1.3 Overview

This specification provides basic reference information about **Message object** properties referenced by protocol specifications. The following information is provided for each property, as appropriate:

Alternate names: Any additional names used to refer to this property.

Area: A group of properties with related functionality.

Canonical name: The name used to refer to this property in other protocol specifications.

Description: A brief description of the contents of the property. Properties that are not defined in the core protocol documents do not have descriptions.

Data type: The property value type, as specified in [MS-OXCDATA], that specifies the type of values allowed for this property.

Property ID: An unsigned 16-bit quantity that identifies a **tagged property**.

Property long ID (LID): An unsigned 32-bit quantity that, along with the **property set**, identifies a **named property**.

Property name: A string that, along with the property set, identifies a named property.

Property set: A **GUID** that identifies a group of properties with a similar purpose.

References: One or more protocol documents that specify the semantics and allowed values for this property or refer to this property without specifying semantics or allowed values.

Defining References: One or more protocol documents that specify the semantics and allowed values for this property.

Consuming References: One or more protocol documents that refer to this property but do not specify semantics and allowed values.

1.3.1 Common Message Classes

Applications set certain required properties corresponding to the object's **message class**. Applications handle the case where required properties are missing; treating a Message object as IPM.Note is a common fallback strategy. The following table lists several common message classes, the functional area to which each one corresponds, and the document that specifies each one's required and optional properties.

In this table, an asterisk "*" denotes that any string can appear at that point.

Area	PidTagMessageClass values	Document
Common	IPM.*	[MS-OXCMSG]
Email	IPM.Note, REPORT.*	[MS-OXCMSG]
Calendar	IPM.Appointment, IPM.Schedule.Meeting.Request, IPM.Schedule.Meeting.Resp.*, IPM.Schedule.Meeting.Canceled, IPM.Schedule.Meeting.Notification	[MS-OXOCAL]

1.3.3 Property ID Ranges

The 65,536 possible values of the **property ID** are divided into sub-ranges reserved for various purposes, as specified in the following table.

In this context, the term "non-transmittable" refers specifically to transmission via an e-mail transport protocol (such as SMTP), and not to any network transport protocol (such as **TCP**).

- Servers do not allow property ID in ranges specified as non-transmittable to be submitted for transport to another server via an e-mail transport protocol. Property IDs in ranges not specified as non-transmittable are submitted for transport to another server.
- Clients can use properties in ranges specified as message class-defined for application-defined purposes. When doing so, applications specify a value for PidTagMessageClass (section 2.884) that is distinct from any value listed in section 1.3.1.
- Clients can use any named property for application-defined purposes. No constraint is placed on the value of PidTagMessageClass in this case, but the named property's property set is distinct from any value listed in section 1.3.2. Note that named properties are always transmittable.

Copyright © 2011 Microsoft Corporation.

- Clients can use properties in ranges specified as transport-defined, but they cannot define new properties in those ranges.
- Clients can use and define properties in ranges specified as user-defined, but need to avoid conflicts with alternate definitions of the same property ID.

Range minimum	Range maximum	Description
0x0001	0x0BFF	Message object envelope property; reserved
0x0C00	0x0DFF	**Recipient** property; reserved
0x0E00	0x0FFF	Non-transmittable Message property; reserved
0x1000	0x2FFF	Message content property; reserved
0x3000	0x33FF	Multi-purpose property that can appear on all or most objects; reserved
0x3400	0x35FF	Message **store** property; reserved
0x3600	0x36FF	Folder and **address book container** property; reserved
0x3700	0x38FF	Attachment property; reserved
0x3900	0x39FF	**Address Book object** property; reserved
0x3A00	0x3BFF	**Mail user** object property; reserved

0x6800	0x7BFF	Message class-defined content property
0x7C00	0x7FFF	Message class-defined non-transmittable property
0x8000	0xFFFF	Reserved for mapping to named properties. See [MS-NSPI] for more information about the static mapping of **NSPI property names** to property IDs that occurs in this ID range.

1.3.4 WebDAV Property Naming

The e-mail server is natively a MAPI store where the vast majority of properties in it are MAPI properties. The **WebDAV** implementation uses the **Augmented Backus-Naur Form (ABNF)** notation, as specified in [RFC5234], as a way to name MAPI properties, allowing **WebDAV clients** to work with these properties directly.

Copyright © 2011 Microsoft Corporation.

The http://schemas.microsoft.com/mapi/ namespace is used to directly access MAPI properties on the server. The namespace consists of three sub namespaces: proptag, id, and string. The ABNF notation used to specify the format of these namespaces is described in this section.

1.3.4.1 http://schemas.microsoft.com/mapi/proptag Namespace

This namespace is used to access properties on the server that are identified by a property ID. You can access these properties through WebDAV by appending the hexadecimal property ID value and the hexadecimal **property type** value to the namespace prefix.

```
proptag-specifier = "http://schemas.microsoft.com/mapi/proptag/x" property-id property-type

property-id = 4HEXDIG

property-type = 4HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/proptag/x0037001f (PidTagSubject)
```

1.3.4.2 http://schemas.microsoft.com/mapi/id Namespace

This namespace is used to access named properties on the server that are identified by a property **long ID (LID)**. You can access these properties through WebDAV by appending the property set and the hexadecimal property long ID (LID) value to the namespace prefix.

```
id-specifier = "http://schemas.microsoft.com/mapi/id/" property-set "/x" property-long-id

property-set = "{" 8HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 12HEXDIG "}"

property-long-id = 8HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/id/{00062002-0000-0000-C000-000000000046}/x00008213
(PidLidAppointmentDuration)
```

1.3.4.3 http://schemas.microsoft.com/mapi/string Namespace

This namespace is used to access named properties on the server that are identified by a property name. You can access these properties through WebDAV by appending the property set and the property name to the namespace prefix.

```
string-specifier = "http://schemas.microsoft.com/mapi/string/" property-set "/" property-name

property-set = "{" 8*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "-" 12*HEXDIG "}"

property-name = 1*CHAR
```

Example:

```
http://schemas.microsoft.com/mapi/string/{00020329-0000-0000-C000-000000000046}/Subject
(PidNameSubject)
```

1.4 Relationship to Protocols and Other Structures

This document relies on property data type and error code definitions in [MS-OXCDATA]. For tables and examples specifying property data types, and for tables specifying property and other error codes, see [MS-OXCDATA].

The object type specifications listed in section 1.2.1 depend on this document for basic information about message object properties to which they refer. Such basic information includes property IDs and data types. This specification, in turn, depends on each of those object type specifications to specify the behavior and semantics of the properties specific to its protocol.

1.5 Applicability Statement

This document provides the numeric values needed to encode property names, tags, and types in **ROP buffers**. It also serves as a convenient index to the object type documents that define how each property is used.

1.6 Versioning and Localization

None.

1.7 Vendor-Extensible Fields

Property ID ranges, as specified in section 1.3.3, describe how applications choose properties to create new message object types or to add functionality to existing types.
