# 1 Introduction

The Sharing Message Object Protocol is used to share **mailbox** folders between clients. This protocol extends the Message and Attachment Object Protocol, which is described in [\[MS-OXCMSG\]](#).

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [\[RFC2119\]](#). Sections 1.5 and 1.9 are also normative but do not contain those terms. All other sections and examples in this specification are informative.

## 1.1 Glossary

The following terms are specific to this document:

**address book:** A collection of **Address Book objects**, each of which are contained in any number of address lists.

**Address Book object:** An entity in an **address book** that contains a set of attributes (1), each attribute with a set of associated values.

**big-endian:** Multiple-byte values that are byte-ordered with the most significant byte stored in the memory location with the lowest address.

**Folder object:** A messaging construct that is typically used to organize data into a hierarchy of objects containing Message objects and folder associated information (FAI) Message objects.

**handle:** Any token that can be used to identify and access an object such as a device, file, or a window.

**long ID (LID):** A 32-bit quantity that, in combination with a GUID, defines a **named property**.

**mailbox:** A message store that contains email, calendar items, and other **Message objects** for a single recipient.

**Message object:** A set of properties that represents an email message, appointment, contact, or other type of personal-information-management object. In addition to its own properties, a Message object contains recipient properties that represent the addressees to which it is addressed, and an attachments table that represents any files and other Message objects that are attached to it.

**named property:** A property that is identified by both a GUID and either a string name or a 32-bit identifier.

**named property set:** A GUID that groups related named properties into a set.

**property ID:** A 16-bit numeric identifier of a specific attribute (1). A property ID does not include any property type information.

**property name:** A string that, in combination with a property set, identifies a **named property**.

**recipient:** An entity that is in an address list, can receive email messages, and contains a set of attributes (1). Each attribute has a set of associated values.

**remote operation (ROP):** An operation that is invoked against a server. Each ROP represents an action, such as delete, send, or query. A ROP is contained in a ROP buffer for transmission over the wire.

**ROP request:** See ROP request buffer.

**ROP response:** See ROP response buffer.

**sharing invitation:** A type of **Sharing Message object** that informs a user that the user was granted access to another user's folder and provides the information necessary to locate that folder.

**Sharing Message object:** A **Message object** that is used to inform a recipient that they were granted access to another user's folder, request access to a recipient's folder, or respond to a request for access to a folder.

**sharing provider:** A software agent that is responsible for properly generating and processing a predefined **Sharing Message object** format.

**sharing request:** A type of **Sharing Message object** that is used to request access to a user's folder.

**sharing response:** A type of **Sharing Message object** that is used to respond to a sharing request.

**special folder:** One of a default set of **Folder objects** that can be used by an implementation to store and retrieve user data objects.

**Uniform Resource Locator (URL):** A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [\[RFC1738\]](#).

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.3 Overview

The Sharing Message Object Protocol allows a user to invite, request, accept, and deny the sharing of that user's **mailbox** folder. To communicate about the sharing of a folder, this protocol uses the **Sharing Message object**. The properties that are specific to a Sharing Message object facilitate granting access to a folder, requesting access to a folder, or responding to a request for access to a folder.

This protocol extends the Message and Attachment Object Protocol, which is described in [\[MS-OXCMSG\]](#), in that it defines new properties on a **Message object** and adds constraints to the existing properties of a Message object.

## 1.4 Relationship to Other Protocols

This protocol has the same dependencies as the Message and Attachment Object Protocol, as described in [\[MS-OXCMSG\]](#). This protocol is a peer of the Email Object Protocol, which is described in [\[MS-OXOMSG\]](#).

For conceptual background information and overviews of the relationships and interactions between this and other protocols, see [\[MS-OXPROTO\]](#).

## 1.5 Prerequisites/Preconditions

The Sharing Message Object Protocol has the same prerequisites and preconditions as the Message and Attachment Object Protocol, as specified in [\[MS-OXCMSG\]](#).

## 1.6 Applicability Statement

The client can use this protocol to send and respond to requests about the sharing of a folder in the user's mailbox.

The Sharing Message Object Protocol cannot be used to convey information about any type of object other than a **Folder object**.

## 1.7 Versioning and Capability Negotiation

None.

## 1.8 Vendor-Extensible Fields

This protocol provides no vendor-extensibility beyond what is specified in [\[MS-OXCMSG\]](#).

## 1.9 Standards Assignments

None.

Preliminary

## 2 Messages

### 2.1 Transport

The Sharing Message Object Protocol uses the same underlying transport as that used by the Message and Attachment Object Protocol, as specified in [\[MS-OXCMSG\]](#).

### 2.2 Message Syntax

A Sharing Message object can be created and modified by clients and servers. Except where noted, this section defines constraints under which both clients and servers operate.

Clients operate on Sharing Message objects by using the Email Object Protocol specified in [\[MS-OXOMSG\]](#) and the Message and Attachment Object Protocol specified in [\[MS-OXCMSG\]](#). How a server operates on Sharing Message objects is implementation-dependent, but the results of any such operation MUST be exposed to clients in a manner that is consistent with the Sharing Message Object Protocol.

Unless otherwise specified, a Sharing Message object adheres to all property constraints specified in [\[MS-OXPROPS\]](#) and all property constraints specified in [\[MS-OXCMSG\]](#).

Where a property's value is specified as a hexadecimal string representation of a binary value, the characters composing the string represent the hexadecimal digits that reflect the byte sequence of the binary value. For example, the string "00000000DCA740C8" is the hexadecimal string representation of the following byte sequence.

```
00 00 00 00 DC A7 40 C8
```

Where a property's value is specified as a hexadecimal string representation of an integer value, the characters composing the string represent the hexadecimal digits that reflect the integer value in **big-endian** format. Leading "0" characters are not included. For example, the hexadecimal string representation of the integer 0x0000010B is "10B".

#### 2.2.1 Common Message Object Properties

## 3 Protocol Details

### 3.1 Client Details

The client creates and manipulates a Sharing Message object and in all other ways operates within the client role, as specified in [\[MS-OXCMSG\]](#).

#### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

A Sharing Message object extends the Message object. In all other ways, the abstract data model of this protocol does not differ from that specified in [\[MS-OXCMSG\]](#) section 3.1.1.

#### 3.1.2 Timers

None.

#### 3.1.3 Initialization

None.

#### 3.1.4 Higher-Layer Triggered Events

##### 3.1.4.1 Creating a Sharing Invitation

When a user creates a sharing response to deny a sharing request, the client creates a Message object as specified in [\[MS-OXCMSG\]](#) and sets properties in accordance with the requirements in sections [2.2.1](#), [2.2.2](#), and [2.2.5](#). The client addresses and sends the response as specified in [\[MS-OXOMSG\]](#).

The client then opens the sharing request as specified in [\[MS-OXCMSG\]](#) and sets the properties in accordance with the requirements in section [2.2.4](#) to indicate that the request was denied. The client saves the sharing request as specified in [\[MS-OXCMSG\]](#).

## 4 Protocol Examples

Kendall Keil wants to see Ryan Gregg's calendar special folder. Kendall sends a sharing request to Ryan and Ryan responds.

The following is a description of what a client might do to accomplish this scenario and the responses a server might return. For details about the **remote operations (ROPs)** used in this example, see [\[MS-OXCPRPT\]](#) and [\[MS-OXCMSG\]](#).

Before manipulating Sharing Message objects, the client sends a **RopGetPropertyIdsFromNames ROP request** ([\[MS-OXCROPS\]](#) section 2.2.8.1) to ask the server to map each **named property** to a **property ID**. The following table lists each named property with its **named property set** GUID and its **long ID (LID)** or **property name**. The server's **RopGetPropertyIdsFromNames ROP response** provides the corresponding property IDs, as shown in the subsequent table.

#### 4.1 Sending a Sharing Request

Kendall's client creates a sharing request by using the **RopCreateMessage** ROP ([\[MS-OXCROPS\]](#) section 2.2.6.2). The server returns a success code and a **handle** to a Message object.

The client then sets the properties on the sharing request by using the **RopSetProperties** ROP ([\[MS-OXCROPS\]](#) section 2.2.8.6), as shown in the following table.

After addressing the message as described in [\[MS-OXOMSG\]](#), the client sends the message to Ryan by using the **RopSubmitMessage** ROP ([\[MS-OXCROPS\]](#) section 2.2.7.1) and then releases the Message object by using the **RopRelease** ROP ([\[MS-OXCROPS\]](#) section 2.2.15.3).

## 4.2 Denying a Sharing Request

Ryan wants to send a sharing response denying the sharing request that is described in section [4.1](#). The client creates a new Message object by using the **RopCreateMessage** ROP ([\[MS-OXCROPS\]](#) section 2.2.6.2). The server returns a success code and a handle to a Message object.

The client then sets the properties on the sharing response by using the **RopSetProperties** ROP ([\[MS-OXCROPS\]](#) section 2.2.8.6), as shown in the following table.

After addressing the message as described in [\[MS-OXOMSG\]](#), the client sends the message to Kendall by using the **RopSubmitMessage** ROP ([\[MS-OXCROPS\]](#) section 2.2.7.1) and then releases the Message object by using the **RopRelease** ROP ([\[MS-OXCROPS\]](#) section 2.2.15.3).

Then, the client opens the sharing request by using the **RopOpenMessage** ROP ([\[MS-OXCROPS\]](#) section 2.2.6.1). The server returns a success code and a handle to the Message object.

The client sets properties on the sharing request to indicate that the client has sent a sharing response denying the request and to specify the time at which the response was sent, as shown in the following table. The client sets these properties by using the **RopSetProperties** ROP ([\[MS-OXCROPS\]](#) section 2.2.8.6).

### 4.3 Accepting a Sharing Request

## 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

- Microsoft Exchange Server 2007
- Microsoft Exchange Server 2010
- Microsoft Exchange Server 2013
- Microsoft Office Outlook 2007
- Microsoft Outlook 2010
- Microsoft Outlook 2013
- Microsoft Outlook 2016 Preview

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> [Section 2.2.2.8](#): Office Outlook 2007 sets the value of the **PidLidSharingInitiatorName** property (section [2.2.2.8](#)) but, upon receipt, ignores the property and queries the **address book** for its value based on the **PidLidSharingInitiatorEntryId** property (section [2.2.2.7](#)).

<2> [Section 2.2.2.9](#): Office Outlook 2007 sets the value of the **PidLidSharingInitiatorSmtip** property (section [2.2.2.9](#)) but, upon receipt, ignores the property and queries the address book for its value based on the **PidLidSharingInitiatorEntryId** property (section [2.2.2.7](#)).

<3> [Section 2.2.2.14](#): Office Outlook 2007 sets the value of the **PidLidSharingProviderName** property (section [2.2.2.14](#)) but, upon receipt, ignores the property and instead uses a custom value based on the **PidLidSharingProviderGuid** property (section [2.2.2.12](#)).

<4> [Section 2.2.2.15](#): Office Outlook 2007 sets the value of the **PidNameXSharingProviderName** property (section [2.2.2.15](#)) but, upon receipt, ignores the property and instead uses a custom value based on the **PidLidSharingProviderGuid** property (section [2.2.2.12](#)).

<5> [Section 2.2.2.16](#): Office Outlook 2007 sets the value of the **PidLidSharingProviderUrl** property (section [2.2.2.16](#)) but, upon receipt, ignores the property and instead uses a custom value based on the **PidLidSharingProviderGuid** property (section [2.2.2.12](#)).

<6> [Section 2.2.2.17](#): Office Outlook 2007 sets the value of the **PidNameXSharingProviderUrl** property (section [2.2.2.17](#)) but, upon receipt, ignores the property and instead uses a custom value based on the **PidLidSharingProviderGuid** property (section [2.2.2.12](#)).

<7> [Section 2.2.3](#): Office Outlook 2007 sets these properties regardless of the type of Sharing Message object.

<8> [Section 2.2.3.5](#): Office Outlook 2007 sets the **PidLidSharingRemoteType** property to the same value as the **PidLidSharingLocalType** property (section [2.2.2.10](#)) but, upon receipt, ignores the property and uses only the **PidLidSharingLocalType** property to determine behavior.

<9> [Section 2.2.3.6](#): Office Outlook 2007 sets the **PidNameXSharingRemoteType** property to the same value as the **PidLidSharingLocalType** property (section [2.2.2.10](#)) but, upon receipt, ignores the property and uses only the **PidLidSharingLocalType** property to determine behavior.

<10> [Section 2.2.6](#): Office Outlook 2007 sets differing subsets of these properties in different scenarios, but their values have no meaning in the context of this protocol.

## 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).
