## 1.3 Protocol Overview (Synopsis)

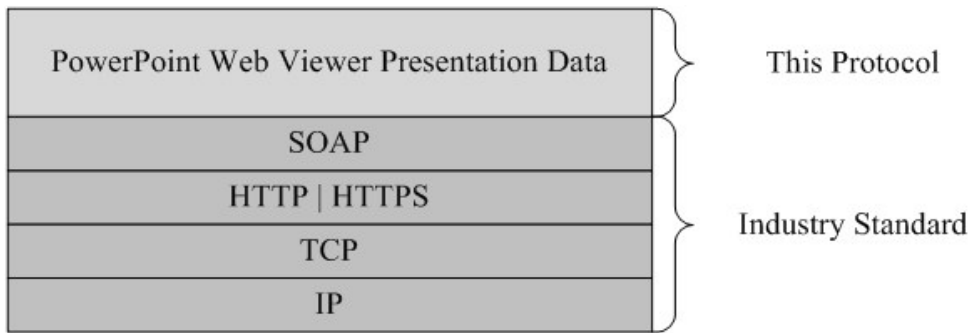

This protocol enables a protocol client to send a request to retrieve information about **presentation** content from the protocol server. To facilitate this, the protocol allows the protocol client to request specific pieces of content from a presentation stored on the protocol server. In a **presentation slide** contained within a presentation, a protocol client can retrieve information describing the presentation slide contents as well as images of the presentation slide contents.

The protocol also enables an attendee client to send requests to a protocol server allowing the client to join a **broadcast** session, and to retrieve data about the state of a broadcast on the protocol server.

## 1.4 Relationship to Other Protocols

This protocol uses the **SOAP** message protocol for formatting request and response messages, as described in [\[SOAP1.1\]](#), [\[SOAP1.2/1\]](#) and [\[SOAP1.2/2\]](#). It transmits those messages by using **HTTP**, as described in [\[RFC2616\]](#), or **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#).

The following diagram shows the underlying messaging and transport stack used by the protocol:

**Figure 1: This protocol in relation to other protocols**

## 1.5 Prerequisites/Preconditions

This protocol operates against a **website (1)** that is identified by a **URL** that is known by protocol clients. The protocol server endpoint is formed by appending "/p/ppt/view.svc" or "/\_vti\_bin/ppt/view.svc" to the URL of the website (1), for example <http://www.contoso.com/p/ppt/view.svc>.

This protocol assumes that authentication has been performed by the underlying protocols.

## 1.6 Applicability Statement

This protocol is designed to retrieve information about presentations that are stored on the protocol server.

## 1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following area: **Supported Transports:** This protocol uses multiple transports with SOAP as specified in section [2.1](#).

## 1.8 Vendor-Extensible Fields

None.

## 1.9 Standards Assignments

None.

## 2 Messages

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the protocol. The **WSDL** in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the protocol as specified restricts the same elements to being non-empty, not null, and present.

### 2.1 Transport

Protocol servers **MUST** support SOAP over HTTP. Protocol servers **SHOULD** additionally support SOAP over HTTPS for securing communication with clients. Protocol servers **SHOULD** support JSON [\[RFC4627\]](#) over HTTP and HTTPS.

Protocol messages **MUST** be formatted as specified either in [\[SOAP1.1\]](#) section 4 or in [\[SOAP1.2/1\]](#) section 5. Protocol server faults **MUST** be returned either using HTTP Status Codes, as specified in [\[RFC2616\]](#) section 10 or using **SOAP faults**, as specified in either [\[SOAP1.1\]](#) section 4.4 or in [\[SOAP1.2/1\]](#) section 5.4.

### 2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses XML Schema as defined in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and WSDL as defined in [\[WSDL\]](#).

#### 2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

### **2.2.6 Attributes**

This specification does not define any common XML schema attribute definitions.

### **2.2.7 Groups**

This specification does not define any common XML schema group definitions.

### **2.2.8 Attribute Groups**

This specification does not define any common XML schema attribute group definitions.

### 3 Protocol Details

In the following sections, the schema definition might differ from the processing rules imposed by the protocol. The WSDL in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL might specify differences that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **not null**, and **present**.

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret HTTP status codes returned by the protocol server as specified in [\[RFC2616\]](#) (Section 10, Status Code Definitions).

This protocol allows protocol servers to notify protocol clients of application-level faults using SOAP faults. Except where specified, these SOAP faults are not significant for interoperability, and protocol clients can interpret them in an implementation-specific manner.

This protocol allows protocol servers to perform implementation-specific authorization checks and notify protocol clients of authorization faults either using HTTP status codes or using SOAP faults as specified previously in this section.

#### 3.1 Server Details

The following high-level sequence diagram illustrates the operation of the protocol.

**Figure 2: PowerPoint Web Viewer Presentation Data Protocol high-level sequence diagram.**

First, a protocol client sends the **IPptService\_GetPresentationId\_InputMessage SOAP message** as specified in [\[MS-PWEDPS\]](#) section 3.1.4.27 to obtain a valid **presentationId** within an **IPptService\_GetPresentationId\_OutputMessage**. Next, a protocol client sends an [IPptViewingService\\_GetPresentation\\_InputMessage](#) message and the protocol server responds with an [IPptViewingService\\_GetPresentation\\_OutputMessage](#) containing information about the requested presentation. Next, the protocol client sends one or more [IPptViewingService\\_GetSlide\\_InputMessage](#) messages and the protocol server responds with an

[IPptViewingService\\_GetSlide\\_OutputMessage](#) containing information about the requested presentation slide.

The following high-level sequence diagram illustrates the operation of the attendee client protocol.

**Figure 3: PowerPoint Web Viewer Presentation Data Protocol high-level sequence diagram for attendee clients.**

First, a protocol client acting as slide show broadcast attendee sends a [BroadcastJoinSession](#) message and the protocol server responds with a [BroadcastJoinSessionResponse](#) message to acknowledge the request. Next, the protocol client sends one or more [BroadcastGetData](#) messages and the server sends a [BroadcastGetDataResponse](#) message containing the current data about the state of a broadcast. Finally, the protocol client SHOULD [BroadcastUnjoinSession](#) message to unjoin from the session and the protocol server will respond with a [BroadcastUnjoinSessionResponse](#) message. To obtain a valid **presentationId** for use with the protocol methods [GetPresentation](#) and [GetSlide](#), a protocol client acting as a slide show broadcast attendee sends a **GetMetadataXml** request as specified in [\[MS-OMPWHP\]](#) section 3.1.4.1.1. A valid **presentationId** is the value of the query string parameter named "presentationId" in the **url** attribute of **slideImage** element in the **mobilePres** root element returned by the **GetMetadataXml** method, as specified in [\[MS-PWVRSC\]](#) section 2.3.10.

### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The protocol server maintains the following data across all messages exchanged during a presentation session:

- **presentationId**: An entity which represents a unique identifier for a presentation.

The protocol server maintains the following data across all messages exchanged during a broadcast session:

- **SessionId**: An entity which represents a unique identifier for a broadcast session.

### 3.1.2 Timers

None.

### 3.1.3 Initialization

The protocol server MUST expose its Web methods at the following URL, which builds upon a base URL. The URL SHOULD<40> conform to the following structure: *base URL/p/ppt/view.svc*. This is the minimal required structure. Case-sensitivity is specific to the protocol server implementation.

### 3.1.4 Message Processing Events and Sequencing Rules

Section 3.1 specifies the sequencing of the protocol messages and how they relate to each other. The following sections specify the details of each individual message.

The following table summarizes the list of operations as defined by this specification.

Operation	Description
<b>BinaryConvert</b>	The <b>BinaryConvert</b> operation is used to convert a presentation from the binary file format for a PPT file (.ppt) described in [MS-PPT] to the Office Open XML File Format Specification PresentationML format described in the [ISO/IEC29500:2011] specification.
<b>BroadcastGetData</b>	The <b>BroadcastGetData</b> operation SHOULD<41> be used by the broadcast attendee to retrieve information about the current state of the broadcast on the protocol server.
<b>BroadcastJoinSession</b>	The <b>BroadcastJoinSession</b> operation SHOULD<42> be used to join an attendee client to a slide show broadcast session.
<b>BroadcastUnjoinSession</b>	The <b>BroadcastUnjoinSession</b> operation SHOULD<43> be used to unjoin an attendee client from a slide show broadcast session.

<b>GetPresentation</b>	The <b>GetPresentation</b> protocol method returns information about the content of a specified presentation.
<b>GetPresentationInfoXml</b>	Reserved. MUST not be called.
<b>GetSlide</b>	The <b>GetSlide</b> protocol method returns information about the content of a specified presentation slide contained within a specified presentation.
<b>GetSlideInfo</b>	Reserved. MUST not be called.
<b>LogULS</b>	Reserved. MUST not be called.
<b>Print</b>	A <b>Print</b> operation SHOULD<44> be used to print a presentation.

## 4 Protocol Examples

The following example contains a sample interaction between the protocol client and the protocol server.

### 4.1 Interaction Between Protocol Client and Protocol Server

The protocol client sends a request to the PowerPoint Web Editor Data Protocol [\[MS-PWEDPS\]](#) server for the identifier of a presentation. The following **IPptService\_GetPresentationId\_InputMessage** message is sent to the protocol server:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentationId
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointEditServer
      InternalService/">
      <rawDocId>/Shared Documents/MyFile.pptx</rawDocId>
    </GetPresentationId>
  </s:Body>
</s:Envelope>
```

The protocol server responds with the appropriate identifier for the presentation. The following **IPptService\_GetPresentationId\_OutputMessage** message is sent to the protocol client:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentationIdResponse
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointEditServer
      InternalService/">
      <GetPresentationIdResult>d=F39bc64b0ef8e43c493bc0191f7fb5371m371f1619a41e40dd8a9a007e0723241f
      m18af359c163142ad81aa5449d829efd1m</GetPresentationIdResult>
    </GetPresentationIdResponse>
  </s:Body>
</s:Envelope>
```

Next, the protocol client sends a request to the protocol server for information about the presentation. The following **IPptViewingService\_GetPresentation\_InputMessage** message is sent to the protocol server:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentation
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingSer
      vice/"><presentationId>d=F39bc64b0ef8e43c493bc0191f7fb5371m371f1619a41e40dd8a9a007e0723241fm1
      8af359c163142ad81aa5449d829efd1m</presentationId>
      <powerpointView>ReadingView</powerpointView>
    </GetPresentation>
  </s:Body>
</s:Envelope>
```

The protocol server responds with the appropriate information about the presentation. The following **IPptViewingService\_GetPresentation\_OutputMessage** message is sent to the protocol client:

Next, the protocol client sends a request to the protocol server for information about a presentation slide. The **slideInfoId** is specified by the **sldInfo** child element of the [CT\\_SlideEntry](#) element in the response of the previous request. The following **IPptViewingService\_GetSlide\_InputMessage** message is sent to the protocol server:

    </GetSlide>
  </s:Body>
</s:Envelope>

```

The protocol server responds with the appropriate information about the presentation slide. The following **IPptViewingService\_GetSlide\_OutputMessage** message is sent to the protocol client:

#### 4.1.1 Interaction Between Attendee Protocol Client and Protocol Server

The attendee protocol client begins by sending a request to the protocol server to join the slide show broadcast. The following **BroadcastJoinSessionSoapIn** message () is sent to the protocol server:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastJoinSession
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
      <sessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</sessionId>
    </BroadcastJoinSession>
  </soap:Body>
</soap:Envelope>

```

The protocol server responds with a message to acknowledge the request and to provide host information and a session identifier to be used by the attendee protocol client for future requests. The following **BroadcastJoinSessionSoapOut** message is sent to the attendee protocol client:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastJoinSessionResult>
      <Result xsi:type="BroadcastUser">
        <SessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</SessionId>
        <UserToken>f52b7833-6167-438f-b71d-ea99219c4da3</UserToken>
      </Result>
    </BroadcastJoinSessionResult>
  </soap:Body>
</soap:Envelope>

```

Next, the attendee protocol client requests information about the current state of the slide show broadcast from the protocol server. The following **BroadcastGetDataSoapIn** message is sent to the protocol server:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastGetData
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService">

```

```

    <User>
      <SessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</SessionId>
      <UserToken>f52b7833-6167-438f-b71d-ea99219c4da3</UserToken>
    </User>
  </BroadcastGetData>
</soap:Body>
</soap:Envelope>

```

The protocol server responds with information about the current state of the slide show broadcast. The following **BroadcastGetDataSoapOut** message is sent to the attendee protocol client:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastGetDataResponse>
      <BroadcastGetDataResult>
        <Result xsi:type="BroadcastData">
          <SlideShowState>Normal</SlideShowState>
          <HostToken> /sites/broadcast/9d51d0b1f4774b6893cb728c0ba15a57/faf48352-f17f-
46ed-ad44-9adac3fd37bb.pptx</HostToken>
          <SlideId>256</SlideId>
          <AnimationStepDataList>
            <BroadcastAnimationStepData>
              <TimelineId>0_anim</TimelineId>
              <Step>0</Step>
            </BroadcastAnimationStepData>
          </AnimationStepDataList>
          <SequenceNumber>2</SequenceNumber>
        </Result>
      </BroadcastGetDataResult>
    </BroadcastGetDataResponse>
  </soap:Body>
</soap:Envelope>

```

The attendee protocol client continues to send **BroadcastGetDataSoapIn** messages to request the latest state of the slide show broadcast.

Finally, the attendee protocol client unjoins from the slide show broadcast by sending **BroadcastUnjoinSessionSoapIn** message to the protocol server:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastUnjoinSession
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
      <sessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</sessionId>
    </BroadcastUnjoinSession>
  </soap:Body>
</soap:Envelope>

```

The protocol server responds by sending the **BroadcastUnjoinSessionSoapOut** message to the attendee protocol client:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">

```

```
<soap:Body>
  <BroadcastUnjoinSessionResponse
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
    <BroadcastUnjoinSessionResult xmlns:a="http://schemas.datacontract.org/2004/07/p"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
      <a:Error i:nil="true"/><a:Result i:nil="true"/>
    </BroadcastUnjoinSessionResult>
  </BroadcastUnjoinSessionResponse>
</soap:Body>
</soap:Envelope>
```

## 5 Security

### 5.1 Security Considerations for Implementers

A [GetNotesHtmlServiceResultResponse](#) contains [\[HTML\]](#) fragments. HTML fragments are susceptible to **cross-site scripting** attacks. Implementers are advised to sanitize these HTML fragments when generating or processing a [GetNotesHtmlServiceResultResponse](#).

There are no additional security considerations that are specific to this protocol. General security considerations pertaining to [\[RFC2822\]](#) apply.

### 5.2 Index of Security Parameters

None.

## 8 Appendix C: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Microsoft Office Home and Business 2010
- Microsoft Office Home and Student 2010
- Microsoft Office Professional 2010
- Microsoft Office Professional Plus 2010
- Microsoft Office Standard 2010

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. ## 9 Change Tracking

This section identifies changes that were made to the [MS-PWVPDP] protocol document between the February 2013 and July 2013 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
