Preliminary

1 Introduction

The PowerPoint Web Viewer Presentation Data Protocol enables a protocol client to obtain information about presentation content on a protocol server.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [\[RFC2119\]](#). Sections 1.5 and 1.9 are also normative but do not contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are specific to this document:

broadcast: A style of resource location or data transmission in which a client makes a request to all parties on a network simultaneously (a one-to-many communication). Also, a mode of resource location that does not use a name service.

comment: An annotation that is associated with a cell, text, or other object to provide context-specific information or reviewer feedback.

Coordinated Universal Time (UTC): A high-precision atomic time standard that approximately tracks Universal Time (UT). It is the basis for legal, civil time all over the Earth. Time zones around the world are expressed as positive and negative offsets from UTC. In this role, it is also referred to as Zulu time (Z) and Greenwich Mean Time (GMT). In these specifications, all references to UTC refer to the time at UTC-0 (or GMT).

cross-site scripting: A type of security vulnerability that enables malicious users to insert client-side script into webpages and to run that script when those pages are viewed by other users. The script might then gain access to user-specific data, such as cookies, cached objects, and application settings. Also referred to as XSS.

hit test region: An area that is configured to execute an action, such as opening the destination of a hyperlink, in response to user input, such as a mouse click or key press.

hyperlink: A relationship between two anchors, as described in [\[RFC1866\]](#).

Hypertext Transfer Protocol (HTTP): An application-level protocol for distributed, collaborative, hypermedia information systems (text, graphic images, sound, video, and other multimedia files) on the World Wide Web.

Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS): An extension of **HTTP** that securely encrypts and decrypts webpage requests.

main master slide: A slide that defines the formatting and content that can be used by presentation slides. If a slide uses formatting and content from a main master slide, it is referred to as following a main master slide.

motion path: A set of related coordinates, typically in pixels, that define how to render an object, such as a curve or line, or an animation. Also referred to as path.

presentation: A collection of slides that are intended to be viewed by an audience.

presentation broadcast: A feature that enables users to run a presentation over the web. The presentation is saved in HTML format and can contain audio and video. It can also be recorded and saved for viewing later.

presentation slide: A slide that contains the content that can be displayed during a slide show. A presentation slide can derive formatting and content from a main master slide or a title master slide.

shape: A collection of qualifiers, such as names, and quantifiers, such as coordinates, that is used to represent a geometric object. A shape can be contained in a document, file structure, run-time structure, or other medium.

slide layout: An organizational scheme, such as Title Only or Comparison, for content on a presentation slide.

slide show: A delivery of a sequence of presentation slides, typically to an audience.

slide show broadcast: A delivery of a sequence of presentation slides, typically to an audience, as a single session between a protocol server and one or more protocol clients.

SOAP: A lightweight protocol for exchanging structured information in a decentralized, distributed environment. **SOAP** uses XML technologies to define an extensible messaging framework, which provides a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation-specific semantics. SOAP 1.2 supersedes SOAP 1.1. See [\[SOAP1.2-1/2003\]](#).

SOAP action: The HTTP request header field used to indicate the intent of the **SOAP** request, using a URI value. See [\[SOAP1.1\]](#) section 6.1.1 for more information.

SOAP body: A container for the payload data being delivered by a **SOAP message** to its recipient. See [\[SOAP1.2-1/2007\]](#) section 5.3 for more information.

SOAP fault: A container for error and status information within a **SOAP message**. See [\[SOAP1.2-1/2007\]](#) section 5.4 for more information.

SOAP message: An XML document consisting of a mandatory SOAP envelope, an optional SOAP header, and a mandatory **SOAP body**. See [\[SOAP1.2-1/2007\]](#) section 5 for more information.

ToolTip: A small pop-up window that provides brief context-sensitive help when users point to an item. Also referred to as ScreenTip.

Uniform Resource Locator (URL): A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [\[RFC1738\]](#).

view: See form view (Microsoft InfoPath), list view (SharePoint Products and Technologies), or View (Microsoft Business Connectivity Services).

Web Services Description Language (WSDL): An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.

website: A group of related webpages that is hosted by a server on the World Wide Web or an intranet. Each website has its own entry points, metadata, administration settings, and workflows. Also referred to as site.

WSDL message: An abstract, typed definition of the data that is communicated during a **WSDL operation**, as described in [\[WSDL\]](#).

WSDL operation: A single action or function of a web service. The execution of a WSDL operation typically requires the exchange of messages between the service requestor and the service provider.

XML namespace: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].

XML namespace prefix: An abbreviated form of an **XML namespace**, as described in [XML].

XML schema: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by XML itself. An XML schema provides a view of a document type at a relatively high level of abstraction.

XML Schema (XSD): A language that defines the elements, attributes, namespaces, and data types for XML documents as defined by [XMLSCHEMA1/2] and [W3C-XSD] standards. An XML schema uses XML syntax for its language.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.3 Protocol Overview (Synopsis)

This protocol enables a protocol client to send a request to retrieve information about **presentation** content from the protocol server. To facilitate this, the protocol allows the protocol client to request specific pieces of content from a presentation stored on the protocol server. In a **presentation slide** contained within a presentation, a protocol client can retrieve information describing the presentation slide contents as well as images of the presentation slide contents.

The protocol also enables an attendee client to send requests to a protocol server allowing the client to join a **broadcast** session, and to retrieve data about the state of a broadcast on the protocol server.

1.4 Relationship to Other Protocols

This protocol uses the **SOAP** message protocol for formatting request and response messages, as described in [\[SOAP1.1\]](#), [\[SOAP1.2/1\]](#) and [\[SOAP1.2/2\]](#). It transmits those messages by using **HTTP**, as described in [\[RFC2616\]](#), or **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [\[RFC2818\]](#).

The following diagram shows the underlying messaging and transport stack used by the protocol:

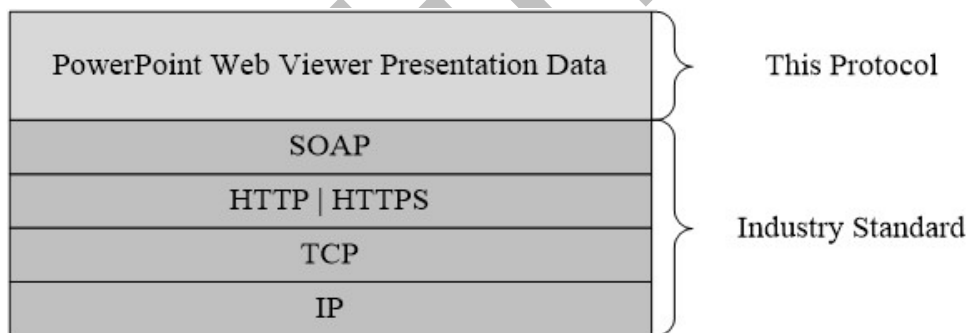

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol operates against a **website** that is identified by a **URL** that is known by protocol clients. The protocol server endpoint is formed by appending "/p/ppt/view.svc" or "/_vti_bin/ppt/view.svc" to the URL of the website, for example <http://www.contoso.com/p/ppt/view.svc>.

This protocol assumes that authentication has been performed by the underlying protocols.

1.6 Applicability Statement

This protocol is designed to retrieve information about presentations that are stored on the protocol server.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following area:**Supported Transports:** This protocol uses multiple transports with SOAP as specified in section [2.1](#).

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

Preliminary

2 Messages

In the following sections, the schema definition might differ from the processing rules imposed by the protocol. The **WSDL** in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL might specify differences that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **not null**, and **present**.

2.1 Transport

Protocol servers **MUST** support SOAP over HTTP. Protocol servers **SHOULD** additionally support SOAP over HTTPS for securing communication with clients. Protocol servers **SHOULD** support JSON [\[RFC4627\]](#) over HTTP and HTTPS.

Protocol messages **MUST** be formatted as specified either in [\[SOAP1.1\]](#) section 4 or in [\[SOAP1.2/1\]](#) section 5. Protocol server faults **MUST** be returned either using HTTP Status Codes, as specified in [\[RFC2616\]](#) section 10 or using **SOAP faults**, as specified in either [\[SOAP1.1\]](#) section 4.4 or in [\[SOAP1.2/1\]](#) section 5.4.

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses **XML schema (XSD)** as defined in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and WSDL as defined in [\[WSDL\]](#).

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

2.2.6 Attributes

This specification does not define any common XML schema attribute definitions.

2.2.7 Groups

This specification does not define any common XML schema group definitions.

2.2.8 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

3 Protocol Details

In the following sections, the schema definition might differ from the processing rules imposed by the protocol. The WSDL in this specification matches the WSDL that shipped with the product and provides a base description of the schema. The text that introduces the WSDL might specify differences that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be **empty**, **null**, or **not present** but the behavior of the protocol as specified restricts the same elements to being **non-empty**, **not null**, and **present**.

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret HTTP status codes returned by the protocol server as specified in [RFC2616](#) (Section 10, Status Code Definitions).

This protocol allows protocol servers to notify protocol clients of application-level faults using SOAP faults. Except where specified, these SOAP faults are not significant for interoperability, and protocol clients can interpret them in an implementation-specific manner.

This protocol allows protocol servers to perform implementation-specific authorization checks and notify protocol clients of authorization faults either using HTTP status codes or using SOAP faults as specified previously in this section.

3.1 Server Details

The following high-level sequence diagram illustrates the operation of the protocol.

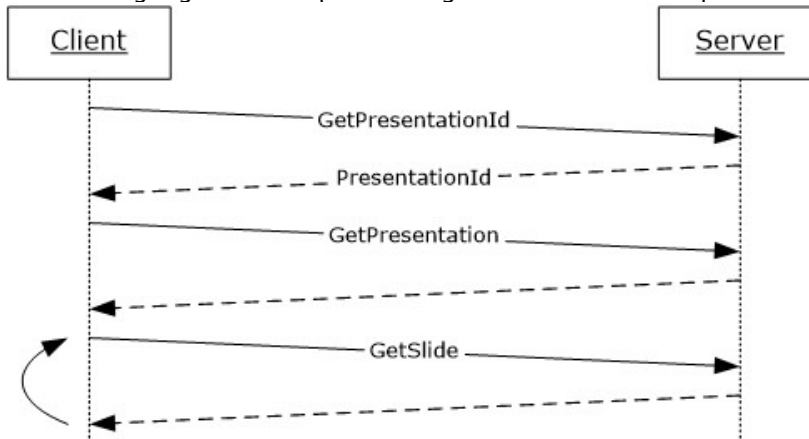

Figure 2: PowerPoint Web Viewer Presentation Data Protocol high-level sequence diagram.

First, a protocol client sends the **IPptService_GetPresentationId_InputMessage SOAP message** as specified in [\[MS-PWEDPS\]](#) section 3.1.4.10 to obtain a valid **presentationId** within an **IPptService_GetPresentationId_OutputMessage**. Next, a protocol client sends an **IPptViewingService_GetPresentation_InputMessage** (section [3.1.4.6.1.1](#)) message and the protocol server responds with an **IPptViewingService_GetPresentation_OutputMessage** (section [3.1.4.6.1.2](#)) containing information about the requested presentation. Next, the protocol client sends one or more **IPptViewingService_GetSlide_InputMessage** (section [3.1.4.9.1.1](#)) messages and the protocol server responds with an **IPptViewingService_GetSlide_OutputMessage** (section [3.1.4.9.1.2](#)) containing information about the requested presentation slide.

The following high-level sequence diagram illustrates the operation of the attendee client protocol.

Figure 3: PowerPoint Web Viewer Presentation Data Protocol high-level sequence diagram for attendee clients.

First, a protocol client acting as slide show broadcast attendee sends a **BroadcastJoinSession** (section 3.1.4.3.2.1) message and the protocol server responds with a **BroadcastJoinSessionResponse** (section 3.1.4.3.2.2) message to acknowledge the request. Next, the protocol client sends one or more **BroadcastGetData** (section 3.1.4.2.2.1) messages and the server sends a **BroadcastGetDataResponse** (section 3.1.4.2.2.2) message containing the current data about the state of a broadcast. Finally, the protocol client SHOULD send a **BroadcastUnjoinSession** (section 3.1.4.4.2.1) message to unjoin from the session and the protocol server will respond with a **BroadcastUnjoinSessionResponse** (section 3.1.4.4.2.2) message. To obtain a valid **presentationId** for use with the protocol methods **GetPresentation** (section 3.1.4.6) and **GetSlide** (section 3.1.4.8), a protocol client acting as a slide show broadcast attendee sends a **GetMetadataXml** request as specified in [MS-OMPWHP] section 3.1.4.1.1. A valid **presentationId** is the value of the query string parameter named "presentationId" in the **url** attribute of **slideImage** element in the **mobilePres** root element returned by the **GetMetadataXml** method, as specified in [MS-PWVRSC] section 2.3.10.

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The protocol server maintains the following data across all messages exchanged during a presentation session:

- **presentationId**: An entity which represents a unique identifier for a presentation.

The protocol server maintains the following data across all messages exchanged during a broadcast session:

- **SessionId**: An entity which represents a unique identifier for a broadcast session.

3.1.2 Timers

None.

3.1.3 Initialization

The protocol server MUST expose its Web methods at the following URL, which builds upon a base URL. The URL SHOULD <40> conform to the following structure: *base URL/p/ppt/view.svc*. This is the minimal required structure. Case-sensitivity is specific to the protocol server implementation.

3.1.4 Message Processing Events and Sequencing Rules

Section 3.1 specifies the sequencing of the protocol messages and how they relate to each other. The following sections specify the details of each individual message.

The following table summarizes the list of operations as defined by this specification.

Operation	Description
BinaryConvert	The BinaryConvert operation is used to convert a presentation from the binary file format for a PPT file (.ppt) described in [MS-PPT] to the Office Open XML File Format Specification PresentationML format described in the [ISO/IEC29500:2011] specification.
BroadcastGetData	The BroadcastGetData operation SHOULD <41> be used by the broadcast attendee to retrieve information about the current state of the broadcast on the protocol server.
BroadcastJoinSession	The BroadcastJoinSession operation SHOULD <42> be used to join an attendee client to a slide show broadcast session.
BroadcastUnjoinSession	The BroadcastUnjoinSession operation SHOULD <43> be used to unjoin an attendee client from a slide show broadcast session.
GetNotesHtmlServiceResult	The GetNotesHtmlServiceResult protocol method returns the presentation notes content of a specified presentation.
GetPresentation	The GetPresentation protocol method returns information about the content of a specified presentation.
GetPresentationInfoXml	Reserved. MUST not be called.
GetSlide	The GetSlide protocol method returns information about the content of a specified presentation slide contained within a specified presentation.
GetSlideInfo	Reserved. MUST not be called.
LogULS	Reserved. MUST not be called.
Print	A Print operation SHOULD <44> be used to print a presentation.

3.1.4.1 BinaryConvert

The **BinaryConvert** operation is used to convert a presentation from the binary file format for a PPT file (.ppt) described in [MS-PPT] to the Office Open XML File Format Specification PresentationML format described in the [ISO/IEC29500:2011] specification.

The following is the WSDL port type specification of the **BinaryConvert WSDL operation**.

```
<wsdl:operation name="BinaryConvert" xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
```

```

    <wsdl:input
      wsaw:Action="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointView

4 Protocol Examples

The following example contains a sample interaction between the protocol client and the protocol server.

4.1 Interaction Between Protocol Client and Protocol Server

The protocol client sends a request to the PowerPoint Web Editor Data Protocol [\[MS-PWEDPS\]](#) server for the identifier of a presentation. The following **IPptService_GetPresentationId_InputMessage** message is sent to the protocol server:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentationId
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointEditServer
      InternalService/">
      <rawDocId>/Shared Documents/MyFile.pptx</rawDocId>
    </GetPresentationId>
  </s:Body>
</s:Envelope>
```

The protocol server responds with the appropriate identifier for the presentation. The following **IPptService_GetPresentationId_OutputMessage** message is sent to the protocol client:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentationIdResponse
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointEditServer

    </GetPresentationIdResponse>
  </s:Body>
</s:Envelope>
```

Next, the protocol client sends a request to the protocol server for information about the presentation. The following **IPptViewingService_GetPresentation_InputMessage** message is sent to the protocol server:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Body>
    <GetPresentation
      xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingSer

4.1.1 Interaction Between Attendee Protocol Client and Protocol Server

The attendee protocol client begins by sending a request to the protocol server to join the slide show broadcast. The following **BroadcastJoinSessionSoapIn** message () is sent to the protocol server:

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastJoinSession
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
      <sessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</sessionId>
    </BroadcastJoinSession>
  </soap:Body>
</soap:Envelope>
```

The protocol server responds with a message to acknowledge the request and to provide host information and a session identifier to be used by the attendee protocol client for future requests. The following **BroadcastJoinSessionSoapOut** message is sent to the attendee protocol client:

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastJoinSessionResult>
      <Result xsi:type="BroadcastUser">
        <SessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</SessionId>
        <UserToken>f52b7833-6167-438f-b71d-ea99219c4da3</UserToken>
      </Result>
    </BroadcastJoinSessionResult>
  </soap:Body>
</soap:Envelope>
```

Next, the attendee protocol client requests information about the current state of the slide show broadcast from the protocol server. The following **BroadcastGetDataSoapIn** message is sent to the protocol server:

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastGetData
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService">
      <User>
        <SessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</SessionId>
        <UserToken>f52b7833-6167-438f-b71d-ea99219c4da3</UserToken>
      </User>
    </BroadcastGetData>
  </soap:Body>
</soap:Envelope>
```

The protocol server responds with information about the current state of the slide show broadcast. The following **BroadcastGetDataSoapOut** message is sent to the attendee protocol client:

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <soap:Body>
    <BroadcastGetDataResponse>
      <BroadcastGetDataResult>
        <Result xsi:type="BroadcastData">
```

```

        <SlideShowState>Normal</SlideShowState>
        <HostToken> /sites/broadcast/9d51d0b1f4774b6893cb728c0ba15a57/faf48352-f17f-
46ed-ad44-9adac3fd37bb.pptx</HostToken>
        <SlideId>256</SlideId>
        <AnimationStepDataList>
            <BroadcastAnimationStepData>
                <TimelineId>0_anim</TimelineId>
                <Step>0</Step>
            </BroadcastAnimationStepData>
        </AnimationStepDataList>
        <SequenceNumber>2</SequenceNumber>
    </Result>
</BroadcastGetDataResult>
</BroadcastGetDataResponse>
</soap:Body>
</soap:Envelope>

```

The attendee protocol client continues to send **BroadcastGetDataSoapIn** messages to request the latest state of the slide show broadcast.

Finally, the attendee protocol client unjoins from the slide show broadcast by sending **BroadcastUnjoinSessionSoapIn** message to the protocol server:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <soap:Body>
        <BroadcastUnjoinSession
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
            <sessionId>601022d2-306a-43fb-8ffd-a4a739cba8c0</sessionId>
        </BroadcastUnjoinSession>
    </soap:Body>
</soap:Envelope>

```

The protocol server responds by sending the **BroadcastUnjoinSessionSoapOut** message to the attendee protocol client:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
    <soap:Body>
        <BroadcastUnjoinSessionResponse
xmlns="http://schemas.microsoft.com/office/PowerPoint/Server/WebServices/PowerPointViewingService/">
            <BroadcastUnjoinSessionResult xmlns:a="http://schemas.datacontract.org/2004/07/p"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
                <a:Error i:nil="true"/><a:Result i:nil="true"/>
            </BroadcastUnjoinSessionResult>
        </BroadcastUnjoinSessionResponse>
    </soap:Body>
</soap:Envelope>

```

5 Security

5.1 Security Considerations for Implementers

A **GetNotesHtmlServiceResultResponse** (section [3.1.4.5.2.2](#)) contains [\[HTML\]](#) fragments. HTML fragments are susceptible to **cross-site scripting** attacks. Implementers are advised to sanitize these HTML fragments when generating or processing a **GetNotesHtmlServiceResultResponse**.

There are no additional security considerations that are specific to this protocol. General security considerations pertaining to [\[RFC2822\]](#) apply.

5.2 Index of Security Parameters

None.

9 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
8 Appendix C: Product Behavior	Updated list of supported products.	Y	Content updated due to protocol revision.
