# 1 Introduction

The Exchange Server Protocols Master Property List provides implementers with a single source of information about all the properties that are described by the specifications that comprise the Exchange Server Protocols documentation. If a property is not described by the specifications included in the Exchange Server Protocols documentation, it is not included in this document.

The criteria for including a property in the Exchange Server Protocols documentation are that it is set by a client in order to affect server behavior, or that it is set by a server in order to affect client behavior. Properties that are merely stored by the server on behalf of the client, or generated by the server for its own use and ignored by the client, are not necessarily documented. As a result, the properties that are included in the Exchange Server Protocols documentation, and therefore this document, are the critical **Message object** properties used for communication between clients and servers.

This document provides implementers with a convenient catalog of all these critical properties, a source of navigation to the individual technical specifications that describe these properties in detail, and a resource for additional helpful property information that is unique to this document.

Sections 1.7 and 2 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. All other sections and examples in this specification are informative.

## 1.3 Overview

Each property listing in this document contains a link to the section of the technical specification in the Exchange Server Protocols documentation that acts as the defining reference for the property. The defining reference for each property contains the semantic use and definition of the property, including the property data type. The property information that is included in the defining reference for each property is required to successfully parse property data. As such, this document provides implementers with a single source of navigation to all of the critical property information that is included in the individual Exchange Server Protocols technical specifications.

This document also provides additional information about each property that is helpful to the implementer, such as the functional area where the property is used, a list of all the technical specifications that cite the property, and a list of alternate names by which the canonical property is known within the system. This information is not included in the technical specifications that describe each property, and is unique to this document. It is provided for informational purposes only.

A typical scenario for using this document is when an implementer encounters both **property IDs** and property values with no other identification coming across the wire. The property data type and the semantic definition of the property that are included in the defining reference for each property allow the implementer to correctly parse property values that show up in **ROP buffers**. The parsed values in the ROP buffers include lists of property IDs, which are typically lists of four hexadecimal characters. By searching the information in this document for those four hexadecimal characters, the implementer can quickly name the associated property and navigate to the definition of the individual property in its defining specification.

The following information is provided for each property, as appropriate.

**Alternate names:** Alternate names are implementation-specific names for properties that are used in source code and non-protocol-related documentation. Information about alternate names is useful when the implementer needs to refer to legacy documentation about a specific canonical property.

**Area:** The functional area where the property is used. Sections 1.3.1. 1.3.2, and 1.3.3 describe the general functional areas where properties are used. The listing for each property in section 2 describes the areas with more varied descriptions so as to provide more insight into property usage.

**Canonical name:** The name used to refer to the property in the Exchange Server Protocols documentation. The prefix of the canonical name identifies the basic characteristics of a property to the implementer.

The canonical naming structure uses three categories that are denoted by the following prefixes to the canonical **property name**:

- PidLid prefix: Properties identified by an unsigned 32-bit quantity along with a property set.
- PidName prefix: Properties identified by a string name along with a property set.
- PidTag prefix: Properties identified by an unsigned 16-bit quantity.

**Description:** A brief description of the contents of the property.

Preliminary

Copyright © 2012 Microsoft Corporation.

**Data type:** The property value type, as described in [MS-OXCDATA], that specifies the type of values allowed for the property.

**Property ID:** An unsigned 16-bit quantity that identifies a **tagged property**. Property IDs are not necessarily unique. With the exception of property IDs in the range from 0x6800 to 0x7BFF (see section 1.3.3), the combination of property ID and data type are unique. Property IDs in the range from 0x6800 to 0x7BFF are defined by the **message class**.

**Property long ID (LID):** An unsigned 32-bit quantity that, along with the **property set**, identifies a **named property**.

**Property name:** A string that, along with the property set, identifies a named property.

**Property set:** A **GUID** that identifies a group of properties with a similar purpose.

**Defining references:** One or more technical specifications that describe the semantics and allowed values for the property.

**Consuming references:** One or more technical specifications that refer to the property but do not describe semantics and allowed values.

### 1.3.3 Property ID Ranges

The 65,536 possible values of the property ID are divided into sub-ranges reserved for various purposes, as described in the following table.

In this context, the term "non-transmittable" refers specifically to transmission via an e-mail transport protocol (such as **SMTP**), and not to any network transport protocol (such as **TCP**):

- Servers do not allow property IDs in ranges specified as non-transmittable to be submitted for transport to another server via an e-mail transport protocol. Property IDs in ranges not specified as non-transmittable are submitted for transport to another server.
- Clients can use properties in ranges described as message class-defined for application-defined purposes. When doing so, applications specify a value for the **PidTagMessageClass** property (section 2.854) that is distinct from any value listed in section 1.3.1.
- Clients can use any named property for application-defined purposes. No constraint is placed on the value of the **PidTagMessageClass** property in this case, but the property set of the named property is distinct from any value listed in section 1.3.2. Note that named properties are always transmittable.
- Clients can use properties in ranges specified as transport-defined, but they cannot define new properties in those ranges.
- Clients can use and define properties in ranges specified as user-defined, but need to avoid conflicts with alternate definitions of the same property ID.

| Range minimum | Range maximum | Description |
|---|---|---|
| 0x0001 | 0x0BFF | Message object envelope property; reserved |
| 0x0C00 | 0x0DFF | **Recipient (1)** property; reserved |

| 0x3000 | 0x33FF | Multi-purpose property that can appear on all or most objects; reserved |
| 0x3400 | 0x35FF | Message **store** property; reserved |
| 0x3600 | 0x36FF | Folder and **address book container** property; reserved |
| 0x3700 | 0x38FF | Attachment property; reserved |

| 0x7C00 | 0x7FFF | Message class-defined non-transmittable property |
| 0x8000 | 0xFFFF | Reserved for mapping to named properties. For more information about the static mapping of **NSPI** property names to property IDs that occurs in this ID range, see [MS-OXNSPI]. |

### 1.3.4 WebDAV Property Naming

The e-mail server is natively a **Messaging Application Programming Interface (MAPI)** store where the vast majority of properties in it are MAPI properties. The **WebDAV** implementation uses the **Augmented Backus-Naur Form (ABNF)** notation, as described in [RFC5234], as a way to name MAPI properties, allowing Web Distributed Authoring and Versioning Protocol (WebDAV) clients to work with these properties directly.

The http://schemas.microsoft.com/mapi/ namespace is used to access MAPI properties directly on the server. The namespace consists of three sub namespaces: proptag, id, and string. The ABNF notation used to specify the format of these namespaces is described in this section.

#### 1.3.4.1 http://schemas.microsoft.com/mapi/proptag Namespace

The http://schemas.microsoft.com/mapi/proptag namespace is used to access properties on the server that are identified by a property ID. The implementer can access these properties through WebDAV by appending the hexadecimal property ID value and the hexadecimal **property type** value to the namespace prefix.

Copyright © 2012 Microsoft Corporation.

Preliminary

```
proptag-specifier = "http://schemas.microsoft.com/mapi/proptag/x" property-id property-type

property-id = 4HEXDIG

property-type = 4HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/proptag/x0037001f (PidTagSubject)
```

#### 1.3.4.2 http://schemas.microsoft.com/mapi/id Namespace

The http://schemas.microsoft.com/mapi/id namespace is used to access named properties on the server that are identified by a property **long ID (LID)**. The implementer can access these properties through WebDAV by appending the property set and the hexadecimal property long ID (LID) value to the namespace prefix.

```
id-specifier = "http://schemas.microsoft.com/mapi/id/" property-set "/x" property-long-id

property-set = "{" 8HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 4HEXDIG "-" 12HEXDIG "}"

property-long-id = 8HEXDIG
```

Example:

```
http://schemas.microsoft.com/mapi/id/{00062002-0000-0000-C000-000000000046}/x00008213
(PidLidAppointmentDuration)
```

#### 1.3.4.3 http://schemas.microsoft.com/mapi/string Namespace

The http://schemas.microsoft.com/mapi/string namespace is used to access named properties on the server that are identified by a property name. The implementer can access these properties through WebDAV by appending the property set and the property name to the namespace prefix.

```
string-specifier = "http://schemas.microsoft.com/mapi/string/" property-set "/" property-name

property-set = "{" 8*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "-" 4*HEXDIG "-" 12*HEXDIG "}"

property-name = 1*CHAR
```

Example:

```
http://schemas.microsoft.com/mapi/string/{00020329-0000-0000-C000-000000000046}/Subject
(PidNameSubject)
```

## 1.6 Versioning and Localization

None.

## 1.7 Vendor-Extensible Fields
