Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](https://aka.ms/osp) or the [Microsoft Community Promise](https://aka.ms/mcpp). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](https://aka.ms/patentmap).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](https://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

1 Introduction

The RSS Object Protocol enables representation of an item that is from a news feed. This protocol extends the Message and Attachment Object Protocol, which is described in [MS-OXCMSG].

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

atom feed: An XML structure that contains metadata about content, such as the language version and the date when the content was last modified, and is sent to subscribers by using the Atom Publishing Protocol (AtomPub), as described in [RFC4287].

Attachment object: A set of properties that represents a file, Message object, or structured storage that is attached to a Message object and is visible through the attachments table for a Message object.

Coordinated Universal Time (UTC): A high-precision atomic time standard that approximately tracks Universal Time (UT). It is the basis for legal, civil time all over the Earth. Time zones around the world are expressed as positive and negative offsets from UTC. In this role, it is also referred to as Zulu time (Z) and Greenwich Mean Time (GMT). In these specifications, all references to UTC refer to the time at UTC-0 (or GMT).

enclosure: An XML element that is in a feed and contains information such as a URL for a file, typically a media file, that is associated with an RSS item or Atom entry, for example, a podcast.

Folder object: A messaging construct that is typically used to organize data into a hierarchy of objects containing Message objects and folder associated information (FAI) Message objects.

handle: Any token that can be used to identify and access an object such as a device, file, or a window.

Mail User Agent (MUA): A client application that is used to compose and read email messages.

Message object: A set of properties that represents an email message, appointment, contact, or other type of personal-information-management object. In addition to its own properties, a Message object contains recipient properties that represent the addressees to which it is addressed, and an attachments table that represents any files and other Message objects that are attached to it.

named property: A property that is identified by both a GUID and either a string name or a 32-bit identifier.

property ID: A 16-bit numeric identifier of a specific attribute. A property ID does not include any property type information.

Really Simple Syndication (RSS): An XML-based syndication format for content, as described in [RSS2.0].

recipient: An entity that can receive email messages.

remote operation (ROP): An operation that is invoked against a server. Each ROP represents an action, such as delete, send, or query. A ROP is contained in a ROP buffer for transmission over the wire.
**ROP request**: See ROP request buffer.

**ROP response**: See ROP response buffer.

**RSS item**: An item element in an RSS feed, as described in [RSS2.0].

**RSS object**: A Message object that represents an entry from an RSS item or atom feed.

**Uniform Resource Locator (URL)**: A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [RFC1738].

**XML**: The Extensible Markup Language, as described in [XML1.0].

**XML element**: An XML structure that typically consists of a start tag, an end tag, and the information between those tags. Elements can have attributes and can contain other elements.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT**: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

### 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

#### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

**[MS-OXORSS]** - v20220215

RSS Object Protocol

Copyright © 2022 Microsoft Corporation

Release: February 15, 2022
1.3 Overview

The RSS Object Protocol allows representation of an item from either an RSS feed or an atom feed for viewing by the user. Items from the feed are in XML format. This protocol enables a client to convert the XML of an RSS item, described in [RSS2.0], or an atom entry, described in [RFC4287], to properties on an RSS object. In addition to the XML conversion, the entire XML content of the RSS item or atom entry is saved in its own property on the RSS object.

The RSS Object Protocol extends the Message and Attachment Object Protocol in that it defines new properties on a Message object and adds constraints to the existing properties of a Message object. For information about the Message and Attachment Object Protocol, see [MS-OXCMSG].

1.4 Relationship to Other Protocols

The RSS Object Protocol has the same dependencies as the Message and Attachment Object Protocol, as described in [MS-OXCMSG].

The RSS Object Protocol is a peer of the Email Object Protocol and uses a subset of the properties that are described in [MS-OXOMSG].

For conceptual background information and overviews of the relationships and interactions between this and other protocols, see [MS-OXPROM].

1.5 Prerequisites/Preconditions

The RSS Object Protocol has the same prerequisites and preconditions as the Message and Attachment Object Protocol, as specified in [MS-OXCMSG].

1.6 Applicability Statement

A client can use this protocol to represent an item that is transmitted in a news feed format when the user subscribes to a news feed.

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

This protocol provides no extensibility beyond what is already specified in [MS-OXCMSG].

1.9 Standards Assignments

None.
2 Messages

2.1 Transport
The RSS Object Protocol uses the same underlying transport as that used by the Message and Attachment Object Protocol, as specified in [MS-OXCMSG].

2.2 Message Syntax
An RSS object can be created and modified by clients and servers. Except where noted, this section defines constraints under which both clients and servers operate.

Clients operate on an RSS object by using the Message and Attachment Object Protocol, as specified in [MS-OXCMSG]. The manner in which a server operates on an RSS object is implementation-dependent, but the results of any such operations MUST be exposed to clients in a manner that is consistent with the RSS Object Protocol.

Unless otherwise specified in this section, an RSS object adheres to all property constraints, as specified in both [MS-OXPROPS] and [MS-OXCMSG]. An RSS object can also contain other properties, but these properties have no impact on the RSS Object Protocol.

The values of the properties specified in this section are taken from the XML elements of the RSS feed or atom feed, unless otherwise specified. For details about the XML formats of the RSS feed and the atom feed, see [RSS2.0] and [RFC4287], respectively.

2.2.1 RSS Object-Specific Properties
The properties that are specific to RSS objects are defined in section 2.2.1.1 through section 2.2.1.8.

2.2.1.1 PidLidPostRssChannelLink Property
Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidLidPostRssChannelLink property ([MS-OXPROPS] section 2.205) contains the URL of the RSS feed or atom feed from which the XML file came.

This property is set as follows:

- For an RSS feed, this property is set to the value of the link child element of the channel element.
- For an atom feed, this property is set to the value of the href attribute of the link child element of the feed element. This property is set only if the rel attribute of the link element either is set to "alternate" or is not present. Otherwise, this property is not set for an atom entry.

2.2.1.2 PidLidPostRssItemLink Property
Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidLidPostRssItemLink property ([MS-OXPROPS] section 2.208) contains the URL of the item or entry.

This property is set as follows:

- For an RSS item, this property is set to the value of the link child element of the item element.
- For an atom entry, this property is set to the value of the `href` attribute of the `link` child element of the `entry` element. This property is set only if the `rel` attribute of the `link` element either is set to "alternate" or is not present. Otherwise, this property is not set for an atom entry.

### 2.2.1.3 PidLidPostRssItemHash Property

Type: PtypInteger32 ([MS-OXCDATA] section 2.11.1)

The `PidLidPostRssItemHash` property ([MS-OXPROPS] section 2.207) contains a hash of the XML from the RSS feed or the atom feed. The hash is computed by using an implementation-dependent algorithm and is used to quickly determine whether two items are different.

### 2.2.1.4 PidLidPostRssItemGuid Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The `PidLidPostRssItemGuid` property ([MS-OXPROPS] section 2.206) contains a unique identifier for the object.

This property is set as follows:
- For an RSS item, this property is set to the value of the `GUID` element or the `link` element.
- For an atom entry, this property is set to the value of the `id` element. If the `id` element is not present, this property is set to the value of the `href` attribute of the `link` element.

### 2.2.1.5 PidLidPostRssChannel Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The `PidLidPostRssChannel` property ([MS-OXPROPS] section 2.204) contains the title of the atom feed or the RSS feed. For an atom feed, this property is set to the value of the `title` child element of the `feed` element. For an RSS feed, this property is set to the value of the `title` child element of the `channel` element.

### 2.2.1.6 PidLidPostRssItemXml Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The `PidLidPostRssItemXml` property ([MS-OXPROPS] section 2.209) contains either the contents of the `item` element and all of its child elements from an RSS feed or the contents of the `entry` element and all of its child elements from an atom feed.

### 2.2.1.7 PidLidPostRssSubscription Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The `PidLidPostRssSubscription` property ([MS-OXPROPS] section 2.210) contains the user's preferred name for the subscription. This property either is set to a user-specified value or is set as follows:
- For an RSS feed, this property is set to the value of the `title` child element of the `channel` element.
- For an atom feed, this property is set to the value of the `title` child element of the `feed` element.
2.2.1.8 PidTagMessageDeliveryTime Property

Type: PtypTime ([MS-OXCDATA] section 2.11.1)

The PidTagMessageDeliveryTime property ([MS-OXPROPS] section 2.789) specifies the posting date, in Coordinated Universal Time (UTC), of the item or entry. This property is optional.

This property is set as follows:

- For an RSS item, this property is set to the value of the pubDate element. If the pubDate element is not present in the RSS item, this property is set to the value of the lastBuildDate element.
- For an atom entry, this property is set to the value of the updated or published element. If none of these elements is present under the entry element, then the updated element that is under the feed element is used.
- This property can be set to the current time if none of the specified elements exist in the RSS item or the atom entry.

2.2.2 Additional Property Constraints

Additional constraints beyond those specified in [MS-OXCMSG], [MS-OXOMSG], and [MS-OXCSPAM] are specified in section 2.2.2.1 through section 2.2.2.6.

2.2.2.1 PidNameExchangeJunkEmailMoveStamp Property

Type: PtypInteger32 ([MS-OXCDATA] section 2.11.1)

The PidNameExchangeJunkEmailMoveStamp property ([MS-OXCSPAM] section 2.2.1.2) MUST be set on all RSS objects.

2.2.2.2 PidTagMessageClass Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagMessageClass ([MS-OXCMSG] section 2.2.1.3) property specifies the type of the Message object. The value MUST be "IPM.Post.RSS" or begin with "IPM.Post.RSS.".

2.2.2.3 PidTagSenderName Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagSenderName property ([MS-OXOMSG] section 2.2.1.51) contains origination information about the RSS object.

This property is set as follows:

- For an RSS item, this property is set to the value of the author or title element.
- For an atom entry, this property is set to the value of the title element or to the value of the name child element of the author element.
- If none of the specified elements exist in the RSS item or the atom entry, this property is set to an empty string.
2.2.2.4 PidTagSenderEmailAddress Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagSenderEmailAddress property ([MS-OXOMSG] section 2.2.1.49) contains the value of the email child element of the author element of an atom entry. If the email element is not present, this property is set to an empty string. This property does not apply to an RSS item.

2.2.2.5 PidTagSentRepresentingName Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagSentRepresentingName property ([MS-OXOMSG] section 2.2.1.57) contains origination information about the RSS object.

This property is set as follows:

- For an RSS item, this property is set to the value of the author or title element.
- For an atom entry, this property is set either to the value of the title element or to the value of the name child element of the author element.
- If none of the specified elements exist in the RSS item or the atom entry, this property is set to an empty string.

2.2.2.6 PidTagSentRepresentingEmailAddress Property

Type: PtypString ([MS-OXCDATA] section 2.11.1)

The PidTagSentRepresentingEmailAddress property ([MS-OXOMSG] section 2.2.1.55) contains the contents of the email child element of the author element of an atom entry. If the email element is not present, this property is set to an empty string. This property does not apply to an RSS item.

2.2.3 Additional Object Constraints

Additional constraints beyond those specified in [MS-OXCMGS], [MS-OXOMSG], and [MS-OX CSPAM] are specified in section 2.2.3.1 through section 2.2.3.2.

2.2.3.1 Attachment Objects

2.2.3.1.1 Full Article Attachment Objects

A full article Attachment object contains the contents of the linked document. Its PidTagAttachMethod property ([MS-OXCMGS] section 2.2.2.9) MUST be set to 0x00000001 (afByValue). The PidLidPostRssItemLink property (section 2.2.1.2) MUST be set to the URL from which the document was downloaded.

An RSS object MUST NOT have more than one full article Attachment object.

2.2.3.1.2 Enclosure Attachment Objects

An enclosure Attachment object contains the contents of an enclosure. For an atom entry, the enclosure is a file referenced in the href attribute of a link element that has its rel attribute set to "enclosure". For an RSS item, the enclosure is a file referenced in the enclosure element.

An enclosure Attachment object MUST have the PidTagAttachMethod property ([MS-OXCMGS] section 2.2.2.9) set to 0x00000001 (afByValue). The PidLidPostRssItemLink property (section 2.2.1.2) MUST be set to the URL from which the enclosure was downloaded.
2.2.3.1.3 Other Attachment Objects

An RSS object MUST NOT have Attachment objects other than full article Attachment objects and enclosure Attachment objects.

2.2.3.2 Recipients

An RSS object MUST NOT have recipients.
3 Protocol Details

3.1 Client Details

The client creates and manipulates an RSS object and in all other ways operates within the client role as specified in [MS-OXCMSG].

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

This protocol uses the abstract data model that is specified in [MS-OXCMSG] section 3.1.1 with the following adaptations:

- The RSS object is an extension of the Message object.
- An RSS object is created in a Folder object that has a container class of "IPF>Note.OutlookHomepage" unless the Mail User Agent (MUA) explicitly specifies otherwise.

3.1.2 Timers

None.

3.1.3 Initialization

None.

3.1.4 Higher-Layer Triggered Events

3.1.4.1 Creation of an RSS Object

When the user subscribes to a news feed, the client creates an RSS object by creating a Message object, as specified in [MS-OXCMSG], sets properties on the RSS object in accordance with the requirements in section 2.2, and saves the resulting RSS object as specified in [MS-OXCMSG]. In particular, the PidNameExchangeJunkEmailMoveStamp property (section 2.2.2.1) MUST be set before the RSS object is saved the first time.

3.1.4.2 Modification of an RSS Object

When the user updates a subscription to a news feed, the client first opens the RSS object in the same way that it opens any Message object, as specified in [MS-OXCMSG]. The client then modifies any properties in accordance with the requirements in section 2.2 and saves the RSS object as specified in [MS-OXCMSG].

3.1.4.3 Deletion of an RSS Object

When the user deletes a subscription to a news feed, the client deletes the RSS object in the same way that it deletes any Message object, as specified in [MS-OXCFOLD].
3.1.5 Message Processing Events and Sequencing Rules
None.

3.1.6 Timer Events
None.

3.1.7 Other Local Events
None.

3.2 Server Details
The server processes a client’s requests regarding an RSS object and in all other ways operates within the server role as specified in [MS-OXCMSG].

3.2.1 Abstract Data Model
This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

This protocol uses the abstract data model that is specified in [MS-OXCMSG] section 3.2.1 with the following adaptations:

- The RSS object is an extension of the Message object.
- An RSS object is created in a Folder object that has a container class of "IPF.Note.OutlookHomepage" unless the MUA explicitly specifies otherwise.

3.2.2 Timers
None.

3.2.3 Initialization
None.

3.2.4 Higher-Layer Triggered Events
None.

3.2.5 Message Processing Events and Sequencing Rules
The server responds to client requests as specified in [MS-OXCMSG].

3.2.6 Timer Events
None.
3.2.7 Other Local Events

None.
## 4 Protocol Examples

A user subscribes to an **RSS** feed. The client polls the feed and finds a new item. The following is a description of what a client might do to accomplish the user's intentions and describes the responses a server might return. For information about the remote operations (ROPs) described in the example, see [MS-OXCRPT] and [MS-OXCMSG].

Before manipulating **RSS objects**, the client asks the server to map **named properties** to **property IDs** by sending a **RopGetPropertyIDsFromNames ROP request** ([MS-OXCROPS] section 2.2.8.1).

<table>
<thead>

<td><a href="HTTP://schemas.microsoft.com/exchange/junkemailmovestamp">HTTP://schemas.microsoft.com/exchange/junkemailmovestamp</a></td>
</tr>
</tbody>
</table>
The server sends a **RopGetPropertyIDsFromNames** ROP response with the following property IDs, which will be used in the example that follows. (The actual property IDs are at the discretion of the server.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Property ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>PidLidPostRssChannel</td>
<td>0x8318</td>
</tr>
<tr>
<td>PidLidPostRssChannelLink</td>
<td>0x8314</td>
</tr>
<tr>
<td>PidLidPostRssItemGuid</td>
<td>0x8317</td>

<td>0x8319</td>
</tr>
<tr>
<td>PidLidPostRssSubscription</td>
<td>0x831A</td>
</tr>
<tr>
<td>PidLidSideEffects</td>
<td>0x81F8</td>
</tr>
</tbody>
</table>

To create an RSS object, the client uses the **RopCreateMessage** ROP ([MS-OXCROPS] section 2.2.6.2). The server returns a success code and a handle to the object.

After processing the contents of the RSS item, the client transmits the properties to the server by using the **RopSetProperties** ROP ([MS-OXCROPS] section 2.2.8.6). The properties that are set are shown in the following table.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

When the client has made all its changes to the item, it commits the properties to the server by using the **RopSaveChangesMessage** ROP [(MS-OXCROPS) section 2.2.6.3] and then releases the RSS object by using the **RopRelease** ROP [(MS-OXCROPS) section 2.2.15.3]. The values of some properties will change during the processing of the **RopSaveChangesMessage** ROP, but the properties specified in this document will not change.

**Note 1:** The **PidLidPostRssItemXml** property contains the following text.

```xml
<?xml version="1.0"?><item><title>Learn to narrow your search criteria for better searches in Contoso</title><description>Instant Search can help you find information in a flash.</description><link>http://www.contoso.com</link></item>
```

**Note 2:** The **PidTagHtml** property contains the following text, encoded into binary as described in [MS-OXBBODY].

```html

```
Instant Search can help you find information in a flash.

5 Security

5.1 Security Considerations for Implementers

There are no special security considerations specific to this protocol. General security considerations that pertain to the underlying transport apply as described in [MS-OXCMSG].

5.2 Index of Security Parameters

None.
6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Exchange Server 2003
- Microsoft Exchange Server 2007
- Microsoft Exchange Server 2010
- Microsoft Exchange Server 2013
- Microsoft Exchange Server 2016
- Microsoft Office Outlook 2003
- Microsoft Office Outlook 2007
- Microsoft Outlook 2010
- Microsoft Outlook 2013
- Microsoft Outlook 2016
- Microsoft Exchange Server 2019
- Microsoft Outlook 2019
- Microsoft Outlook 2021

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.
7 Change Tracking

No table of changes is available. The document is either new or has had no changes since its last release.
