[MS-SPDIAG]:

SharePoint Diagnostics Web Service Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights**. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets**. Microsoft does not claim any trade secret rights in this documentation.
- **Patents**. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- **Trademarks**. The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Preliminary Documentation. This particular Open Specifications document provides documentation for past and current releases and/or for the pre-release version of this technology. This document provides final documentation for past and current releases and preliminary documentation, as applicable and specifically noted in this document, for the pre-release version. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this technology. Because this documentation might change between the pre-release version and the final

version of this technology, there are risks in relying on this preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

Revision Summary

Table of Contents

1 Introduction

The SharePoint Diagnostics Web Service Protocol enables a protocol client to submit diagnostic reports describing application errors that occur on the protocol client.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

endpoint: A communication port that is exposed by an application server for a specific shared service and to which messages can be addressed.

Hypertext Transfer Protocol (HTTP): An application-level protocol for distributed, collaborative, hypermedia information systems (text, graphic images, sound, video, and other multimedia files) on the World Wide Web.

Hypertext Transfer Protocol Secure (HTTPS): An extension of HTTP that securely encrypts and decrypts web page requests. In some older protocols, "Hypertext Transfer Protocol over Secure Sockets Layer" is still used (Secure Sockets Layer has been deprecated). For more information, see [SSL3] and [RFC5246].

SOAP: A lightweight protocol for exchanging structured information in a decentralized, distributed environment. **SOAP** uses XML technologies to define an extensible messaging framework, which provides a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation-specific semantics. SOAP 1.2 supersedes SOAP 1.1. See [SOAP1.2-1/2003].

SOAP action: The HTTP request header field used to indicate the intent of the **SOAP** request, using a **URI** value. See [SOAP1.1] section 6.1.1 for more information.

SOAP body: A container for the payload data being delivered by a **SOAP message** to its recipient. See [SOAP1.2-1/2007] section 5.3 for more information.

SOAP fault: A container for error and status information within a **SOAP message**. See [SOAP1.2-1/2007] section 5.4 for more information.

SOAP message: An XML document consisting of a mandatory SOAP envelope, an optional SOAP header, and a mandatory **SOAP body**. See [SOAP1.2-1/2007] section 5 for more information.

Uniform Resource Identifier (URI): A string that identifies a resource. The URI is an addressing mechanism defined in Internet Engineering Task Force (IETF) Uniform Resource Identifier (URI): Generic Syntax [RFC3986].

Uniform Resource Locator (URL): A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [RFC1738].

Web Services Description Language (WSDL): An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.

WSDL message: An abstract, typed definition of the data that is communicated during a **WSDL operation** [WSDL]. Also, an element that describes the data being exchanged between web service providers and clients.

WSDL operation: A single action or function of a web service. The execution of a WSDL operation typically requires the exchange of messages between the service requestor and the service provider.

XML fragment: Lines of text that adhere to XML tag rules, as described in [XML], but do not have a Document Type Definition (DTD) or schema, processing instructions, or any other header information.

XML namespace: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].

XML namespace prefix: An abbreviated form of an **XML namespace**, as described in [XML].

XML schema: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by XML itself. An XML schema provides a view of a document type at a relatively high level of abstraction.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

In many modern web pages, there is a large amount of code (for example, JavaScript) running in client web browser. To help diagnose common errors encountered with the web pages mentioned, it is desirable that the developers of the pages can get detailed information regarding these errors.

This protocol defines an operation that allows a protocol client to submit details about an error report (for example, call stack, error message, or operating environment). The developers can use the submitted error reports to discover and fix errors encountered by the users.

1.4 Relationship to Other Protocols

This protocol uses the **SOAP** message protocol for formatting request and response messages, as described in [SOAP1.1], [SOAP1.2-1/2007] and [SOAP1.2-2/2007]. It transmits those messages by using **HTTP**, as described in [RFC2616], or **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)**, as described in [RFC2818].

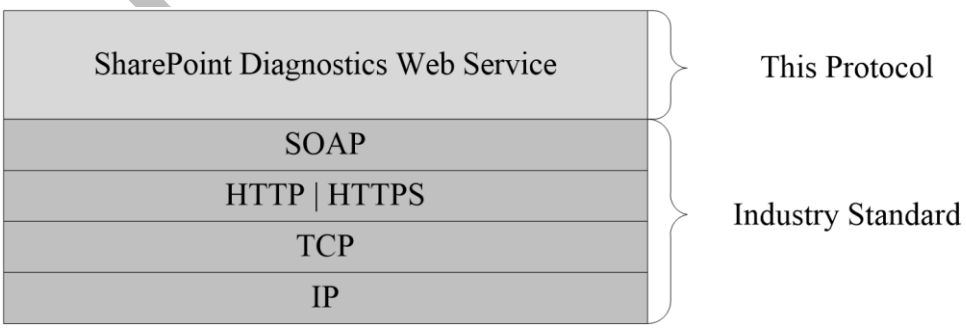

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions

This protocol operates against a protocol server that exposes one or more **endpoint URIs** that are known by protocol clients. The endpoint URI of the protocol server and the transport that is used by the protocol server are either known by the protocol client or obtained by using the discovery mechanism that is described in [MS-SPTWS].

The protocol client obtains the requisite ApplicationClassId and ApplicationVersion values and the endpoint URI of the protocol server that provides the discovery mechanism, as described in [MS-SPTWS], by means that are independent of either protocol.

This protocol requires the protocol client to have permission to call the methods on the protocol server.

The protocol client implements the token-based security mechanisms that are required by the protocol server and related security protocols, as described in [MS-SPSTWS].

1.6 Applicability Statement

This protocol is intended to transfer small amounts of data (less than 6 kilobytes) from a protocol client to a protocol server. Therefore, the protocol client is expected to gather and format relevant information (such as the call stack) in an **XML fragment**.

This protocol is not intended to transfer large regions of memory or other comprehensive error data collection from a protocol client.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Supported Transports**: This protocol can be implemented by using transports that support sending **Simple Object Access Protocol (SOAP)** messages, as described in section 2.1.
- **Protocol Versions**: This protocol is not versioned.

Capability Negotiation: This protocol does not support version negotiation.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

Protocol servers MUST support **SOAP** over **HTTP** or **HTTPS**.

All protocol messages MUST be transported by using HTTP bindings at the transport level.

Protocol messages MUST be formatted as specified in either [SOAP1.1] section 4 or [SOAP1.2-1/2007] section 5. Protocol server faults MUST be returned by using either HTTP status codes, as specified in [RFC2616] section 10, or **SOAP faults**, as specified in [SOAP1.1] section 4.4 or [SOAP1.2-1/2007] section 5.4.

If the HTTPS transport is used, a server certificate MUST be deployed.

This protocol MAY transmit an additional SOAP header, the **ServiceContex**t header, as specified in [MS-SPSTWS].

This protocol does not define any means for activating a protocol server or protocol client. The protocol server MUST be configured and begin listening in an implementation-specific way. In addition, the protocol client MUST know the format and transport that is used by the protocol server, for example, the SOAP format over an HTTP transport.

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses an **XML schema** as defined in [XMLSCHEMA1] and [XMLSCHEMA2], and **WSDL** as defined in [WSDL].

2.2.1 Namespaces

This specification defines and references various **XML namespaces** using the mechanisms specified in [XMLNS]. Although this specification associates a specific **XML namespace prefix** for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
http	http://schemas.xmlsoap.org/wsdl/http/	[RFC2616]
soap	http://schemas.xmlsoap.org/wsdl/soap/	[SOAP1.1]
soap12	http://schemas.xmlsoap.org/wsdl/soap12/	[SOAP1.2-1/2007] [SOAP1.2-2/2007]
tns	http://schemas.microsoft.com/sharepoint/diagnostics/	
wsdl	http://schemas.xmlsoap.org/wsdl/	[WSDL]
xs	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1/2] [XMLSCHEMA2/2]

2.2.2 Messages

This specification does not define any common **WSDL message** definitions.

2.2.3 Elements

This specification does not define any common **XML schema** element definitions.

2.2.4 Complex Types

This specification does not define any common **XML schema** complex type definitions.

2.2.5 Simple Types

This specification does not define any common **XML schema** simple type definitions.

2.2.6 Attributes

This specification does not define any common **XML schema** attribute definitions.

2.2.7 Groups

This specification does not define any common **XML schema** group definitions.

2.2.8 Attribute Groups

This specification does not define any common **XML schema** attribute group definitions.

3 Protocol Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret **HTTP** status codes returned by the protocol server as specified in [RFC2616] section 10.

This protocol allows protocol servers to notify protocol clients of application-level faults using SOAP faults. Except where specified, these **SOAP** faults are not significant for interoperability, and protocol clients can interpret them in an implementation-specific manner.

This protocol allows protocol servers to perform implementation-specific authorization checks and notify protocol clients of authorization faults either using HTTP status codes or using SOAP faults as specified previously in this section.

3.1 Server Details

The following diagram describes the communication between the protocol client and the protocol server.

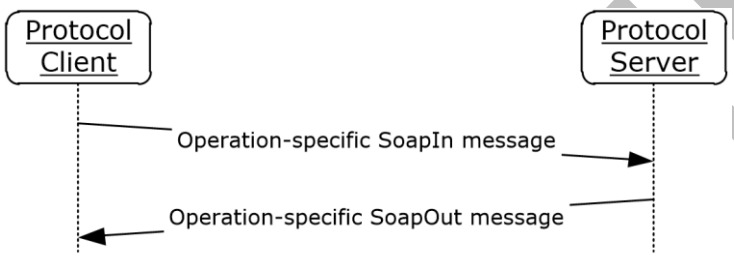

Figure 2: Message exchange between client and server

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

This protocol does not dictate any specific information required in the error report. If available, the error report data includes information about the client operating environment (such as web browser name, browser version, and protocol client language). The error report data includes information about the error (message, **URL**, line number, and call stack). The error report includes information about the origination of the error (application name, file name). The error report is specified in section 3.1.4.1.

3.1.2 Timers

None.

3.1.3 Initialization

None.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of operations as defined by this specification.

Operation	Description
SendClientScriptErrorReport	This operation is used to submit error reports originating from the protocol client to the protocol server.

3.1.4.1 SendClientScriptErrorReport

This operation is used to submit error reports originating from the protocol client to the protocol server.

The following is the **WSDL** port type specification of the **SendClientScriptErrorReport** **WSDL operation**.

```
<wsdl:operation name="SendClientScriptErrorReport"
xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/">
  <wsdl:input message="tns:SendClientScriptErrorReportSoapIn"/>
  <wsdl:output message="tns:SendClientScriptErrorReportSoapOut"/>
</wsdl:operation>
```

The protocol client sends a **SendClientScriptErrorReportSoapIn** request **WSDL message**, and the protocol server responds with a **SendClientScriptErrorReportSoapOut** response WSDL message.

3.1.4.1.1 Messages

The following table summarizes the set of **WSDL message** definitions that are specific to this operation.

Message	Description
SendClientScriptErrorReportSoapIn	The request WSDL message for the **SendClientScriptErrorReport** **WSDL operation**.
SendClientScriptErrorReportSoapOut	The response WSDL message for the **SendClientScriptErrorReport** WSDL operation.

3.1.4.1.1.1 SendClientScriptErrorReportSoapIn

The request **WSDL message** for the **SendClientScriptErrorReport** **WSDL operation**.

The **SOAP action** value is:

```
http://schemas.microsoft.com/sharepoint/diagnostics/SendClientScriptErrorReport
```

The **SOAP body** contains the **SendClientScriptErrorReport** element.

3.1.4.1.1.2 SendClientScriptErrorReportSoapOut

The response **WSDL message** for the **SendClientScriptErrorReport WSDL operation**.

The **SOAP body** contains the **SendClientScriptErrorReportResponse** element.

3.1.4.1.2 Elements

The following table summarizes the **XML schema** element definitions that are specific to this operation.

Element	Description
SendClientScriptErrorReport	The input data for the **SendClientScriptErrorReport WSDL operation**.
SendClientScriptErrorReportResponse	The result data for the **SendClientScriptErrorReport** WSDL operation.

3.1.4.1.2.1 SendClientScriptErrorReport

The **SendClientScriptErrorReport** element specifies the input data for the **SendClientScriptErrorReport WSDL operation**.

```
<xs:element name="SendClientScriptErrorReport" xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" maxOccurs="1" name="message" type="xs:string"/>
      <xs:element minOccurs="0" maxOccurs="1" name="file" type="xs:string"/>
      <xs:element minOccurs="1" maxOccurs="1" name="line" type="xs:int"/>
      <xs:element minOccurs="0" maxOccurs="1" name="client" type="xs:string"/>
      <xs:element minOccurs="0" maxOccurs="1" name="stack" type="xs:string"/>
      <xs:element minOccurs="0" maxOccurs="1" name="team" type="xs:string"/>
      <xs:element minOccurs="0" maxOccurs="1" name="originalFile" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

message: A string containing the message associated with the current error.

file: A string containing the **URL** file name associated with the current error.

line: An integer containing the line number associated with the current error.

client: A string argument representing the protocol client operating environment.<1>

stack: A string argument representing the call stack of the error.<2>

team: A string containing the application associated with the current error.

originalFile: A string containing the physical file name associated with the current error.

3.1.4.1.2.2 SendClientScriptErrorReportResponse

The **SendClientScriptErrorReportResponse** element specifies the result data for the **SendClientScriptErrorReport WSDL operation**.

```
<xs:element name="SendClientScriptErrorReportResponse"
xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:complexType>
    <xs:sequence>
      <xs:element minOccurs="0" maxOccurs="1" name="SendClientScriptErrorReportResult"
type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

SendClientScriptErrorReportResult: Implementation specific result. The protocol client MUST NOT rely on this data to follow any particular format.

3.1.4.1.3 Complex Types

None.

3.1.4.1.4 Simple Types

None.

3.1.4.1.5 Attributes

None.

3.1.4.1.6 Groups

None.

3.1.4.1.7 Attribute Groups

None.

3.1.5 Timer Events

None.

3.1.6 Other Local Events

None.

4 Protocol Examples

To submit an error report to the server, the protocol client constructs the following **SOAP message**:

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <SendClientScriptErrorReport
xmlns="http://schemas.microsoft.com/sharepoint/diagnostics/">
          <message>'null'%20is%20null%20or%20not%20an%20object</message>
          <file>init.debug.js</file>
          <line>407</line>
          <client>
                   &lt;client&gt;
                    &lt;browser name=&quot;Microsoft Internet Explorer&quot;
version=&quot;7&quot;/&gt;
                    &lt;useragent&gt;Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 6.0;
Trident/4.0; SLCC1; .NET CLR 2.0.50727; .NET CLR 1.1.4322; .NET CLR 3.5.30729; .NET CLR
3.0.30618; MS-RTC LM 8; InfoPath.2)&lt;/useragent&gt;
                    &lt;language&gt;en-us&lt;/language&gt;
&lt;location&gt;http://www.example.com/SitePages/Home.aspx&lt;/location&gt;
                    &lt;/client&gt;
           </client>
           <stack>
                    &lt;stack&gt;
                    &lt;function depth=&quot;0&quot; signature=&quot;CancelEvent(e)&quot;&gt;
                    &lt;![CDATA[function CancelEvent(e) {
                      ULSxSy:;
                      e.cancelBubble=true;
                      if(e.preventDefault)
                        e.preventDefault();
                      if(e.stopPropogation)
                        e.stopPropogation();
                      e.returnValue=false;
                      return false;
                      }]]&gt;
                    &lt;argument name=&quot;e&quot;
type=&quot;object&quot;&gt;{undefined}&lt;/argument&gt;
            </stack>
          <team>Example</team>
          <originalFile>init.debug.js</originalFile>
     </SendClientScriptErrorReport>
  </soap:Body>
</soap:Envelope>
```

The protocol server then responds with the following:

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <soap:Body>
  <SendClientScriptErrorReportResponse
xmlns="http://schemas.microsoft.com/sharepoint/diagnostics/">
    <SendClientScriptErrorReportResult>Example
     14.0.4020
     407
     'null' is null or not an object
     Microsoft Internet Explorer
     7
     init.debug.js  CancelEvent
    </SendClientScriptErrorReportResult>
  </SendClientScriptErrorReportResponse>
```

```
  </soap:Body>
</soap:Envelope>
```

5 Security

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Full WSDL

For ease of implementation, the full WSDL is provided in this appendix.

```
<?xml version="1.0" encoding="UTF-8"?>
<wsdl:definitions xmlns:soap12="http://schemas.xmlsoap.org/wsdl/soap12/"

  </wsdl:message>
</wsdl:definitions>
```

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft SharePoint Foundation 2010
- Microsoft SharePoint Foundation 2013
- Microsoft SharePoint Server 2016
- Microsoft SharePoint Server 2019
- Microsoft SharePoint Server Subscription Edition Preview

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 3.1.4.1.2.1: The string SHOULD be a valid **XML fragment** when all the predefined entities are replaced by their character references per XML Specification. SharePoint Foundation 2010 looks specifically for the following nodes (expressed using [XPATH] notation): `client/browser/@name`, `client/browser/@version`, and `client/language`. Other nodes in the XML fragment are ignored.

<2> Section 3.1.4.1.2.1: The string SHOULD be a valid XML fragment when all the predefined entities are replaced by their character references per XML Specification. SharePoint Foundation 2010 looks specifically for the following node (expressed using [XPATH] notation): `stack/function[@depth="0"]/@signature`. Other nodes in the XML fragment are ignored.

8 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
7 Appendix B: Product Behavior	Updated list of supported products.	Major
