates a Message object, as specified in [MS-OXCMSG] section 3.1.4.2, sets properties in accordance with the requirements in section 2, and saves the resulting Journal object, as specified in [MS-OXCMSG] section 3.1.4.3.

3.1.4.2 Modifying a Journal Object

When the user modifies a journal entry, the client opens the Journal object as specified in [MS-OXCMSG] section 3.1.4.1, modifies any of the properties in accordance with the requirements in section 2, and saves the Journal object as specified in [MS-OXCMSG] section 3.1.4.3. For details about modifying the properties of a Message object, see [MS-OXCPRPT].

3.1.4.3 Deleting a Journal Object

When a user deletes a journal entry, the client deletes the Journal object in the same way that it deletes any Message object, as specified in [MS-OXCFOLD] section 3.1.4.8.

3.1.5 Message Processing Events and Sequencing Rules

None.
3.1.6 Timer Events
None.

3.1.7 Other Local Events
None.

3.2 Server Details
The server processes a client's requests regarding a Journal object and in all other ways operates within the server role as specified in [MS-OXCMSG].

3.2.1 Abstract Data Model
This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as the external behavior of the implementation is consistent with the behavior described in this document.

This protocol uses the abstract data model that is specified in [MS-OXCMSG] section 3.2.1 with the following adaptations:

- The Journal object is an extension of the Message object.
- A Journal object is created in the Journal special folder unless the end-user or MUA explicitly specifies another folder. For details about special folders, see [MS-OXOSFLD].

3.2.2 Timers
None.

3.2.3 Initialization
None.

3.2.4 Higher-Layer Triggered Events
None.

3.2.5 Message Processing Events and Sequencing Rules
The server responds to client requests as specified in [MS-OXCMSG] section 3.2.5.

3.2.6 Timer Events
None.

3.2.7 Other Local Events
None.
## 4 Protocol Examples

### 4.1 Journal Object for a Telephone Call Example

A user creates a journal entry to track a telephone call. The user records the start and end times, puts notes in the body, and links a contact and company. The following is a description of what a client might do to accomplish Joe's intentions and the responses a server might return. For information about remote operations (ROPs), see [MS-OXCPRPT] and [MS-OXCMSG].

Before manipulating a Journal object, the client asks the server to map named properties to property IDs, by sending a RopGetPropertyIDsFromNames ROP request ([MS-OXCROPS] section 2.2.8.1).

</tbody>
</table>

To create a Journal object, the client uses the RopCreateMessage ROP ([MS-OXCROPS] section 2.2.6.2). The server returns a handle to a Message object.

After the user has input his content for the Journal object, the client transmits the data to the server by using the RopSetProperties ROP ([MS-OXCROPS] section 2.2.8.6). For information about the property types in the following table, see [MS-OXCDATA] section 2.11.1.

<table>

</tbody>
</table>

* The PidLidContactLinkEntry property contains a representation of the contact link, as described in [MS-OXCMSG] section 2.2.1.59.1.

** The PidLidContactLinkSearchKey property contains a representation of the contact link, as described in [MS-OXCMSG] section 2.2.1.59.4.

*** The PidTagRtfCompressed property ([MS-OXCMSG] section 2.2.1.58.4) contains the compressed Rich Text Format (RTF) representation of the body, as described in [MS-OXRTFCP].

When the user saves the changes, the client commits the properties on the server by using the RopSaveChangesMessage ROP ([MS-OXCROPS] section 2.2.6.3) and then releases the Journal object by using the RopRelease ROP ([MS-OXCROPS] section 2.2.15.3).

The values of some properties will change during the processing of the RopSaveChangesMessage ROP, but the properties specified in this document will not change.
5 Security

5.1 Security Considerations for Implementers

There are no special security considerations specific to the Journal Object Protocol. General security considerations pertaining to the underlying transport apply, as described in [MS-OXCMSG].

5.2 Index of Security Parameters

None.
6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Exchange Server 2003
- Microsoft Exchange Server 2007
- Microsoft Exchange Server 2010
- Microsoft Exchange Server 2013
- Microsoft Exchange Server 2016
- Microsoft Exchange Server 2019
- Microsoft Office Outlook 2003
- Microsoft Office Outlook 2007
- Microsoft Outlook 2010
- Microsoft Outlook 2013
- Microsoft Outlook 2016
- Microsoft Outlook 2019
- Microsoft Outlook 2021
- Microsoft Outlook 2024 Preview

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 2.2.1.7: Outlook 2013, Outlook 2016, and Outlook 2019 do not support the PidLidLogDocumentPrinted property (section 2.2.1.7).

<2> Section 2.2.1.8: Outlook 2013, Outlook 2016, and Outlook 2019 do not support the PidLidLogDocumentSaved property (section 2.2.1.8).

<3> Section 2.2.1.9: Outlook 2013, Outlook 2016, and Outlook 2019 do not support the PidLidLogDocumentRouted property (section 2.2.1.9).

<4> Section 2.2.1.10: Outlook 2013, Outlook 2016, and Outlook 2019 do not support the PidLidLogDocumentPosted property (section 2.2.1.10).
7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.
