Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- Copyrights. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- **Trademarks**. The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
6/27/2008	1.0	New	First release
8/15/2008	1.01	Minor	Revised and edited the technical content
10/6/2008	1.02	Minor	Revised and edited the technical content
1/16/2009	1.03	Minor	Updated the Intellectual Property Rights Notice
7/13/2009	1.04	Major	Changes made for template compliance
8/28/2009	1.05	Editorial	Revised and edited the technical content
11/6/2009	1.06	Editorial	Revised and edited the technical content
2/19/2010	2.0	Major	Updated and revised the technical content
3/31/2010	2.01	Editorial	Revised and edited the technical content
4/30/2010	2.02	Editorial	Revised and edited the technical content
6/7/2010	2.03	Minor	Updated the technical content
6/29/2010	2.04	Editorial	Changed language and formatting in the technical content.
7/23/2010	2.04	None	No changes to the meaning, language, or formatting of the technical content.
9/27/2010	2.05	Minor	Clarified the meaning of the technical content.
11/15/2010	2.05	None	No changes to the meaning, language, or formatting of the technical content.
12/17/2010	2.05	None	No changes to the meaning, language, or formatting of the technical content.
3/18/2011	2.05	None	No changes to the meaning, language, or formatting of the technical content.
6/10/2011	2.05	None	No changes to the meaning, language, or formatting of the technical content.
1/20/2012	2.6	Minor	Clarified the meaning of the technical content.
4/11/2012	2.6	None	No changes to the meaning, language, or formatting of the technical content.
7/16/2012	2.6	None	No changes to the meaning, language, or formatting of the technical content.
10/8/2012	2.7	Minor	Clarified the meaning of the technical content.
2/11/2013	2.7	None	No changes to the meaning, language, or formatting of the technical content.
7/30/2013	2.8	Minor	Clarified the meaning of the technical content.
11/18/2013	2.8	None	No changes to the meaning, language, or formatting of the technical content.
2/10/2014	2.8	None	No changes to the meaning, language, or formatting of the

Date	Revision History	Revision Class	Comments
			technical content.
4/30/2014	3.0	Major	Significantly changed the technical content.
7/31/2014	3.1	Minor	Clarified the meaning of the technical content.
10/30/2014	3.2	Minor	Clarified the meaning of the technical content.
3/16/2015	4.0	Major	Significantly changed the technical content.
9/4/2015	4.1	Minor	Clarified the meaning of the technical content.
7/15/2016	4.2	Minor	Clarified the meaning of the technical content.
8/23/2016	4.2	None	No changes to the meaning, language, or formatting of the technical content.
9/14/2016	4.2	None	No changes to the meaning, language, or formatting of the technical content.
10/17/2016	5.0	Major	Significantly changed the technical content.
6/20/2017	6.0	Major	Significantly changed the technical content.
9/19/2017	6.1	Minor	Clarified the meaning of the technical content.
12/12/2017	6.1	None	No changes to the meaning, language, or formatting of the technical content.
4/27/2018	7.0	Major	Significantly changed the technical content.
8/28/2018	8.0	Major	Significantly changed the technical content.
12/11/2018	8.0	None	No changes to the meaning, language, or formatting of the technical content.

1 Introduction

The Excel Binary File Format (.xls) Structure specifies the Excel Binary File Format (.xls). The Excel Binary File Format (.xls) is a collection of records and structures that specify **workbook** content, which can include unstructured or semi-structured tables of numbers, text, or both numbers and text, formulas, external data connections, charts, and images. Workbook content is typically organized in a grid based layout, and often includes numeric data, structured data, and formulas.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

- **3-D Phong shading**: A shading algorithm that is used to apply shading to 3-D charts. The algorithm interpolates color between points on the surface of a chart to give a smooth 3-D appearance.
- **A1**: A **reference style** in which each column is identified sequentially from left-to-right with a letter or series of letters in alphabetical order. Column headings are ordered A-Z, then AA-AZ, BA-BZ... ZA-ZZ, AAA-AAZ, and so forth. Each row is numbered sequentially from the top down.
- **absolute reference**: A reference to a fixed location on a **sheet (1)**. An absolute reference always refers to the same range, even if the formula that contains it is moved or copied to a new location.

accelerator key: Any combination of keys that are pressed simultaneously to run a command.

active cell: The cell that is currently selected in a worksheet.

active pane: The pane that currently has focus or contains the current selection or object.

active sheet: The sheet that is currently selected.

ActiveX control: A reusable software control, such as a check box or button, that uses ActiveX technology and provides options to users or runs macros or scripts that automate a task. See also **ActiveX object**.

ActiveX Data Objects (ADO): A data access interface that connects to, retrieves, manipulates, and updates data in **Object Linking and Embedding (OLE)** database-compliant data sources.

ActiveX object: An object that is supplied by a component that supports automation.

add-in: Supplemental functionality that is provided by an external application or macro to extend the capabilities of an application.

add-in function: A worksheet function that is provided by an add-in, instead of being built-in.

advanced filter: An extended filter option that enables users to specify complex filter criteria and a destination range for the filter results.

aggregation function: A function, such as sum or average, that appears in the total row of a table and is used to summarize data.

ALL: See OLAP All member.

alternate startup directory: A secondary location that stores files to be opened by an application when the application starts.

- American National Standards Institute (ANSI) character set: A character set defined by a code page approved by the American National Standards Institute (ANSI). The term "ANSI" as used to signify Windows code pages is a historical reference and a misnomer that persists in the Windows community. The source of this misnomer stems from the fact that the Windows code page 1252 was originally based on an ANSI draft, which became International Organization for Standardization (ISO) Standard 8859-1 [ISO/IEC-8859-1]. In Windows, the ANSI character set can be any of the following code pages: 1252, 1250, 1251, 1253, 1254, 1255, 1256, 1257, 1258, 874, 932, 936, 949, or 950. For example, "ANSI application" is usually a reference to a non-Unicode or code-page-based application. Therefore, "ANSI character set" is often misused to refer to one of the character sets defined by a Windows code page that can be used as an active system code page; for example, character sets defined by code page 1252 or character sets defined by code page 950. Windows is now based on Unicode, so the use of ANSI character sets is strongly discouraged unless they are used to interoperate with legacy applications or legacy data.
- **ASCII**: The American Standard Code for Information Interchange (ASCII) is an 8-bit character-encoding scheme based on the English alphabet. ASCII codes represent text in computers, communications equipment, and other devices that work with text. ASCII refers to a single 8-bit ASCII character or an array of 8-bit ASCII characters with the high bit of each character set to zero.
- **attribute hierarchy**: A single-level **hierarchy** that uses only an attribute or a column from a source, back-end relational database as its hierarchy. An attribute hierarchy typically has the same name as the attribute and is always associated with the attribute on which it is based. An all-level member can optionally be enabled for an attribute hierarchy. See also OLAP hierarchy.
- **Augmented Backus-Naur Form (ABNF)**: A modified version of Backus-Naur Form (BNF), commonly used by Internet specifications. ABNF notation balances compactness and simplicity with reasonable representational power. ABNF differs from standard BNF in its definitions and uses of naming rules, repetition, alternatives, order-independence, and value ranges. For more information, see [RFC5234].
- **AutoComplete**: A feature that suggests text automatically based on the first few characters that a user types.
- **AutoFilter**: A mechanism that can be used to filter tabular data based on user-defined criteria such as values, strings, and formatting.
- **AutoFormat**: A built-in set of complementary formatting options that can be applied to ranges of cells and other objects in a document.
- **AutoRecover**: A feature that recovers document and application states in the event of a hardware or software failure.
- **AutoShow**: A filter option that enables users to display a specified number of the top- or bottom-most items within a PivotTable field.
- **background color**: A color against which characters, patterns, and graphics are displayed. See also **foreground color**.
- **beta**: A pre-released version of a product that is sent to customers and partners for evaluation and feedback.
- **BIFF12**: A binary file format that is used to save workbooks in Microsoft Office Excel 2007 and Microsoft Excel 2010.
- BIFF2: A binary file format that is used by default to save worksheets in Microsoft Excel 2.1.
- **BIFF3**: A binary file format that is used by default to save worksheets in Microsoft Excel 3.0 for Windows.

- **BIFF4**: A binary file format that is used by default to save worksheets in Microsoft Excel 4.0 for Windows.
- **BIFF5**: A binary file format that is used by default to save workbooks in Microsoft Excel 5.0 for Windows and Microsoft Excel for Windows 95.
- **BIFF8**: A binary file format that is used to save workbooks in Microsoft Office Excel 2003 and earlier versions of Microsoft Excel.
- **big-endian**: Multiple-byte values that are byte-ordered with the most significant byte stored in the memory location with the lowest address.
- **Binary Interchange File Format (BIFF)**: The binary file formats that are used to save Excel workbooks.
- **block-level formatting**: A type of formatting that can be applied to a field or column in a table. It is applied to all existing records and automatically to new records.
- **border**: A line that can be applied to the outer edge of a cell, shape, object, or chart element. A border can be variously formatted for style, color, and thickness.
- **border formatting**: A set of properties that, as a whole, specify the appearance of a border, such as color, line style, and thickness.
- border style: See border formatting.
- **bounding rectangle**: A frame that encompasses an object. A bounding rectangle is not rotated and, therefore, always aligns along the x and y axes.
- **Briefcase**: A system folder in Windows that is used to share and synchronize files between computers.
- bubble size: A value that represents the diameter of a bubble in a bubble chart.
- **build identifier**: An integer that identifies a build.
- **build number**: A part of a sequential numbering system that is used to differentiate one version of a software product from another.
- **built-in name**: A member of the group of defined names that are reserved for specific functionality.
- **ButtonPopup control**: A type of Button control that displays a menu of related commands when activated.
- **calculation mode**: A setting that determines whether the formulas in a worksheet are recalculated automatically or manually. See also automatic calculation mode and manual calculation mode.
- **camera picture**: An image of a range of cells that is generated by using the camera tool. The image can be linked such that when the data in the source range changes, the image is updated automatically.
- **caption**: One or more characters that can be used as a label for display purposes or as an identifier.
- cascading style sheet (CSS): An extension to HTML that enables authors and users of HTML documents to attach style sheets to those documents, as described in [CSS-LEVEL1] and [CSS-LEVEL1] and [CSS-LEVEL1">[CSS-LEVEL1] and [CSS-LEVEL1"] and [CSS-L

- category: (1) A custom string that is used to group one or more documents.
 - (2) A subdivision of items into useful groups such as geographical regions. For example, categories that represent geographical regions could be North, South, East, and West.
- **category label**: A label that appears on the horizontal (x) axis of a chart and identifies the categories of the source data.
- **cell**: A box that is formed by the intersection of a row and a column in a worksheet or a table. A cell can contain numbers, strings, and formulas, and various formats can be applied to that data.
- **cell reference**: A set of coordinates that a cell occupies on a worksheet. For example, "B3" is the reference of a cell that appears at the intersection of column "B" and row "3".
- **cell value**: The text or numeric content of a cell, or the results of a formula. A cell value does not include a formula expression, cell formatting, or other metadata.
- **center-across-selection alignment**: A formatting setting that centers cell content horizontally within a selected range of cells.
- **centered alignment**: A formatting setting that specifies how content is positioned within the horizontal, vertical, or both horizontal and vertical space within a cell, object, or page. When centered, content is equidistant from the edges of the cell, object, or page.
- **character set**: A mapping between the characters of a written language and the values that are used to represent those characters to a computer.
- **chart area**: A region in a chart object that is used to position chart elements, render axes, and plot data.
- chart sheet: A single logical container that is used to create and store charts in a workbook.
- **checksum**: A value that is the summation of a byte stream. By comparing the checksums computed from a data item at two different times, one can quickly assess whether the data items are identical.
- **child**: An object that is immediately below the current object in a hierarchy.
- class identifier (CLSID): A GUID that identifies a software component; for instance, a DCOM object class or a COM class.
- **class module**: A module that contains the definition for a new object. Each instance of a class creates a new object, and procedures that are defined in the module become properties and methods of the object.
- **client area**: In an application, the display area that is used to create data, such as drawing or typing functions. The client area does not include toolbars, menus, or status bars.
- code page: An ordered set of characters of a specific script in which a numerical index (code-point value) is associated with each character. Code pages are a means of providing support for character sets and keyboard layouts used in different countries. Devices such as the display and keyboard can be configured to use a specific code page and to switch from one code page (such as the United States) to another (such as Portugal) at the user's request.
- **collapsed outline state**: A state in which the content that is nested within an outline is not displayed.
- **color palette**: A collection of colors that is available to format text, shapes, cells, and chart elements.

- **color scale**: A specific range of colors that is used to give additional meaning to data by assigning certain values to colors in the spectrum.
- **color scheme**: A table of color values that enables colors to be referenced by an index value in the table instead of a color value. See also **color palette**.
- column formula: A formula that is used in a calculated column.
- column outline: A nested grouping of columns in a worksheet.
- **comment**: An annotation that is associated with a cell, text, or other object to provide contextspecific information or reviewer feedback.
- **compact axis**: A state in which PivotTable members from different levels in a hierarchy are displayed in a single column.
- **Component Object Model (COM)**: An object-oriented programming model that defines how objects interact within a single process or between processes. In **COM**, clients have access to an object through interfaces implemented on the object. For more information, see [MS-DCOM].
- **conditional formatting**: A mechanism that changes the appearance of a user interface element based on the evaluation of a rule or expression.
- **connection string**: A series of arguments, delimited by a semicolon, that defines the location of a database and how to connect to it.
- consolidation range: A range of source data that is used in a data consolidation process.
- **cryptographic service provider**: An independent software module that performs authentication, encoding, and encryption services that Windows-based applications access through the CryptoAPI.
- **cube**: A set of data that is organized and summarized into a multidimensional structure that is defined by a set of **dimensions (1)** and **measures**.
- **cube function**: A function that is used to extract and display Online Analytical Processing (OLAP) data sets and values.
- custom color palette: A set of user-defined colors that is available for formatting.
- **custom filter**: A filter that contains preconfigured expressions in which users can optionally enter a string to filter data.
- custom list: A user-defined list or enumeration that can be used to sort data in a worksheet.
- **custom rollup**: An aggregation calculation that is customized for a dimension level, dimension member, or measure. A custom rollup contains a custom formula or operator, overrides the aggregate functions of a cube's measures, and is defined on a hierarchy.
- **custom view**: A collection of display and print settings that users can name and save. Users can switch between custom views to change settings quickly.
- **Data Access Objects (DAO)**: A programming interface that can be used to access and manipulate database objects.
- **data bar**: A graphical representation of cell content as a bar graph.
- **data consolidation**: The process of combining tabular data from various worksheets into a single list.

- **data marker**: A customizable symbol or shape that identifies a data point on a line, scatter, or radar chart. A data marker can be formatted with various sizes and colors.
- **data provider**: A known data source that is specific to a target type and that provides data to a collector type.
- **data recovery**: A process in which files are repaired through error correction or restored from backup media.
- **data region**: A region of a table that encompasses the range of cells that contains the table records. A data region does not include the **header row**, insert row, or total row of a table.
- **data source**: A database, web service, disk, file, or other collection of information from which data is gueried or submitted. Supported data sources vary based on application and data provider.
- **data table**: (1) A range of cells that is designated to perform what-if analysis for formulas, based on various input values.
 - (2) A grid that can be added to some charts and contains the numeric data that is plotted in the chart.
- **data validation**: The process of testing the accuracy of data; a set of rules that specify the type and range of data that users can enter.
- date system: A method of calculating calendar dates and times.
- **DDE link**: A connection between a **Dynamic Data Exchange (DDE)** source document and a destination document.
- **DDE server**: An application that responds to a **Dynamic Data Exchange (DDE)** request from a DDE client application.
- **DDE topic**: A general classification of information about a **Dynamic Data Exchange (DDE)** server within which multiple, specific data items related to the topic can be exchanged.
- **defined name**: A word or string of characters in a formula that represents a cell, range of cells, formula, or constant value.
- **descending order**: A sort order in which text strings are arranged in reverse alphabetical order, numerical values are arranged from largest to smallest, and dates and times are arranged from newest to oldest.
- **diagonal-down**: A cell **border formatting** that displays a line diagonally from the top left corner of a cell to the bottom right corner.
- **diagonal-up**: A cell **border formatting** that displays a line diagonally from the bottom left corner of a cell to the top right corner.
- dialog sheet: A single logical container that is used to create a custom dialog box.
- **dimension**: (1) A structural attribute of a cube, which is an organized hierarchy of categories (levels) that describe data in a fact table. These categories typically describe a similar set of members upon which the user bases an analysis.
 - (2) A categorization of data in rows or columns in an Excel worksheet.
- **display folder**: A folder into which attributes, measures, calculated members, and key performance indicators can be organized to facilitate browsing.
- **display units**: An axis-formatting option that determines how numeric units are displayed on a value axis.

- **distributed alignment**: A formatting setting that spreads text evenly, both vertically and horizontally, between the edges of a cell, object, or page. Distributed alignment is used primarily with East Asian languages. See also **justify distributed**.
- **document library**: A type of list that is a container for documents and folders.
- **double accounting**: An underline style that places two lines beneath the formatted text. Double accounting is frequently used to indicate totals.
- down bar: See up-down bar.
- **drawing**: A collection of drawing objects, such as shapes, curves, or WordArt, that are viewed together as a single image.
- **drawing group**: A collection of images that are designated by the user as a single group of images and manipulated as a single **drawing object**.
- **drawing object**: A shape, curve, line, WordArt, or other type of graphical object that can be inserted into a document.
- **drillthrough**: A query that is used to retrieve individual records that were used to calculate an aggregate value.
- **drop lines**: A set of supplemental lines on an area chart or a line chart. Drop lines increase the legibility of a chart by connecting each data point in a series to the category axis.
- **Dynamic Data Exchange (DDE):** An inter-process communication method that is featured in Windows. DDE allows two or more applications that are running simultaneously to exchange data and commands.
- **embedded object**: An object that is created by using one application and is hosted in a document that was created by using another application. Embedding an object, rather than inserting or pasting it, ensures that the object retains its original format. Users can double-click an embedded object and edit it with the toolbars and menus from the application that was used to create it. See also **Object Linking and Embedding (OLE)**.
- **Excel Linked Library (XLL)**: A Dynamic Link Library (DLL) that is authored to function as an **add-in** for Microsoft Excel.
- **Excel macro (XLM)**: A programming language that provides development capability in Microsoft Excel. XLM was superseded by Microsoft Visual Basic for Applications (VBA).
- **expand/collapse button**: A user interface control that is used to determine which hierarchical level is displayed in an outline, or in row and column groupings.
- **expression**: A combination of operators, symbols, constants, literal values, functions, names of fields or columns, controls, and properties that evaluates to a single value.
- external data: Data that is stored in a repository outside a workbook.
- **external link**: A reference to a cell, range, defined name, or other object in another worksheet or workbook.
- **fill**: A color, pattern, or other attribute that is used to format the background of a cell, shape, or chart element. See also **fill color** and **fill pattern**.
- **fill alignment**: A setting that repeats a cell value to fill the horizontal space of a cell. If the cell value exceeds the horizontal width of the cell, the value is truncated.
- fill color: A color that is used to fill the background of a cell, shape, or chart element.

fill pattern: A repetitive design that users can add to the background of a cell, shape, or chart element.

filter: A mechanism by which a set of data is scoped to display only those entries that meet specified logical criteria.

filtering state: A setting that indicates whether a filter value or filter date value is included as part of the criteria that is used to define the filter for an **AutoFilter**.

fit to page: A printing option that scales a document to print on a specified number of pages.

floating-point number: A number that is represented by a mantissa and an exponent according to a given base. The mantissa is typically a value between "0" and "1". To find the value of a floating-point number, the base is raised to the power of the exponent, and the mantissa is multiplied by the result.

floor: An extension of the horizontal axis, or the area created by the inclusion of the z axis, in a 3-D chart to create a three-dimensional effect. See also **wall**.

folder: A file system construct. File systems organize a volume's data by providing a hierarchy of objects, which are referred to as folders or directories, that contain files and can also contain other folders.

followed hyperlink: A hyperlink that has been activated by a user.

font: An object that defines the graphic design, or formatting, of a collection of numbers, symbols, and letters. A font specifies the style (such as bold and strikeout), size, family (a typeface such as Times New Roman), and other qualities to describe how the collection is drawn.

font face weight: A value that specifies the thickness of a font.

font family: A set of fonts that all have common stroke width and serif characteristics. For example, Times Roman and Times Roman Italic are members of the same font family.

font scaling: A process of resizing a proportionally-spaced font.

font scheme: A combination of complementary fonts in a **theme**.

forecast: The process of projecting values forward or backward in a series, based on trends in existing data.

foreground color: A color that is used to display text, patterns, and other objects that appear in front of or on top of the **background color**.

form: A structured document with controls and spaces that are reserved for entering and displaying information. Forms can contain special coding for actions such as submitting and querying data.

format string: A string that contains the number formatting information to apply to data, such as decimal position, percentage indicator, or currency symbol.

formatting run: A set of formatting properties that are applied to a text run.

formula bar: A user interface element that appears at the top of a worksheet and is used to display and edit cell content.

formula error checking: A mechanism that identifies invalid worksheet data, formulas, or formatting and then proposes corrections.

friendly name: A name for a user or object that can be read and understood easily by a human.

frozen: See frozen panes.

frozen panes: Portions of a worksheet that remain static and do not scroll when the worksheet is displayed in split pane view. See also **split pane**.

full screen view: A document view that expands the display of a document to fill the computer screen. The view hides menus, toolbars, and taskbars.

function: A code module that takes a value as input, performs an operation, and returns the results to a worksheet.

function category: A group of worksheet functions that are part of the same broad usage area, such as Finance or Statistical. A function category can be built-in or user-defined.

general alignment: A default formatting setting for the horizontal alignment of cell content in a worksheet. Text is positioned to the left and numbers are positioned to the right.

globally unique identifier (GUID): A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122]] or [C706]] must be used for generating the **GUID**. See also universally unique identifier (UUID).

gradient fill: A type of fill that applies gradient formatting to the background of a cell or an object.

gradient stop: A marker on a gradient spectrum that denotes where a specific color is introduced in gradient formatting.

grand total: An aggregation of all of the field subtotals in a PivotTable report.

graph object: An object that represents a chart and the datasheet that contains the data for that chart.

GraphicDropDown control: A type of DropDown control that can display custom graphics in a list of options.

gridline: A line that is drawn on a worksheet or table for use as a visual aid to distinguish between cells.

gutter: An area above a column heading and to the left of a row heading. A gutter typically displays outline symbols that are used to expand and collapse groups of cells.

hash: A fixed-size result that is obtained by applying a one-way mathematical function, which is sometimes referred to as a hash algorithm, to an arbitrary amount of data. If the input data changes, the hash also changes. The hash can be used in many operations, including authentication and digital signing.

header row: A row in a table, typically the first row, that contains labels for columns in the table.

hidden: A condition of an object that prevents it from being displayed in rendered output.

hidden cell: A cell that does not appear in a worksheet view because it is contained within a **hidden row** or a **hidden column**.

hidden column: A column that does not appear in a worksheet view because its width is set to 0 (zero). A column can be hidden if an outline is collapsed.

hidden protection: A cell protection property that prevents formulas, but not values, from appearing in a cell when a worksheet is **protected**.

- **hidden row**: A row that does not appear in a worksheet view because its height is set to "0" (zero). A row can be hidden if the data is filtered or an outline is collapsed.
- **hierarchy**: A logical tree structure that organizes the members of a dimension such that each member has one parent member and zero or more child members.
- **high-low lines**: Supplemental lines that are added to a line chart and connect the maximum data points of one series with the minimum data points of another series for each **category (2)**. High-low lines are typically used on stock charts.
- **horizontal alignment**: A formatting setting that specifies how content is positioned within the horizontal space of a cell, object, or page. Content can be aligned along the left or right edge, or distributed evenly across the horizontal space.
- **hyperlink**: A relationship between two anchors, as described in [RFC1866].
- **Hypertext Markup Language (HTML)**: An application of the Standard Generalized Markup Language (SGML) that uses tags to mark elements in a document, as described in <a href=[HTML].
- **icon**: A graphical image used to supplement alphanumeric text in the visual identification of an object on a computer monitor. **Icons** are typically small, relative to the size of the area on which they are displayed.
- icon set: A collection of icons that can be used to comment and classify data into categories.
- **indentation level**: A measure of the distance between the position of content that is in a cell and the logical left side of the cell. An indentation level is equal to three spaces.
- **Information Rights Management (IRM)**: A technology that provides persistent protection to digital data by using encryption, certificates, and authentication. Authorized recipients or users acquire a license to gain access to the protected files according to the rights or business rules that are set by the content owner.
- **ink**: A process of entering text in handwritten form. Instead of converting handwritten text to typed text, ink is converted to an object and displayed exactly as it was written.
- **inner rectangle**: In a cell that is formatted with a rectangular gradient, a rectangle that is formed by the leftmost, rightmost, topmost, and bottommost lines of pixels in which the initial color of the gradient is completely dissipated. See also **rectangular gradient**.
- input cell: A cell in which each input value from a data table is substituted.
- **input language**: A pairing of input language and input method. The pairing determines what language is currently being entered and how. The input language is usually determined by the keyboard language that is currently active in the operating system. Users can install keyboard layouts and Input Method Editors (IMEs) for several languages, and then switch between them at appropriate times to indicate the input language.
- **Input Method Editor (IME)**: An application that is used to enter characters in written Asian languages by using a standard 101-key keyboard. An IME consists of both an engine that converts keystrokes into phonetic and ideographic characters and a dictionary of commonly used ideographic words.
- **insert row**: A placeholder row at the bottom of a table. It is used to enter new records.
- **international macro sheet**: A macro sheet that displays English function names and operates with U.S. English locale settings, regardless of product locale, user locale, or system locale.
- **iterative calculation**: A **calculation mode** in which calculations are performed until a specific numeric condition is met or a maximum number of iterations is reached.

- **justify distributed**: A special, distributed-alignment setting that evenly distributes the last line of text in a cell. The setting is primarily used for East Asian languages. See also **distributed alignment**.
- **key performance indicator (KPI)**: A predefined measure that is used to track performance against a strategic goal, objective, plan, initiative, or business process. A visual cue is frequently used to communicate performance against the measure.
- **language code identifier (LCID)**: A 32-bit number that identifies the user interface human language dialect or variation that is supported by an application or a client computer.
- **leader line**: A line that connects a data label to its corresponding data point. The primary purpose of a leader line is to increase legibility.
- **left-to-right**: A reading order in which characters in words are read from left to right, and words are read from left to right in sentences.
- legend entry: An item in a chart legend that identifies a single series or category (2).
- legend key: A symbol that is associated with a legend entry.
- **library directory**: A directory in which Microsoft Excel **add-ins** are installed.
- **license key**: An array of bytes that enables access to a control according to the usage policies for that control.
- **line style**: A style, including width and dash type, that is applied to and alters the appearance of a line or **border**.
- **linear gradient**: A type of gradient fill in which the color of a cell or other object gradually changes horizontally, vertically, or diagonally from one edge of the object to the other.
- **linked object**: An object that is inserted into a document and continues to exist in a separate source file. If the object in the source file changes, the object in the document is updated automatically to reflect those changes.
- **list**: A container within a SharePoint site that stores list items. A list has a customizable schema that is composed of one or more fields.
- **list view**: A named collection of settings for querying and displaying items in a SharePoint list. There are two types of views: Personal, which can be used only by the user who created the view; and Public, which can be used by all users who have permission to access to the site.
- **little-endian**: Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.
- **local name**: A defined name whose scope is limited to a specific sheet instead of the entire workbook.
- **locale**: A collection of rules and data that are specific to a language and a geographical area. A locale can include information about sorting rules, date and time formatting, numeric and monetary conventions, and character classification.
- **localization**: The process of adapting an application or documentation, including text and non-text elements, to meet the language, cultural, and political expectations and requirements of a specific geographic country or region.
- **locked**: The condition of a cell, worksheet, or other object that restricts edits or modifications to it by users.

- **locked protection**: A cell-protection property that restricts the editing of cell content when a worksheet is **protected**.
- **logical left**: A position that is relative to the language orientation of a document. Logical left means left, except in a right-to-left language where it means right. Also referred to as leading edge.
- **logical right**: A position that is relative to the language orientation of a document. Logical right means right, except in a right-to-left language where it means left. Also referred to as trailing edge.
- **logical top-left**: A position that is relative to the language orientation of a document. Logical top-left is the upper-left corner of a range or object when in left-to-right mode. It is the upper-right corner when in right-to-left mode.
- **logical top-right**: A position that is relative to the language orientation of a document. Logical top-right is the upper-right corner of a range or object when in left-to-right mode. It is the upper-left corner when in right-to-left mode.
- **long file name**: A folder or file name that is longer than the 8.3 file name standard, which permits as many as eight characters followed by a period and a file name extension of three characters.
- **macro**: A set of instructions that are recorded or written, and then typically saved to a file. When a macro is run, all of the instructions are performed automatically.
- macro sheet: A single, logical container that is used to store and run Excel 4.0 macro formulas.
- **major gridline**: A horizontal or vertical line that is in the plot area of a chart and corresponds to the major scaling unit on an axis.
- major scheme: A font scheme that is used for primary text elements, such as headings and titles, in a theme.
- major tick mark: A tick mark that corresponds to a major scaling unit on an axis.
- **Mandarin phonetic symbols**: A phonetic system for transcribing Chinese through the use of an alphabet that includes characters for all possible sounds in the spoken Mandarin language.
- **manifest**: A file that stores metadata about an expansion pack, such as the name of the expansion pack, the files and resources that are included in the expansion pack, and the dependencies that it has on other files and components.
- **MD5**: A one-way, 128-bit hashing scheme that was developed by RSA Data Security, Inc., as described in [RFC1321].
- **MDX unique name**: A unique identifier for a multidimensional expression (MDX) member or value in a given Online Analytical Processing (OLAP) cube, for example "[Customer].[Customer Geography].[Country].&[Australia]".
- **measure**: In a cube, a set of values that are typically numeric and are based on a column in the fact table of the cube. Measures are the central values that are aggregated and analyzed.
- **measure group**: A collection of related **measures** in a **cube** that derive from a single fact table, typically in a data source view.
- member: (1) An identity that belongs to a shared space.
 - (2) See **OLAP member**.
- **member property**: An attribute on a data item within a specific dimension in an Online Analytical Processing (OLAP) database.

- **merge conflict**: A problem that occurs if two users are editing the same cell or other type of object in a workbook while changes are being merged in a shared workbook.
- merged cell: A single cell that is created by combining two or more adjacent cells.
- **messaging system service provider**: A business that supplies email and other messaging services to individuals, businesses, and other organizations.
- **metafile**: A file that stores an image as graphical objects, such as lines, circles, and polygons, instead of pixels. A metafile preserves an image more accurately than pixels when an image is resized.
- **Microsoft Office Web Components**: A set of controls that can be used to create data analysis and reporting solutions.
- **minimal save**: A process that saves only critical workbook data to disk when errors are detected during a file save operation.
- **minor gridline**: A horizontal or vertical line that is in the plot area of a chart and corresponds to the minor scaling unit on an axis.
- minor scheme: A font scheme that is used for secondary text elements, such as body text, in a theme.
- minor tick mark: A tick mark that corresponds to a minor scaling unit on an axis.
- **module**: A collection of routines and data structures that performs a specific task or implements a specific abstract data type. Modules usually consist of two parts, a module header and a module body. A module header is a set of name/value attribute pairs that specify the linguistic characteristics of the module. A module body is the VBA source code, a set of declarations followed by procedures. VBA supports two types of modules, procedural modules and class modules.
- **moving average**: A type of trendline that is calculated based on the most recent period of data points in a series.
- **Multidimensional Expressions (MDX)**: A syntax that is used for defining multidimensional objects, and for querying and manipulating multidimensional data.
- named range: See defined name.
- **narrow katakana**: A non-cursive **character set** that is used to write non-Japanese words phonetically in Japanese. Narrow katakana characters are represented with a single byte. Also referred to as half-width katakana.
- **natural language formula**: A syntax for referring to tabular data in formulas by using column and row labels instead of cell references.
- **natural language label**: A value of a cell or cells that identifies a range in a natural language formula. A label is typically the same as a column or row header in tabular data.
- **ninched**: A condition in which a group of selected cells or objects do not share a specific property. For example, if a selection has three cells and only two of the cells share the same color formatting, the color formatting of the selection is in a ninched state.
- **non-contiguous range**: A selected **range** that includes non-adjacent cells.
- **Normal view**: A document view that displays text formatting and a simplified page layout of a document. The Normal view hides some layout elements such as the header and footer. Referred to as Draft view in Microsoft Office Word 2007 and Microsoft Word 2010.

- **number format**: A property of a cell or other type of object that determines how numerical data is displayed or interpreted. For example, a currency number format affixes the proper currency symbol to the number.
- **obfuscation key**: A secret shared key combined with a cryptographic hash function that is intended to prevent a reversal of an encoding process. See also **XOR obfuscation**.
- **Object Linking and Embedding (OLE)**: A technology for transferring and sharing information between applications by inserting a file or part of a file into a compound document. The inserted file can be either embedded or linked. See also **embedded object** and **linked object**.
- **object model**: A collection of object-oriented APIs that represent data structures and are designed to promote software interoperability.
- **OCXDropDown control**: A type of DropDown control that displays a list of the ActiveX controls that are available within that application.
- **Office data connection (ODC) file**: A file that stores information about a connection to a data source, such as an Access database, worksheet, or text file. This file facilitates data source administration.
- **OLAP calculated member:** An **OLAP member** whose value is calculated at run time.
- **OLAP cube**: A data structure that aggregates **Online Analytical Processing (OLAP)** measures by **OLAP levels** and **OLAP hierarchies**. An OLAP cube combines several OLAP hierarchies, such as time, geography, and product lines, with OLAP measures, such as sales or inventory figures.
- **OLAP hierarchy**: An **attribute hierarchy** or a user-defined hierarchy in a data structure. By default, each dimension attribute has an attribute hierarchy. A user-defined hierarchy is a set of related attribute hierarchies that is used to facilitate browsing an **OLAP cube**.
- **OLAP KPI**: See key performance indicator (KPI).
- **OLAP level**: Within an **OLAP hierarchy**, a set of data that is organized into a lower or higher level of detail, such as Year, Quarter, Month, and Day levels in a Time hierarchy.
- **OLAP measure**: A set of numeric values in an **OLAP cube** that is used in aggregation and analysis.
- **OLAP measure group**: A collection of related **OLAP measures** in an **OLAP cube**. An OLAP cube can contain multiple measure groups.
- **OLAP member**: An item that is in an **OLAP level**. For example, a Canada member in a Country level of a Geography hierarchy.
- **OLAP member property**: A relationship between two **OLAP hierarchies**, such as a Population member property of a Country member.
- **OLAP named set**: A collection of **OLAP tuples** that have the same dimensionality. Also referred to as OLAP set.
- **OLAP set**: A collection of **OLAP tuples** with the same dimensionality. Also referred to as OLAP named set.
- **OLAP tuple**: An ordered collection of members that are from different dimensions of an **OLAP cube**. A single member is a special case of a tuple.
- **OLE compound file**: A form of structured storage, as described in [MS-CFB]. A compound file allows independent storages and streams to exist within a single file.

- **OLE DB**: A set of interfaces that are based on the Component Object Model (COM) programming model and expose data from a variety of sources. These interfaces support the amount of Database Management System (DBMS) functionality that is appropriate for a data store and they enable a data store to share data.
- **OLE link**: A connection between an **Object Linking and Embedding (OLE)** object and its OLE server. See also **DDE link**.
- OLE object: An object that supports the Object Linking and Embedding (OLE) protocol.
- **OLE server**: An application or DLL that supplies a linked or embedded OLE object to another application.
- OLE2: See Object Linking and Embedding (OLE).
- **one-variable data table**: A data table that consists of only one input cell, which is either a row input cell or a column input cell.
- **Online Analytical Processing (OLAP)**: A technology that uses multidimensional structures to provide access to data for analysis. The source data for OLAP is stored in data warehouses in a relational database. See also **cube**.
- **Open Database Connectivity (ODBC)**: A standard software API method for accessing data that is stored in a variety of proprietary personal computer, minicomputer, and mainframe databases. It is an implementation of [ISO/IEC9075-3:2008] and provides extensions to that standard.
- outline: A nested grouping of rows or columns that are in a worksheet.
- **outline effect**: A formatting effect in which a line is placed around the edge of a shape or around each character in a text string.
- **outline level**: The number of levels that a task is indented from the top level of an outline; the order associated with an outline.
- **outline state**: A setting that specifies whether an outline is currently outline expanded or outline collapsed.
- **out-of-memory**: A state of a computer or application when it halts because all of the available volatile memory has been allocated and none is currently available for reallocation.
- page break: A divider that breaks a worksheet into separate pages for printing. Page breaks are inserted automatically based on the paper size, margin settings, scaling options, and the positions of any page breaks that are inserted manually.
- **Page Break Preview view:** A worksheet view that displays the areas to be printed and the locations of page breaks.
- **Page Layout view**: A sheet view that displays a sheet as it would appear on a printed page, including margins, header and footer elements, and pagination.
- palette color: A specific color among those that are available on the active color palette.
- **pane**: A portion of a software window that has a distinct function and is bounded by and separated from other portions of the window by vertical or horizontal bars.
- **Pane control**: A type of toolbar control that hosts a window within itself. The hosted window is not constrained by the layout and control type options of a basic toolbar or a menu toolbar.

- **parameterized query**: A query that contains parameters. It applies to Open Database Connectivity (ODBC) and web queries. For example, a web query that retrieves stock quotes from a webpage can prompt users for a parameter, such as a stock symbol.
- phonetic guide: A set of supplemental phonetic symbols that appears above text in Japanese and other East Asian languages. A phonetic guide is displayed automatically and can be edited by the user.
- **phonetic information**: A series of characters that appear above text in a cell and provide information that helps users pronounce the text.
- **phonetic string**: A series of characters that appear above a string and provide information that helps users pronounce the string. Phonetic strings are typically used in East Asian languages.
- **phonetic text run**: A series of characters that are within a **phonetic string**.
- **PivotChart filter pane**: A user interface element that displays a list of active fields in a PivotChart view and is used to apply filters to those fields.
- **PivotTable field list**: A user interface element that displays a list of all of the fields in a PivotTable report. It can be used to populate a PivotTable report and to manipulate the fields.
- pixel: A discrete unit of display on a computer display device.
- **placeholder**: A character or symbol that is used in place of an actual value, text, or object. The actual value that the placeholder represents is unknown or unavailable at the current time, or is not displayed for security reasons.
- **plot area**: A portion of a chart area that contains the plotted data and axes.
- point: A unit of measurement for fonts and spacing. A point is equal to 1/72 of an inch.
- **Popup control**: A built-in or custom control on a menu bar or toolbar that displays a menu of related commands when clicked.
- post method: A method of submitting form data in the header of an HTTP request.
- **precision as displayed**: A calculation setting that permanently changes stored values in cells from full precision (15 digits) to the currently displayed format, including the number of decimal places.
- **primary pie**: The main chart in a bar of pie or pie of pie chart. A primary pie chart has one pie slice (data point) that is a grouping of data points.
- **print area**: A collection of one or more ranges of cells that are designated to be printed. If a worksheet includes a print area, only the content inside the print area is printed.
- **print settings**: The settings that specify how a file is printed in a specific print job, such as duplex or landscape orientation. Printer settings are settings that can differ from printer to printer but apply to every print job of a given printer. Print settings are values that typically vary between print jobs.
- **print titles**: The rows or columns that appear on each page when a page is printed. Print titles are typically used to print column headers above tabular data that spans several printed pages.
- **ProgID**: An identifier that is used by the Windows registry to uniquely identify an object and is in the form OLEServerName.ObjectName, for example, "Excel.Sheet" or "PowerPoint.Slide."
- **property stream**: A series of object properties that is used in processes such as checksum calculations.

- **protected**: A property that is applied manually to a file or a portion of a file, with or without a password, and that helps prevent users from accidentally or deliberately changing, moving, or deleting data.
- **protection**: A mechanism that helps restrict users from making unwanted changes to the data or structure of a workbook.
- **published**: A condition of portions of a workbook that are marked as being available to the user when that workbook is processed by a protocol server.
- published item: A specific named object that is in a published workbook.
- **query**: A formalized instruction to a data source to either extract data or perform a specified action. A query can be in the form of a query expression, a method-based query, or a combination of the two. The data source can be in different forms, such as a relational database, XML document, or in-memory object. See also search query.
- query table: A two-dimensional table that presents data from an external data source.
- **R1C1**: A **reference style** in which each row and each column has a numeric heading that is numbered sequentially from top to bottom and left to right, respectively. "R" stands for row and "C" stands for column.
- **range**: An addressable region that is in a workbook. A range typically consists of zero or more cells and represents a single, contiguous rectangle of cells on a single sheet.
- **reading order**: The positioning of characters in words and the positioning of words in sentences. This can be left-to-right or right-to-left.
- **read-only recommended**: A file sharing property that displays an alert when a file is being opened. The text of the alert recommends that the user open the file with read-only permission.
- **real-time data (RTD)**: Data that is pushed into a worksheet from an **RTD server** and is updated continually. Real-time data is frequently used to track stock prices or inventory levels in real time
- recalculate: The process of computing a value in a workbook by initiating a calculation repeatedly.
- **reconnect condition**: A condition that specifies whether to connect to a database again after a connection expires.
- **rectangular gradient**: A type of gradient fill in which the color of a cell or other object gradually changes with each successive inner rectangle of pixels.
- **red-green-blue-alpha (RGBA)**: A color model that describes color information in terms of the red (R), green (G), blue (B), and alpha (A) intensities that comprise a color.
- **reference style**: A system that is used in formulas to specify cells or ranges of cells. A reference style specifies a cell in a two-dimensional table by identifying the row and column that contain that cell or range of cells.
- **refresh**: A process that retrieves values from a data source and populates a workbook with those values.
- regional settings: See locale settings.
- **relative reference**: A reference to a location on a sheet that is relative to the cell that contains the reference. A relative reference can be stored as a cell reference or as an offset.
- **relative security descriptor**: A security descriptor that contains all associated security information in a contiguous block of memory.

result cell: A cell that contains the results of the calculation of changing cells in a scenario.

revision: A change in a document, file, or other object.

revision history: A list of data that describes document updates, such as when and by whom a document was modified.

revision record: Any of the records in the revision stream of a **shared workbook** that stores user edits to the workbook and other tracked information.

right-to-left: A reading and display order that is optimized for right-to-left languages.

routing slip: Information that specifies how a document is to be distributed from a document originator and processed by one or more recipients. It also specifies subject and message body text that is associated with the document routing process and routing status or workflow information.

routing stage: The current status of a document with a routing slip.

row outline: A mechanism for grouping and nesting the rows in a worksheet.

RTD server: A Component Object Model (COM) Automation server that is used by the real-time data (RTD) function to retrieve data in real time. The RTD server can exist as an ActiveX DLL or as an executable (.exe) file that runs on the same local computer or on a remote server.

RTD topic: A discrete combination of parameters that is used to request data from a real-time data (RTD) server.

ruler: A user interface element that enables users to adjust page margins and to measure and align objects in a document.

safe load: A process of loading a file in which additional error checking is performed and various corruption patterns in the file are detected and repaired.

scenario: A named set of input values (changing cells) that can be substituted in a worksheet model.

Scenario Manager: A process for creating and managing different sets of input values for calculation models in a worksheet.

secondary bar/pie: A secondary chart in a bar of pie or pie of pie chart that displays the detailed data of the grouped data point in the primary pie chart. The secondary bar/pie chart takes the form of a stacked bar chart or a pie chart that is connected to the primary pie chart with series lines.

security descriptor: A data structure containing the security information associated with a securable object. A security descriptor identifies an object's owner by its security identifier (SID). If access control is configured for the object, its security descriptor contains a discretionary access control list (DACL) with SIDs for the security principals who are allowed or denied access. Applications use this structure to set and query an object's security status. The security descriptor is used to guard access to an object as well as to control which type of auditing takes place when the object is accessed. The security descriptor format is specified in [MS-DTYP] section 2.4.6; a string representation of security descriptors, called SDDL, is specified in [MS-DTYP] section 2.5.1.

selected: The condition of a set of items that has focus in a workbook.

selection: An item or set of items, such as cells, shapes, objects, and chart elements, that has focus in a document.

- **series line**: A supplemental line on a stacked column, stacked bar, pie of pie, or bar of pie chart that connects each data point in a series with the next data point to increase legibility.
- **server name**: The name of a server, as specified in the operating system settings for that server.
- **shade**: A color that is mixed with black. A 10-percent shade is one part of the original color and nine parts black.
- **shadow effect**: A formatting effect that makes a font or object appear to be elevated from the page or screen surface, and therefore casts a shadow.
- **shape**: A collection of qualifiers, such as names, and quantifiers, such as coordinates, that is used to represent a geometric object. A shape can be contained in a document, file structure, runtime structure, or other medium.
- **shared workbook**: A workbook that is configured to enable multiple users on a network to view and make changes to it at the same time. Each user who saves the workbook sees the changes that are made by other users.
- **sheet**: (1) A part of an Excel workbook. There are four types of sheets: **worksheet**, **macro sheet**, **dialog sheet**, and **chart sheet**. Multiple sheets are stored together within a workbook.
 - (2) A worksheet. The term sheet frequently refers to a worksheet because worksheets are the most common type of sheet.
- **sheet stream**: See **stream** and document stream.
- sheet tab: A control that is used to select a sheet.
- **sheet view**: A collection of display settings, such as which cells are shown, and the zoom level for a sheet window.
- **shrink to fit**: The process of adjusting the font size of text in a cell to fit the current height and width of the cell.
- **single accounting**: An underline style that places one line beneath the text. Single accounting can be used to indicate subtotals.
- **single sign-on (SSO) identifier**: A string that represents the definition of user credentials that permit a user to access a network. See also single sign-on (SSO).
- **smart document**: A file that is programmed to assist the user as the user creates or updates the document. Several types of files, such as forms and templates, can also function as smart documents.
- **smart tag**: A feature that adds the ability to recognize and label specific data types, such as people's names, within a document and displays an action button that enables users to perform common tasks for that data type.
- **smart tag actions button**: A user interface control that displays a menu of actions that are associated with a specific smart tag.
- **smart tag indicator**: A triangular symbol that appears in the bottom right corner of a cell and indicates that the cell contains a smart tag.
- sort: A process that arranges cells in ascending or descending order, based on cell content.
- **sort condition**: A condition that determines how to sort cells in a range.
- **sort order**: A specific arrangement of cells that is based on cell content. The order can be ascending or descending.

- **sort range**: A range of cells that will be or has been sorted.
- **source data**: The data that is used as the basis for charts, PivotTable reports, and other data visualization features.
- **split pane**: A pane that consists of two or more discrete areas of a window. Each area displays content and scrolls independently from other areas of the window. See also **frozen panes**.
- **SplitButtonMRUPopup control**: A type of **SplitButtonPopup control** whose icon changes to reflect the command that the user most recently selected from the menu that is displayed by that button.
- **SplitButtonPopup control**: A type of Button control that performs an action when clicked, and can also display a menu of related commands when the user clicks a drop-down arrow that appears on the button.
- **SplitDropDown control**: A type of Button control that performs a default action when clicked, and can also expand to display a list of other possible actions when the user clicks a drop-down arrow that appears on the button.
- **startup directory**: The directory from which an application opens data files when the application starts.
- **storage**: An element of a compound file that is a unit of containment for one or more storages and streams, analogous to directories in a file system, as described in [MS-CFB].
- **stream**: An element of a compound file, as described in [MS-CFB]. A stream contains a sequence of bytes that can be read from or written to by an application, and they can exist only in storages.
- **strikethrough formatting**: A formatting option in which characters are crossed out by horizontal line.
- **stripe band**: One or more adjacent columns or rows that are in a table and have the same stripe formatting.
- **stroke order**: A sort order that arranges items in a sort range according to the number of strokes that is used to write each glyph. Stroke order is used when sorting text that is written in some East Asian languages.
- **Structured Query Language (SQL)**: A database query and programming language that is widely used for accessing, querying, updating, and managing data in relational database systems.
- **style**: A set of formatting options that is applied to text, tables, charts, and other objects in a document.
- **subtotal column**: A column that uses a summary or subtotal function to display the total of detail items in a PivotTable field.
- table: A list that is defined in a workbook.
- **template**: A file that contains pre-defined formatting including layout, text and graphics. It serves as the basis for new documents that have a similar look or purpose. See also form template (Microsoft InfoPath) and site template (SharePoint Products and Technologies).
- **text importation**: A process that incorporates textual data into a workbook, either by opening a text file or through an external link.
- text query: A query that is used to import data from text files.

- **text run**: A string of characters that represents a discrete span of text with the same formatting properties.
- text style: A formatting option, such as bold or italic, that can be applied to a font.
- **theme**: A set of unified design elements, such as colors, fonts, graphics, and styles, that define the appearance of a website, document, or data visualization.
- **time hierarchy**: A specialized Online Analytical Processing (OLAP) hierarchy that can be organized into lower and higher levels of detail, such as Year, Quarter, Month, and Day.
- **toolbar control**: An object that appears on a toolbar and enables user interaction or input, typically to initiate an action, display information, or set values.
- **toolbar view**: A visual state of a toolbar that depends on the current state of the application. Valid toolbar views are docked, floating, and not visible.
- **ToolTip**: A small pop-up window that provides brief context-sensitive help when users point to an item. Also referred to as ScreenTip.
- top N filter: A filter that matches the top or bottom N items or N% of items in a specified column.
- **total row**: A row in a list or table that provides a selection of aggregate functions that are useful for working with numerical data.
- **transfer protocol**: A protocol that governs the transfer of files, Internet messages, and webpages between networked computers. On the Open Systems Interconnection (OSI) Basic Reference Model, these are application layer protocols. Examples of transfer protocols are Hypertext Transfer Protocol (HTTP), Simple Mail Transfer Protocol (SMTP), and File Transfer Protocol (FTP).
- **transition formula entry**: A worksheet option that enables users to enter formulas that use IBM Lotus 1-2-3 syntax.
- **transition formula evaluation**: A setting that enables formulas in a worksheet to be calculated in a manner that is consistent with IBM Lotus 1-2-3.
- **trendline**: A line that is added to a chart to show the trend of multiple data points in a series. A trendline is used to facilitate regression analysis.
- **tuple**: An ordered grouping of members from different dimensions or hierarchies. A single member is a special case of a tuple and can be used as an expression. Every hierarchy does not have to be represented in a tuple.
- **twip**: A unit of measurement that is used in typesetting and desktop publishing. It equals one-twentieth of a printer's point, or 1/1440 of an inch.
- **two-variable data table**: A data table that consists of two input cells, a row input cell and a column input cell.
- **type library**: A binary file that describes the methods, properties, and data structure of a component.
- **UNC volume**: A storage device that is accessible by network protocols and addressed in the standard Universal Naming Convention format, for example, "\\Server Name\\Share Name".
- **unfrozen pane**: A portion of a worksheet that continues to scroll and function normally in split pane view. See also **frozen pane**.
- **Unicode**: A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The **Unicode** standard [UNICODE5.0.0/2007]

- provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).
- **Uniform Resource Identifier (URI)**: A string that identifies a resource. The URI is an addressing mechanism defined in Internet Engineering Task Force (IETF) Uniform Resource Identifier (URI): Generic Syntax [RFC3986].
- **Uniform Resource Locator (URL)**: A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [RFC1738].
- up bar: See up-down bar.
- **up-down bar**: A vertical bar that highlights the difference between data points in a line chart that contains more than one data series.
- **user name**: A unique name that identifies a specific user account. The user name of an account is unique among the other group names and user names within its own domain or workgroup.
- user-defined function (UDF): A function that is coded in a VBA module, macro sheet, add-in, or Excel Linked Library (XLL). A UDF can be used in formulas to return values to a worksheet, similar to built-in functions.
- **VBA project**: A collection of the modules, class modules, and user forms that are needed to create an application. Modules, class modules, and user forms can be imported into and exported from a project.
- **Vector Markup Language (VML)**: A system of marking up or tagging two-dimensional vector graphics for publication on the World Wide Web. VML graphics are scalable and editable, and typically require less disk space and less time to download.
- **vertical alignment**: A formatting setting that specifies how content is positioned within the vertical space of a cell, object, or page. Content can be aligned along the top or bottom edge, or distributed evenly across the vertical space.
- visible: A condition of an object that allows it to be displayed in rendered output.
- **Visual Basic for Applications (VBA)**: A macro-based programming language that derives from Microsoft Visual Basic and can be used to customize and extend an application. Unlike Visual Basic, VBA code and macros can be run only from within a host application that supports VBA.
- **volatile**: A condition of a formula in which the formula is calculated every time the workbook is calculated. This is unlike a non-volatile formula, which is calculated only when dependent values are changed.
- **wall**: An extension of the background of a 3-D chart to create a three-dimensional effect. See also **floor**.
- watched cell: A cell whose value is monitored in a separate window while formulas that are associated with the cell are calculated.
- **web query**: An external data connection that retrieves a table from a website and inserts table data into a workbook.
- web-only view: A view of a workbook from within a web browser.
- **wide katakana**: A non-cursive **character set** that is used to write non-Japanese words phonetically in Japanese. Wide katakana characters are represented with two bytes.
- **window state**: The current positioning state of a window. Windows can be maximized or minimized, or the window size can be customized by the user.

workbook: A container for a collection of sheets (1).

workbook parameter: A single cell that is designated to receive input from users.

worksheet: A single logical container for a set of tabular data and other objects in a workbook.

write reservation: A field or condition that is set on a document, workbook, or presentation to help prevent users from modifying it.

XML: The Extensible Markup Language, as described in [XML1.0].

- **XML map**: A feature that is used to import data from databases and applications and to map XML elements and attributes from the associated **XML schema** to cells in a worksheet. The revised **XML** data can then be exported for interaction with other databases and applications.
- **XML namespace**: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].
- **XML node**: The smallest unit of a valid, complete structure in an XML document. For example, a node can represent an element, an attribute, or a text string.
- **XML Path Language (XPath)**: A language used to create expressions that can address parts of an XML document, manipulate strings, numbers, and Booleans, and can match a set of nodes in the document, as specified in [XPATH]. XPath models an XML document as a tree of nodes of different types, including element, attribute, and text. XPath expressions can identify the nodes in an XML document based on their type, name, and values, as well as the relationship of a node to other nodes in the document.
- **XML schema**: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by **XML** itself. An XML schema provides a view of a document type at a relatively high level of abstraction.
- **XML schema definition (XSD)**: The World Wide Web Consortium (W3C) standard language that is used in defining XML schemas. Schemas are useful for enforcing structure and constraining the types of data that can be used validly within other XML documents. XML schema definition refers to the fully specified and currently recommended standard for use in authoring **XML schemas**.
- **XOR obfuscation**: A type of file encryption that helps protect private data by using an exclusive or bitwise operation. This is done by adding a mathematical expression that prevents a simple reverse-engineering process.
- **XPath expression**: An expression that searches an 71 XML document and can extract and manipulate data in elements or attributes within that document.
- **zoom level**: The degree to which a portion of an image, document, or other screen object is made to appear closer or farther away relative to its default appearance. This value is usually expressed as a percentage of the default appearance.

z-order: The rendering order of an object on a z axis.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

This document specifies **workbook** data contained in a compound file as described in [MS-CFB]. The data is stored in the compound file by using storages, **streams** (section 2.1.2), and **substreams** (section 2.1.3) that contain information about the content and structure of a workbook, including workbook data such as **worksheet** definitions. Some storages, **streams**, and **substreams** store information by using binary **records** (section 2.1.4). The binary **record** (section 2.1.4) structure and content are specified in this document. Each binary **record** contains its record type, information about the record size, and zero or more type-specific fields depending on the record type, which is specified in section 2.3. Type-specific fields contain information further specifying the workbook data. Specifications of the fields for a given record type can be found in section 2.4.

See the **File Structure** section (section <u>2.1</u>) for a more detailed overview of specific file architecture and content.

1.3.1 stream Byte Ordering

Some computer architectures number bytes in a binary word from left to right, which is referred to as **big-endian**. This documentation uses big-endian bit diagrams. Other architectures number the bytes in a binary word from right to left, which is referred to as **little-endian**. The underlying file format enumerations, objects, and records are little-endian.

Using big-endian and little-endian methods, the number 0x12345678 would be stored as shown in the following table:

Byte order	Byte 0	Byte 1	Byte 2	Byte 3
Big-endian	0x12	0x34	0x56	0x78
Little-endian	0x78	0x56	0x34	0x12

Unless otherwise specified, all data in files of the type specified by this document are stored in littleendian format.

1.3.2 Organization of This Documentation

Section $\underline{2}$ of this document is arranged with overviews of higher-level concepts being followed by more detailed concepts. Section $\underline{2.1}$ and section $\underline{2.2}$, in particular, specify higher-level concepts that are required to understand the remainder of the document, and are read before reading the remainder of section $\underline{2}$.

Section 2.1 specifies the structures and concepts that are used to organize and structure the file itself. Subsection 2.1.7 further specifies the valid storages, **streams** (section 2.1.2), and **substreams** (section 2.1.3) allowed within files of the type specified by this document.

Section 2.2 specifies higher-level concepts that are normatively described for use in later sections of this document.

Section $\underline{2.3}$ specifies the record name associated with a given record type. For more information about record types, see section $\underline{2.1.4}$. These associations are listed by record name as well as by record type.

Section 2.4 specifies the details of individual records.

Section 2.5 specifies the details of structures used by records and other structures.

Section <u>3</u> provides specific examples intended to illustrate the concepts, records, and structures of this file format.

Section $\underline{4}$ discusses encryption, obfuscation and other security issues relating to files of the type specified by this document.

Section 5 is a list of version-specific behaviors. It is not intended to be read alone, but rather to be understood in the context of specifications in section 2. Specifications in section 2 provide links to the relevant items in Section 5.

1.4 Relationship to Protocols and Other Structures

The Excel Binary File Format is an **OLE compound file** as described in [MS-CFB]. It is dependent on the structures defined in the following references:

- [ECMA-376] for the persistence of custom XML mappings.
- [MS-CTXLS] for command bar tables.
- [MS-ODRAW] for the persistence format for **shapes**.
- [MS-OFFCRYPTO] for the persistence format for document signing, information rights management, document encryption and obfuscation.
- [MS-OVBA] for the persistence format for a VBA project.
- [MS-OSHARED] for the persistence format for additional common structures.

1.5 Applicability Statement

This document specifies a persistence format for **workbook** content and templates, which can include unstructured or semi-structured tables of numbers, text, or both numbers and text, formulas, external data connections, charts and images. This persistence format is applicable for persistence of documents with a grid-based layout, including those with numeric data, structured data, and formulas.

This persistence format is applicable for use as a stand-alone document, and for containment within other documents as an embedded object as described in [MS-OLEDS].

This persistence format provides interoperability with applications that create or read documents conforming to this structure.

1.6 Versioning and Localization

This document covers versioning issues in the following areas:

Structure Versions: There is only one version of the Excel Binary File Format (.xls) Structure Specification.

Localization: The following records and structures contain fields that specify locale-dependent meaning:

- **Header** (section <u>2.4.136</u>)
- **Footer** (section <u>2.4.124</u>)
- Format (section <u>2.4.126</u>)
- CodeName (section <u>2.4.51</u>)
- **Font** (section 2.4.122)

The Security Considerations section (section $\underline{4}$), the **Password Verifier Algorithm** section (section $\underline{2.2.9}$), the Encryption (Password to Open) section (section $\underline{2.2.10}$), and the **Macro Sheet Substream** section (section $\underline{2.1.7.20.4}$) also specify processes and data that are locale-dependent. See each record, structure, and section description for more information.

1.7 Vendor-Extensible Fields

This persistence format can be extended by storing information in **streams** and storages not specified in section $\underline{2}$. Implementations are not required to preserve or remove additional streams or storages when modifying an existing document.

2 Structures

2.1 File Structure

This section specifies the overall structure of a file that conforms to this specification.

A file of the type specified by this document is an **OLE compound file**. A **compound file** (section 2.1.1) contains storages, **streams** (section 2.1.2), and **substreams** (section 2.1.3). Each **stream** or **substream** contains a series of binary **records** (section 2.1.4). Each binary **record** contains zero or more structured fields that contain the **workbook** data.

2.1.1 Compound File

A file of the type specified by this document MUST be an **OLE compound file** as specified in [MS-CFB].

2.1.2 Stream

A file of the type specified by this document consists of storages and **streams** as specified in [MS-CFB]. Each binary stream or **substream** (section 2.1.3) that contains **workbook** data MUST be written as a series of binary **records** (section 2.1.4) as specified in section 2.1.7.

The valid storages, streams, and **substreams** in a file of the type specified by this document are specified in section 2.1.7.

A workbook MUST contain the **workbook** stream (section 2.1.7.20), with at least one **sheet (1) substream** (**Worksheet Substream** (section 2.1.7.20.5), **Chart Sheet Substream** (section 2.1.7.20.1), **Macro Sheet Substream** (section 2.1.7.20.4), or **Dialog Sheet Substream** (section 2.1.7.20.2)) that follows the **Globals Substream** (section 2.1.7.20.3).

This document uses **Augmented Backus-Naur Form (ABNF)** as specified in [RFC5234] to specify the **record** sequence for **streams** and **substreams** that contain binary **records**.

2.1.3 Substream

The **workbook** stream (section 2.1.7.20) contains substreams that specify global properties and data for a **workbook** and specify the **sheets (1)** that constitute the workbook. The beginning of each substream is marked by a **BOF** record (section 2.4.21) that has a **dt** field that specifies the type of the substream. The end of each substream is marked by an **EOF** record (section 2.4.103).

For more information about these substreams, see section 2.1.7.20 and subsections.

2.1.4 Record

A record is the basic building block used to store information about features in a **workbook**. Each binary record is a variable-length sequence of bytes. A binary record consists of three components: a record type, a record size, and the record data that is specific to that record type.

The record type is a two-byte unsigned integer that specifies what type of information is specified by the record and how the structure of the record data specific to this record is ordered and structured. Record type values MUST be a value from the **Record** Enumeration (section $\underline{2.3}$) or the record MUST make use of the **future record** architecture (section $\underline{2.1.6}$).

The record size is a two-byte unsigned integer that specifies the count of bytes that specifies the total size of the record data. The record size MUST be greater than or equal to 0 and MUST be less than or equal to 8224.

The record data component contains fields that correspond to a particular record type and comprise the remainder of the record. The order and structure of the fields for a given record type listed in section 2.3 are specified in the corresponding section for that record type in section 2.4. The size of the record data component MUST be equal to the record size. Fields in the record data component can contain simple values, arrays of values, structures of several fields, arrays of fields, and arrays of structures.

If the total number of bytes to be written for a given record data component is greater than 8224, a collection of **Continue** (section 2.4.58), **ContinueFrt** (section 2.4.60), **ContinueFrt11** (section 2.4.61), or **ContinueFrt12** (section 2.4.62) records, as specified in the respective **ABNF** for that record, is used to contain the remaining record data. In general, the first 8224 bytes of data is contained in the record data component of the given record and the remaining data is divided into blocks of 8224 bytes and contained in the subsequent collection of **Continue** (section 2.4.58), **ContinueFrt** (section 2.4.60), **ContinueFrt11** (section 2.4.61), or **ContinueFrt12** records, until all the data is written. See specific record definitions for exceptions. **ContinueBigName** (section 2.4.59) and **CrtMIFrtContinue** (section 2.4.71) are special cases that only apply to a single record type.

2.1.5 Collection of Records

A collection of **records** (section 2.1.4) is a series of related **records** that are treated as a single set. **Records** in a collection do not have to share the same **record** type. A collection of **records** can further contain other collections of **records**. The beginning of a collection of **records** is sometimes indicated by a different type of **record**, as specified in the **record** sequence **ABNF** where the rule that contains that **record** is specified. Similarly the end of a collection of **records** is sometimes indicated by a different type of **record**, as specified by the **record** sequence ABNF where the rule that contains that **record** is specified. Each **record** or collection within the collection can be referred to by index, and the index count starts over for each collection.

In this document, **record** A precedes **record** B when **record** A is the last **record** of that type to appear before **record** B, in the **stream** (section 2.1.2) or **substream** (section 2.1.3) that contains those **records**.

In this document, **record** B follows **record** A when **record** A is the last **record** of that type to appear before **record** B, in the **stream** or **substream** that contains those **records**.

2.1.6 Future Record

The future record architecture enables an application that does not support certain **records** (section 2.1.4) to open and save the file while ignoring but preserving those **records** in the file. **Records** that contain an **FRTHeader** (section 2.5.135), **FrtHeaderOld** (section 2.5.136), **FrtRefHeader** (section 2.5.137), **FrtRefHeaderNoGrbit** (section 2.5.138). or **FrtRefHeaderU** (section 2.5.139) structure, as specified in this document, are future records and can be treated as such by an application that implements the future record architecture. Future **records** that are not supported by an application can be cached on load and persisted on save, enabling the data to be retained in the file for an application that does support those **records**. When loading and caching these unsupported **records**, an application can process **range** references associated with the unsupported **records** as specified in the **FRTHeader**, **FrtHeaderOld**, **FrtRefHeader**, **FrtRefHeaderNoGrbit**, or **FrtRefHeaderU** structures. The application can adjust these range references as **cells** are inserted, deleted or moved in the **sheets** (1) to preserve the correctness and validity of these range references associated with the unsupported **records**.

For an in-depth discussion of how these structures relate to each other, read the specification for each structure in section 2.5.

2.1.6.1 Chart

There are three types of **future records** (section 2.1.6) that can appear in the **Chart Sheet Substream** (section 2.1.7.20.1).

The first type of **future record** is specific to a **chart** (section 2.2.3.3) and is stored by using the **future record** architecture as specified in the Future Record section (section 2.1.6). Specifically, these **future records** that are specific to **charts** have a record type that MUST be greater than or equal to 2048 and MUST be less than or equal to 2303, as specified in section 2.3. These **future records** MUST exist in the collection of **records** (section 2.1.4) specified by the **StartBlock** records (section 2.4.266) and **EndBlock** records (section 2.4.267) and **EndObject** records (section 2.4.267) and **EndObject** records (section 2.4.101). The **StartBlock** records (section 2.4.266) and **EndBlock** records themselves MUST NOT appear in the collection of **records** specified by the **StartObject** records and **EndObject records**. Furthermore, a **ChartFrtInfo** record (section 2.4.49) MUST precede the first **future record** that is specific to a **chart** in a **Chart Sheet Substream**.

The second type of **future record** is stored by wrapping otherwise non-**future records** in the **FrtWrapper** record (section 2.4.130), as specified in section 2.4.130. These **records** MUST be written in their entirety (the record type, record size and record data components, as specified in section 2.1.4) in the **wrappedRecord** field of the **FrtWrapper record**. These MUST exist in the collection of **records** specified by the **StartObject** records and **EndObject** records.

The third type of **future record** is any other **future record** that is stored by using the **future record** architecture as specified in section 2.1.6, not belonging to the first two types.

See the respective **record definitions** (section <u>2.4</u>) for details on how these **records** are written relative to other **future records** in the **Chart Sheet Substream**.

2.1.6.2 PivotTable

PivotTables (section 2.2.5) implement the future record architecture as specified in section 2.1.6. There are multiple classes of PivotTable records (section 2.2.5.1) represented using the **SXAddl record** (section 2.4.273.2). Each **record** (section 2.1.4) in a class specifies a different piece of information for the part of the **PivotTable** (section 2.2.5) to which the **SXAddl record** applies. For more information about how the **SXAddl record** is used, read section 2.2.5.1.1.

2.1.7 Storages and Streams

This section specifies the **storages**, **streams** and substreams of the Excel Binary File Format (.xls) file. Refer to section 2.1 for an understanding of storages, **streams**, and **substreams**.

If the stream is in **Binary Interchange File Format (BIFF)** format, the record sequence is specified using **ABNF** grammar.

2.1.7.1 Component Object Stream (\001CompObj)

The Component Object Stream is specified in [MS-OLEDS] section 2.3.8.

The name of this **stream** MUST be "001CompObj", where 001 is the character with the value 0x01, not the string literal "001".

A file MUST contain at most one **Component O**bject **S**tream.

2.1.7.2 Control Stream (Ctls)

An instance of the **Control Stream** specifies the **OLE objects** and **ActiveX controls** that use stream-based persistence.

The name of this **stream** MUST be "Ctls". A file MUST contain at most one **Control S**tream. An object persisted in this stream MUST have a corresponding **Obj** record (section <u>2.4.181</u>) in a **worksheet substream** (section <u>2.1.7.20.5</u>) with a **cmo.ot** field that equals 8 and a **pictFlags.fPrstm** field that equals 1. The **pictFmla.lPosInCtlsStm** and **pictFmla.cbBufInCtlsStrm** fields of the **Obj** record specify the location of the object data associated with that **Obj** record.

2.1.7.3 Data Spaces Storage (\006DataSpaces)

The Data Spaces Storage is specified in [MS-OFFCRYPTO] section 2.1.

The name of this **storage** MUST be " $\006$ DataSpaces", where $\006$ is the character with the value 0x06, not the string literal " $\006$ ". A file MUST contain at most one **Data Spaces Storage**.

2.1.7.4 Document Summary Information Stream (\005DocumentSummaryInformation)

The Document Summary Information Stream is specified in [MS-OSHARED] section 2.3.3.2.2.

The name of this **stream** MUST be "\005DocumentSummaryInformation", where \005 is the character with the value 0x05, not the string literal "\005". A file MUST contain at most one Document Summary **Information S**tream.

2.1.7.5 Embedding Storage (MBD...)

An instance of the **Embedding Storage** specifies an embedded **OLE object** or an **ActiveX control** that uses **storage**-based persistence.

The name of this storage MUST be "MBD" followed by eight hexadecimal digits uniquely identifying the **embedded object**. An object persisted in an **Embedding Storage** MUST have a corresponding **Obj** (section 2.4.181) in a **worksheet substream** (section 2.1.7.20.5), **macro sheet substream** (section 2.1.7.20.4), or **dialog sheet substream** (section 2.1.7.20.2) with a **cmo.ot** field that equals 8, a **pictFlags.fPrstm** field that equals 0, and a **pictFlags.fDde** field that equals 0. The **pictFmla.lPosInCtlsStm** field of the **Obj** record specifies the name of the **Embedding Storage** that is associated with that **Obj** record.

2.1.7.6 Encryption Stream (encryption)

The Encryption Stream is specified in [MS-OFFCRYPTO] section 2.3.5.4.

The name of this **stream** MUST be "encryption". A file MUST contain at most one **Encryption S**tream.

2.1.7.7 Link Storage (LNK...)

An instance of the **Link Storage** specifies a linked **OLE object** and any default data or presentation caching established for it.

The name of this storage MUST be "LNK" followed by eight hexadecimal digits uniquely identifying the **linked object**. An object persisted in a **Link Storage** MUST have a corresponding **Obj** (section 2.4.181) in a **worksheet substream** (section 2.1.7.20.5), **macro sheet substream** (section 2.1.7.20.4), or **dialog sheet substream** (section 2.1.7.20.2) with a **cmo.ot** field that equals 8, a **pictFlags.fPrstm** field that equals 0, and a **pictFlags.fDde** field that equals 1. Additionally, the **pictFmla.fmla** field of the **Obj** record (section 2.4.181) specifies a formula that refers to an

ExternName (section 2.4.105) with a **body** field of type **ExternOleDdeLink** (section 2.5.107) with a **IStgName** field that specifies the name of the **Link Storage** that is associated with that **Obj** record.

2.1.7.8 List Data Stream (List Data)

The List **Data S**tream specifies one or more Web-based **data provider data source** definitions. Each data source definition is related to a Web-based data provider list.

The name of the **stream** MUST be "List Data". A file MUST contain at most one List **Data S**tream. Each data source definition is related to a **Feature11** record (section <u>2.4.114</u>) or **Feature12** record (section <u>2.4.115</u>). The **IPosStmCache**, **cbStmCache** and **cchStmCache** fields of the **TableFeatureType** structure (section <u>2.5.266</u>) specify the relationship between the **Feature11** record or **Feature12** record and the **List Data S**tream.

Each data source definition is specified as a compressed stream. The compression algorithm is specified in [RFC1951]. The stream is specified by the following **XML schema**:

```
<?xml version="1.0" encoding="utf-8"?>
<s:schema xmlns:rs="urn:schemas-microsoft-com:rowset"</pre>
           xmlns:z="#RowsetSchema"
           attributeFormDefault="unqualified"
           elementFormDefault="qualified"
           xmlns:s="http://www.w3.org/2001/XMLSchema">
  <s:element name="LIST">
    <s:complexType>
      <s:attribute name="Version" type="s:string" use="required" />
      <s:sequence>
        <s:element name="LISTNAME" type="s:string" />
        <s:element name="VIEWGUID" type="s:string" minOccurs="0"/>
        <s:element name="LISTWEB" type="s:string" />
        <s:element name="ROOTFOLDER" type="s:string" />
        <s:element name="LISTSCHEMA">
          <s:complexType mixed="true" >
            <s:sequence>
              <s:any />
            </s:sequence>
          </s:complexType>
        </s:element>
        <s:element name="VIEWSCHEMA" minOccurs="0">
          <s:complexType mixed="true" >
            <s:sequence>
              <s:any />
            </s:sequence>
          </s:complexType>
        </s:element>
        <s:element name="LISTDATA" minOccurs="0">
          <s:complexTvpe>
            <s:sequence>
              <s:element ref="rs:data" />
            </s:sequence>
          </s:complexType>
        </s:element>
        <s:element name="UPDATE">
          <s:complexType>
            <s:sequence>
              <s:element name="Inserts" minOccurs="0">
                <s:complexType>
                  <s:sequence>
                    <s:element ref="rs:data" />
                  </s:sequence>
                </s:complexType>
              </s:element>
              <s:element name="Updates" minOccurs="0">
                <s:complexType>
                  <s:sequence>
                    <s:element ref="rs:data" />
```

```
</s:sequence>
               </s:complexType>
              </s:element>
              <s:element name="Deletes" minOccurs="0">
                <s:complexType>
                  <s:sequence>
                   <s:element ref="rs:data" />
                 </s:sequence>
                </s:complexType>
              </s:element>
            </s:sequence>
         </s:complexType>
        </s:element>
        <s:element name="LISTDATAFTR" type="s:string" />
      </s:sequence>
   </s:complexType>
 </s:element>
</s:schema>
```

2.1.7.8.1 Attributes

The following table specifies the attributes that can be used in the LIST element:

Attribute	Description
Version	Web-based data provider server version from which the data was retrieved. MUST be less than or equal to 20 characters.

2.1.7.8.2 Elements

The following table specifies the **XML schema definition (XSD)** elements that are specific to the LIST element:

Element	Description		
LISTNAME (section 2.1.7.8.2.1)	Display name or GUID , as specified by [MS-DTYP], of a Web-based data provider list.		
VIEWGUID (section 2.1.7.8.2.2)	GUID, as specified by [MS-DTYP], of a Web-based data provider list view.		
LISTWEB (section 2.1.7.8.2.3)	Uniform Resource Identifier (URI) of the Web-based data provider server from which the list was retrieved.		
ROOTFOLDER (section 2.1.7.8.2.4)	Path on the Web-based data provider server where the list is located.		
LISTSCHEMA (section 2.1.7.8.2.5)	XML schema of the fields of the Web-based data provider list.		
VIEWSCHEMA (section 2.1.7.8.2.6)	XML schema of the Web-based data provider list view.		
LISTDATA (section 2.1.7.8.2.7)	Specifies the data of the list.		
UPDATE (section 2.1.7.8.2.8)	Specifies the inserted, deleted, and updated fields that were modified from the original data source .		

Element	Description		
LISTDATAFTR (section	Validation footer used to validate the integrity of the data within the stream .		
<u>2.1.7.8.2.9</u>)			

2.1.7.8.2.1 LISTNAME

The **LISTNAME** element specifies a list on the Web-based **data provider** server. It MUST be the display name or the **GUID**, as specified by [MS-DTYP], of a **list**. The **LISTNAME** element is specified as follows:

```
<s:element name="LISTNAME" type="s:string" />
```

2.1.7.8.2.2 **VIEWGUID**

The **VIEWGUID** element specifies a list view on the server. It MUST be the **GUID**, as specified by [MS-DTYP], of a list view. The **VIEWGUID** element is specified as follows:

```
<s:element name="VIEWGUID" type="s:string" minOccurs="0"/>
```

When the **VIEWGUID** element is not present or the value of the **VIEWGUID** element is empty, the current **data source** definition within the **List Data Stream** (section 2.1.7.8) MUST retrieve data from the default list view of the list on the server.

2.1.7.8.2.3 LISTWEB

The **LISTWEB** element specifies, as a **URI**, the name of the Web-based **data provider** server from which the list data was retrieved. MUST be a valid URI, as specified by [RFC3986]. The **LISTWEB** element is specified as follows:

```
<s:element name="LISTWEB" type="s:string"/>
```

2.1.7.8.2.4 ROOTFOLDER

The **ROOTFOLDER** element specifies the path from the **LISTWEB URI** where the Web-based **data provider** list from which the data was retrieved is located. When concatenated to the end of the **LISTWEB** field value, the result MUST be a valid URI, as specified by [RFC3986]. The **ROOTFOLDER** element is specified as follows:

```
<s:element name="ROOTFOLDER" type="s:string"/>
```

2.1.7.8.2.5 LISTSCHEMA

The **LISTSCHEMA** element specifies the fields of the Web-based **data provider** list from which the data was retrieved, along with additional information. The additional information includes **regional settings** and whether attachments are enabled. The **LISTSCHEMA** element is specified as follows:

```
<s:element name="LISTSCHEMA" minOccurs="0">
    <s:complexType mixed="true" >
        <s:sequence>
        <s:any />
        </s:sequence>
```

```
</s:complexType>
</s:element>
```

The **LISTSCHEMA** element is further specified in [MS-LISTSWS] section 2.2.4.12.

2.1.7.8.2.6 VIEWSCHEMA

The **VIEWSCHEMA** element specifies the list view of the Web-based **data provider** list from which the data was retrieved. The **VIEWSCHEMA** element is specified as follows:

The **VIEWSCHEMA** element is further specified in [MS-VIEWSS] section 2.2.

2.1.7.8.2.7 LISTDATA

The **LISTDATA** element specifies the data retrieved from the Web-based **data provider** list. The **LISTDATA** element is specified as follows:

```
<s:element name="LISTDATA">
  <s:complexType>
        <s:sequence>
            <s:element ref="rs:data" />
            </s:sequence>
        <s:complexType>
</s:element></selement>
```

The referenced **rs:data** type is specified in [MS-PRSTFR] section 2.2. Additional information and examples is also specified in [MS-LISTSWS] section 3.1.4.21.2.2.

2.1.7.8.2.8 UPDATE

The **UPDATE** element specifies the inserted, deleted, and updated fields that were modified from the data specified in **LISTDATA** (section <u>2.1.7.8.2.7</u>). The definition of the **UPDATE** element is as follows:

```
<s:element name="UPDATE">
 <s:complexType>
   <s:sequence>
     <s:element name="Inserts" minOccurs="0">
       <s:complexType>
         <s:sequence>
           <s:element ref="rs:data" />
         </s:sequence>
       </s:complexType>
     </s:element>
     <s:element name="Updates" minOccurs="0">
       <s:complexType>
         <s:sequence>
           <s:element ref="rs:data" />
          </s:sequence>
       </s:complexType>
     </s:element>
```

The **UPDATE** element is a parent element, which contains 3 optional child elements: **Inserts**, **Updates** and **Deletes**. **Inserts** specifies rows that were added locally, and are not synchronized with the **data source**. **Updates** specifies rows that were modified locally, and that are not synchronized with the data source. **Deletes** specifies rows that were deleted locally, and that are not synchronized with the data source. The referenced **rs:data** type for each of the elements is specified in [MS-PRSTFR] section 2.2. Additional information and examples is also specified in [MS-LISTSWS] section 3.1.4.21.2.2.

2.1.7.8.2.9 LISTDATAFTR

The **LISTDATAFTR** element specifies elements used to validate the integrity of the data within the **stream**. It contains a sequence of signed integers which specify the **MD5** hash of each **rs:data** within the stream. The definition of the **LISTDATAFTR** element is a follows:

```
<s:element name="LISTDATAFTR" type="s:string" />
```

The signed integers specified in the string data MUST be separated by the ";#" separator. There MUST be an MD5 hash, as specified by [RFC1321], for the LISTDATA element, the UPDATE.Inserts element, the UPDATE.Updates element and the UPDATE.Deletes element. The MD5 hash MUST appear in the following order: LISTDATA element, the UPDATE.Inserts element, the UPDATE.Updates element and the UPDATE.Deletes element. If an element is not present in the stream, the corresponding MD5 hash MUST NOT be present.

2.1.7.9 Office Data Store Storage (MsoDataStore)

The **Office Data Store Storage** is specified in [MS-OSHARED] section 2.3.6.

The name of this storage MUST be "MsoDataStore". A file MUST contain at most one **Office Data Store S**torage.

2.1.7.10 Office Toolbars Stream (XCB)

The **Office Toolbars Stream** specifies the custom toolbars attached to the file.

The name of this **stream** MUST be "XCB". A file MUST contain at most one **Office Toolbars S**tream. This stream MUST only contain a single **CTBWRAPPER** structure (section 2.6.1).

Parts of this stream are specified in [MS-OSHARED] section 2.3.1. Refer to [MS-OSHARED] section 1.3 for a diagram that illustrates an example of the XCB binary stream with its toolbar customization structures.

Following is the record sequence **ABNF** for the XCB binary stream:

```
XCB = CTBWRAPPER
CTBWRAPPER = CTBS 1*CTB
```

For more information about the **CTBWRAPPER** structure, see section 2.6.1. For more information about the **CTBS** structure, see section 2.6.2. For more information about the **CTB** structure, see section 2.6.3.

2.1.7.11 OLE Stream (\0010le)

The OLE Stream is specified in [MS-OLEDS] section 2.3.3.

The name of this **stream** MUST be "0010le", where 001 is the character with the value 0x01, not the string literal "001".

A file MUST contain at most one **OLE Stream**.

2.1.7.12 Pivot Cache Storage (_SX_DB_CUR)

The **Pivot Cache Storage** specifies zero or more streams, each of which specify a **PivotCache** (section 2.2.5.3) for a **PivotTable** (section 2.2.5). The name of each **stream** MUST be unique within the storage, and the name MUST be a four digit hexadecimal number stored as text.

The name of this storage MUST be "_SX_DB_CUR". A file MUST contain at most one **Pivot Cache Storage**.

The number of **FDB** rules that occur MUST be equal to the value of **cfdbTot** in the **SXDB record** (section 2.4.275).

Record sequence **ABNF** for each stream:

```
PIVOTCACHE = SXDB SXDBEX *SXFORMULA *FDB *DBB EOF

FDB = SXFDB SXFDBType [SXFMLA / (*GRPSXOPER [SXRANGE / *(SxIsxoper *Continue)])] *SRCSXOPER

DBB = [SXDBB] *SXOPER

SXFORMULA = SXFMLA PIVOTRULE SXFormula

SXFMLA = SxFmla *(SxName *SXPair)

GRPSXOPER = SXOPER

SRCSXOPER = SXOPER

SXOPER = SXNII / SXNum / SxBool / SxErr / SXString / SXDtr

SXRANGE = SXRng (3SXNum / (2SXDtr SXInt))
```

2.1.7.13 Protected Content Stream (\009DRMContent)

The **Protected Content Stream** is specified in [MS-OFFCRYPTO] section 2.2.10.

The name of this **stream** MUST be "009DRMContent", where 009 is the character with the value 0x09, not the string literal "009". A file MUST contain at most one **Protected Content S**tream.

2.1.7.14 Revision Stream (Revision Log)

An instance of the **Revision Stream** specifies the **revision logs** (section $\underline{2.2.11.2}$) and **revision records** (section $\underline{2.2.11.3}$) for a **shared workbook** (section $\underline{2.2.11}$).

The name of this **stream** MUST be "Revision Log". A file MUST contain at most one **Revision Stream**. The **Revision Stream** MUST exist if the **workbook** is a **shared workbook** (section 2.2.11).

Record sequence ABNF:

```
REVISION = RRDInfo FileLock UsrExcl *(HEADER *(RENSHEET / INSDEL / CONFLICT / INSDELSH / CHGCELL
       / MOVE / FORMAT / AUTOFMT / DEFNAME / VIEW / NOTE / TRASHQTFIELD)) EOF
HEADER = RRDHead RRTabId
RENSHEET = RRDRenSheet
INSDEL = INS / DEL
INS = RRDInsDel *(CHGCELL / FORMAT)
DEL = RRDInsDelBegin RRDInsDel *(CHGCELL / FORMAT) RRDInsDelEnd
CONFLICT = RRDConflict
INSDELSH = RRInsertSh
CHGCELL = RRDChgCell *Continue *RRDRstEtxp
MOVE = RRDMoveBegin RRDMove * (CHGCELL / FORMAT) RRDMoveEnd
FORMAT = RRFormat
AUTOFMT = RRAutoFmt
DEFNAME = RRDDefName
VIEW = RRDUserView
NOTE = Note
TRASHQTFIELD = RRDTQSIF
```

2.1.7.15 Signatures Stream (_signatures)

The **Signatures Stream** is specified in [MS-OFFCRYPTO] section 2.5.1.

The name of this **stream** MUST be "_signatures". A file MUST contain at most one **Signatures** Stream $\leq 1 \geq$.

When generating the **Signature** value, as specified in [MS-OFFCRYPTO] section 2.5.1.5, the record data, as specified in section 2.1.4, of the **WriteAccess record** (section 2.4.349) in the **Globals Substream** (section 2.1.7.20.3) is skipped.

2.1.7.16 Summary Information Stream (\005SummaryInformation)

The **Summary Information Stream** is specified in [MS-OSHARED] section 2.3.3.2.1.

The name of this **stream** MUST be " $\005$ SummaryInformation", where $\005$ is the character with the value 0x05, not the string literal " $\005$ ". A file MUST contain at most one Summary **Information S**tream.

2.1.7.17 User Names Stream (User Names)

The **User Names Stream** specifies a **user log** (section 2.2.11.1) for a **shared workbook** (section 2.2.11).

The name of this **stream** MUST be "User Names". The presence of the **User Names Stream** indicates the **workbook** is a **shared workbook** (section 2.2.11). A file MUST contain at most one **User Names Stream**.

Record sequence ABNF:

USERNAMES = CUsr UsrChk CbUsr BCUsrs *UsrInfo

2.1.7.18 VBA Storage (_VBA_PROJECT_CUR)

The **VBA Storage** is specified in [MS-OVBA].

The name of this storage MUST be "_VBA_PROJECT_CUR". A file MUST contain at most one **VBA S**torage.

2.1.7.19 Viewer Content Stream (\009DRMViewerContent)

The **Viewer Content Stream** is specified in [MS-OFFCRYPTO] section 2.2.11.

The name of this **stream** MUST be "\009DRMViewerContent", where \009 is the character with the value 0x09, not the string literal "\009". A file MUST contain at most one **Viewer Content S**tream.

2.1.7.20 Workbook Stream (Workbook)

The **Workbook Stream** specifies global properties and data for a **workbook**, as well as the **sheets** (1) that constitute a workbook.

The name of this **stream** MUST be "Workbook". A file MUST contain exactly one **Workbook Stream**, which consists of several substreams. There MUST be exactly one **substream** (section <u>2.1.7.20.3</u>), and the **substream** MUST be the first substream to appear in the **Workbook Stream**, which MUST be followed by one or more of the following substreams:

- Chart Sheet Substream (section <u>2.1.7.20.1</u>)
- Dialog Sheet Substream (section <u>2.1.7.20.2</u>)
- Macro Sheet Substream (section <u>2.1.7.20.4</u>)
- Worksheet Substream (section 2.1.7.20.5)

2.1.7.20.1 Chart Sheet Substream

The **Chart Sheet Substream** specifies either a separate **chart sheet** that contains a single chart, or an **embedded** chart **object** (section 2.2.3.1) contained within a **worksheet** (section 2.1.7.20.5) or **macro sheet** (section 2.1.7.20.4).

If a record in the **ABNF** grammar for this substream is one of the following: **Font** (section 2.4.122), **Continue** (section 2.4.58), **LineFormat** (section 2.4.156), **AreaFormat** (section 2.4.3), **SeriesText** (section 2.4.254), **DefaultText** (section 2.4.88), **Text** (section 2.4.324), **FontX** (section 2.4.123), **ObjectLink** (section 2.4.182), **Frame** (section 2.4.128), **Begin** (section 2.4.17), **End** (section 2.4.99), **PicF** (section 2.4.193), **Pos** (section 2.4.201), **AlRuns** (section 2.4.1), **BRAI** (section 2.4.29), **Fbi** (section 2.4.109), or **GelFrame** (section 2.4.131), and is in a collection specified by

StartObject (section <u>2.4.267</u>) and **EndObject** (section <u>2.4.101</u>), that record MUST be replaced by an **FrtWrapper** record (section <u>2.4.130</u>) and the **wrappedRecord** field of that **FrtWrapper** record MUST specify the record that is replaced. **StartBlock** record (section <u>2.4.266</u>) and **EndBlock** record (section <u>2.4.100</u>) pairs and **ChartFrtInfo** (section <u>2.4.49</u>) are omitted from the ABNF grammar. See section <u>2.1.6.1</u> and the respective record specifications for more information.

```

For ABNF rules not listed here, see section <u>2.1.7.20.6</u>. Within the sequence of records specified by the **CUSTOMVIEW** rule (section 2.1.7.20.6) specified in section 2.1.7.20.6, the **Selection** (section <u>2.4.248</u>), **HorizontalPageBreaks** (section <u>2.4.142</u>), and **VerticalPageBreaks** (section <u>2.4.343</u>) records MUST NOT be present.

2.1.7.20.2 Dialog Sheet Substream

The **Dialog Sheet Substream** specifies a **dialog sheet**.

Record sequence <3><4> ABNF:

For ABNF rules not listed here, see section 2.1.7.20.6.

2.1.7.20.3 Globals Substream

The **Globals Substream** specifies global properties and data in a **workbook**.

There MUST be exactly one **Globals Substream** in a **Workbook Stream** (section <u>2.1.7.20</u>), and the **Globals Substream** MUST be the first substream in the **Workbook Stream**.

Record sequence <5><6> ABNF:

```
WORKBOOKCONTENT = [WriteProtect] [FilePass] [Template] INTERFACE WriteAccess [FileSharing]

2.1.7.21 XML Signatures Storage (_xmlsignatures)

The **XML Signatures Storage** is specified in [MS-OFFCRYPTO] section 2.5.2.

The name of this storage MUST be "_xmlsignatures". A file MUST contain at most one **XML Signatures S**torage $\leq 12 >$.

When generating the **DigestValue**, as specified in [XMLDSig] section 4.3.3.6, the record data, as specified in the **Record** section (section 2.1.4), in the **WriteAccess record** (section 2.4.349) in the **Globals Substream** (section 2.1.7.20.3) is skipped.

2.1.7.22 XML Stream (XML)

The XML **S**tream specifies one or more **XML maps**.

The name of the stream MUST be "XML". A file MUST contain at most one XML Stream.

The syntax of the structures contained in this part uses **XML schema definition (XSD)**, as specified in [XMLSCHEMA1/2] and [XMLSCHEMA2/2].

This specification defines and references various **XML namespaces** using the mechanisms specified in [XMLNS].

The content of this stream is **XML** as specified by the following **XML schema**:

```
<?xml version="1.0" encoding="utf-8"?>
<s:schema
  attributeFormDefault="unqualified"
  elementFormDefault="unqualified"
  xmlns:s="http://www.w3.org/2001/XMLSchema">

```

2.1.7.22.1 Elements

The following table specifies the **XSD** elements that are specific to the **XML Stream** (section 2.1.7.22):

Element	Description
MapInfo (section 2.1.7.22.1.1)	This element specifies a container for all of the XML schemas and XML maps attached to workbook.
Schema (section 2.1.7.22.1.2)	This element specifies an XML schema associated with an XML map.
Map (section 2.1.7.22.1.3)	This element specifies an XML map and the behaviors expected during refresh operations.
DataBinding (section 2.1.7.22.1.4)	This element specifies a connection to an XML file data source that is used when the XML map is refreshed.

2.1.7.22.1.1 MapInfo

The **MapInfo element** specifies a container for all of the **XML schemas** and **XML maps** attached to workbook.

SelectionNamespaces: An **ST_Xstring65535** (section <u>2.1.7.22.2.4</u>) that specifies the **XML namespace** for use in **XPath** expressions.

2.1.7.22.1.2 Schema

The **Schema element** specifies an **XML schema** associated with an **XML map**. The contents of this element MUST be an **XSD**, as specified in [XMLSCHEMA1/2] and [XMLSCHEMA2/2].

ID: An **ST_Xstring65535** that specifies the unique name for this attached XML schema.

Namespace: An ST_Xstring65535 that specifies the XML namespace used by the XML schema.

SchemaRef: An **ST_Xstring65535** that specifies the other **Schema elements** in this parent **MapInfo element** (section <u>2.1.7.22.1.1</u>) that contain XML schemas that the XML schema for this **Schema element** is dependent on. The value MUST specify the dependent **Schema** elements by **ID** in a space-delimited list. The **SchemaRef** attribute MUST be absent or the value MUST be empty if there are no dependencies.

2.1.7.22.1.3 Map

The **Map element** specifies an **XML map** and the behaviors expected during **refresh** operations.

Append: An **ST_XmlMapBoolean** (section <u>2.1.7.22.2.2</u>) that specifies whether **XML** data overwrites or is appended to the **table** or **range** of cells associated with the XML map on refresh.

AutoFit: An **ST_XmlMapBoolean** that specifies whether columns are resized to fit the XML data after a refresh operation.

ID: An **ST_XmlMapId** (section <u>2.1.7.22.2.3</u>) that specifies the identifier of the XML map.

Name: An **ST_Xstring256** (section 2.1.7.22.2.5) that specifies the name of the XML map. **Name** MUST be unique for each **Map**.

PreserveFormat: An **ST_XmlMapBoolean** that specifies whether **number formats** in the **sheet** (1) are preserved during refresh or whether the number formats specified by the **XML schema** are used.

PreserveSortAFlayout: An **ST_XmlMapBoolean** that specifies whether to reapply the **filtering state** of the table after a refresh.

RootElement: An ST_X string65535 (section 2.1.7.22.2.4) that specifies the name of the root XML element.

SchemaID: An **ST_Xstring65535** that specifies the name of the XML schema used for the XML map. **SchemaID** MUST equal the **ID** attribute of a **Schema** element (section 2.1.7.22.1.2) contained within the parent **MapInfo** element (section 2.1.7.22.1.1).

ShowImportExportValidationErrors: An **ST_XmlMapBoolean** that specifies whether validation errors are displayed during refresh or data export.

2.1.7.22.1.4 DataBinding

The **DataBinding element** specifies a connection to an **XML** file **data source** that is used when the **XML map** is refreshed.

DataBindingLoadMode: An **ST_DataBindingLoadMode** (section <u>2.1.7.22.2.1</u>) that specifies the method for loading XML data.

DataBindingName: An **ST_Xstring65535** that specifies the name for this connection. **DataBindingName** MUST be unique for each **DataBinding** element.

FileBinding: An **ST_Xstring65535** that specifies the XML file data source used for **refresh**. **FileBinding** MUST NOT be "true" or "false".

FileBindingName: An **ST_Xstring65535** that specifies the name for the XML file data source. **FileBindingName** MUST be unique for each **DataBinding** element.

2.1.7.22.2 Simple Types

The following table specifies the **XSD** simple types that are specific to the **XML Stream** (section 2.1.7.22):

Element	Description
ST_DataBindingLoadMode (section 2.1.7.22.2.1)	This simple type specifies the method for loading XML data related to a DataBinding element (section 2.1.7.22.1.4).
ST_XmlMapBoolean (section 2.1.7.22.2.2)	This simple type specifies Boolean values.
ST_XmlMapId (section 2.1.7.22.2.3)	This simple type is an integral value that specifies the identifier of an XML map (section 2.1.7.22.1.3) in the XML Stream (section 2.1.7.22).
ST_Xstring65535 (section 2.1.7.22.2.4)	This simple type is a string that MUST NOT exceed 65,535 Unicode characters.
ST_Xstring256 (section 2.1.7.22.2.5)	This simple type is a string that MUST NOT exceed 256 Unicode characters.

2.1.7.22.2.1 ST_DataBindingLoadMode

The **ST_DataBindingLoadMode** simple type specifies the method for loading **XML** data related to a **DataBinding** element (section 2.1.7.22.1.4).

The following are possible enumeration values for this type:

Enumeration Value	Description
0	None.
1	Normal.
2	Delay Load.
3	Asynchronous.

4	Object Model.
---	---------------

2.1.7.22.2.2 ST_XmlMapBoolean

The **ST_XmlMapBoolean** simple type defines **Boolean** values (section 2.5.14).

The following are possible enumeration values for this type:

Enumeration Value	Description
false	False Boolean value.
true	True Boolean value.

2.1.7.22.2.3 ST_XmlMapId

The **ST_XmlMapId** simple type is an integral value that specifies the identifier of an **XML map** (section <u>2.1.7.22.1.3</u>) in the **XML Stream** (section <u>2.1.7.22</u>). **ST_XmlMapId** MUST be greater than or equal to 1 and less than or equal to 2147483647.

2.1.7.22.2.4 ST_XmlString65535

The **ST_XmlString65535** simple type is a string that MUST NOT exceed 65,535 **Unicode** characters.

2.1.7.22.2.5 ST_XmlString256

The **ST_XmlString256** simple type is a string that MUST NOT exceed 256 **Unicode** characters.

2.2 Conceptual Overview

This section specifies how higher-level features of the file format are represented by combinations of records.

2.2.1 Cell Table

Text, formulas, and numerical data within **workbooks** are primarily stored in the cells that make up **worksheets** (section 2.1.7.20.5) and **macro sheets** (section 2.1.7.20.4). Cells are the fundamental building blocks that contain data, formulas, and formatting to form the workbook. The data structure associated with the grid of cells is called the **cell table**.

The cell table is stored in the sequence of records that conform to the **CELLTABLE** rule (section 2.1.7.20.6) within the Common Productions **ABNF**. The cell table consists of a series of row blocks. From the first row containing data to the last row containing data, every 32 consecutive rows, including blank rows, comprise a row block.

The number of row blocks in a **sheet (1)** is specified by the following algorithm that uses fields from the **Dimensions** record (section 2.4.90):

```
if ((rwMac -rwMic) % 32 == 0)
  number of row blocks = (rwMac -rwMic) / 32
else
  number of row blocks = (rwMac -rwMic) / 32 + 1
```

Within each row block, a **Row** record (section <u>2.4.221</u>) is saved for each row that contains data or row formatting. For each such row, every **cell** that contains data or individual cell formatting is represented by a record. Formatting information for a cell can be derived from individual cell formatting, row formatting, column formatting, or the default cell format as specified by the **XFIndex** structure (section <u>2.5.282</u>). The order of precedence for formatting is individual cell formatting with the highest precedence, followed by row formatting, and then column formatting, and then the default cell format. Cells that do not contain data and do not contain individual formatting are not saved.

Cells are specified by any of the records specified in the **CELL** rule (section 2.1.7.20.6). Multiple cells can be represented by one record—for example, a **MulBlank** record (section 2.4.174) specifies a series of blank cells. Note that blank cells are only included when they contain individual cell formatting. Rows are saved in increasing order, and cells are saved in row-major order.

The order of the records that comprise a row block begins with a series of **Row** records (a maximum of 32 such records), followed by the records representing the cells, followed by the **DBCell** record (section 2.4.78). A cell in the cell table is referred to by its row and column indexes, which are zero-based. The maximum row index is 65535. The maximum column index is 255.

The bounding box of the non-empty cells is stored in the **Dimensions** record. Information that applies to each column is specified in the **COLUMNS** collection (section 2.1.7.20.6).

2.2.1.1 Retrieval of Last-Calculated Cell Values Without Loading Cell Table

The only way to retrieve formulas, formats and other cell data is to read the cell table normally as defined earlier. However, in certain situations (for example when resolving external references to values) it is beneficial to retrieve only the last calculated value from a cell, without actually loading the cell table. To improve the performance of a random read access to the values in the **cell table** (section 2.2.1), **BIFF** provides **Index** (section 2.4.144) and **DBCell** (section 2.4.78) records. To find a particular **cell** value, an application can perform the following:

- Read Index records to find one such that the cell row is greater or equal to rwMic and less than rwMac.
- Compute the data offset of the required **DBCell** record according to the description of the **Index** record.
- 3. Read the **DBCell** record (section 2.4.78) in the obtained position, and compute the data offset of the cell row according to the following:
 - 1. The file position of the first non-empty **Row** (section <u>2.4.221</u>) in a row block is equal to the file position of the **DBCell** record —the **dbRtrw** field of **DBCell** record.
 - The file position of the first CELL record (section 2.1.7.20.6) for the first non-empty Row (section 2.4.221) is equal to the file position of the second Row record (the end of the first Row record) + rgdb[0]. Other non-empty CELL records for the first row follow this first CELL record.
 - 3. The file position of the first **CELL** record for the second non-empty **Row** is equal to the file position of the first **CELL** record for the first **Row** + **rgdb[1]**. Other non-empty **CELL** records for the 2nd row follow this first **CELL** record.
 - 4. The file position for the first **CELL** record for the third non-empty **Row** is equal to the file position of the first **CELL** record for the second **Row** + **rgdb[2]**.
- 4. Read cell table data starting from the previously computed position.

Note that if the **Row** of the **CELL** record is known, it is possible to calculate the file position of the first **CELL** record of that **Row** first, and then get all the following **CELL** records without going through the first **Row**, the second **Row**, and so on.

2.2.2 Formulas

A formula is sequence of values, cell references, names, functions, or operators in a cell that together produce a new value. **Formulas** are stored in a tokenized representation known as "parsed expressions." In this section, formula is a synonym for parsed expression. A parsed expression is converted into a textual formula at runtime for display and user editing. Cell formulas are specified by the **Formula** record (section <u>2.4.127</u>). Array formulas are specified by the **Array** record (section <u>2.4.4</u>). Shared formulas are specified by the **ShrFmla** record (section <u>2.4.260</u>).

Formulas that are part of a **revision** as specified in the Shared Workbooks overview (section 2.2.11) are specified by the **pe.rgce** field or the **peOld.rgce** field of the **RRDDefName** record (section 2.4.225), or by the **xpe.rgce** field or the **xpeOld.rgce** field of the **RRDChgCell** record (section 2.4.223).

A parsed **expression** contains a sequence of parse tokens, each of which is either an **operand** token (section $\underline{2.2.2.2}$), an **operator** token (section $\underline{2.2.2.1}$), a **control** token (section $\underline{2.2.2.3}$), a **display** token (section $\underline{2.2.2.4}$), or a **mem** token (section $\underline{2.2.2.5}$). All tokens are stored as Parse Things (**Ptg** (section $\underline{2.5.198.25}$)).

With the exception of **control** tokens (section 2.2.2.3), **display** tokens (section 2.2.2.4), and **mem** tokens (section 2.2.2.5) that are described in subsequent sections, parsed expressions are stored in **Rgce** (section 2.5.198.104) using Reverse-Polish notation. Reverse-Polish notation is a logical system for the specification of mathematical formulas in which operands are followed by operators. Inside an **Rgce**, the operands and operators are represented by an array of **Ptg** structures (section 2.5.198.25) of variable lengths. The first one or two bytes of a **Ptg** structure (section 2.5.198.25) contain the token type that determines which specific **Ptg** type (section 2.5.198.25) the **Ptg** is, as specified in the **Ptg** structure The remainder of the structure varies according to the token type.

Evaluation of a formula specified in Reverse-Polish notation is usually based around an evaluation stack. The expression is parsed from beginning to end, and operands are pushed onto the stack as they are encountered. When operators are encountered, the required number of operands is popped from the stack and the result of the operation is pushed back onto the stack. Evaluation begins with an empty stack, and when the evaluation is finished, there will be exactly one value left on the stack. The value is the result of the evaluation. Subsequent subsections refer to a stack as described by this model.

2.2.2.1 Operator Tokens

Unary Operator Tokens

Unary Operator Tokens specify operations that are performed on the previous element in the grammar specified by **Rgce** (section 2.5.198.104). For example, **PtgPercent** (section 2.5.198.81) divides the last expression on the stack by 100.

Binary Operator Tokens

Binary Operator Tokens specify operations that are performed on the previous two elements in the grammar specified by **Rgce**. For example, **PtgIsect** (section <u>2.5.198.67</u>), which intersects the topmost two expressions on the stack.

2.2.2.2 Operand Tokens

Operand Tokens represent values and references that are used by operators and functions. Operands fall into one of two classes, **reference class** (section <u>2.2.2.2.2</u>), or **value class** (section <u>2.2.2.2.1</u>), depending on what result type the formula expects from the operand.

2.2.2.1 Value Class

Value Class is the most common type of operand, and represents a single value or array of values. When **Ptg records** (section <u>2.5.198.25</u>) with reference contents are used by an operator that requires **Value Class** operands, the **Ptg records** can be stored as **Value Class** operands rather than **reference class** (section <u>2.2.2.2.2</u>) operands. For example, in a formula where the contents of A1 is added to the integer value 1, the value of **cell** A1 is pushed onto the stack as a **Value Class** operand **PtgRef** (section <u>2.5.198.84</u>) because the subsequent **PtgAdd** operator (section <u>2.5.198.26</u>) requires **Value Class** operands. Arrays are stored in a similar fashion. For example, when adding the array of values {1,2,3,4,5,6}, the values are stored in a **PtgArray** operand (section <u>2.5.198.32</u>).

2.2.2.2 Reference Class

When operands are stored as **R**eference **Class** operands, any references contained in the operand are not de-referenced and do not return the underlying value or values. They are pushed onto the stack in reference form.

2.2.2.3 Control Tokens

Control Tokens do not perform operations or push values onto the stack. Conditional **C**ontrol Tokens (**PtgAttrIf** (section <u>2.5.198.36</u>), **PtgAttrChoose** (section <u>2.5.198.34</u>), and **PtgAttrGoto** (section <u>2.5.198.35</u>)) are used at runtime to prescribe short-circuit evaluation inside conditional functions and can be ignored when converting parsed expressions into textual formulas.

2.2.2.4 Display Tokens

Display Tokens, like **C**ontrol Tokens (section 2.2.2.3), do not perform operations or push values onto the stack. **Display** Tokens (**PtgParen** (section 2.5.198.80 and **PtgAttrSpace** (section 2.5.198.38)) are used at runtime to represent parentheses and space characters in a formula when parsed expressions are converted into textual formulas. **Display** Tokens do not affect the order of operations of the formula.

2.2.2.5 Mem Tokens

Mem Tokens have two purposes: they cache the results of **reference class expressions** (section 2.2.2.2.2) and they can return the results of **reference class expressions** (section 2.2.2.2.2) as **value class expressions** (section 2.2.2.2.1). **Mem** Tokens act on **binary-reference-expressions** (section 2.5.198.104) that follow them it in a **mem-area-expression** (section 2.5.198.104).

2.2.2.6 Formula Elements

Some **Ptg** records (section 2.5.198.25) require extra data that is not stored in the **Rgce** (section 2.5.198.104). When an **Rgce**contains one or more of these **Ptg** records, the containing formula structure includes an **RgbExtra** (section 2.5.198.103) containing the data for those **Ptg** records. The size of these components is specified by the **RgbExtra** structures. The **Ptg** records do not contain an offset into the **RgbExtra** for their data. The **Ptg** records that require a corresponding structure in **RgbExtra** are specified in section 2.5.198.103.

2.2.3 Charts

The following diagram identifies the major aspects of the file format representation of a chart.

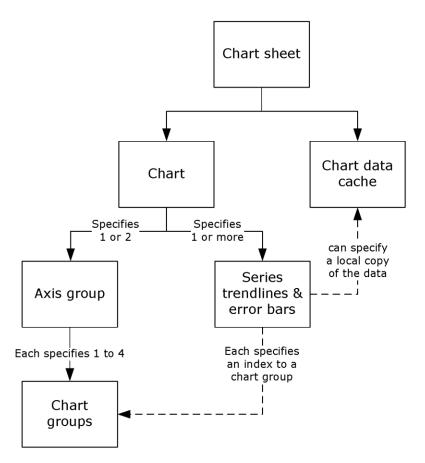

Figure 1: High-level structure of a chart

The **chart sheet** (section 2.2.3.1) specifies a **chart** (section 2.2.3.3), a graphic that displays data or the relationships between sets of data in a visual form, and a **chart data cache** (section 2.2.3.2), a local copy of the data that is used if the **chart** data is missing or if links to external **data sources** are broken. The **chart** specifies one or two **axis groups** (section 2.2.3.5), a set of **axes** (section 2.2.3.6) the **chart** data is plotted against, and the set of **series** (section 2.2.3.9), **trendlines** (section 2.2.3.12), and **error bars** (section 2.2.3.13) specified in the **chart**. Each **axis groups** specifies one to four **chart groups** (section 2.2.3.7) that specify the type of visualization used to display the data. Each **series**, **trendline**, and **error bar** specifies a **chart group** it is associated with.

2.2.3.1 Chart Sheet

A **chart sheet** is a set of data and the **chart** (section 2.2.3.3) that displays the data. There are two types of **chart sheets**: embedded **chart sheets**, and chart sheets that are not embedded.

A **chart sheet** that is not embedded is a separate **sheet (1)** in the **workbook** that is intended to display a **chart**. An embedded **chart sheet** is the logical container for a **chart** displayed on a **worksheet**.

A chart sheet is specified by the chart sheet substream (section 2.1.7.20.1).

The **chart sheet substream** for an embedded **chart sheet** is contained within a **worksheet substream** (section 2.1.7.20.5). A chart sheet that is not embedded is specified by a **chart sheet substream** that is not contained in another substream.

The following records and rules specify the significant parts of a **chart sheet**:

- The **SheetExt** record (section <u>2.4.259</u>) specifies properties of the sheet (1) containing the **chart**. If the **chart sheet** is embedded, the **SheetExt** record MUST NOT exist.
- The WebPub record (section 2.4.344) specifies properties of a chart sheet that has been published to the web.
- The sequences of records that conform to the PAGESETUP rule (section 2.1.7.20.6) and BACKGROUND rule (section 2.1.7.20.6) and the HFPicture (section 2.4.138), PrintSize (section 2.4.204), and HeaderFooter (section 2.4.137) records specify information about how the chart is printed.
- The **Fbi** (section <u>2.4.109</u>) and **Fbi2** (section <u>2.4.110</u>) records specify properties used for **font** scaling on the **chart**.
- The **Palette** (section <u>2.4.188</u>) and **CIrtClient** (section <u>2.4.50</u>) records specify properties of the **color palettes** used in the **chart sheet**.
- The sequence of records that conforms to the PROTECTION rule (section 2.1.7.20.6) and the WriteProtect record (section 2.4.350) specify protection settings for the chart. If the chart sheet is embedded, the WriteProtect record MUST NOT exist.
- The SXViewLink (section <u>2.4.316</u>), PivotChartBits (section <u>2.4.196</u>), and SBaseRef (section <u>2.4.242</u>) records specify the PivotTable (section <u>2.2.5</u>) that is the data source for this chart. If the chart is not a Pivot Chart (section <u>2.2.3.4</u>) these records MUST be ignored.
- The sequence of records that conforms to the OBJECTS rule (section 2.1.7.20.6) and the MsoDrawingGroup record (section 2.4.171) specify the drawing objects on the chart
- The sequence of records that conforms to the **CHARTFOMATS** rule (section 2.1.7.20.6) specifies the **chart** that is contained in the **chart sheet**.
- The sequence of records that conforms to the **SERIESDATA** rule (section 2.1.7.20.6) specifies the **chart data cache** (section 2.2.3.2).
- The sequences of records that conform to the WINDOW rule (section 2.1.7.20.6) and CUSTOMVIEW rule (section 2.1.7.20.6) specify the sheet (1) that contains the chart. If the chart sheet is not embedded, at least one sequence of records that conform to the WINDOW rule MUST exist. If the chart sheet is embedded, a sequence of records that conforms to the WINDOW rule and CUSTOMVIEW rule MUST NOT exist.
- The sequence of records that conforms to the **CRTMLFRT** rule (section 2.1.7.20.6) specifies **future records** (section 2.1.6) for the **chart sheet**.

2.2.3.2 Chart Data Cache

A **chart data cache** is a local copy of the data for a **chart** (section <u>2.2.3.3</u>). The **chart data cache** is used if data is missing or if links to external **data sources** are broken.

A **chart data cache** is specified by a sequence of records that conforms to the **SERIESDATA** rule (section <u>2.1.7.20.1</u>) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

The following records and rules specify the significant parts of a **chart data cache**:

- The **Dimensions** record (section 2.4.90) specifies the cells that contain data used by this **chart**.
- The **SIIndex** record (section 2.4.262) specifies the beginning of a sequence of records that contains a cache of the data for the sequence of records that conforms to a specific **AI** rule (section 2.1.7.20.1) in the **series** (section 2.2.3.12) and **error bars** (section 2.2.3.13). The relationship between the **series** and the chart data cache is specified as follows:

- The first **SIIndex** record in the **chart sheet substream**, which MUST contain a **numIndex** field equal to 0x0001, corresponds to the second sequence of records that conforms to the **AI** rule.
- The second **SIIndex** record in the **chart sheet substream**, which MUST contain a **numIndex** field equal to 0x0002, corresponds to the third sequence of records that conforms to the **AI** rule.
- The third **SIIndex** record in the **chart sheet substream**, which MUST contain a **numIndex** field equal to 0x0003, corresponds to the fourth sequence of records that conforms to the **AI** rule.
- The **Number** (section <u>2.4.180</u>), **BoolErr** (section <u>2.4.24</u>), **Blank** (section <u>2.4.20</u>), and **Label** (section <u>2.4.148</u>) records each specify an individual value stored in the cache. Each column in the cache corresponds to a **series** or **error bar**, where the zero-based index of the column, specified by the **cell.col** field in the **Number**, **BoolErr**, **Blank**, or **Label** records, equals the zero-based index of the **Series** record (section <u>2.4.252</u>) in the collection of **Series** records that corresponds to the **series** or **error bar**.

The following restrictions apply to the **chart data cache**:

- The **chart data cache** MUST contain data that corresponds to a sequence of records that conforms to the **AI** rule in a **series** if the corresponding data is not specified in the **chart** or on the same **sheet (1)** as the **chart**.
- The **chart data cache** MUST NOT contain data that corresponds to a sequence of records that conforms to the **AI** rule in a **series** if the corresponding data is specified in the **chart** or on the same sheet (1) as the **chart**.
- The **chart data cache** MUST NOT contain data that corresponds to the third or fourth sequence of records that conforms to the **AI** rule in an **error bar**.
- If the ebsrc field of the SerAuxErrBar record (section <u>2.4.249</u>) in an error bar equals 0x04, the chart data cache MUST contain data that corresponds to the second sequence of records that conforms to the AI rule in the error bar.
- If the **ebsrc** field of the **SerAuxErrBar** record in an error bar does not equal 0x04, the **chart data cache** MUST NOT contain data that corresponds to the second sequence of records that conforms to the **AI** rule in the **error bar**.
- The **chart data cache** MUST NOT contain data that corresponds to a **trendline** (section 2.2.3.12).

2.2.3.3 Chart

A **chart** is a graphic that displays data or the relationships between sets of data in a visual form. A **chart** element is an item within the chart such as an **axis** (section 2.2.3.6), **legend** (section 2.2.3.8), **series** (section 2.2.3.9), **data point** (section 2.2.3.10), **data label** (section 2.2.3.11), **trendline** (section 2.2.3.12), **error bar** (section 2.2.3.13), or **data table** (section 2.2.3.14).

A **chart data cache** (section 2.2.3.2) is specified by a sequence of records that conforms to the **CHARTFOMATS** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

A **chart** can contain the following records and rules that specify the parts of the **chart**:

- The **Chart** record (section <u>2.4.45</u>) specifies the position and size of the **chart area** (section <u>2.2.3.17</u>) for a non-embedded chart.
- The sequence of records that conforms to the FONTLIST rule (section 2.1.7.20.1) specifies font
 information for the chart.

- The **Scl** record (section <u>2.4.247</u>) specifies the **zoom level** of the current view in the window used to display the **chart**.
- The **PlotGrowth** record (section 2.4.198) specifies font scaling for the text on the **chart**.
- The sequence of records that conforms to the **FRAME** rule (section 2.1.7.20.1) specifies formatting of the chart area (section 2.2.3.17).
- The sequence of records that conforms to the **SERIESFORMAT** rule (section 2.1.7.20.1) specifies the **series**, **trendlines**, and **error** on the **chart**.
- The sequences of records that conform to the SS rule (section 2.1.7.20.1) specify properties of the data labels, series, data points, trendlines, and error bars on the chart. These records MUST NOT exist if the chart sheet substream contains a Series record (section 2.4.252). See the data label overview for additional restrictions on these collections of records.
- The sequences of records that conform to the **DFTTEXT** rule (section 2.1.7.20.1) and **TEXTPROPS** rule (section 2.1.7.20.1) specify default properties of the text in the **chart**. The **DataLabExt** (section 2.4.75), **StartObject** (section 2.4.267), and **EndObject** (section 2.4.101) records MUST NOT exist in these sequences of records that conform to the **DFTTEXT** rule (section 2.1.7.20.1).
- The **AxesUsed** record (section <u>2.4.10</u>) and the sequence of records that conforms to the **AXISPARENT** rule (section 2.1.7.20.1) specify the **axis groups** (section <u>2.2.3.5</u>) of the **chart**.
- The **CrtLayout12A** record (section <u>2.4.67</u>) specifies layout information for the **plot area**.
- The sequence of records that conforms to the **DAT** rule (section 2.1.7.20.1) specifies the **data** table for the **chart**.
- The sequence of records that conforms to the **ATTACHEDLABEL** rule (section 2.1.7.20.1) specifies the chart title. This sequence of records MUST have an **ObjectLink** record (section 2.4.182) where the **wLinkObj** field has a value of 0x0001.
- The sequence of records that conforms to the ATTACHEDLABEL rule and is preceded by the optional DataLabExt record specifies properties of series and data point data labels. This sequence of records MUST have an ObjectLink record where the wLinkObj field has a value of 0x0004. See the data label overview for additional information and restrictions on this collection of records.
- The sequence of records that conforms to the **CRTMLFRT** rule (section 2.1.7.20.1) specifies **future records** (section 2.1.6) for the **chart**.

2.2.3.4 Pivot Chart

A **Pivot Chart** is a **chart** (section 2.2.3.3) that uses a **PivotTable** (section 2.2.5) as a **data source**. The **SXViewLink** (section 2.4.316), **PivotChartBits** (section 2.4.196), and **SBaseRef** (section 2.4.242) records in the **chart sheet** (section 2.2.3.1) specify the **PivotTable**.

2.2.3.5 Axis Group

An **axis group** is a set of **axes** (section 2.2.3.6) that specify a coordinate system, a set of **chart groups** (section 2.2.3.7) that are plotted using these **axes** and the **plot area** that defines where the **axes** are rendered on the **chart** (section 2.2.3.3).

An **axis group** is specified by a sequence of records that conforms to the **AXISPARENT** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

The following records and rules define the significant parts of an **axis group**:

- The **AxisParent** record (section 2.4.13) specifies if the **axis group** is the primary axis group or the secondary axis group on a **chart**. Often the **axes** of the primary **axis group** are displayed to the left and bottom sides of the plot area, while **axes** of the secondary **axis group** are displayed on the right and top sides of the plot area.
- The **Pos** record (section <u>2.4.201</u>) specifies the position and size of the outer plot area. The outer plot area is the **bounding rectangle** that includes the **axis** labels, the **axis** titles, and **data table** (section <u>2.2.3.14</u>) of the **chart**. This record MUST be ignored on a secondary **axis group**.
- The sequences of records that conform to the **IVAXIS** (section 2.1.7.20.1), **DVAXIS** (section 2.1.7.20.1), and **SERIESAXIS** (section 2.1.7.20.1) rules in the collection of records that conform to the **AXES** rule (section 2.1.7.20.1) specify the **axes** of the **axis group**.
- The sequences of records that conform to the ATTACHEDLABEL rule (section 2.1.7.20.1) in the sequence of records that conform to the AXES rule specify the axis titles of the axis group. Each attached label (section 2.2.3.15) MUST contain an ObjectLink record (section 2.4.182) that conforms to the following requirements:
 - The wLinkObj field MUST equal to 0x0002, 0x0003, or 0x0007, indicating which axis the
 axis title is associated.
 - The wLinkObj field MUST specify an axis defined in the current axis group.
 - The wLinkObj field MUST be unique among the other attached labels that represent axis titles in the same axis group.
- The **PlotArea** record (section 2.4.197) and the sequence of records that conforms to the **FRAME** rule (section 2.1.7.20.1) in the sequence of records that conform to the **AXES** rule specify the properties of the inner plot area. The inner plot area is the rectangle bounded by the chart **axes**. The **PlotArea** record (section 2.4.197) MUST NOT exist on a secondary **axis group**.
- The sequences of records that conform to the **CRT** rule (section 2.1.7.20.1) specify the **chart groups** of the **axis group**.

Because there are many different ways to represent data visually, each representation has specific requirements about the layout of the data and the way it is plotted. This results in restrictions on the combinations of **chart group** types that can be plotted on the same **axis group**, and the combinations of **chart group** types that can be plotted in the same **chart**.

A chart MUST contain one of the following:

- A single **axis group** that contains a single **chart group** that contains a **Chart3d** record (section 2.4.46).
- One or two axis groups that each contain a single bubble chart group.
- One or two axis groups that each conform to one of the following restrictions on chart group type combinations:
 - Zero or one of each of the following chart group types: area, column, line, and scatter.
 - Zero or one of each of the following chart group types: bar of pie, doughnut, pie, and pie of pie.
 - A single bar chart group.
 - A single filled radar chart group.
 - A single radar chart group.

In addition to the restrictions on the combinations of **chart group** types that can be plotted on the same **axis group** or **chart**, there are additional restrictions on the **axes** of the **axis group** based on the **chart groups** of the axis group.

The following restrictions apply to the **axes** of an **axis group**:

- The axis group MUST NOT contain any axes if the axis group contains a bar of pie, doughnut, pie, or pie of pie chart group.
- The axis group MUST contain a category (2) or date axis if the axis group contains an area, bar, column, filled radar, line, radar, or surface chart group.
- The axis group MUST contain an area, bar, column, filled radar, line, radar, or surface chart group if the axis group contains a category (2) or date axis.
- The axis group MUST contain two value axes if and only if all chart groups are of type bubble or scatter.
- The axis group MUST contain a series axis if and only if the chart group attached to the axis group is one of the following:
 - An area chart group with the fStacked field of the Area record (section 2.4.2) equal to 0.
 - A column **chart group** with the **fStacked** field of the **Bar** record (section 2.4.15) equal to 0 and the **fClustered** field of the **Chart3d** record equal to 0.
 - A line chart group with field fStacked of the Line record (section 2.4.155) equal to 0.
 - A surface chart group.
- The chart group on the axis group MUST contain a Chart3d record if the axis group contains a series axis.

2.2.3.6 Axis

An **axis** is a line that borders the **chart** (section 2.2.3.3) **plot area** and provides a frame of reference for measurement. In addition to the **axis** line and its properties, the **axis** also specifies all parts of the **chart** that are associated with the **axis** line, such as the **axis** labels, **major gridlines**, **minor gridlines**, and the **walls** and **floor** of the **chart**.

An **axis** is specified by a sequence of records that conforms to either the **IVAXIS** (section 2.1.7.20.1), **DVAXIS** (section 2.1.7.20.1), or **SERIESAXIS** (section 2.1.7.20.1) rules specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

An **axis** has a type as defined by the following table:

Туре	Specified By	Description
Category	A sequence of records that conform to the IVAXIS that contains an AxcExt record (section 2.4.9) with field fDateAxis equal to 0.	A category (2) axis displays a set of category (2) labels that are evenly distributed along the axis in a given order. A category (2) axis displays arbitrary text values such as "Qtr1", "Qtr2", and "Qtr3", and cannot display scaled numerical values.
Date	A sequence of records that conform to the IVAXIS rule that contains an AxcExt record with field fDateAxis equal to 1.	A date axis displays scaled date or time values and can display data points (section 2.2.3.10) located at uneven intervals.
Series	A sequence of records that conform to the SERIESAXIS rule.	A series axis displays a set of series (section 2.2.3.9) names that are evenly distributed along

Туре	Specified By	Description
		the axis. When this axis is used, the data points of each series are plotted in a 3-dimensional space. The data points of a single series are plotted on a plane identified by the corresponding series name on this axis.
Value	A sequence of records that conform to the DVAXIS rule.	A value axis displays scaled numeric values. The bubble and scatter chart groups (section 2.2.3.7), which can contain two value axes, distinguish the value axes by specifying the axis orientation, either horizontal or vertical.

The following records and rules define the significant parts of an axis:

- The **CatSerRange** (section 2.4.39) and **ValueRange** (section 2.4.341) records specify the scaling properties of the **axis**, the crossing location of the other **axis** in the **axis group** (section 2.2.3.5), and the direction of the **axis**.
- The AxcExt record specifies if an axis is of type category (2) or date and specifies properties of a
 date axis.
- The CatLab record (section 2.4.38) specifies additional properties of the axis labels.
- The IFmtRecord record (section 2.4.143) in the sequence of records that conform to the AXS rule (section 2.1.7.20.1) specifies the number format of the axis labels.
- The Tick record (section 2.4.327) in the sequence of records that conform to the AXS rule specifies properties of the axis labels, and specifies the major tick marks and minor tick marks of the axis.
- The FontX record (section 2.4.123) and the sequence of records that conforms to the TEXTPROPS rule (section 2.1.7.20.1), in the collection of records that conform to the AXS rule, specify the font properties of the axis labels.
- The AxisLine (section 2.4.12) and LineFormat (section 2.4.156) record pairs and the sequences of records that conform to the SHAPEPROPS rule (section 2.1.7.20.1), in the sequence of records that conform to the AXS rule, specify the axis line, major gridlines and minor gridlines of the axis, and the border lines of the walls and floor of the chart. The omission of the AxisLine and LineFormat record pair specifying the axis line results in the axis line having default line format properties. The omission of other AxisLine and LineFormat record pairs results in the corresponding chart element being omitted from the chart.
- The **AreaFormat** record (section <u>2.4.3</u>) and the collection of records that conform to the **GELFRAME** rule (section 2.1.7.20.1) in the sequence of records that conform to the **AXS** rule specifies the fill format for the walls and floor of the **chart**. If the **wType** field of the **Axis** record (section <u>2.4.11</u>) in the **axis** equals 0x0000, these records apply to the walls of the **chart**. If the **wType** field of the **Axis** record in the **axis** equals 0x0001, these records apply to the floor of the **chart**. If the **wType** field of the **Axis** record in the axis equals 0x0002, these records MUST NOT exist. If the **chart sheet substream** does not contain a **Chart3d** record (section <u>2.4.46</u>), these records MUST NOT exist.
- The sequence of records that conforms to the AXM rule (section 2.1.7.20.1) specifies the display units and the display units label of a value axis.

2.2.3.7 Chart Group

A **chart group** is a set of one or more **series** (section 2.2.3.9) that visually represent data in a similar manner and are plotted using the same coordinate system. A **chart group** also includes all parts of the **chart** (section 2.2.3.3) that are associated with the set of **series** and the chart group can specify default properties for the **data points** (section 2.2.3.10) and **data labels** (section 2.2.3.11) associated with the **series**.

Basic **charts** have a single **chart group** because they contain one or more **series** of a single type and all **data points** are plotted using the same coordinates. Complex **charts**, such as combination **charts** that contain multiple **series** of different types or multiple **series** of similar type that are plotted using different sets of **axes** (section 2.2.3.6), contain multiple **chart groups**.

A **chart group** specifies a collection of **series** of a common type that share an **axis group** (section 2.2.3.5) and specifies the **chart** elements that are common to the collection of **series**.

A **chart group** is specified by a sequence of records that conforms to the **CRT** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

A **chart group** has a type as defined by the following table:

Туре	Specified By	Description
Area	A chart group that contains an Area record (section <u>2.4.2</u>).	A chart group type in which the data points of a series are plotted in a line and the region between the line and the horizontal axis is filled.
Bar	A chart group that contains a Bar record (section 2.4.15) with field fTranspose equal to 1.	A chart group type in which the data points in a series are represented as horizontal bars.
Bar of pie	A chart group that contains a BopPop record (section 2.4.25) with field pst equal to 0x02.	A chart group type that plots data points as segments in a circle or bar, where the bar displays the details of the data called out from a single segment of the circle.
Bubble	A chart group that contains a Scatter record (section 2.4.243) with field fBubbles equal to 1.	A chart group type that is a variation on a scatter chart group type in which the data points are represented as bubbles. A bubble chart group type compares three variables. The third variable determines the size of the data point .
Column	A chart group that contains a Bar record (section 2.4.15) with field fTranspose equal to 0.	A chart group type in which the data points in a series are represented as vertical bars.
Doughnut	A chart group that contains a Pie record (section 2.4.194) with field pcDonut not equal to 0x0000.	A chart group type in which multiple series are represented as concentric rings and the data points are represented as segments of the ring.
Filled radar	A chart group that contains a RadarArea record (section <u>2.4.213</u>).	A chart group type that is a variation on a radar group type in which the data points in a series are connected by a line and the area enclosed by the line is filled.
Line	A chart group that contains a Line record (section <u>2.4.155</u>).	A chart group type in which data points in a series are connected by a line.
Pie	A chart group that contains a Pie record (section 2.4.194) with field pcDonut equal to 0x0000.	A chart group type that plots data points as segments (or slices) of a circle.
Pie of pie	A chart group that contains a BopPop	A chart group type that plots data points as

Туре	Specified By	Description
	record (section 2.4.25) with field pst equal to 0x01.	segments (or slices) of two circles, where the secondary circle displays the details of the data called out from a single segment of the primary circle.
Radar	A chart group that contains a RadarArea record (section 2.4.213).	A chart group type in which each data point in a series is plotted along a separate axis that starts at the center of the chart and extends outward.
Scatter	A chart group that contains a Scatter record (section 2.4.243) with field fBubbles equal to 0.	A chart group type that displays quantitative values on both horizontal and vertical axes to represent two variables as a single data point .
Surface	A chart group that contains a Surf record (section <u>2.4.272</u>).	A chart group type that shows a three dimensional surface that connects a set of data points .

The following records and rules define the significant parts of a chart group:

- The **SeriesList** record (section <u>2.4.253</u>) specifies the **series** of the **chart**. This record MUST NOT exist in the first **chart group** in the **chart sheet substream**. This record MUST exist when not in the first **chart group** in the **chart sheet substream**.
- The Chart3d record (section 2.4.46) specifies that the plot area, axis group (section 2.2.3.5), and chart group are rendered in a 3-D scene, rather than a 2-D scene, and specifies properties of the 3-D scene. If this record exists in the chart sheet substream, the chart sheet substream MUST have exactly one chart group. This record MUST NOT exist in a bar of pie, bubble, doughnut, filled radar, pie of pie, radar, or scatter chart group.
- The sequence of records that conforms to the **LD** rule (section 2.1.7.20.1) specifies the **legend** (section 2.2.3.8) on the **chart**. The sequence of records that conforms to the **LD** rule (section 2.1.7.20.1) MUST NOT exist in a **chart group** that is not the first **chart group** in the **chart sheet substream**.
- The sequences of records that conform to the DROPBAR rule (section 2.1.7.20.1) specify the up-down bars on the chart group.
- The CrtLine (section 2.4.68) LineFormat (section 2.4.156) record pairs and the sequences of records that conform to the SHAPEPROPS rule (section 2.1.7.20.1) specify the drop lines, highlow lines, series lines, and leader lines for the chart.
- The sequences of records that conform to the **DFTTEXT** rule (section 2.1.7.20.1), the **DataLabExtContents** record (section 2.4.76), and the sequence of records that conforms to the **SS** rule (section 2.1.7.20.1) specify the **data label** and **data point** formatting for the **chart group**. Refer to the **data label** overview for details on the **chart group data label**.

2.2.3.8 Legend

A **legend** identifies different groupings of information about the **chart** (section 2.2.3.3). A **legend** consists of a set of **legend entries**. Each legend entry, which consists of a **legend key** and a text label, identifies either the **data points** (section 2.2.3.10) in the **chart**, the **series** (section 2.2.3.9) and **trendlines** in the **chart**, or the bands on a surface **chart group** (section 2.2.3.7).

A **legend** is specified by a sequence of records that conforms to an **LD** rule (section 2.1.7.20.1) in a **chart group** as specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

A **legend** on a **chart** can contain three types of content:

- A legend can contain legend entries for each of the series and trendlines in the chart:
 - Each legend entry represents a single series or trendline.
 - The legend keys contain the same formatting as the corresponding series or trendline.
 - The legend text labels contain the name of the corresponding series or trendline.
 - This type of **legend** is used when the **chart group** type is not surface and one of the following conditions is satisfied:
 - The chart has more than one included series.
 - The chart has a single included series, no data point formatting exceptions on the included series, and either contains a trendline or contains a ChartFormat record (section 2.4.48) associated with the included series that has the fVaried field equal to 0 or ignored.
- A **legend** can contain legend entries for each **data point** in the **chart**:
 - Each legend entry represents a single data point on the chart.
 - The legend keys contain the same formatting as the corresponding data point.
 - The **legend** text labels contain the **category (2)** name or horizontal value of the corresponding **data point**.
 - This type of legend is used when the chart group type is not surface and the conditions for a legend that contains legend entries for each of the series and trendlines in the chart are not satisfied.
- A **legend** can contain legend entries for each band on a surface **chart group** (which is formatted into different bands based on the value of the surface at any given **data point** in space):
 - Each legend entry represents a single band that represents a range of values on a surface **chart group**.
 - The legend keys contain the same formatting as the corresponding band.
 - The legend text labels contain the value range of the corresponding band.
 - This type of legend is used when the chart contains a surface chart group.

The following records and rules define the significant parts of a **legend**:

- The **Legend** record (section 2.4.152) specifies the layout of the legend and specifies if the **legend** is automatically positioned.
- The Pos record (section <u>2.4.201</u>), CrtLayout12 record (section <u>2.4.66</u>), and the sequence of records that conforms to the CRTMLFRT rule (section 2.1.7.20.1), specify the position of the legend.
- The sequences of records that conform to the ATTACHEDLABEL (section 2.1.7.20.1) and TEXTPROPS (section 2.1.7.20.1) rules specify the default text formatting for the legend entries. The Pos record of the attached label (section 2.2.3.15) MUST be ignored. The ObjectLink record (section 2.4.182) of the attached label MUST NOT exist. A series can specify formatting exceptions for individual legend entries.
- The sequence of records that conforms to the **FRAME** rule (section 2.1.7.20.1) specifies the fill and **border formatting** properties of the **legend**.

2.2.3.9 Series

A **series** is of a set of related **data points** (section 2.2.3.10) that are plotted in a **chart** (section 2.2.3.3). In addition to specifying the **data points** of the **series** and the formatting properties of the **data points**, a **series** can also specify a series name and properties of the **data label** (section 2.2.3.11) and **legend entries** that are associated with the **series**.

A **series** is defined by a sequence of records that conforms to the **SERIESFORMAT** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF** that contains a **SerToCrt** record (section 2.4.256).

A **series** can either be of type included or excluded. Included **series** are **series** that are shown in the **chart**. Excluded **series** are not shown in the **chart**, but exist as **series** in the file. A **series** is an excluded **series** if both of the following conditions are satisfied:

- The **chart group** (section 2.2.3.7) type of the **series** is bar of pie, pie, or pie of pie.
- The series is not the first series in the chart sheet substream to be on the chart group and contain in the second sequence of records that conform to the AI rule (section 2.1.7.20.1) a BRAI record (section 2.4.29) that contains an ifmt field that specifies a formula (section 2.2.2) that equals to a row or column that is not excluded from the chart sheet.

This occurs when the **chart group** is of type bar of pie, pie, or pie of pie, and the **chart sheet** contains multiple **series**, because these **chart group** types will only display the first **series** of data on the **chart**.

All other series are included series.

The following records and rules define the significant parts of a **series**:

The **Series** record (section 2.4.252) specifies the type and size of the data in the **series**.

- The four sequences of records that conform to the AI rule specify formulas. The meaning of the formulas are specified as follows:
 - 1. In the first sequence, the value of the **formula** specifies the name of the **series**. The **SeriesText** record (section 2.4.254) specifies a cache of the name of the **series**.
 - 2. In the second sequence, the value of the **formula** specifies:
 - A set of coordinates along the vertical value **axis** (section <u>2.2.3.6</u>) if the series is in a bubble or scatter **chart group**.
 - A set of coordinates along the value axis if the series is in any other chart group type.
 - 3. In the third sequence, the value of the **formula** specifies:
 - A set of coordinates along a horizontal value axis if the series is in a bubble or scatter chart group.
 - A set of **category (2) axis** labels that are distributed evenly along the category (2) **axis** based on their order in the set or a set of dates along a date **axis** is in any other **chart group** type.
 - 4. In the fourth sequence of records, the value of the **formula** specifies a set of scalar values used in a bubble **chart group** to define the size of the bubbles.
- The sequence of records that conform to the SS rule (section 2.1.7.20.1) specify the data point and data label properties for a series or individual data points of the series. If formatting is not specified for an individual data point, the data point inherits the formatting of the series. If formatting is not specified for the series, the series inherits the formatting of the chart group

that contains the **series**. The **yi** field of the **DataFormat** record (section <u>2.4.74</u>) MUST specify the zero-based index of the **Series** record associated with this **series** in the collection of all **Series** records in the current **chart sheet substream** that contains the **series**. Refer to the **data label** overview for an explanation of the **data label** and the conditions on this collection of records.

- The SerToCrt record (section 2.4.256) specifies the chart group that contains the current series.
- The **LegendException** record (section <u>2.4.153</u>) specifies a legend entry in the **legend** (section <u>2.2.3.8</u>) that corresponds to the **series**. If the **LegendException** record (section 2.4.153) specifies that the legend entry has non-default formatting, then the **attached label** (section <u>2.2.3.15</u>) and the sequence of records that conforms to the **TEXTPROPS** rule (section 2.1.7.20.1) that follow the **LegendException** (section 2.4.153) and **Begin** (section <u>2.4.17</u>) records specify the custom formatting of the legend entry. If the **fLabel** field of **LegendException** equals 0, the **attached label** MUST NOT exist.

2.2.3.10 Data Point

A **data point** is a value plotted in a **chart** (section 2.2.3.3) and visually displayed as shapes, such as bars, columns and markers, as specified by the **chart group** (section 2.2.3.7) type of the **chart**.

A **data point** consists of a set of three values located on the same index of the second to fourth sequences of records that conform to the **AI** rule (section 2.1.7.20.1) contained in the **series** (section 2.2.3.9) of the **data point**. For example, the set of three values for a **data point** in a bubble **chart group** consists of a coordinate of the **data point** along the vertical value **axis** (section 2.2.3.6), the coordinate of the **data point** along the horizontal value **axis**, and the scalar value that defines the **bubble size** of the **data point**.

2.2.3.11 Data Label

A **data label** is a label on a **chart** (section 2.2.3.3) that is associated with a **data point** (section 2.2.3.10), or associated with a **series** (section 2.2.3.9) on an area or filled radar **chart group** (section 2.2.3.7). A **data label** contains information about the associated **data point**, such as the description of the **data point**, a **legend key**, or custom text.

Inheritance

For any given **data point**, there is an order of inheritance that determines the contents of a **data label** associated with the **data point**:

- **Data labels** can be specified for a **chart group**, specifying the default setting for the **data labels** associated with the **data points** on the **chart group**.
- Data labels can be specified for a series, specifying the default setting for the data labels
 associated with the data points of the series. This type of data label overrides the data label
 properties specified on the chart group for the data labels associated with the data points in a
 given series.
- **Data labels** can be specified for a **data point**, specifying the settings for a **data label** associated with a particular **data point**. This type of **data label** overrides the **data label** properties specified on the **chart group** and **series** for the **data labels** associated with a given **data point**.

Records

The set of records that specifies a **data label**, and the requirements that exist on these records, differ if the **data label** is specified for a **chart group**, **series**, or **data point**. The set of records that represent a **data label** are as follows:

- For a **chart group**, properties of a data label are specified by the following collections of records that are specified in the **chart group**:
 - 1. The sequence of records that conforms to the **DFTTEXT** rule (section 2.1.7.20.1).
 - The **DataLabExtContents** record (section <u>2.4.76</u>) that is not contained in the sequence of records that conforms to the **LD** rule (section 2.1.7.20.1) or the sequence of records that conforms to the **DFTTEXT** rule.
 - 3. The **AttachedLabel** record (section 2.4.5) that is contained in the sequence of records that conforms to the **SS** rule (section 2.1.7.20.1).
- For a series or data point, properties of a data label are specified by the following collections of records that are specified in the chart:
 - 1. The **attached label** (section <u>2.2.3.15</u>) that corresponds to the **series** or **data point**. The **attached label** that corresponds to a **series** or **data point** appears in the **chart sheet substream** (section 2.1.7.20.1) after the **axis group** (section <u>2.2.3.5</u>) and is specified by the following properties of the **attached label**:
 - 1. The **wLinkObj** field of the **ObjectLink** record (section <u>2.4.182</u>) equals 0x0004.
 - The wLinkVar1 field of the ObjectLink record equals the index to the corresponding series.
 - 3. The **wLinkVar2** field of the **ObjectLink** record equals the index to the corresponding **data point** or equals 0xFFFF for a corresponding **series**.
 - 2. The **AttachedLabel** record (section 2.4.5) that corresponds to the **series** or **data point**. The **AttachedLabel** record that corresponds to a **series** or **data point** appears in the sequence of records that conforms to the **SS** rule that has the following properties:
 - The yi field of the DataFormat record (section <u>2.4.74</u>) equals the index to the corresponding series.
 - 2. The **xi** field of the **DataFormat** record equals the index to the corresponding **data point** or equals 0xFFFF for a corresponding **series**.

Overrides

Some properties of the records that specify the contents of a **data label** can overlap and conflict. For the information that overlaps between these records, there is a set of rules that specifies the relationships between these records and specifies the fields that need to be ignored in conflict situations.

In general, properties of the **DataLabExtContents** record (section 2.4.76) of the **data label** override properties of the **Text** record (section 2.4.324) of the of the **data label**, which overrides the properties of the **AttachedLabel** record of the **data label**. Details of the relationships between individual fields are specified in the records.

The following section provides an explanation of how to interpret the **data label** and when the different records that specify the **data label** are relevant to the **data label**.

On a data label associated with a chart group:

• When the chart group has a data label, the following algorithm determines the data label contents. Once the set of records that represents the data label has been established, the data label information that overlaps across records is respected on the DataLabExtContents record and ignored on the Text and AttachedLabel records of the data label. In this algorithm, ABNF rules are used to specify the sequence of records that conform to the rule. In this algorithm,

"DFTTEXT with id" specifies the sequence of records that conforms to the **DFTTEXT** rule that contains a **DefaultText** record (section 2.4.88) with and **id** field equal to the value specified.

```
//Define variables
X equals a DataLabExtContents record
Y equals a DataLabExtContents record
SS equals an to AttachedLabel record
SWAP equals a boolean
//Initialize SWAP
SET SWAP equal to FALSE
//Initialize SS
SET SS equal to AttachedLabel record in the sequence of records that conforms to
    the SS rule
//Initialize X
IF DFTTEXT with id field equal to 0 exists
    IF DFTTEXT with id field equals to 0 has a DataLabExtContents record
        SET X equal to DataLabExtContents record in DFTTEXT with id field equal to
    ELSE

        END IF
        SET the DataLabExtContents record of the data label equal to X
    ELSE
        IF DFTTEXT with id field equal to 1 exists
           SET the data label equal to DFTTEXT with id field equal to 1
        ELSE
           SET the data label equal to the default formatting properties
        END IF
        SET the DataLabExtContents record of the data label equal to Y
```

On a data label associated with a series or data point:

- The attached label specifies an exception on the data label and indicates that the current data label differs from the data label inherited from the chart group for a series, or from the chart group and series for a data point. The attached label of the data label contains a Text record and can contain a DataLabExtContents record.
- On a data label associated with a data point, when the attached label exists and contains a BRAI record (section 2.4.29) with field formula not equal to 0x0000, the formula field specifies the contents of the data label.
- On a data label associated with a data point, when the attached label exists and contains a SeriesText record (section 2.4.254) and a BRAI record with field formula equal to 0x0000, the SeriesText record specifies the contents of the data label.
- When the attached label exists and contains a DataLabExtContents record, the data label
 information specified by the DataLabExtContents record that overlaps across records is
 respected, and the information contained in the Text and AttachedLabel records of the data
 label that overlaps is ignored.
- When the attached label exists and does not contain a DataLabExtContents record, the data label specified by the Text record that overlaps across records is respected, and the information contained in the AttachedLabel record of the data label that overlaps is ignored.
- When the data label does not specify an attached label, the AttachedLabel record of the data label specifies the content properties of the data label.

Restrictions

The following requirements and restrictions exist on different parts of the collections of records that represent the **data label**.

If the chart group contains a data label:

- The **chart group** SHOULD<13> contain two sequences of records that conform to the **DFTTEXT** rule that have the same records with the same field values.
- If the **chart group** contains a **DataLabExtContents** record, the **DataLabExtContents** record in the sequences of records that conform to the **DFTTEXT** rule on the chart group and the **DataLabExtContents** record that is not specified in the sequences of records that conform to the **DFTTEXT** rule on the chart group SHOULD<14> contain the same field values.
- If the chart group contains a sequence of records that conforms to the DFTTEXT rule the following restrictions apply:
 - The **fShowValue** field of the **AttachedLabel** record SHOULD<15> equal the **fShowValue** field of the **Text** record in the sequence of records that conforms to the **DFTTEXT** rule.
 - The fShowPercent field of the AttachedLabel record SHOULD<16> equal the fShowPercent field of the Text record in the sequence of records that conforms to the DFTTEXT rule.
 - The fShowLabelAndPerc field of the AttachedLabel record SHOULD<17> equal the fShowLabelAndPerc field of the Text record in the sequence of records that conforms to the DFTTEXT rule.

2.2.3.12 Trendline

A **trendline** is a straight or curved line that graphically represents the general trend of the **data points** (section 2.2.3.10) of a **series** (section 2.2.3.9). In addition to specifying the data and formatting properties of the line, the **trendline** name and the **trendline** label can also be specified in the **trendline**.

A trendline is defined by a sequence of records that conforms to the **SERIESFORMAT** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF** that contains a **SerAuxTrend** record (section 2.4.250).

The following records and rules define the significant parts of a **trendline**:

- The SeriesText record (section <u>2.4.254</u>) in the first sequence of records that conforms to the AI rule (section 2.1.7.20.1) specifies a custom trendline name to display in the legend (section <u>2.2.3.8</u>).
- The sequence of records that conforms to the SS rule (section 2.1.7.20.1) specifies the formatting properties of the trendline. The yi field of the DataFormat record (section 2.4.74) MUST specify the zero-based index of the Series record (section 2.4.252) associated with this trendline in the collection of all Series records in the current chart sheet substream. Each trendline MUST contain zero or one sequences of records that conform to the SS rule.
- The SerParent record (section <u>2.4.255</u>) specifies the series associated with the trendline.
- The SerAuxTrend record specifies properties of the trendline, such as the trendline type and the number of periods to forecast forward and backward, and specifies properties of the content of the trendline label.
- The LegendException record (section 2.4.153) specifies the formatting of the legend entry in the legend (section 2.2.3.8) that corresponds to the trendline. This record is specified if the legend entry has been deleted or does not use the default formatting of the legend. When the legend entry has non-default formatting, the attached label (section 2.2.3.15) that follows the LegendException record and Begin records (section 2.4.17) specifies the custom formatting of the legend entry.

The following restrictions apply to a **trendline**:

- All fields except the cValx and cValy fields in the Series record (section 2.4.252) MUST be ignored. The cValy and cValx fields in the Series records MUST be greater than 0.
- The **BRAI** records (section 2.4.29) in the sequence of records that conforms to the **AI** rule (section 2.1.7.20.1) MUST be ignored and the **ifmt** field of the **BRAI** records MUST equal 0x0000.

2.2.3.13 Error Bar

An **error bar** is a set of lines displayed on a **chart** (section 2.2.3.3) that indicates a range of uncertainty in the measurement of each **data points** (section 2.2.3.10) in a **series** (section 2.2.3.9).

An **error bar** is specified by a sequence of records that conforms to the **SERIESFORMAT** rule (section 2.1.7.20.1) specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF** that contains a **SerAuxErrBar** record (section 2.4.249).

The following records and rules define the significant parts of an **error bar**:

• The sequence of records that conforms to the **SS** rule (section 2.1.7.20.1) specifies the formatting properties of the **error bar**. The **yi** field of the **DataFormat** record (section 2.4.74) MUST specify the zero-based index of the **Series** record (section 2.4.252) associated with this **error bar** in the collection of all **Series** record in the current **chart sheet substream**. Each **error bar** MUST contain zero or one sequences of records that conform to the **SS** rule.

- The **SerParent** record (section 2.4.255) specifies the **series** associated with the **error bar**.
- The SerAuxErrBar record specifies properties of the error bar, including the direction and type
 of the error bar.

The following restrictions apply to **error bars**:

- All fields except the cValx and cValy fields in the Series record MUST be ignored.
- The **cValx** field MUST equal the **cValx** field of the **Series** record in the associated **series** specified by the **SerParent** record.
- If the **ebsrc** field of the **SerAuxErrBar** record equals 0x04 and the **sertm** field of the **SerAuxErrBar** equals 0x01 or 0x02, the **cValx** field MUST equal the number of values represented by the **formula** field of the second **BRAI** record (section 2.4.29) in the sequence of records that conforms to the **AI** rule (section 2.1.7.20.1).
- If the **ebsrc** field of the **SerAuxErrBar** record equals 0x04 and the **sertm** field of the **SerAuxErrBar** equals 0x03 or 0x04, the **cValy** field MUST equal the number of values represented by the **formula** field of the second **BRAI** record in the sequence of records that conforms to the **AI** rule.
- If the **ebsrc** field of the **SerAuxErrBar** record does not equal 0x04, the **cValy** field MUST equal the **cValy** field of the **Series** record in the associated **series** specified by the **SerParent** record.
- The BRAI records in the first, third, and fourth sequences of records that conform to the AI rule MUST be ignored and the ifmt field of the BRAI records MUST equal 0x0000.
- If the **ebsrc** field of the **SerAuxErrBar** record equals 0x04, the **ifmt** field of the **BRAI** records contained in the second collection of records that conform to the **AI** rule specifies a **Formula** (section 2.4.127) that specifies custom values of the **error bar**.
- If the **ebsrc** field of the **SerAuxErrBar** record equals 0x04, the **BRAI** records in the second sequence of records that conforms to the **AI** rule MUST be ignored and the **ifmt** field of the **BRAI** records MUST equal 0x0000.
- The LegendException record (section <u>2.4.153</u>) in the chart sheet substream MUST NOT exist.

2.2.3.14 Data Table

A **data table (2)** is a table on a **chart** (section <u>2.2.3.3</u>) that contains a row for each **series** (section <u>2.2.3.9</u>) and lists the values of each **data point** (section <u>2.2.3.10</u>) on the **chart**.

A data table (2) is specified by a sequence of records that conforms to a **DAT** rule (section 2.1.7.20.1) as specified by the **chart sheet substream** (section 2.1.7.20.1) **ABNF**.

The following records and rules define the significant parts of a data table (2):

- The **Dat** record (section 2.4.73) specifies if the data table (2) shows **legend keys** next to the name of the **series** and specifies which data table (2) borders are displayed.
- The sequences of records that conform to the **ATTACHEDLABEL** (section 2.1.7.20.1) and **TEXTPROPS** (section 2.1.7.20.1) rules in the sequence of records that conforms to the **LD** rule (section 2.1.7.20.1) specify the text formatting for the data table (2). The **Pos** record (section 2.4.201) of the **attached label** (section 2.2.3.15) MUST be ignored. The **ObjectLink** record (section 2.4.182) of the **attached label** MUST NOT exist.
- The sequence of records that conforms to the **FRAME** rule (section 2.1.7.20.1) in the sequence of records that conforms to the **LD** rule specifies the formatting properties of the data table (2).

The following restrictions apply to the collection of records that represents a data table (2):

- The **fWasDataTable** field of the **Legend** record (section 2.4.152) in the sequence of records that conforms to the **LD** rule MUST equal 1.
- The **Pos** record in the sequence of records that conforms to the **LD** rule MUST be ignored. A data table (2) is automatically positioned.
- The CrtLayout12 record (section 2.4.66) and the sequence of records that conforms to the CRTMLFRT rule (section 2.1.7.20.1), in the sequence of records that conforms to the LD rule, MUST NOT exist in a data table (2).

A data table (2) is not displayed on a **chart** if the **chart** contains a bar of pie, bubble, doughnut, filled radar, pie, pie of pie, radar, or scatter **chart group** (section 2.2.3.7).

2.2.3.15 Attached Label

An **attached label** is a generic text element that is used on a **chart** (section 2.2.3.3). An **attached label** can specify properties of an **axis** (section 2.2.3.6) title, **chart** title, **data label** (section 2.2.3.11), **data table** (section 2.2.3.14), **display units** label, **legend** (section 2.2.3.8), **legend entry**, **trendline** (section 2.2.3.12) label, or the default text properties of the entire **chart**.

The location of the **attached label** in the **chart sheet substream** (section 2.1.7.20.1) **ABNF** and the properties of the **ObjectLink** record (section 2.4.182) of the **attached label** specify the **chart** element to which the **attached label** applies. Refer to the **conceptual overviews** (section 2.2.3) for explanation of the meaning of the **attached label** in each context that it is used.

An **attached label** is specified by a collection of records that conforms to an **ATTACHEDLABEL** rule (section 2.1.7.20.1) as specified by the **chart sheet substream** (section 2.1.7.20.1) ABNF.

- The Text record (section 2.4.324) and the collection of records that conforms to the TEXTPROPS rule (section 2.1.7.20.1) specify properties of the text in the attached label. These properties include text options such as text rotation and reading order. On attached labels that represent data labels, the Text record also specifies content and layout properties of the data labels.
- The **Pos** (section <u>2.4.201</u>) and **CrtLayout12** (section <u>2.4.66</u>) records specify the position of the **attached label** on the **chart**. The **Pos** record MUST be ignored if the **attached label** represents the **data labels** on a **series** (section <u>2.2.3.9</u>) or **chart group** (section <u>2.2.3.7</u>), a **data table**, the default text of the **chart**, or a **legend key**.
- The **FontX** (section <u>2.4.123</u>) and **AlRuns** (section <u>2.4.1</u>) records specify the font and rich text formatting properties of the **attached label**.
- The collection of records that conforms to the AI rule (section 2.1.7.20.1) specifies custom text of the attached label.
- The collection of records that conforms to the FRAME rule (section 2.1.7.20.1) specifies the fill
 and border properties of the attached label.
- The **ObjectLink** record specifies the **chart** element the **attached label** applies to.
- The DataLabExtContents record (section 2.4.76) specifies additional data label properties on attached labels that represent a data label. Refer to the data label overview for the conditions when this record can be written. This record MUST NOT exist unless the attached label specifies properties of a data label. An attached label specifies properties of a data label if the wLinkObj field of the ObjectLink record is equal to 0x0004 or the attached label is in the collection of records that conforms to the DFTTEXT rule (section 2.1.7.20.1) in a chart group.
- The collection of records that conforms to the CRTMLFRT rule (section 2.1.7.20.1) specifies future records (section 2.1.6) for the attached label.

2.2.3.16 SPRC

A **SPRC** is a unit of measurement that is 1/4000th of the height or width of the **chart** (section 2.2.3.3). If the field is being used to specify a width or horizontal distance, the **SPRC** is 1/4000th of the width of the **chart**. If the field is being used to specify a height or vertical distance, the **SPRC** is 1/4000th of the height of the **chart**.

2.2.3.17 Chart Area

For non-embedded **charts**, the size of the area is specified by the **Chart** record (section $\underline{2.4.45}$) in points. For embedded **charts**, the **chart** is treated as a drawing and its size is calculated from the **OfficeArtClientAnchorSheet** record (section $\underline{2.5.193}$) that is contained in the **MsoDrawing** (section $\underline{2.4.170}$) preceding the **chart** stream. The **chart area** calculation is as follows:

1. Get chart area width in pixels

chart area width in pixels = (dx field of **Chart** record - 8) * DPI of the display device / 72 for non-embedded **charts**.

chart area width in pixels is calculated from individual cell widths/heights that anchor the **chart** as indicated by **OfficeArtClientAnchorSheet** (section 2.5.193) for embedded charts.

If the **frt** field of the **Frame** record (section 2.4.128) following the **Chart** record (section 2.4.45) is 0x0004 and the **chart** is not embedded, add the shadow size:

chart area width in pixels -= 2 * line width of the display device in pixels

2. Get chart area height in pixels

chart area height in pixels = (dy field of **Chart** record - 8) * DPI of the display device / 72 for non-embedded **charts**.

chart area height in pixels is calculated from individual cell widths/heights that anchor the **chart** as indicated by **OfficeArtClientAnchorSheet** (section 2.5.193) for embedded charts.

If the **frt** field of the **Frame** record (section 2.4.128) following the **Chart** record (section 2.4.45) is 0x0004 and the **chart** is not embedded, add the shadow size:

chart area height in pixels -= 2 * line height of the display device in pixels

2.2.4 Metadata

Metadata is additional data associated with a particular **cell** or its content. **Metadata** is recorded in **BIFF8** for future extensibility purpose only.

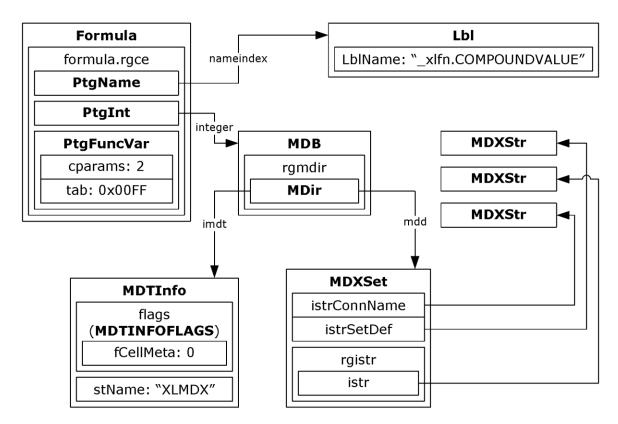

Figure 2: Metadata

The following sections define terms used in this diagram.

2.2.4.1 Metadata Types

The architecture of the metadata allows for multiple types of metadata.

Each type of metadata has an associated collection of metadata records, a unique name, and a set of predefined properties. Those properties describe whether the metadata remains associated with the **cell** or its content during runtime operations (for example, insert, shift, copy/paste, merge, or unmerge operations), as well as whether the metadata is **cell metadata** (section 2.2.4.2) or **value metadata** (section 2.2.4.3).

A metadata type is represented by an **MDTInfo** record (section 2.4.162).

2.2.4.2 Cell Metadata

Cell metadata is metadata associated with a **cell** itself. **Cell metadata** is not represented in **BIFF8** format.

2.2.4.3 Value Metadata

Value metadata is metadata associated with the value of a particular **cell**. **Value metadata** is associated with a cell through a **formula** (section 2.2.2) containing a single special function, _xlfn.COMPOUNDVALUE, whose single mandatory argument references a **metadata block** record (section 2.2.4.4)<18>.

The only value metadata type represented in BIFF8 is MDX metadata (section 2.2.4.5).

2.2.4.4 Metadata Block

Cells are associated with actual metadata values using a metadata mapping table known as a **metadata block**. A **metadata block** contains a collection of indexes to metadata records, along with the corresponding **metadata types** (section <u>2.2.4.1</u>).

A **metadata block** is represented by an **MDB record** (section 2.4.161).

2.2.4.5 MDX Metadata

The only type of metadata used is **MDX** metadata.

The **MDTInfo** record (section $\underline{2.4.162}$) that specifies the **metadata type** (section $\underline{2.2.4.1}$) for MDX metadata MUST have the following values:

Field	Value
fGhostRow	0
fGhostCol	0
fEdit	0
fDelete	0
fCopy	1
fPasteAll	1
fPasteFormulas	0
fPasteValues	1
fPasteFormats	0
fPasteComments	0
fPasteDataValidation	0
fPasteBorders	0
fPasteColWidths	0
fPasteNumberFormats 0	
fMerge	1
fSplitFirst	1
fSplitAll	0
fRowColShift	1
fClearAll	0
fClearFormats	1
fClearContents	0
fClearComments	1

Field	Value
fAssign	1
fCoerce	1
fAdjust	0
fCellMeta	0
stName	"XLMDX"

An MDX metadata record references the connection name and the **cube function** used or referenced in a **cell**.

There are four types of MDX metadata records: **MDX tuple metadata** (section $\underline{2.2.4.5.1}$), **MDX set metadata** (section $\underline{2.2.4.5.2}$), **MDX member property metadata** (section $\underline{2.2.4.5.3}$), and **MDX KPI metadata** (section $\underline{2.2.4.5.4}$).

2.2.4.5.1 MDX Tuple Metadata

An **MDX tuple** is the intersection between two or more **members (2)** from different **dimensions (1)**.

MDX tuple metadata is used by cube functions returning a member (2) or a value.

MDX tuple metadata is represented by an **MDXTuple** record (section 2.4.167).

2.2.4.5.2 MDX Set Metadata

An MDX set is an ordered collection of members (2) within the same dimension (1).

MDX set metadata is used by **cube functions** returning a set or the number of items in a set.

MDX set metadata is represented by an **MDXSet** record (section 2.4.165).

2.2.4.5.3 MDX Member Property Metadata

An MDX member property represents the property value of a member (2).

MDX member property metadata references a member (2) name and a property name.

MDX member property metadata is represented by an **MDXProp** record (section 2.4.164).

2.2.4.5.4 MDX KPI Metadata

An **MDX key performance indicator (KPI)** represents the KPI property value of a KPI **member** (2).

MDX KPI metadata references a KPI name, a KPI property, and a member (2) name.

MDX KPI metadata is represented by an **MDXKPI** record (section 2.4.163).

2.2.5 PivotTables

A PivotTable is a mechanism for summarizing **source data** (section <u>2.2.5.3.2</u>) to get an overview of the distribution of that data. In a PivotTable, applicable columns of the **source data** become fields that can be used to summarize data.

When the **source data** of the **PivotTable** is **OLAP source data**, **OLAP hierarchies** and some other OLAP entities become fields in the PivotTable.

A PivotTable has two major parts, a **PivotCache** (section 2.2.5.3) and a **PivotTable view** (section 2.2.5.4). These parts are described in the following sections. There can be multiple **PivotTable views** based on a single non-**OLAP PivotCache** (section 2.2.5.3.4). An **OLAP PivotCache** MUST have exactly one **associated PivotTable view** (section 2.2.5.3.3).

The values produced by a PivotTable are placed in cells of a **sheet (2)** and these cells make up a PivotTable report.

The PivotTable structures are not needed to obtain values from a **PivotTable** report because those values are available in the sheet (2) cells. The structures are needed for the following purposes:

- To show extra information related to a PivotTable report in an application, such as sort and filter information.
- To recalculate a **PivotTable view**, to incorporate changes such as sorting and filtering made to it, and to update the corresponding **PivotTable** report accordingly.
- To refresh a **PivotCache**, to incorporate changes made to the **source data**, and then recalculate
 any **PivotTable views** associated with the **PivotCache** and to update the corresponding **PivotTable** reports accordingly.

2.2.5.1 PivotTable Records

For general information about records see section $\underline{2.1}$. **PivotTable** (section $\underline{2.2.5}$) uses records from the **Worksheet Substream** (section $\underline{2.1.7.20.5}$), the **Globals Substream** (section $\underline{2.1.7.20.3}$), and the **streams** in the **Pivot Cache Storage** ($\underline{SX_DB_CUR}$) (section $\underline{2.1.7.12}$).

Concepts specified for **PivotTables** can have multiple sequences of records specifying them. The sequences can be in different streams or substreams. In these cases additional information is specified for the concept in the **PIVOTFRT9** rule (section 2.1.7.20.5) or by **SXAddI** records (section 2.4.273.2). See the individual records, the **QsiSXTag** record (section 2.4.211) and section 2.2.5.1.1 for more information about how the additional information is connected to the concept.

2.2.5.1.1 Usage of SXAddl Records

The **SXAddl** records (section 2.4.273.2) is a record used for storing additional **PivotTable view** (section 2.2.5.4), **PivotCache** (section 2.2.5.3) or **query table** information of a variety of types.

SXAddI records have an **hdr** field of type **SXAddIHdr** (section <u>2.5.253</u>) that specifies the current **class** (section <u>2.2.5.1.1.1</u>) and the full type of record, see section 2.2.5.1.1.1 for details. The full record type specifies the meaning of the **data** field of the **SXAddI** record.

2.2.5.1.1.1 Class

All **SXAddI** records (section <u>2.4.273.2</u>) are grouped into classes. Each **SXAddI** record has a current class. An **SXAddI** record can be in other classes as well. The different classes and their specifications follow.

Unless the value of the **hdr.sxc** field of **SXAddI** is 0x09 and the value of the **hdr.sxd** field of **SXAddI** is 0xFF, the **hdr.sxc** field of the **SXAddI** record specifies the current class and MUST be a value from the following table:

Name	Value	Current Class
SXCVIEW	0x00	SxcView class (section 2.2.5.1.1.1.1)
SXCFIELD	0x01	SxcField class (section 2.2.5.1.1.1.2)

Name	Value	Current Class
SXCHIERARCHY	0x02	SxcHierarchy class (section 2.2.5.1.1.1.3)
SXCCACHE	0x03	SxcCache class (section 2.2.5.1.1.1.4)
SXCCACHEFIELD	0x04	SxcCacheField class (section 2.2.5.1.1.1.5)
SXCQSI	0x05	SxcQsi class (section 2.2.5.1.1.1.6)
SXCQUERY	0x06	SxcQuery class (section 2.2.5.1.1.1.7)
SXCGRPLEVEL	0x07	SxcGrpLevel class (section 2.2.5.1.1.1.8)
SXCGROUP	0x08	SxcGroup class (section 2.2.5.1.1.1.9)
SXCCACHEITEM	0x09	SxcCacheItem class (section 2.2.5.1.1.1.10)
SXCSXRULE	0x0C	SxcSXRule class (section 2.2.5.1.1.1.11)
SXCSXFILT	0x0D	SxcSXFilt class (section 2.2.5.1.1.1.12)
SXCSXDH	0x10	SxcSXDH class (section <u>2.2.5.1.1.1.13</u>)
SXCAUTOSORT	0x12	SxcAutoSort class (section 2.2.5.1.1.1.14)
SXCSXMGS	0x13	SxcSXMgs class (section 2.2.5.1.1.1.15)
SXCSXMG	0x14	SxcSXMg class (section 2.2.5.1.1.1.16)
SXCFIELD12	0x17	SxcField12 class (section <u>2.2.5.1.1.1.17</u>)
SXCSXCONDFMTS	0x1A	SxcSXCondFmts class (section 2.2.5.1.1.1.18)
SXCSXCONDFMT	0x1B	SxcSXCondFmt class (section 2.2.5.1.1.1.19)
SXCSXFILTERS12	0x1C	SxcSXFilters12 class (section 2.2.5.1.1.1.20)
SXCSXFILTER12	0x1D	SxcSXFilter12 class (section 2.2.5.1.1.1.21)

The current **class** and the **hdr.sxd** field of **SXAddl** specify the full type of the record, see the individual **classes** for details.

If the value of the **hdr.sxc** field of **SXAddI** is 0x09 and the value of the **hdr.sxd** field of **SXAddI** is 0xFF, then the current **class** is specified by **SxcCacheField** class and the full record type is **SXAddI_SXCCacheItem_SXDEnd** (section 2.4.273.20).

Classes can be nested inside other classes in a hierarchical manner as specified by the Globals Substream (section 2.1.7.20.3) Augmented Backus-Naur Form (ABNF), Worksheet Substream (section 2.1.7.20.5) ABNF, and Common Productions (section 2.1.7.20.6) ABNF. Properties from the outer classes apply to the inner classes unless otherwise specified. Records in classes nested inside other classes, are members (1) of both the inner and outer classes, but their current class is given by the value of their hdr.sxc field. For example, SXAddl_SXCHierarchy_SXDProperty (section 2.4.273.57) is a member (1) of the SxcView class and the SxcHierarchy class and its current class is the SxcHierarchy class.

2.2.5.1.1.1.1 SxcView Class

The **SxcView** class specifies additional information for a **PivotTable view** (section 2.2.5.4).

The **SxcView** class is specified by the sequence of records specified by the **PIVOTADDL** rule (section 2.1.7.20.5).

The **PivotTable view** that the **SxcView** class specifies information for is specified by the **stName** field of the **SXAddl_SXCView_SXDId** record (section 2.4.273.105).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCVIEW (0x00), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCView_SXDId
SXDVERUPDINV	0x01	SXAddl_SXCView_SXDVerUpdInv (section 2.4.273.110)
SXDVER10INFO	0x02	SXAddl_SXCView_SXDVer10Info (section 2.4.273.108)
SXDCALCMEMBER	0x03	SXAddl_SXCView_SXDCalcMember (section 2.4.273.100)
SXDCALCMEMSTRING	0x0A	SXAddl_SXCView_SXDCalcMemString (section <u>2.4.273.101</u>)
SXDVER12INFO	0x19	SXAddl_SXCView_SXDVer12Info (section 2.4.273.109)
SXDTABLESTYLECLIENT	0x1E	SXAddl_SXCView_SXDTableStyleClient (section 2.4.273.107)
SXDCOMPACTRWHDR	0x21	SXAddl_SXCView_SXDCompactRwHdr (section 2.4.273.103)
SXDCOMPACTCOLHDR	0x22	SXAddl_SXCView_SXDCompactColHdr (section 2.4.273.102)
SXDSXPIIVMB	0x26	SXAddl_SXCView_SXDSXPIIvmb (section 2.4.273.106)
SXDEND	0xFF	SXAddl_SXCView_SXDEnd (section 2.4.273.104)

2.2.5.1.1.1.2 SxcField Class

The **SxcField** class specifies additional information for a **pivot field** (section 2.2.5.4.3).

The **SxcField** class is specified by the sequence of records specified by the **SXADDLFIELD** rule (section 2.1.7.20.5).

The **pivot field** that the **SxcField** class specifies information for is specified by the **stName** field of the **SXAddl_SXCField SXDId** record (section 2.4.273.26).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCFIELD (0x01), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCField SXDId
SXDVER10INFO	0x02	SXAddl_SXCField_SXDVer10Info (section 2.4.273.27)
SXDEND	0xFF	SXAddl_SXCField_SXDEnd (section 2.4.273.25)

2.2.5.1.1.1.3 SxcHierarchy Class

The **SxcHierarchy** class specifies additional information for a **pivot hierarchy** (section 2.2.5.4.5).

The **SxcHierarchy** class is specified by the sequence of records specified by the **SXADDLHIERARCHY** rule (section 2.1.7.20.5).

The **pivot hierarchy** (section 2.2.5.4.5) that the **SxcHierarchy** class specifies information for is specified by the **stHierUnq** field of the **SXAddl_SXCHierarchy_SXDId** record (section <u>2.4.273.47</u>).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCHIERARCHY (0x02), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCHierarchy_SXDId

Name	Value	Full record type
SXDVERUPDINV	0x01	SXAddl_SXCHierarchy_SXDVerUpdInv (section 2.4.273.60)
SXDPROPERTY	0x05	SXAddl_SXCHierarchy_SXDProperty (section 2.4.273.57)
SXDFILTERMEMBER	0x09	SXAddl_SXCHierarchy_SXDFilterMember (section 2.4.273.44)
SXDSXSETPARENTUNIQUE	0x1D	SXAddl_SXCHierarchy_SXDSXSetParentUnique (section 2.4.273.58)
SXDUSERCAPTION	0x1F	SXAddl_SXCHierarchy_SXDUserCaption (section 2.4.273.59)
SXDICONSET	0x20	SXAddl_SXCHierarchy_SXDId record (section 2.4.273.47)
SXDMEASUREGRP	0x24	SXAddl_SXCHierarchy_SXDMeasureGrp (section 2.4.273.55)
SXDDISPLAYFOLDER	0x25	SXAddl_SXCHierarchy_SXDDisplayFolder (section 2.4.273.42)
SXDPARENTKPI	0x26	SXAddl_SXCHierarchy_SXDParentKPI (section 2.4.273.56)
SXDKPIVALUE	0x27	SXAddl_SXCHierarchy_SXDKPIValue (section 2.4.273.53)
SXDKPIGOAL	0x28	SXAddl_SXCHierarchy_SXDKPIGoal (section 2.4.273.49)
SXDKPISTATUS	0x29	SXAddl_SXCHierarchy_SXDKPIStatus (section 2.4.273.50)
SXDKPITREND	0x2A	SXAddl_SXCHierarchy_SXDKPITrend (section 2.4.273.52)
SXDKPIWEIGHT	0x2B	SXAddl_SXCHierarchy_SXDKPIWeight (section 2.4.273.54)
SXDKPITIME	0x2C	SXAddl_SXCHierarchy_sxdKPITime (section 2.4.273.51)
SXDFILTERMEMBER12	0x3F	SXAddl_SXCHierarchy_sxdFilterMember12 (section 2.4.273.45)
SXDINFO12	0x41	SXAddl_SXCHierarchy_SXDInfo12 (section 2.4.273.48)
SXDEND	0xFF	SXAddl_SXCHierarchy_SXDEnd (section 2.4.273.43)

2.2.5.1.1.1.4 SxcCache Class

The **SxcCache** class specifies additional information for a **PivotCache** (section 2.2.5.3).

The **SxcCache** class is specified by the sequence of records specified by the **SXADDLCACHE** rule (section 2.1.7.20.5).

The **PivotCache** that the **SxcCache** class specifies information for is specified by the **idCache** field of the **SXAddl_SXCCache_SXDId** record (section $\underline{2.4.273.6}$).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCCACHE (0x03), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCCache_SXDId
SXDVERUPDINV	0x01	SXAddl_SXCCache_SXDVerUpdInv (section 2.4.273.11)
SXDVER10INFO	0x02	SXAddl_SXCCache_SXDVer10Info (section 2.4.273.9)

Name	Value	Full record type
SXDVERSXMACRO	0x18	SXAddl_SXCCache_SXDVerSXMacro (section 2.4.273.10)
SXDINVREFRESHREAL	0x34	SXAddl_SXCCache_SXDInvRefreshReal (section 2.4.273.8)
SXDINFO12	0x41	SXAddl_SXCCache_SXDInfo12 (section 2.4.273.7)
SXDEND	0xFF	SXAddl_SXCCache_SXDEnd (section 2.4.273.5)

2.2.5.1.1.1.5 SxcCacheField Class

The **SxcCacheField** class specifies additional information for a **cache field** (section 2.2.5.3.5).

The **SxcCacheField** class is specified by the sequence of records specified by the **SXADDLCACHEFIELD** rule (section 2.1.7.20.5).

The **cache field** that the **SxcCacheField** class specifies information for is specified by the **stSourceName** field of the **SXAddl_SXCCacheField_SXDId** record (section <u>2.4.273.14</u>).

If the **hdr.sxc** field of an **SXAddI** record (section 2.4.273.2) equals SXCCACHEFIELD (0x04), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCCacheField_SXDId
SXDPROPERTY	0x05	SXAddl_SXCCacheField_SXDProperty (section 2.4.273.17)
SXDSXRMITMCOUNT	0x2D	SXAddl_SXCCacheField_SXDSxrmitmCount (section 2.4.273.19)
SXDCAPTION	0x2F	SXAddl_SXCCacheField_SXDCaption (section 2.4.273.12)
SXDIFDBMEMPROPMAP	0x30	SXAddl_SXCCacheField_SXDIfdbMempropMap (section 2.4.273.15)
SXDIFDBMPMAPCOUNT	0x31	SXAddl_SXCCacheField_SXDIfdbMpMapCount (section 2.4.273.16)
SXDPROPNAME	0x40	SXAddl_SXCCacheField_SXDPropName (section 2.4.273.18)
SXDEND	0xFF	SXAddl_SXCCacheField_SXDEnd (section 2.4.273.13)

Additionally, $SXAddl_SXCCacheItem_SXDEnd$ has a current class of SxcCacheField class, as specified in section 2.2.5.1.1.1.

2.2.5.1.1.1.6 SxcQsi Class

The **SxcQsi** class specifies additional information for a **query table**.

The **SxcQsi** class is specified by the sequence of records specified by the **SXADDLQSI** rule (section 2.1.7.20.5).

The query table that the **SxcQsi** class specifies information for is specified by **stName** field of the **SXAddl_SXCQsi_SXDId** record (section 2.4.273.62).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCQSI (0x05), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCQsi_SXDId

Name	Value	Full record type
SXDEND	0xFF	SXAddl_SXCQsi_SXDEnd (section 2.4.273.61)

2.2.5.1.1.1.7 SxcQuery Class

The **SxcQuery** class specifies additional information for an **external connection** (section 2.2.8).

The **SxcQuery** class is specified by the sequence of records specified by the **SXADDLDBQUERY** rule (section <u>2.1.7.20.6</u>).

The **external connection** (section 2.2.8) the **SxcQuery** class specifies information for is specified by the **stURL** field of the **SXAddl_SXCQuery_SXDXMLSource** record (section 2.4.273.67).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCQUERY (0x06), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDXMLSOURCE	0x04	SXAddl_SXCQuery_SXDXMLSource
SXDSCRDATAFILE	0x05	SXAddl_SXCQuery_SXDSrcDataFile (section 2.4.273.66)
SXDSRCCONNFILE	0x06	SXAddl_SXCQuery_SXDSrcConnFile (section 2.4.273.65)
SXDRECONNCOND	0x07	SXAddl_SXCQuery_SXDReconnCond (section 2.4.273.64)
SXDEND	0xFF	SXAddl_SXCQuery_SXDEnd (section 2.4.273.63)

2.2.5.1.1.1.8 SxcGrpLevel Class

The **SxcGrpLevel** class specifies information for an **OLAP group level** (section 2.2.5.3.10).

The **SxcGrpLevel** class is specified by the sequence of records specified by the **SXADDLGRPLEVEL** rule (section 2.1.7.20.5).

The **OLAP group level** the **SxcGrpLevel** class specifies information for is specified by the **stUnique** field of the **SXAddl_SXCGrpLevel_SXDId** record (section <u>2.4.273.41</u>).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCGRPLEVEL (0x07), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCGrpLevel_SXDId
SXDGRPLEVELNFO	0x06	SXAddl_SXCGrpLevel_SXDGrpLevelInfo (section 2.4.273.40)
SXDEND	0xFF	SXAddl_SXCGrpLevel_SXDEnd (section 2.4.273.39)

2.2.5.1.1.1.9 SxcGroup Class

The **SxcGroup** class specifies information for an **OLAP grouping** (section 2.2.5.3.10).

The **SxcGroup** class is specified by the sequence of records specified by the **SXADDLGROUP** rule (section 2.1.7.20.5).

The **OLAP grouping** the **SxcGroup** class specifies information for is specified by the **stName** field of the **SXAddl_SXCGroup_SXDId** record (section 2.4.273.37).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCGROUP (0x08), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCGroup_SXDId
SXDGRPINFO	0x07	SXAddl_SXCGroup_SXDGrpInfo (section 2.4.273.36)
SXDMEMBER	0x08	SXAddl_SXCGroup_SXDMember (section 2.4.273.38)
SXDEND	0xFF	SXAddl_SXCGroup_SXDEnd (section 2.4.273.35)

2.2.5.1.1.1.10 SxcCacheItem Class

The **SxcCacheItem** class specifies additional information for a **cache item** (section 2.2.5.3.6).

The **SxcCacheItem** class is specified by the sequence of records specified by the **SXADDLCACHEITEM** rule (section 2.1.7.20.3).

The **cache item** that the **SxcCacheItem** class specifies information for is specified by the **dwItem** field of the **SXAddl_SXCCacheItem_SXDId** record (section <u>2.4.273.21</u>).

If the **hdr.sxc** field of an **SXAddl** record (section 2.4.273.2) equals SXCCACHEITEM (0x09), then the **hdr.sxd** field of the **SXAddl** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCCacheItem_SXDId
SXDSXRMITMDISP	0x2E	SXAddl_SXCCacheItem_SXDSxrmitmDisp (section 2.4.273.24)
SXDITMMPROPMAP	0x32	SXAddl_SXCCacheItem_SXDItmMpropMap (section 2.4.273.23)
SXDITMMPMAPCOUNT	0x33	SxAddl_SXCCacheItem_SXDItmMpMapCount (section 2.4.273.22)
SXDEND	0xFF	SXAddl_SXCCacheItem_SXDEnd (section 2.4.273.20)

SXAddl_SXCCacheItem_SXDEnd is a part of the **SxcCacheField** class (section <u>2.2.5.1.1.1.5</u>) and is not a **member (1)** of the **SxcCacheItem** class. **SXAddl_SXCCacheItem_SXDEnd** specifies the end of a collection of **SxcCacheItem** classes.

2.2.5.1.1.1.11 SxcSXrule Class

The **SxcSXrule** class specifies a **PivotTable** rule (section 2.2.5.4.11).

The **SxcSXrule class** is specified by the sequence of records specified by the **SXADDLSXRULE** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCRULE (0x0C), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXrule_SXDId (section 2.4.273.98)
SXDSXRULE	0x13	SXAddl_SXCSXrule_SXDSXrule (section 2.4.273.99)
SXDEND	0xFF	SXAddl_SXCSXrule_SXDEnd (section 2.4.273.97)

2.2.5.1.1.1.12 SxcSXfilt Class

The **SxcSXfilt** class specifies information for a **PivotTable rule filter** (section 2.2.5.4.11).

The **SxcSXfilt** class is specified by the sequence of records specified by the **SXADDLSXFILT** rule (section <u>2.1.7.20.5</u>).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXFILT (0x0D), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXfilt_SXDId (section 2.4.273.76)
SXDSXFILT	0x14	SXAddl_SXCSXfilt_SXDSXfilt (section 2.4.273.77)
SXDSXITM	0x15	SXAddl_SXCSXfilt_SXDSXItm (section 2.4.273.78)
SXDEND	0xFF	SXAddl_SXCSXfilt_SXDEnd (section 2.4.273.75)

2.2.5.1.1.1.13 SxcSXDH Class

The **SxcSXDH** class specifies the **OLAP dimensions (1)** for **pivot hierarchies** (section <u>2.2.5.4.5</u>) in the **associated PivotTable view** (section <u>2.2.5.3.3</u>) of the **OLAP PivotCache** (section <u>2.2.5.3.4</u>). MUST NOT be present if the **PivotCache** (section <u>2.2.5.3</u>) is a non- **OLAP PivotCache**.

The **SxcSXDH** class is specified by the sequence of records specified by the **SXADDLSXDH** rule (section 2.1.7.20.3).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXDH (0x10), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXDH_SXDId (section 2.4.273.73)
SXDSXDH	0x1A	SXAddl_SXCSXDH_SXDSxdh (section 2.4.273.74)
SXDEND	0xFF	SXAddl_SXCSXDH_SXDEnd (section <u>2.4.273.72</u>)

2.2.5.1.1.1.14 SxcAutoSort Class

The **SxcAutoSort** class specifies **pivot field sorting** (section 2.2.5.4.3.1) information for a **pivot field** (section 2.2.5.4.3).

The **SxcAutoSort** class is specified by the sequence of records specified by the **SXADDLAUTOSORT** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section 2.4.273.2) equals SXCAUTOSORT (0x12), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCAutoSort_SXDId (section 2.4.273.4)
SXDEND	0xFF	SXAddl_SXCAutoSort_SXDEnd (section 2.4.273.3)

2.2.5.1.1.1.15 SxcSXMgs Class

The SxcSXMgs class specifies OLAP measure groups.

The **SxcSXMgs** class is specified by the sequence of records specified by the **SXADDLSXMGS** rule (section 2.1.7.20.3).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXMGS (0x13), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXMgs_SXDId (section 2.4.273.95)
SXDMGRPSXDHMAP	0x23	SXAddl_SXCSXMgs_SXDMGrpSXDHMap (section <u>2.4.273.96</u>)
SXDEND	0xFF	SXAddl_SXCSXMgs_SXDEnd (section 2.4.273.94)

2.2.5.1.1.1.16 SxcSXMg Class

The **SxcSXMg** class specifies information for an **OLAP measure group**.

The **SxcSXMg** class is specified by the sequence of records specified by the **SXADDLSXMG** rule (section <u>2.1.7.20.3</u>).

The OLAP measure group that the **SxcSXMg** class specifies information for is specified by the **stName** field of the **SXAddl_SXCSXMg_SXDId** record (section <u>2.4.273.92</u>).

If the **hdr.sxc** field of an **SXAddI** record (section 2.4.273.2) equals SXCSXMG (0x14), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXMg_SXDId
SXDUSERCAPTION	0x1F	SXAddl_SXCSXMg_SXDUserCaption (section 2.4.273.93)
SXDEND	0xFF	SXAddl_SXCSXMg_SXDEnd (section 2.4.273.91)

2.2.5.1.1.1.17 SxcField12 Class

The **SxcField12** class specifies additional information for a **pivot field** (section 2.2.5.4.3).

The **SxcField12** class is specified by the sequence of records specified by the **SXADDLFIELD12** rule (section 2.1.7.20.5).

The **pivot field** that the **SxcField12** class specifies information for is specified by **stName** field of the **SXAddl_SXCField12_SXDId** record (section 2.4.273.30).

If the **hdr.sxc** field of an **SXAddI** record (section 2.4.273.2) equals SXCFIELD12 (0x17), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCField12_SXDId
SXDVERUPDINV	0x01	SXAddl_SXCField12_SXDVerUpdInv (section 2.4.273.34)
SXDMEMBERCAPTION	0x11	SXAddl_SXCField12_SXDMemberCaption (section 2.4.273.32)
SXDVER12INFO	0x19	SXAddl_SXCField12_SXDVer12Info (section 2.4.273.33)
SXDISXTH	0x1C	SXAddl_SXCField12_SXDISXTH (section 2.4.273.31)
SXDAUTOSHOW	0x37	SXAddl_SXCField12_SXDAutoshow (section 2.4.273.28)
SXDEND	0xFF	SXAddl_SXCField12_SXDEnd (section 2.4.273.29)

2.2.5.1.1.1.18 SxcSXCondFmts Class

The **SxcSXCondFmts** class specifies information for **PivotTable** (section <u>2.2.5</u>) **conditional formatting** rules.

The **SxcSXCondFmts** class is specified by the sequence of records specified by the **SXADDLCONDFMTS** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXCONDFMTS (0x1A), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXCondFmts_SXDId (section 2.4.273.71)
SXDEND	0xFF	SXAddl_SXCSXCondFmts_SXDEnd (section 2.4.273.70)

2.2.5.1.1.1.19 SxcSXCondFmt Class

The **SxcSXCondFmt** class specifies information for a **PivotTable** (section <u>2.2.5</u>) **conditional formatting** rule.

The **SxcSXCondFmt** class is specified by the sequence of records specified by the **SXADDLCONDFMT** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section 2.4.273.2) equals SXCSXCONDFMT (0x1B), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDSXCONDFMT	0x35	SXAddl_SXCSXCondFmt_SXDSXCondFmt (section 2.4.273.69)
SXDEND	0xFF	SXAddl_SXCSXCondFmt_SXDEnd (section 2.4.273.68)

2.2.5.1.1.1.20 SxcSXFilters12 Class

The **SxcSXFilters12** class specifies **advanced filters** (section <u>2.2.5.4.8.1</u>).

The **SxcSXFilters12** class is specified by the sequence of records specified by the **SXADDLSXFILTERS12** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXFILTERS12 (0x1C), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXFilters12_SXDId (section 2.4.273.90)
SXDEND	0xFF	SXAddl_SXCSXFilters12_SXDEnd (section 2.4.273.89)

2.2.5.1.1.1.21 SxcSXFilter12 Class

The **SxcSXFilter12** class specifies an **advanced filters** (section 2.2.5.4.8.1).

The **SxcSXFilter12** class is specified by the sequence of records specified by the **SXADDLSXFILTER12** rule (section 2.1.7.20.5).

If the **hdr.sxc** field of an **SXAddI** record (section <u>2.4.273.2</u>) equals SXCSXFILTER12 (0x1D), then the **hdr.sxd** field of the **SXAddI** record MUST be a value from the following table which specifies the full record type:

Name	Value	Full record type
SXDID	0x00	SXAddl_SXCSXFilter12_SXDId (section 2.4.273.81)
SXDCAPTION	0x2F	SXAddl_SXCSXFilter12_SXDCaption (section 2.4.273.79)
SXDSXFILTER	0x38	SXAddl_SXCSXFilter12_SXDSXFilter (section 2.4.273.82)
SXDSXFILTERDESC	0x39	SXAddl_SXCSXFilter12_SXDSXFilterDesc (section 2.4.273.83)
SXDSXFILTERVALUE1	0x3A	SXAddl_SXCSXFilter12_SXDSXFilterValue1 (section 2.4.273.84)
SXDSXFILTERVALUE2	0x3B	SXAddl_SXCSXFilter12_SXDSXFilterValue2 (section 2.4.273.85)
SXDXLSFILTER	0x3C	SXAddl_SXCSXFilter12_SXDXIsFilter (section 2.4.273.86)
SXDXLSFILTERVALUE1	0x3D	SXAddl_SXCSXFilter12_SXDSXFilterValue1 (section 2.4.273.87)
SXDXLSFILTERVALUE2	0x3E	SXAddl_SXCSXFilter12_SXDXIsFilterValue2 (section 2.4.273.88)
SXDEND	0xFF	SXAddl_SXCSXFilter12_SXDEnd (section 2.4.273.80)

2.2.5.2 Data Functionality Level

A **data functionality level** is a number that represents a set of features and run-time behaviors in the following areas related to data manipulation and display: **PivotTable** (section 2.2.5), **query table**, and **external connections** (section 2.2.8).

See section <u>2.2.5.3.1</u> for specific details about the **data functionality level** of a **PivotCache** (section <u>2.2.5.3</u>).

2.2.5.3 PivotCache

The **PivotCache** is a set of structures that contains information about the **source data** (section 2.2.5.3.2) being summarized in the **PivotTable views** (section 2.2.5.4) using that **PivotCache**. The information includes **source data** organization, data types, and the values. A PivotCache is specified by the records conforming to the following rules:

Rule	Notes	
PIVOTCACHE (section 2.1.7.12)	This is in a stream as specified in section 2.1.7.12.	
PIVOTCACHEDEFINITION (section 2.1.7.20.3)	The SXStreamID record (section 2.4.303) specifies the associated stream in section 2.1.7.12.	
PIVOTFRT9 (section 2.1.7.20.5)	If an associated PivotTable view (section 2.2.5.3.3) is specified by the QsiSXTag record (section 2.4.211), then PivotCache properties specified in this rule apply to this PivotCache .	

2.2.5.3.1 PivotCache Functionality Level

The **PivotCache functionality level** is the **data functionality level** (section 2.2.5.2) associated with a **PivotCache** (section 2.2.5.3). The **PivotCache functionality level** is used in specification of restrictions for the **PivotCache** and **associated PivotTable views** (section 2.2.5.3.3). It is specified as follows:

- If an SXAddl_SXCCache_SXDVerSXMacro record (section <u>2.4.273.10</u>) exists, then the value of the dwVer field of the SXAddl_SXCCache_SXDVerSXMacro specifies the PivotCache functionality level.
- If an SXAddl_SXCCache_SXDVerSXMacro record does not exist and an SXAddl_SXCView_SXDVer10Info record (section 2.4.273.108) exists for an associated PivotTable views, then the value of the bVerSxMacro field of the SXAddl_SXCView_SXDVer10Info record specifies the PivotCache functionality level, except if that value is greater than or equal to 3, in which case the PivotCache functionality level is specified to be 1.
- If an SXAddl_SXCCache_SXDVerSXMacro record does not exist and an SXAddl_SXCView_SXDVer10Info record does not exist for an associated PivotTable views, then the PivotCache functionality level is specified to be 0.

2.2.5.3.2 Source Data

A **PivotCache** (section 2.2.5.3) can be based on four different types of **source data**. The type of **source data** is specified by the **sxvs** field of the **SXVS** record (section 2.4.317).

When the **source data** type is SHEET as specified by **SXVS**, the data is read from the **range** specified by a **DConRef** (section 2.4.86), **DConName** (section 2.4.85), or **DConBin** (section 2.4.83) record. If the range is a **table**, then the **PivotCache** will have one **cache field** (section 2.2.5.3.5) for each column of the table using the column header captions for **cache field** names, and the **data region** values of the table are used as **source data** values, specified by **cache records** (section 2.2.5.3.12). Otherwise the **PivotCache** has one **cache field** for each column of the range, using the values in the first row of the range for **cache field** names, and all other rows are used as **source data** values, specified by **cache records**.

When the **source data** type is SCENARIO as specified by **SXVS**, no new **source data** is available for the **PivotCache** and the **PivotCache** cannot be refreshed. A snapshot of the **source data** might be available in the **cache records**.

When the **source data** type is EXTERNAL, as specified by **SXVS**, the **source data** is read from an external **data source**. There is an associated **external connection** (section 2.2.8) that is used to obtain data from the external data source. The **external connection** is specified by the sequence of records that conforms to the **DQBUERY** rule (section 2.1.7.20.3) in the sequence of records that conforms to the **PIVOTCACHEDEFINITION** rule (section 2.1.7.20.3) and the combination of other records as specified in section 2.2.8. For a non-**OLAP PivotCache** (section 2.2.5.3.4), the **source**

data is a rectangular table and the **PivotCache** (section 2.2.5.3) has one **cache field** for each column of the table using the column header captions for **cache field** names, and the rows of the table are used as **source data** values, specified by **cache records**.

If the source data is external and the external connection is an **OLAP Connection** (section <u>2.2.8.3.1</u>) then the **PivotCache** MUST be an **OLAP PivotCache**. For an **OLAP PivotCache**, the **source data** is handled by the data provider specified by the associated **OLAP Connection** and the **PivotCache** MUST NOT have **cache records**.

When the **source data** type is CONSOLIDATION as specified by **SXVS**, the **source data** is read from one or more ranges. For more details, see the section <u>2.2.5.3.2.1</u>.

When a **pivot field** (section 2.2.5.4.3) is on the **page axis** (section 2.2.5.4.9.1) of the **PivotTable view** (section 2.2.5.4), the **pivot field** is a server-based page field if the **fServerBased** field of the **SXVDEx** record (section 2.4.310) is equal to 1 and the **fServerBased** field of the associated **SXFDB** record (section 2.4.283) is equal to 1. A server-based page field is a **pivot field** on the **page axis** that causes the query that is used to retrieve **source data** for populating the **PivotCache** to be parameterized. The query is parameterized according to the page filter criteria, as specified in section 2.2.5.4.9.1. This feature can only be used for an **ODBC PivotCache**.

2.2.5.3.2.1 Multiple Consolidation Ranges

A **multiple** consolidation ranges **PivotCache** (section 2.2.5.3) is used for summarizing multiple **ranges** that contain **source data** in cross-tab format. A **multiple consolidation ranges PivotCache** is a collection of ranges and page information that is specified by the sequence of records that conforms to the **SXTBL** rule (section 2.1.7.20.3). Each range is specified by one of the **DConName** (section 2.4.85), **DConBin** (section 2.4.83), or **DConRef** (section 2.4.86) records.

The following figure shows an example of a range in cross-tab format. The first column of the range contains names of sales people ("George" and "Allan"). The first row in the range contains product groups ("Cars" and "Bikes"). The remaining **cells** in the range contain numeric values representing how many products in a certain product group were sold by each sales person.

	Cars	Bikes
George	1	2
Allan	3	4

Figure 3: Example of a range in cross-tab format

A **multiple** consolidation ranges **PivotCache** is used to summarize multiple cross-tab ranges as shown in the following figure, which shows eight cross-tab ranges.

	А	В	С	D	E	F	G
1	2006 Q1				20	07 Q1	
2		Cars	Bikes			Cars	Bikes
3	George	1	2		George	17	18
4	Allan	3	4		Allan	19	20
5							
6	20	006 Q2	2		20	007 Q2	<u> </u>
7		Cars	Bikes			Cars	Bikes
8	George	5	6		George	21	22
9	Allan	7	8		Allan	23	24
10							
11	20	006 Q3	3		20	007 Q3	;
12		Cars	Bikes			Cars	Bikes
13	George	9	10		George	25	26
14	Allan	11	12		Allan	27	28
15							
16	2006 Q4			20	007 Q4	ı	
17		Cars	Bikes			Cars	Bikes
18	George	13	14		George	29	30
19	Allan	15	16		Allan	31	32

Figure 4: Example of eight ranges in cross-tab format

The values in the first column of each range are used to create a **cache field** (section 2.2.5.3.5) with a default name specified by the application. Each **cache item** (section 2.2.5.3.6) of this **cache field** corresponds to one of the values in the first column of the range, eliminating duplicates. This **cache field** is the first **cache field** in the collection of sequences of records that conform to the **FDB** rule (section 2.1.7.12) in the sequence of records that conforms to the **PIVOTCACHE** rule.

The values in the first row of each range are used to create a **cache field** with a default name specified by the application. Each **cache item** of this **cache field** corresponds to one of the values in the first row of the range, eliminating duplicates. This **cache field** is the second **cache field** in the collection of **FDB** rules (section 2.1.7.12) in the **PIVOTCACHE** rule (section 2.1.7.12).

The values in all other cells of each range are used to create a **cache field** with a default name specified by the application. Each **cache item** of this **cache field** corresponds to one of the values in the other cells of the range, eliminating duplicates. This **cache field** is the third **cache field** in the collection of **FDB** rules in **PIVOTCACHE** rule.

A **PivotTable view** (section 2.2.5.4) associated with the **multiple** consolidation ranges **PivotCache** is added on creation. The **pivot fields** (section 2.2.5.4.3) corresponding to the **cache fields** described previously are added to the **row axis** (section 2.2.5.4.9.2), **column axis** (section 2.2.5.4.9.3), and **data axis** (section 2.2.5.4.9.5), respectively.

Up to four additional **cache fields** can optionally exist with default names specified by the application. The corresponding **pivot fields** are added to the **page axis** (section 2.2.5.4.9.1) of the **PivotTable view** on creation, enabling the user to summarize data from all or a subset of the ranges. The ranges to be summarized in the **PivotTable** (section 2.2.5) are selected by adding a **manual filter** (section 2.2.5.4.7) to one or more of these **pivot fields** on the **page axis**. The number of optional **cache fields** created is user-defined and is equal to the **cPages** field of the **SXTbl** record (section 2.4.305). Each optional **cache field** corresponds to an **SXTBRGIITM** record.

The first **SXTBRGIITM** record (section <u>2.4.307</u>) in the **SXTBL** collection (section 2.1.7.20.3) corresponds to the fourth **cache field** in the collection of **FDB** rules. Each **cache item** of this **cache field** corresponds to the **SXString** record (section <u>2.4.304</u>) in the collection of **SXString** records directly following this **SXTBRGIITM** record.

The second **SXTBRGIITM** record in the **SXTBL** collection corresponds to the fifth **cache field** in the collection of **FDB** rules. Each **cache item** of this **cache field** corresponds to the **SXString** record in the collection of **SXString** records directly following this **SXTBRGIITM** record.

The third **SXTBRGIITM** record in the **SXTBL** collection corresponds to the sixth **cache field** in the collection of **FDB** rules. Each **cache item** of this **cache field** corresponds to the **SXString** record in the collection of **SXString** records directly following this **SXTBRGIITM** record.

The fourth **SXTBRGIITM** record in the **SXTBL** collection corresponds to the seventh **cache field** in the collection of **FDB** rules. Each **cache item** of this **cache field** corresponds to the **SXString** record in the collection of **SXString** records directly following this **SXTBRGIITM** record.

The following figure shows a multiple consolidation ranges **PivotTable** report (section 2.2.5) with two **pivot fields** on the **page axis**. The **PivotTable** report is based on the eight ranges in the figure titled **Example of eight ranges in cross-tab format** and summarizes the values from all the ranges because no **manual filter** (section 2.2.5.4.7) has been applied to any of the **pivot fields** on the **page axis**.

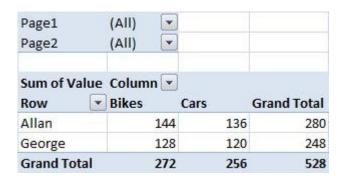

Figure 5: Multiple consolidation ranges PivotTable

The **rgiitem** field of the **SxTbpg** record (section <u>2.4.306</u>) specifies the relationship between each range and the **SXString** records that follow each **SXTBRGIITM** record.

2.2.5.3.3 Associated PivotTable views

The set of **PivotTable views** (section 2.2.5.4) that share an **associated PivotCache** (section 2.2.5.4.1) are specified to be the **associated PivotTable views** of that **PivotCache** (section 2.2.5.3).

A **PivotCache** MUST have at least one associated PivotTable view, and an **OLAP PivotCache** (section 2.2.5.3.4) MUST have exactly one **associated PivotTable view**.

2.2.5.3.4 OLAP PivotCache

A **PivotCache** (section 2.2.5.3) is specified to be an **OLAP** PivotCache if it has an **associated PivotTable view** (section 2.2.5.3.3) that is an **OLAP PivotTable view** (section 2.2.5.4.2).

An OLAP PivotCache MUST have exactly one **associated PivotTable view**.

2.2.5.3.4.1 OLAP Data Model

This section provides background information about the underlying data model for **OLAP** entities.

The principal unit of scope is an **OLAP cube**. See section <u>2.2.8</u> for information about how an OLAP cube is accessed. Items within an OLAP cube can be addressed by an **MDX unique name** string. Within an OLAP cube, there are **OLAP hierarchies**, **OLAP measures** and **OLAP sets**.

An OLAP hierarchy consists of one or more **OLAP levels** and **OLAP member properties**. An OLAP level consists of one or more **OLAP members**. An OLAP member is an atomic unit of data, for example customer "Jim Smith", or a grouping of data, for example "customers in the city of Chicago". OLAP levels contain OLAP members of similar type within an OLAP hierarchy. OLAP members can have parent and child members in OLAP levels above and below them, for example "Jim Smith" might be a child of "customers in the city of Chicago". An OLAP member property can be associated with a single OLAP level or all OLAP levels of an OLAP hierarchy, for example a "Mayor" OLAP member property might be associated with a "City" OLAP level.

An **OLAP tuple** is a way of combining multiple OLAP members to reference a particular point in an OLAP cube, for example "customers in the city of Chicago" and "2008" references data in the OLAP cube corresponding to the year 2008 and customers in Chicago.

An OLAP measure is a value that is available in the OLAP cube. Usually it is numeric, "Sales" and "Head Count" are typical examples of OLAP measures. An OLAP measure is an OLAP member in a measures OLAP hierarchy. For a **PivotTable view** (section <u>2.2.5.4</u>), OLAP measures are stored differently from other OLAP members in this file format.

An OLAP tuple including an OLAP measure can be used to get a value, for example "customers in the city of Chicago", "2008" and "sales" might reference the value \$659,000.

An **OLAP** named set is a collection of OLAP tuples. OLAP named sets are typically used for specific analytical needs that require custom logic, for example an OLAP named set might be defined as the OLAP tuples corresponding to "the top 10 customers by month and sales".

2.2.5.3.5 Cache Fields

A **cache field** represents an entity by which data can be summarized.

Consider a **PivotCache** (section 2.2.5.3) based on the following **source data** (section 2.2.5.3.2):

Country	ntry Product Date		Sales
USA	Bicycle	6/5/2007	500
USA	Car	8/3/2007	20000
Canada	Bicycle	9/2/2007	300
Canada	Car	10/5/2007	35000

In this example, four **cache fields** exist in the **PivotCache**. Each **cache field** corresponds to one of the columns in the **source data**: Country, Product, Date, and Sales.

The sequence of records that conforms to the **FDB** rule (section 2.1.7.12), and optionally the **SXADDLCACHEFIELD** rule (section 2.1.7.20.3), specify a **cache field**. A **cache field** is contained in a **PivotCache**.

A cache field index is a zero-based index of an **FDB** rule in the **PIVOTCACHE** rule (section 2.1.7.12).

A cache field typically corresponds to a **source data entity**. However, **grouping** (section <u>2.2.5.3.7</u>) **cache fields** and **cache fields** representing **calculated fields** (section <u>2.2.5.3.8</u>) do not correspond to **source data entities** (section 2.2.5.3.2). Such **cache fields** are fully specified by information in the **PivotCache**.

The cfdbdb field of the **SXDB** record (section 2.4.275) specifies the number of **cache fields** that correspond to **source data entities**. If the cache field index of an **SXFDB** record (section 2.4.283) is less than cfdbdb, the cache field corresponds to a **source data entity**. Otherwise, the cache field does not correspond to a **source data entity**. A non- **OLAP PivotCache** (section 2.2.5.3.4) MUST have one or more **cache fields** corresponding to **source data columns**. An **OLAP PivotCache** MUST NOT have **cache fields** that do not correspond to **source data entities**.

In a non- **OLAP PivotCache**, a cache field typically corresponds to one column in the **source data** and contains information about that column. The **cache** field name is specified by the **stFieldName** field of the **SXFDB** record. The **cache** field name of a cache field corresponding to a **source data column** is derived from the name of that column in the **source data** and is used to associate the **cache** field with that **source data column**.

All **cache field** names MUST be unique, when using a case-insensitive comparison, within the associated **PivotCache**.

In an **OLAP PivotCache** each **cache field** can be associated with a **pivot hierarchy** (section 2.2.5.4.5). For more information, see section 2.2.5.4.5.1.

2.2.5.3.6 Cache Items

Cache items represent specific instances of the entities represented by **cache fields** (section 2.2.5.3.5). For example, an instance of a Country **cache field** might be the USA **cache item**. Having a USA **cache item** in the Country **cache field** enables **PivotTable views** (section 2.2.5.4) associated with the **PivotCache** (section 2.2.5.3) to display data by USA.

Each cache item specifies its value and a type. In some cases, a **cache item** can have additional information associated with it.

A cache item is contained in a cache field. A cache field can have zero cache items if the cache field is not in use in the PivotTable view.

For a **cache field** that corresponds to **source data** (section 2.2.5.3.2), a collection of cache items is specified by a collection of sequences of records that conform to the **SRCSXOPER** rule (section 2.1.7.12), with each cache item being specified by a sequence of records that conforms to the **SXOPER** rule (section 2.1.7.12), which optionally has a sequence of records that conforms to the **SXADDLCACHEITEM** rule (section 2.1.7.20.3) associated with it. The sequence of records that conforms to the **SXOPER** rule specifies the value of the cache item.

For **grouping** (section $\underline{2.2.5.3.7}$) **cache fields**, the collection of cache items is specified by a collection of sequences of records that conform to the **GRPSXOPER** rule (section 2.1.7.12) with each cache item being specified by an **SXOPER** rule.

Calculated fields (section 2.2.5.3.8) do not contain **cache items**.

A cache item index can be used to reference a cache item within the cache field. Referencing a cache item by index requires an implicit or explicit reference to that cache field because a cache item collection is associated with a specific cache field. A cache field can be referenced by a cache field index, as specified in section 2.2.5.3.5.

If a collection of **GRPSXOPER** rules exists in the cache field, a **cache item** index is a zero-based index into the collection of **GRPSXOPER** rules. Otherwise, a **cache item** index is a zero-based index into the collection of **SRCSXOPER** rules.

There can be multiple entries of **source data** that have the same combination of value and type for a **cache field**. Each **cache item** within a **cache field** MUST have a unique combination of value and type.

If there is one or more references by index to **cache** items of a particular **cache field**, that **cache field** MUST have a **cache items** collection. A **grouping cache field** MUST have a collection of **cache items** associated with it.

A cache item collection can contain unused cache items.

Unused **cache items** are values that did not exist in the **source data** when the **PivotCache** was last refreshed but existed when the **PivotCache** was refreshed previously. The **PivotCache** can retain such unused **cache items** to preserve information associated with them to reapply that information if the value corresponding to the **cache item** is added back to the **source data** at some later point in time.

For an **OLAP PivotCache** (section 2.2.5.3.4), a **cache field** associated with an **OLAP measure** MUST NOT have a **cache** item collection.

For an **OLAP PivotCache**, a **cache item** with a string value specifies the unique name of an **OLAP member**, unless the **cache field** is a **member property** (section 2.2.5.4.6) **cache field**.

An example of cache items and their association with source data is provided here.

Consider a **PivotCache** based on the following **source data** table:

Country	Product	Date	Sales
USA	Bicycle	6/5/2007	500
USA	Car	8/3/2007	20000
Canada	Bicycle	9/2/2007	500
Canada	Car	10/5/2007	35000

Four **cache fields** exist, each corresponding to one of the columns: Country, Product, Date, and Sales. Each of the four **cache fields** can have **cache items** corresponding to the unique values in the **source data columns** as illustrated in the following tables:

Cache items for the Country cache field		
Canada		
USA		

Cache items for the Product cache field		
Bicycle		
Car		

Cache items for the Date cache field		
6/5/2007		
8/3/2007		

Cache items for the Date cache field		
9/2/2007		
10/5/2007		

Cache items for the Sales cache field		
500		
20000		
500		
35000		

2.2.5.3.7 **Grouping**

Grouping is used to combine a set of **cache items** (section 2.2.5.3.6), typically ones that are related in some logical way. There are three different types of **grouping**: numeric grouping, date grouping, and discrete grouping. Numeric grouping combines numeric **cache items** into ranges of values. Date grouping combines date **cache items** into date ranges. Discrete grouping combines specifically selected **cache items** into groups.

The **cache field** (section 2.2.5.3.5) that contains the **cache items** that are to be grouped is called the base **cache field**. The resultant **cache field** that contains the groups of **cache items** is called the parent grouping **cache field**. Each group of **cache items** in the base **cache field** is associated with a single **cache item** in the parent grouping **cache field**. Often **cache items** in parent grouping **cache fields** can be further grouped, creating a hierarchy of parent grouping **cache fields**. The base **cache field** is at the lowest level of the hierarchy.

Numeric grouping is specified by records in the **PivotCache Storage part** (section <u>2.1.7.12</u>) that conform to the **GRPSXOPER** (section 2.1.7.12) and **SXRANGE** (section 2.1.7.12) rules.

For numeric grouping, there is only one **cache field** associated with the grouping and it serves as both the parent grouping **cache field** and the base **cache field**. The numeric grouping is specified by the **fRangeGroup** and **fNumField** fields of the **SXFDB** record (section 2.4.283) associated with the **cache field** being equal to 1. The **fHasParent** field of the **SXFDB** record MUST be 0.

The **cache items** that specify the groups are specified by **SXString** records (section $\underline{2.4.304}$) that follow the **SXFDB** record. The grouping criteria is specified by the **SXRng** record (section $\underline{2.4.300}$) that follows the **SXFDB** record. The **iByType** field of the **SXRng** record MUST be 0. For more details, see section 2.4.300.

Date grouping is specified by records in the **PivotCache Storage part** that conform to the **GRPSXOPER** and **SXRANGE** rules.

For date grouping, there can be up to seven levels of grouping hierarchy. The grouping level for a **cache field** is specified by the **iByType** field of the **SxRng** record that follows the **SXFDB** record which specifies that **cache field**. The **cache field** with the lowest **iByType** value has the finest level of detail, the **cache field** with the next lowest **iByType** value has the next finest level of detail, and so on. Each **cache field** in the hierarchy MUST have an **SxRng** record with a unique **iByType** value.

The **cache field** corresponding to the finest level of detail of date information included serves as both a parent grouping **cache field** and the base **cache field**. Other parent grouping **cache fields** specify

additional levels in the hierarchy. The date grouping is specified by the **fRangeGroup** and **fNumField** fields of the **SXFDB** record associated with the **cache field** being equal to 1 and 0 respectively for all **cache fields** in the grouping. The **ifdbBase** field of each **SXFDB** record associated with the date grouping, except for the **SXFDB** record corresponding to the base **cache field**, MUST specify a **cache field** index to the **SXFDB** record corresponding to the lowest level of the hierarchy.

The **cache items** that specify the groups are specified by **SXString** record that follow the **SXFDB** record for the parent grouping **cache fields**. The grouping criteria is specified by the **SXRng** record that follows the **SXFDB** record. The **iByType** field of the **SXRng** record MUST be greater than or equal to 1 (Seconds) and less than or equal to 7 (Years). For more details, see section 2.4.300.

Discrete grouping is specified by the **GRPSXOPER** rule, the **SxIsxoper** record (section $\underline{2.4.290}$), and the **Continue** records (section $\underline{2.4.58}$) in the **PivotCache Storage part**.

For discrete grouping, a hierarchy of parent grouping **cache fields** can exist, where each parent grouping **cache field** combines the **cache items** of the **cache field** at the next lower level. The discrete grouping is specified by the **fRangeGroup** field of the **SXFDB** record associated with the **cache field** being equal to 0 and the **csxoper** field of the **SXFDB** record being greater than 0. The **ifdbBase** field of the **SXFDB** record specifies a **cache field** index to the base **cache field** at the lowest level of the grouping hierarchy. The **ifdbParent** field of the **SXFDB** record specifies a **cache field** index to the parent grouping **cache field** at the next higher level of the hierarchy. If there is no higher level, then the **fHasParent** field of the **SXFDB** record MUST be 0 and **ifdbParent** MUST be ignored.

The **cache items** that specify the groups are specified by records that conform to the **GRPSXOPER** rule following the **SXFDB** record. The mapping between the **cache items** in the lower level **cache field** and the **cache items** in the parent grouping **cache field** is specified by the **SXIsxoper** record following the **SXFDB** record for the parent grouping **cache field**. The **rgSxIsxoper** field in the **SXIsxoper** record contains an array element for each **cache item** in the lower level **cache field**. The value of the array element is the index of the **cache item** in the parent grouping **cache field** that the **cache item** in the lower level **cache field** is grouped by. For more details, see section 2.4.290.

The following paragraphs explain the three different types of grouping and provide examples of them.

Numeric grouping combines numeric **cache items** into ranges of values. For example, consider the following PivotTable report where the number of people, represented by "Count of Name", of a certain age are listed.

Age	•	Count of Name
	5	1
	11	1
	20	2
	34	2
	45	1
	50	1
Grand To	otal	8

Figure 6: PivotTable report with ages

Analysis of specific ages might not be particularly meaningful. Instead, looking at age groups can be more interesting. The following **PivotTable** report (section 2.2.5) illustrates numeric grouping applied to the "Age" **cache field**. In this example, the numeric grouping is set to start at 0, end at 100, and have groups of 20 years.

Age	Count of Name
<0	
0-19	2
20-39	4
40-59	2
60-79	
80-100	
>100	
Grand Tota	1 8

Figure 7: PivotTable report with age groups

Date grouping is similar to numeric grouping and is used to group cache items into date ranges.

One to seven parent grouping **cache fields** can exist when date grouping is applied to a **cache field**, each corresponding to a different level of detail of date and time information. The **cache field**, to which the date grouping is originally applied, is included in the set of parent grouping **cache fields** and is considered the base **cache field** of the parent grouping **cache fields**. For date grouping, the base **cache field** represents the finest level of detail of date and time information. The following levels of detail of date information are available, each corresponding to one **cache field**:

- Seconds
- Minutes
- Hours
- Days
- Months
- Quarters
- Years

For example, consider the following **PivotTable** report where the number of sales is listed for each individual date.

Date	•	# of Sales
1/1/2	007	1
1/1/2	800	16
2/2/2	007	2
3/3/2	007	3
4/4/2	007	4
5/5/2	007	5
6/6/2	007	6
7/7/2	007	7
8/8/2	007	8
9/9/2	007	9
10/10/2	007	10
11/11/2	007	11
12/12/2	007	12
2/2/2	800	17
3/3/2	800	18
4/4/2	800	19
5/5/2	800	20
6/6/2	800	21
7/7/2008		22
8/8/2008		23
9/9/2008		24
10/10/2008		25
11/11/2008		26
12/12/2008		27
Grand To	tal	336

Figure 8: PivotTable report with dates

This information can be too detailed for some analytical purposes. With date grouping, a more useful higher level summary can be created. The following PivotTable report illustrates the result of applying date grouping to the "Date" **cache field** and including two levels of grouping ("Years" and "Quarters"). In this example, the "Quarters" **cache field** represents the finest level of date information included and is therefore the base **cache field** for this date grouping. The "Years" **cache field** is a parent grouping **cache field** with the "Quarters" **cache field** as its base **cache field**. The items "<1/1/2007" in the two **cache fields** represent dates before 1/1/2007, where the start date is specified by the first **SXNum** record (section 2.4.296) following the **SxRng** record. The items ">12/13/2008" in the two **cache fields** represent dates after 12/13/2008, where the end date is specified by the second **SXNum** record following the **SxRng** record.

Figure 9: PivotTable report with date groups

Discrete grouping combines specifically selected **cache items** into groups. When discrete grouping is applied to a **cache field**, a separate parent grouping **cache field** is created and the **cache field** that the grouping is applied to will become the base **cache field** for that parent grouping **cache field**. Multiple parent grouping **cache fields** can exist for one base **cache field**, forming a hierarchy of parent grouping **cache fields**. A parent grouping **cache field** higher in the hierarchy is considered the parent of the **cache field** just below it in the hierarchy. For a parent grouping **cache field**, each **cache items** collection represents one group.

For example, consider the following **PivotTable** report listing sales by state in the Unites States.

Row Labels 📝 Sun	of Sales Amount
Alabama	\$37.29
Arizona	\$2,104.02
California	\$5,714,257.69
Florida	\$7,760.91
Georgia	\$1,658.92
Illinois	\$2,828.09
Kentucky	\$216.96
Massachusetts	\$2,049.10
Minnesota	\$91.28
Mississippi	\$82.59
Missouri	\$81.46
Montana	\$92.08
New York	\$4,124.19
North Carolina	\$7.28
Ohio	\$359.18
Oregon	\$1,170,991.54
South Carolina	\$2,434.92
Texas	\$1,789.10
Utah	\$4,419.58
Virginia	\$39.98
Washington	\$2,467,248.34
Wyoming	\$7,115.01
Grand Total	\$9,389,789.51

Figure 10: PivotTable report with state names

Discrete grouping can be used to group sets of states, for example, into geographical areas. The following PivotTable report illustrates the result of applying six groups ("Group1" through "Group6") to the **cache field** representing states. The **cache field** representing states is considered the base **cache field** for the discrete grouping in this example. Each group in the example, represented by a **cache item** in the parent grouping **cache field**, combines states in the same geographical area.

ınt	um of Sales Amoun	Row Labels
.83	\$3,000.8	Group1
3.09	\$2,828.0	Illinois
1.28	\$91.2	Minnesota
1.46	\$81.4	Missouri
2.47	\$6,532.4	Group2
9.10	\$2,049.3	Massachusetts
1.19	\$4,124.	New York
9.18	\$359.3	Ohio
3.62	\$1,171,083.0	Group3
2.08	\$92.0	Montana
1.54	\$1,170,991.5	Oregon
2.93	\$2,478,782.9	Group4
9.58	\$4,419.5	Utah
3.34	\$2,467,248.3	Washington
5.01	\$7,115.0	Wyoming
3.85	\$12,238.8	Group5
7.29	\$37.2	Alabama
0.91	\$7,760.9	Florida
3.92	\$1,658.9	Georgia
5.96	\$216.9	Kentucky
2.59	\$82.5	Mississippi
7.28	\$7.2	North Carolina
1.92	\$2,434.9	South Carolina
9.98	\$39.9	Virginia
.81	\$5,718,150.8	Group6
1.02	\$2,104.0	Arizona
7.69	\$5,714,257.0	California
9.10	\$1,789.3	Texas
.51	\$9,389,789.	Grand Total
9	\$1,789	Texas

Figure 11: PivotTable report with state groups

2.2.5.3.8 Calculated Fields

Calculated fields allow users to add calculations to a **PivotTable** report (section 2.2.5). For example, if a **PivotTable** report contains values for sales and cost by products, but no profit values, a **calculated field** with the formula "=sales-cost" can be added so that profit values are calculated and can be analyzed in the **PivotTable** report.

A calculated field is a **cache field** (section 2.2.5.3.5) and does not correspond to a column in the **source data** (section 2.2.5.3.2). The values for a **calculated field** are calculated based on the formula specified for the **calculated field**. A **calculated field** is specified by the **fCalculatedField** field of the **SXFDB** record (section 2.4.283) being equal to 1. The formula is specified by the **SXFormula** record (section 2.4.288) following the **SXFDB** record.

A **pivot field** associated with a calculated field MUST NOT appear on the **row axis** (section 2.2.5.4.9.2), **column axis** (section 2.2.5.4.9.3), or **page axis** (section 2.2.5.4.9.1) of a **PivotTable view** (section 2.2.5.4).

An **OLAP PivotCache** (section <u>2.2.5.3.4</u>) MUST NOT have **calculated fields**.

2.2.5.3.9 Calculated Items

Calculated items allow users to add a **cache item** (section 2.2.5.3.6) that does not exist in the **source data** (section 2.2.5.3.2) to a **cache field** (section 2.2.5.3.5). For example, consider a **PivotTable** report (section 2.2.5) displaying sales for the four quarters of 2007. If there are **source data** rows for sales in 2008, a **calculated item** can be used to add an additional **cache item** as a calculated item that calculates the projected sales for the first quarter of the year 2008 as being 25% higher than the sales for the fourth quarter of 2007. The following figure illustrates a **PivotTable** report with such a **calculated item** (2008 Q1 projected).

Date	Sum of Sales
2007 Q1	\$4,000,000.00
2007 Q2	\$3,500,000.00
2007 Q3	\$5,000,000.00
2007 Q4	\$5,200,000.00
2008 Q1 projected	\$6,500,000.00
Grand Total	\$24,200,000.00

Figure 12: PivotTable report with a calculated item

The values for a **calculated item** are calculated based on the formula specified for the **calculated** item.

The sequence of records that conform to the **SXFORMULA** rule (section 2.1.7.12) specifies one calculation for a specific **calculated item**. Each **calculated item** can have multiple calculations associated with it and in that case, there are multiple sequences of records that conform to the **SXFORMULA** rule corresponding to the same **calculated item**. The **calculated item** that a calculation is associated with is specified by the sequence of records that conform to the **PIVOTRULE** rule (section 2.1.7.20.6) in the **SXFORMULA** rule. The **PIVOTRULE** rule can also specify additional scoping information. For example, if one calculation for a calculated item named "2008 Q1 projected" only applies to the "Cars" product group, the **PIVOTRULE** rule will specify the **cache field** corresponding to "product group" and the **cache item** corresponding to "Cars".

An **OLAP PivotCache** (section 2.2.5.3.4) MUST NOT have **calculated items**.

2.2.5.3.10 OLAP Grouping

Grouping in an **OLAP PivotCache** (section 2.2.5.3.4) is the associating of multiple **OLAP members** that belong to the same **OLAP level** of an **OLAP hierarchy** and have the same **OLAP** member parent. When OLAP members in a particular OLAP level are grouped, a parent grouping OLAP level exists. Each group is represented in the parent grouping OLAP level by one parent grouping OLAP member, and one or more child OLAP members in the OLAP level that the grouping is applied to.

A parent grouping OLAP level is specified by the sequence of records that conform to the **SXADDLGRPLEVEL** rule (section 2.1.7.20.5).

A parent grouping OLAP member is specified by the sequence of records that conform to the **SXADDLGROUP** rule (section 2.1.7.20.5).

2.2.5.3.11 OLAP Calculated Members

A calculated **member (2)** is specified by the sequence of records that conform to the **SXADDLCALCMEMBER** rule (section <u>2.1.7.20.5</u>) and is used to create an **OLAP calculated member** or an **OLAP named set** with an associated user-specified **MDX expression** for a custom calculation.

If the **fLongFormula** field of the **SXAddl_SXCView_SXDCalcMember** record (section <u>2.4.273.100</u>) is equal to one, then the **stMDXFormula** field of the **SXAddl_SXCView_SXDCalcMemString** record (section <u>2.4.273.101</u>) specifies the user-specified MDX expression. If the **fLongFormula** field of the **SXAddl_SXCView_SXDCalcMember** record is equal to zero, then the **stMDXFormula** field of the **SXAddl_SXCView_SXDCalcMember** record specifies the MDX expression.

The **fSet** field of the **SXAddl_SXCView_SXDCalcMember** record specifies whether the associated calculated member (2) creates an OLAP named set or an OLAP calculated member.

If the user-specified MDX expression associated with a calculated member (2) defines an **OLAP measure**, then this calculated member (2) is associated with a measure **pivot hierarchy** (section 2.2.5.4.5) as specified in section 2.2.5.4.5.2.

If the user-specified MDX expression associated with a calculated member (2) specifies an **OLAP member** in an **OLAP hierarchy** other than the OLAP measure hierarchy, then this calculated member (2) can only be associated with a **cache item** (section 2.2.5.3.6).

If a calculated member specifies an OLAP named set, then this calculated member (2) is associated with a named set **pivot hierarchy** as specified in section 2.2.5.4.5.4.

2.2.5.3.12 Cache Records

Cache records, as defined by the **Pivot Cache Storage** (section 2.1.7.12), represent a copy of the **source data** (section 2.2.5.3.2) for a **PivotCache** (section 2.2.5.3) and allow for **PivotTable views** (section 2.2.5.4) using a **PivotCache** to be recalculated without retrieving the **source data**.

Each cache record specifies values for one row of **source data**. Each value in a **cache** record is associated with a corresponding **cache field** (section 2.2.5.3.5). **Cache records** are specified by the sequence of records that conform to the **DBB** rule (section 2.1.7.12). The count of **cache records** MUST be equal to the **crdbdb** field of the **SXDB** record (section 2.4.275). The **SXDBB** record (section 2.4.276) specifies an array of **cache item** (section 2.2.5.3.6) indexes for the **cache fields** for which the **fAllAtoms** field of the **SXFDB** record (section 2.4.283) is equal to 1. The values for the remaining **cache fields** that correspond to **source data** columns are specified by the sequence of records that conform to the **SXOPER** rule (section 2.1.7.12), with each record specifying a value. For each **cache** record, the number of records in the sequence of records that conforms to the **SXOPER** rule (section 2.1.7.12) MUST be the same as the count of **cache fields**, corresponding to **source data** columns, for which the **fAllAtoms** field of the **SXFDB** record is equal to 0.

The **cache records** in a **PivotCache** can be invalid, in which case the **cache records** MUST be ignored. The validity of the **cache records** is determined from the

SXAddl_SXCCache_SXDInvRefreshReal record (section <u>2.4.273.8</u>), if one is present and associated with this **PivotCache**, the **QsiSXTag** record (section <u>2.4.211</u>), if one is present and associated with this **PivotCache**, and the **SXDB** record. If the

SXAddl_SXCCache_SXDInvRefreshReal record is present, then the **cache records** are not valid if the **fInvalid** field of the **SXAddl_SXCCache_SXDInvRefreshReal** record is 1 and valid if that field is 0. Otherwise, if the **QsiSXTag** record is present, then the **cache records** are not valid if the **fInvalid** field of the **QsiSXTag** record is 1 and valid if that field is 0. Otherwise, the **cache records** are not valid if the **fInvalid** field of the **SXDB** record is 1 and valid if that field is 0.

An **OLAP PivotCache** (section $\underline{2.2.5.3.4}$) MUST NOT have **cache records**. **Cache records** are optional for a non- **OLAP PivotCache**.

2.2.5.4 PivotTable View

A PivotTable view is a set of structures that specify layout, filtering, and other properties. These properties are used to produce a **PivotTable** report (section <u>2.2.5</u>) based on data from the associated **PivotCache** (section <u>2.2.5.3</u>).

A **PivotTable view** is specified by the sequence of records that conform to the **PIVOTVIEW** rule (section 2.1.7.20.5).

Functionality specified by a **PivotTable view** includes:

- The arrangement of pivot fields (section <u>2.2.5.4.3</u>) on the row axis (section <u>2.2.5.4.9.2</u>), column axis (section <u>2.2.5.4.9.3</u>), or both to produce a PivotTable report.
- Using data items (section <u>2.2.5.4.9.5.1</u>) on the data axis (section <u>2.2.5.4.9.5</u>) to show summarized result values in the **PivotTable** report.
- Filtering the data in the **PivotTable** report by performing manual filtering (section <u>2.2.5.4.7</u>), filtering by criteria (section <u>2.2.5.4.8</u>), or filtering in the **page axis** (section <u>2.2.5.4.9.1</u>).
- Determining the **PivotTable layout** (section <u>2.2.5.4.10</u>).
- Formatting the entire PivotTable report with a table style (section <u>2.4.320</u>). See the SXAddl_SXCView_SXDTableStyleClient report (section <u>2.4.273.107</u>) for details. Alternatively, for an AutoFormat, see section <u>2.4.313</u> and section <u>2.4.315</u> for details.
- Formatting an area of the **PivotTable** report in a way that logically tracks changes in the **PivotTable** report. For details, see the record specifications for records specified by the **PIVOTFORMAT** rule (section 2.1.7.20.5).
- Conditional formatting an area of the PivotTable report in a way that logically tracks changes
 in the PivotTable report and performs calculations based the fact that the area is in a PivotTable
 report. For details, see the record specifications for records specified by the SXADDLCONDFMT
 rule (section 2.1.7.20.5).
- Sorting **pivot items** (section <u>2.2.5.4.4</u>) of **pivot fields** (section 2.2.5.4.3) within the **PivotTable** report. For details, see section <u>2.2.5.4.3.1</u>.

2.2.5.4.1 Associated PivotCache

A **PivotTable view** (section <u>2.2.5.4</u>) is associated with the **PivotCache** (section <u>2.2.5.3</u>) specified by the **iCache** field of the **SxView** record (section <u>2.4.313</u>). **iCache** is a zero-based index of a sequence of records that conform to the **PIVOTCACHEDEFINITION** rule (section <u>2.1.7.20.3</u>) in the sequence of records that conform to the **WORKBOOKCONTENT** rule (section 2.1.7.20.3).

Each **PivotTable view** MUST be associated with exactly one **PivotCache**. A non- **OLAP PivotCache** (section <u>2.2.5.3.4</u>) MUST be associated with one or more **PivotTable views**. An **OLAP PivotCache** MUST be associated with exactly one **PivotTable view**.

2.2.5.4.2 OLAP PivotTable view

A **PivotTable view** (section 2.2.5.4) is specified to be an **OLAP PivotTable view** if a **QsiSXTag** record (section 2.4.211) exists for the **PivotTable view** and the **fTensorEx** bit of the **QsiSXTag** record is 1. Otherwise, the **PivotTable view** is specified to be a non-**OLAP PivotTable view**. An **OLAP PivotTable view** has an **OLAP PivotCache** (section 2.2.5.3.4) as its associated **PivotCache** (section 2.2.5.3).

2.2.5.4.3 Pivot Fields

A **pivot field** corresponds to a **cache field** (section 2.2.5.3.5). A **pivot field** specifies display information of the data in the **PivotTable view** (section 2.2.5.4).

A **pivot field** is specified by a sequence of records that conforms to the **PIVOTVD** rule (section 2.1.7.20.5) and optionally the **PIVOTVDTEX** (section 2.1.7.20.5) and **SXADDLFIELD** (section 2.1.7.20.5) rules. The **PIVOTVDTEX** rule specifies additional properties for **OLAP PivotTable** views (section 2.2.5.4.2), and the **SXADDLFIELD** rule (section 2.1.7.20.5) specifies additional version specific properties. A pivot field is contained in the **PivotTable view**. A **PivotTable view** contains a collection of **pivot fields** which is specified by the sequence of records that conforms to the **PIVOTVIEW** rule (section 2.1.7.20.5).

A pivot field index, which identifies a pivot field, is specified as the zero-based index of a **PIVOTVD** rule in the collection specified by a **PIVOTVIEW** rule.

Each **pivot field** is associated with the **cache field** with a **cache field** index equal to the **pivot field** index of this **pivot field**. For more details, see section 2.2.5.3.5. The number of pivot fields in the sequence of records that conforms to a **PIVOTCORE** rule (section 2.1.7.20.5) MUST be equal to the number of **cache fields** in the **associated PivotCache** (section 2.2.5.4.1) for the **PivotTable view**.

A **PivotTable view** is used to create a **PivotTable** report (section 2.2.5). This can include information about **pivot fields** placed on **PivotTable axes** (section 2.2.5.4.9) and **data items** (section 2.2.5.4.9.5.1) referring to **pivot fields**.

A **pivot field** can have **pivot items** (section 2.2.5.4.4). A **pivot field** can describe information such as **pivot field sorting** (section 2.2.5.4.3.1) and **subtotaling** (section 2.2.5.4.9.4.2) settings.

The following figure shows a **PivotTable** report with three pivot fields displaying Sales by Country and Fiscal Year.

Sales	Fiscal Year]			
Country	FY 2002	FY 2003	FY 2004	FY 2005	Grand Total
Australia	\$2,568,701.39	\$2,099,585.43	\$4,383,479.54	\$9,234.23	\$9,061,000.58
Canada	\$573,100.97	\$305,010.69	\$1,088,879.50	\$10,853.70	\$1,977,844.86
France	\$414,245.32	\$633,399.70	\$1,592,880.75	\$3,491.95	\$2,644,017.71
Germany	\$513,353.17	\$593,247.24	\$1,784,107.09	\$3,604.83	\$2,894,312.34
United Kingdom	\$550,507.33	\$696,594.97	\$2,140,388.50	\$4,221.41	\$3,391,712.21
United States	\$2,452,176.07	\$1,434,296.26	\$5,483,882.67	\$19,434.51	\$9,389,789.51
Grand Total	\$7,072,084.24	\$5,762,134.30	\$16,473,618.05	\$50,840.63	\$29,358,677.22

Figure 13: PivotTable report with three pivot fields: Sales, Country, and Fiscal Year

2.2.5.4.3.1 Pivot Field Sorting

A **Pivot Field** (section 2.2.5.4.3) has a **sort order** specified if the **PivotTable** (section 2.2.5) is recalculated and the **Pivot Field** (section 2.2.5.4.3) is on the **row axis** (section 2.2.5.4.9.2) or **column axis** (section 2.2.5.4.9.3).

A **Pivot Field** is sorted depending on the setting of the **fAutoSort** field of **SXVDEx** (section 2.4.310).

If the **fAutoSort** field of **SXVDEx** is equal to 0, then the sort order is specified depending on the value of the **fTensorSort** field of **SXVDTEx** record (section 2.4.311) of the **Pivot Field**.

fTensorSort field of SXVDTEx	Meaning
0 or SXVDTEx record not present	The order is determined by the order of the SXVI records (section $\underline{2.4.312}$) for this Pivot Field .

fTensorSort field of SXVDTEx	Meaning
1	The order is determined by the OLAP data source . Only valid for an OLAP PivotTable view (section 2.2.5.4.2).

If the **fAutoSort** field of **SXVDEx** is equal to 1, then sorting is in ascending or descending order according to the **fAscendSort** field of **SXVDEx**. What is sorted depends on the following:

SxcAutoSort class of pivot field presence	isxdiAutoSort field of SXVDEx	Meaning
Not Present	Greater than or equal to 0	Sorting is based on the values in the cells in the PivotTable data area (section 2.2.5.4.10.1.4) that are specified by the data item (section 2.2.5.4.9.5.1) referenced by the isxdiAutoSort field of SXVDEx .
Not Present	-1	Sorting is based on the values of the pivot items (section 2.2.5.4.4) themselves.
Present		Sorting is either based on the values in the cells in the PivotTable data area or on the values of member properties (section 2.2.5.4.6) associated with this pivot field as specified by the SxcSXRule class (section 2.2.5.1.1.1.11) in the SxcAutoSort class (section 2.2.5.1.1.1.14).

2.2.5.4.4 Pivot Items

Pivot items represent specific instances of the entities represented by **pivot fields** (section 2.2.5.4.3). Each **pivot item** specifies its display properties. For example, it can contain the user defined caption for the **pivot item** or information about whether this **pivot item** is hidden or not.

A **pivot item** specifies view properties of a **cache item** (section 2.2.5.3.6) or of an aggregation value associated with a **pivot fields** (section 2.2.5.4.3).

A pivot item is specified by an **SXVI** record (section 2.4.312) in a sequence of records that conforms to the **PIVOTVD** rule (section 2.1.7.20.5), and optionally an **SXVIFlags structure** (section 2.5.263) specified by an element in the array specified by the **rgsxvi** field of the **SXVDTEx** record (section 2.4.311). The **SXVIFlags structure** (section 2.5.263) specifies additional properties for **OLAP PivotTable views** (section 2.2.5.4.2).

If the **itmType** field of **SXVI** (section 2.4.312) is 0x0000, then this **pivot item** is associated with the **cache item** (section 2.2.5.3.6) specified by the iCache field of the **SXVI** record (section 2.4.312). Each **pivot item** that is associated with a **cache item** (section 2.2.5.3.6) MUST be associated with a different **cache item** (section 2.2.5.3.6) than the other **pivot items** in the collection. If the **itmType** field of this **SXVI** record (section 2.4.312) is not 0x0000, then this **pivot item** MUST NOT have an associated **cache item** (section 2.2.5.3.6).

The number of **pivot items** where the **itmType** field of the **SXVI** record (section 2.4.312) of the **pivot item** is 0x0000 MUST equal zero or the number of **cache items** (section 2.2.5.3.6) in the **cache field** (section 2.2.5.3.5) of the **pivot fields** (section 2.2.5.4.3).

A pivot item can be referenced by a pivot item index. A pivot item index is a zero-based index of **SXVI** records (section 2.4.312) in a **PIVOTVD rule** (section 2.1.7.20.5). Note that unlike pivot field index and cache field index, **pivot item** index and cache item index are not necessarily equal.

2.2.5.4.5 Pivot Hierarchies

A **pivot hierarchy** is specified to be contained by a **PivotTable axis** (section 2.2.5.4.9) when all **pivot fields** (section 2.2.5.4.3) associated with that pivot hierarchy are placed on that **PivotTable axis** (section 2.2.5.4.9). **Pivot fields** (section 2.2.5.4.3) MUST NOT be placed on a **PivotTable axis** (section 2.2.5.4.9) different from the pivot axis that any other **pivot field** (section 2.2.5.4.3) associated with the same pivot hierarchy is placed on. Additional restrictions can apply, as specified by the **SXTH rule** (section 2.1.7.20.5) and the PivotTable Axes section.

A **pivot hierarchy** corresponds to one of the following entities in the **OLAP source data** (section 2.2.5.3.2) associated with an **OLAP PivotCache** (section 2.2.5.3.4):

- OLAP hierarchy
- OLAP measure
- OLAP named set
- OLAP key performance indicator (KPI)

A **pivot hierarchy** is associated with an OLAP hierarchy in the **source data** (section 2.2.5.3.2). A pivot hierarchy is specified by the sequence of records that conform to the **PIVOTTH rule** (section 2.1.7.20.5) and, optionally, the **SXADDLHIERARCHY rule** (section 2.1.7.20.5).

Pivot hierarchies MUST NOT exist if the **PivotTable view** (section <u>2.2.5.4</u>) is a non- **OLAP PivotTable views** (section <u>2.2.5.4.2</u>). At least one **pivot** hierarchy MUST exist if the **PivotTable view** (section 2.2.5.4) is an **OLAP PivotTable views** (section 2.2.5.4.2).

A **pivot hierarchy** specifies OLAP hierarchy information and has one or more associated **pivot fields** (section 2.2.5.4.3) associated with **OLAP levels** of the OLAP hierarchy, an OLAP named set, an **OLAP KPI**, or an OLAP measure.

A pivot hierarchy can be referenced by pivot hierarchy index. A pivot hierarchy index is the zero-based index of a **PIVOTTH rule** (section 2.1.7.20.5) in the associated **PIVOTVIEW rule** (section 2.1.7.20.5).

A pivot hierarchy is associated with an OLAP object as specified in the following table:

fMeasure field of SXTH	fSet field of SXTH	fKPI field of SXTH	Meaning
0	0	0	OLAP hierarchy
0	1	0	OLAP named set
0	0	1	OLAP KPI
1	0	0	OLAP measure

2.2.5.4.5.1 Association of Pivot Hierarchies and Pivot Fields and Cache Fields

A **pivot field** (section 2.2.5.4.3) is associated with the **pivot hierarchy** (section 2.2.5.4.5) specified by either the **isxth** field of the **SXVDTEx record** (section 2.4.311) of that **pivot field** (section 2.2.5.4.3), or the **isxth** field of the **SXAddl_SXCField12_SXDISXTH record** (section 2.4.273.31) of that **pivot field** (section 2.2.5.4.3).

If a **pivot field** (section 2.2.5.4.3) has an **SXAddl_SXCField12_SXDISXTH record** (section 2.4.273.31), the **isxth** field of the **SXVDTEx record** (section 2.4.311) MUST be -1 and the association is specified by **isxth** field of the **SXAddl_SXCField12_SXDISXTH record** (section 2.4.273.31).

A **pivot hierarchy** (section 2.2.5.4.5) associated with a **pivot field** (section 2.2.5.4.3) is associated with the **cache field** (section 2.2.5.3.5) the **pivot field** (section 2.2.5.4.3) is associated.

If a **pivot hierarchy** (section 2.2.5.4.5) is on the **page axis** (section 2.2.5.4.9.1) or **data axis** (section 2.2.5.4.9.5), the **isxvd** field of **SXTH** (section 2.4.308) is a reference to an associated **pivot field** (section 2.2.5.4.3).

If the **pivot hierarchy** (section 2.2.5.4.5) is not a **measure** (section 2.2.5.4.5.2), **named set** (section 2.2.5.4.5.4), **KPI** (section 2.2.5.4.5.3), there can be more than one **pivot field** (section 2.2.5.4.3) associated with it and each array elements in the **rgisxvd** field of **SXTH** (section 2.4.308) is a reference to the associated **pivot field** (section 2.2.5.4.3) for the **pivot hierarchy** (section 2.2.5.4.5) level.

If a **pivot field** (section 2.2.5.4.3) has an **SXAddl_SXCField12_SXDISXTH** record (section 2.4.273.31) **sxaxis.sxaxisData**, **sxaxis.sxaxisRw**, **sxaxis.sxaxisCol** and **sxaxis.sxaxisPage** fields of the **Sxvd record** (section 2.4.309) of the **pivot field** (section 2.2.5.4.3) MUST be 0.

If a **pivot hierarchy** (section 2.2.5.4.5) is a **measure** (section 2.2.5.4.5.2), **named set** (section 2.2.5.4.5.4), or **KPI** (section 2.2.5.4.5.3), there can be no more than one **pivot field** (section 2.2.5.4.3) associated with it.

2.2.5.4.5.2 Measures

A measure pivot hierarchy is a pivot hierarchy that is associated with an **OLAP measure**. The **fMeasure** field of the **SXTH** (section 2.4.308) specifies if a pivot hierarchy is a **measure** pivot hierarchy. An OLAP measure MUST NOT have more than one **cache field** (section 2.2.5.3.5) associated with it. A **measure** pivot hierarchy MUST NOT be located on the **row axis** (section 2.2.5.4.9.2), **column axis** (section 2.2.5.4.9.3), or **page axis** (section 2.2.5.4.9.1).

2.2.5.4.5.3 KPIs

A **key performance indicator (KPI) pivot hierarchy** (section 2.2.5.4.5) is a **pivot hierarchy** (section 2.2.5.4.5) that is associated with an **OLAP KPI**. A **KPI pivot hierarchy** (section 2.2.5.4.5) includes the four main components of an OLAP KPI; value, goal, status and trend. The **fKPI** field of the **SXTH record** (section 2.4.308) specifies if a pivot hierarchy is a KPI **pivot hierarchy** (section 2.2.5.4.5).

2.2.5.4.5.4 Named Sets

A named set pivot hierarchy (section 2.2.5.4.5) is a pivot hierarchy (section 2.2.5.4.5) that is associated with an OLAP named set. The fSet field of the SXTH record (section 2.4.308) specifies if a pivot hierarchy (section 2.2.5.4.5) is a named set pivot hierarchy (section 2.2.5.4.5). An OLAP named set MUST NOT have more than one cache field (section 2.2.5.3.5) associated with it. A named set pivot hierarchy (section 2.2.5.4.5) MUST NOT be located on the data axis (section 2.2.5.4.9.5) or page axis (section 2.2.5.4.9.1).

2.2.5.4.6 Member Properties

A member property is the **PivotTable** (section <u>2.2.5</u>) representation of an **OLAP member property**. **Member properties** can have properties that are associated with the **PivotCache** (section <u>2.2.5.3</u>) and a **PivotTable view** (section <u>2.2.5.4</u>).

A member property is specified by the **SXAddl_SXCHierarchy_SXDProperty record** (section <u>2.4.273.57</u>) in the sequence of records that conform to the **SXADDLHIERARCHY rule** (section <u>2.1.7.20.5</u>). A **member property** is contained in a **pivot hierarchy** (section <u>2.2.5.4.5</u>).

A **member property** is associated with one OLAP member property of the **OLAP hierarchy** specified by the **pivot hierarchy** (section 2.2.5.4.5) of the **member property**.

A member property can be associated with a cache field (section 2.2.5.3.5) and a pivot field (section 2.2.5.4.3). If there is a cache field (section 2.2.5.3.5) with an stFieldName field of the SXFDB record equal to the stProperty field of the SXAddl_SXCHierarchy_SXDProperty record (section 2.4.273.57), then this specifies that the member property is associated with that cache field (section 2.2.5.3.5), and the cache field (section 2.2.5.3.5) is specified to be a member property cache field (section 2.2.5.3.5). The associated pivot field (section 2.2.5.4.3) of a member property cache field (section 2.2.5.3.5) is specified to be a member property pivot field (section 2.2.5.4.3).

It is not required that a **member property** is associated with any **cache field** (section 2.2.5.3.5) or **pivot field** (section 2.2.5.4.3). If there is no **cache field** (section 2.2.5.3.5) with a **stFieldName** field of the **SXFDB record** (section 2.4.283) equal to the **stProperty** field of the **SXAddl_SXCHierarchy_SXDProperty record** (section 2.4.273.57), then this specifies that the **member property** is not associated with any **cache field** (section 2.2.5.3.5) or **pivot field** (section 2.2.5.4.3). Such a **member property** does not participate in the **row axis** (section 2.2.5.4.9.2) or **column axis** (section 2.2.5.4.9.3).

A member property pivot field (section 2.2.5.4.3) can be shown only in the **row area** (section 2.2.5.4.10.1.1) or **column area** (section 2.2.5.4.10.1.2) of a **PivotTable view** (section 2.2.5.4). A **member property pivot field** (section 2.2.5.4.3) can only be shown after the last visible level of the corresponding **pivot hierarchy** (section 2.2.5.4.5). The order of **member property** fields shown in the **PivotTable view** (section 2.2.5.4) is the same as the order of **SXAddl_SXCHierarchy_SXDProperty records** (section 2.4.273.57) in the corresponding **pivot hierarchy** (section 2.2.5.4.5).

2.2.5.4.7 Manual Filters

A manual filter enables specific **pivot items** (section 2.2.5.4.4) or **OLAP members** associated with **pivot fields** (section 2.2.5.4.3) to be shown or hidden in the **PivotTable report** (section 2.2.5). **Manual filtering** affects calculations when **pivot fields** (section 2.2.5.4.3) that have **manual filters** are located on the **row axis** (section 2.2.5.4.9.2), **column axis** (section 2.2.5.4.9.3), or **page axis** (section 2.2.5.4.9.1). The **pivot items** (section 2.2.5.4.4) that are hidden for such **pivot fields** (section 2.2.5.4.3) are not included when calculating values for the **PivotTable view** (section 2.2.5.4).

At least one **SXVI record** (section $\underline{2.4.312}$) following an **Sxvd record** (section $\underline{2.4.309}$) MUST have the **fHidden** field equal to 0x0.

Details about manual **filtering** for **pivot fields** (section 2.2.5.4.3) on the **page axis** (section 2.2.5.4.9.1) are covered in the Page Axis section.

2.2.5.4.7.1 Non-OLAP Manual Filters

For non-**OLAP PivotTable views** (section <u>2.2.5.4.2</u>), the state of the **manual filter** (section <u>2.2.5.4.7</u>) on a **pivot field** (section <u>2.2.5.4.3</u>) can be determined by the value of the **fHidden** field of the **SXVI records** (section <u>2.4.312</u>) directly following the corresponding **Sxvd record** (section <u>2.4.309</u>). This field specifies whether the corresponding **pivot items** (section <u>2.2.5.4.4</u>) is shown or hidden in the **PivotTable report** (section <u>2.2.5</u>).

For non-OLAP PivotTable (section 2.2.5) with PivotCache functionality level (section 2.2.5.3.1) greater than or equal to 3, the fFilterInclusive field of the SXAddl_SXCField12_SXDVer12Info record (section 2.4.273.33) specifies whether new pivot items (section 2.2.5.4.4) in the source data (section 2.2.5.3.2) are shown or hidden by default when the PivotTable report (section 2.2.5) is refreshed in addition to the pivot items (section 2.2.5.4.4) that are already shown in the PivotTable report (section 2.2.5) as the result of an applied manual filter (section 2.2.5.4.7).

2.2.5.4.7.2 OLAP Manual Filters

For **OLAP PivotTable views** (section <u>2.2.5.4.2</u>), **manual filtering** (section <u>2.2.5.4.7</u>) operates on **pivot hierarchies** (section <u>2.2.5.4.5</u>). **OLAP manual filtering** uses filtering lists to determine what filtering to apply. The **OLAP manual filtering** operation depends on the **PivotCache Functionality Level** (section <u>2.2.5.3.1</u>) of the **associated PivotCache** (section <u>2.2.5.4.1</u>) of the **PivotTable view** (section <u>2.2.5.4</u>).

The list of excluded **OLAP members** is specified by the **rgHiddenMemberSets** field of the **SXTH record** (section 2.4.308). If the **fFilterInclusive** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) is equal to 0x1, the list of excluded OLAP members MUST be empty.

The list of included OLAP members is specified by a collection of

SXAddl_SXCHierarchy_SXDFilterMember12 records (section <u>2.4.273.45</u>) of the **pivot hierarchy** (section 2.2.5.4.5). If the **PivotCache Functionality Level** (section 2.2.5.3.1) of the **associated PivotCache** (section 2.2.5.4.1) of the **PivotTable view** (section 2.2.5.4) is less than 3, the selected **pivot items** (section <u>2.2.5.4.4</u>) list MUST be empty. If the **FilterInclusive** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) is equal to 0x0, the list of included OLAP members MUST be empty.

The selected **pivot items** (section 2.2.5.4.4) list is specified to be the list of **pivot items** (section 2.2.5.4.4), with the **fOlapFilterSelected** field of the **SXVIFlags structure** (section 2.5.263) that corresponds to each **pivot item** (section 2.2.5.4.4) equal to 0x1, in the **pivot fields** (section 2.2.5.4.3) associated with the **pivot hierarchy** (section 2.2.5.4.5). If the **PivotCache Functionality Level** (section 2.2.5.3.1) of the **associated PivotCache** (section 2.2.5.4.1) of the **PivotTable view** (section 2.2.5.4) is less than 3, the selected **pivot items** (section 2.2.5.4.4) list MUST be empty.

If all of the lists of excluded OLAP members, included OLAP members and the selected **pivot items** (section 2.2.5.4.4) are empty, then no **manual filtering** (section 2.2.5.4.7) is specified for the **pivot hierarchy** (section 2.2.5.4.5). Otherwise, the value of the **fFilterInclusive** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) determines how the lists are used.

If the **fFilterInclusive** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) is equal to 0x1, the **members (2)** of the included OLAP members list and their ascendants and descendants are included in the **manual filter** (section 2.2.5.4.7). The **pivot items** (section 2.2.5.4.4) in the selected **pivot items** (section 2.2.5.4.4) list, and their ascendants and descendants are also included in the **manual filter** (section 2.2.5.4.7). New OLAP members in the **source data** (section 2.2.5.3.2) will be excluded by default when the **PivotTable view** (section 2.2.5.4) is refreshed.

If the **fFilterInclusive** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) is equal to 0x0, the members (2) of the excluded OLAP members list and their descendants are excluded in the **manual filter** (section 2.2.5.4.7). The **pivot items** (section 2.2.5.4.4) in the selected **pivot items** (section 2.2.5.4.4) list and their descendants are also excluded in the **manual filter** (section 2.2.5.4.7). New OLAP members in the **source data** (section 2.2.5.3.2) will be included by default when the **PivotTable view** (section 2.2.5.4) is refreshed.

The filtering lists do not include OLAP members which are parent or child members of other OLAP members in the lists.

2.2.5.4.8 Filtering by Criteria

Filtering by criteria is the ability to conditionally show **pivot items** (section 2.2.5.4.4) of **pivot fields** (section 2.2.5.4.3) based on user-defined criteria. For example, a criteria **filter** might be defined to show all products that sold for more than \$30,000.

2.2.5.4.8.1 Advanced Filters

An **advanced filter** specifies a user-defined criterion that is used to determine the **pivot items** (section $\underline{2.2.5.4.4}$) of a **pivot field** (section $\underline{2.2.5.4.3}$) that are included when calculating values for

the **PivotTable view** (section $\underline{2.2.5.4}$) and that are displayed in the **PivotTable report** (section $\underline{2.2.5}$).

Only **advanced filters** that are associated with **pivot fields** (section 2.2.5.4.3) that are located on the **row axis** (section 2.2.5.4.9.2) or the **column axis** (section 2.2.5.4.9.3) are applied when the **PivotTable view** (section 2.2.5.4) is calculated.

An **advanced filter** is specified by the <u>SXCSXFilter12 class</u> section. The **isxvd** field of the **SXAddl_SXCSXFilter12_SXDSXFilter record** (section <u>2.4.273.82</u>) specifies the **pivot field** (section 2.2.5.4.3) associated with the **a**dvanced filter.

Advanced filters MUST NOT be applied to pivot fields (section 2.2.5.4.3) of a PivotTable view (section 2.2.5.4) if the PivotCache functionality level (section 2.2.5.3.1) of the associated PivotCache (section 2.2.5.4.1) is less than 3. Advanced filters MUST NOT be applied to an OLAP PivotTable view (section 2.2.5.4.2) with a value of 0 for the fSrvSupportSubquery field of the SXAddl_SXCCache_SXDInfo12 record (section 2.4.273.7) of the associated PivotCache (section 2.2.5.4.1).

There are three types of **advanced filters**: **label filter** (section 2.2.5.4.8.1.1), **date filter** (section 2.2.5.4.8.1.2), and **value filter** (section 2.2.5.4.8.1.3).

A **pivot field** (section 2.2.5.4.3) MUST NOT have more than one associated **advanced filter** of the same type.

2.2.5.4.8.1.1 Label Filters

A **label filter** specifies a criterion that is applied to **pivot item** (section 2.2.5.4.4) captions to determine which **pivot items** (section 2.2.5.4.4) are included in the calculation of values for the **PivotTable view** (section 2.2.5.4) and displayed in the **PivotTable report** (section 2.2.5).

A **label filter** is specified by an **SXAddl_SXCSXFilter12_SXDSXFilter record** (section <u>2.4.273.82</u>) with the **sxft** field equal to a value in the range 0x00000004 through 0x00000011.

Label filters are applied before any **value filters** (section $\underline{2.2.5.4.8.1.3}$), but the order of **label filters** is not specified.

If a caption is specified, the **label filter** is applied to the **stName** field in the **SXVI records** (section 2.4.312) associated with the **pivot items** (section 2.2.5.4.4). If captions are not specified for the **pivot items** (section 2.2.5.4.4), the **label filter** is applied to the values of the **cache items** (section 2.2.5.3.6) associated with these **pivot items** (section 2.2.5.4.4).

A **label filter** can be applied to **member properties** (section <u>2.2.5.4.6</u>). The **isxvdMProp** field of the **SXAddl_SXCSXFilter12_SXDSXFilter record** (section 2.4.273.82) specifies the **member property** (section 2.2.5.4.6) on which this **label filter** is applied.

2.2.5.4.8.1.2 Date Filters

A date filter specifies a criterion that is applied to date type **pivot items** (section 2.2.5.4.4) of a **pivot field** (section 2.2.5.4.3). A **date filter** determines which **pivot items** (section 2.2.5.4.4) are included in the calculation of the **PivotTable view** (section 2.2.5.4) and are displayed in the **PivotTable view** (section 2.2.5.4) report.

Date filters are specified by **SXAddl_SXCSXFilter12_SXDSXFilter records** (section <u>2.4.273.82</u>) with the **sxft** field in the range from 0x0000001A through 0x00000041.

For non-OLAP PivotTable views (section 2.2.5.4.2), a date filter can be applied if and only if the SXFDB record (section 2.4.283) associated with the corresponding pivot field (section 2.2.5.4.3) has the fDateInField field equal to 0x1, and the fNonDates field is equal to 0. For OLAP PivotTable views (section 2.2.5.4.2), a date filter can be applied if the fTimeHierarchy field of the SXTH record (section 2.4.308) that specifies the pivot hierarchy (section 2.2.5.4.5) is equal to 1.

Date filters are applied before **value filters** (section 2.2.5.4.8.1.3) and in no specific order.

2.2.5.4.8.1.3 Value Filters

A **value filter** specifies a criterion that is applied to values of a **data item** (section 2.2.5.4.9.5.1) for **pivot items** (section 2.2.5.4.4) of the **pivot field** (section 2.2.5.4.3) that the **value filter** is applied to. The **value filter** determines which **pivot items** (section 2.2.5.4.4) are included when calculating values for the **PivotTable view** (section 2.2.5.4) and displayed in the **PivotTable view** (section 2.2.5.4) report.

A **value filter** is specified by the **SXAddl_SXCSXFilter12_SXDSXFilter records** (section <u>2.4.273.82</u>) with the **sxft** field equal to a value in one of the following the ranges: from 0x00000001 through 0x00000003 or from 0x00000012 through 0x00000019.

Value filters are applied after **manual filters** (section 2.2.5.4.7), **date filters** (section 2.2.5.4.8.1.2) and **label filters** (section 2.2.5.4.8.1.1) are applied. **Value filters** are applied in the order in which they are specified in the <u>SXCSXFilter12 class</u> section. **Value filtering** takes previous filtering into account when evaluating filters.

2.2.5.4.8.2 Simple Filters

A **simple filter** is a **top N filter** which is also known as **AutoShow**. The **fAutoShow** field of the **SXVDEx record** (section 2.4.310) specifies whether a **simple filter** is applied for a **pivot field** (section 2.2.5.4.3). The **fTopAutoShow** field of the **SXVDEx record** (section 2.4.310) specifies whether a **simple filter** applies to the top or bottom *n* items. The **citmAutoShow** field of the **SXVDEx record** (section 2.4.310) specifies the number of **pivot items** (section 2.2.5.4.4) displayed.

Simple filters MUST only be applied to **pivot fields** (section 2.2.5.4.3) of a **PivotTable view** (section 2.2.5.4) with **data functionality level** (section 2.2.5.2) less than or equal to 2, or to **pivot fields** (section 2.2.5.4.3) of an **OLAP PivotTable views** (section 2.2.5.4.2) with the **fSrvSupportSubquery** field of the **SXAddl_SXCCache_SXDInfo12 record** (section 2.4.273.7) of the corresponding **PivotCache** (section 2.2.5.3) equal to zero.

2.2.5.4.9 PivotTable Axes

A **PivotTable axis** is the set of **pivot fields** (section 2.2.5.4.3) or **pivot hierarchies** (section 2.2.5.4.5) in a **PivotTable view** (section 2.2.5.4) used to populate an area of the **PivotTable report** (section 2.2.5). The placement and positions of **pivot fields** (section 2.2.5.4.3) on the axes are used to determine the **PivotTable Layout** (section 2.2.5.4.10). The four axes of a **PivotTable view** (section 2.2.5.4) are the **page axis** (section 2.2.5.4.9.1), the **row axis** (section 2.2.5.4.9.2), the **column axis** (section 2.2.5.4.9.3), and the **data axis** (section 2.2.5.4.9.5). For non- **OLAP PivotTable views** (section 2.2.5.4.2), a **pivot field** (section 2.2.5.4.3) MUST NOT appear more than once on the **PivotTable view** (section 2.2.5.4), with the exception of the **data axis** (section 2.2.5.4.3) can be placed one or more times on the **data axis** (section 2.2.5.4.2), a **pivot field** (section 2.2.5.4.3) can be placed on any other axis. For **OLAP PivotTable views** (section 2.2.5.4.2), a **pivot field** (section 2.2.5.4.3) MUST NOT be placed more than once on any axis. For both **OLAP** and non-**OLAP PivotTable views** (section 2.2.5.4.3) do not have to be placed on any **PivotTable axis**.

2.2.5.4.9.1 Page Axis

The **page axis** contains the **pivot fields** (section 2.2.5.4.3) or **pivot hierarchies** (section 2.2.5.4.5) that populate the **page area** (section 2.2.5.4.10.1.3) of the **PivotTable report** (section 2.2.5), as specified by **PivotTable Layout** (section 2.2.5.4.10), and that are intended for use as **filters**. These **pivot fields** (section 2.2.5.4.3) and **pivot hierarchies** (section 2.2.5.4.5) do not affect the layout of the other areas of the **PivotTable report** (section 2.2.5), but rather filter the data used by the entire **PivotTable view** (section 2.2.5.4.2).

The **page axis** is specified by the sequence of records that conform to the **PIVOTPI rule** (section 2.1.7.20.5) and optionally by the collection of **SXPIEx records** (section 2.4.299) in the sequence of records that conform to the **PIVOTVIEWEX rule** (section 2.1.7.20.5). For non-**OLAP PivotTable views** (section 2.2.5.4.2), the **SXPI_Item structure** (section 2.5.260) specified by each array element of the **rgsxpi** field of the **SXPI record** (section 2.4.298) specifies one **pivot field** (section 2.2.5.4.3) on the page axis. For **OLAP PivotTable views** (section 2.2.5.4.2), each **SXPIEx record** (section 2.4.299) specifies one **pivot hierarchy** (section 2.2.5.4.5) on the **page axis**. The order of the **pivot fields** (section 2.2.5.4.3) and **pivot hierarchies** (section 2.2.5.4.3) appear on the **page axis**.

For non-**OLAP PivotTable views** (section 2.2.5.4.2), the **isxvd** field of the **SXPI_Item structure** (section 2.5.260) specifies the associated **pivot field** (section 2.2.5.4.3). For **OLAP PivotTable views** (section 2.2.5.4.2), the **isxth** field of the **SXPIEx record** (section 2.4.299) specifies the associated **pivot hierarchy** (section 2.2.5.4.5).

2.2.5.4.9.1.1 Non-OLAP Page Filtering

A non-**OLAP PivotTable view** (section 2.2.5.4.2) can be filtered to not include some **pivot items** (section 2.2.5.4.4) from the **pivot fields** (section 2.2.5.4.3) on the **page axis** (section 2.2.5.4.9.1). The **PivotTable report** (section 2.2.5) only includes values specified by **cache items** (section 2.2.5.3.6) that are associated with **pivot items** (section 2.2.5.4.4) that are filtered in.

The following table specifies how the filtering of **pivot items** (section 2.2.5.4.4) of a **pivot field** (section 2.2.5.4.3) is specified.

In the following table, the first column is the value of the **rgsxpi.isxvi** field of the **SXPI record** (section 2.4.298), and the second column is the value of the **fSubtotalHiddenPageItems** field of the **SXEx record** (section 2.4.282).

Value of rgsxpi.isxvi	Value of fSubtotalHiddenP ageItems	Filtering Behavior
Not 0x7FFD	Any	Specifies that the rgsxpi.isxvi field of the SXPI record (section 2.4.298) specifies a pivot item (section 2.2.5.4.4) index, as specified by the Pivot Items section, of the one pivot item (section 2.2.5.4.4) of a pivot field (section 2.2.5.4.3) that is filtered in.
0x7FFD	0	Specifies that pivot items (section 2.2.5.4.4) are filtered in if and only if the fHidden field of the corresponding SXVI records (section 2.4.312) is equal to 0. However, all pivot items (section 2.2.5.4.4) are factored into the subtotal.
0x7FFD	1	Specifies that pivot items (section 2.2.5.4.4) are filtered in if and only if the fHidden field of the corresponding SXVI records (section 2.4.312) is equal to zero. Only pivot items (section 2.2.5.4.4) that are filtered in are factored into the subtotal.

2.2.5.4.9.1.2 **OLAP Page Filtering**

In an **OLAP PivotTable views** (section <u>2.2.5.4.2</u>) the filtering on the **page axis** (section <u>2.2.5.4.9.1</u>) is specified using the **pivot hierarchy** (section <u>2.2.5.4.5</u>) that the **pivot field** (section <u>2.2.5.4.3</u>) is associated with, as specified in the <u>Association of Pivot Hierarchies and Pivot Fields and Cache Fields</u> section.

If the value of the **fEnableMultiplePageItems** field of the **SXTH record** (section $\underline{2.4.308}$) of the **pivot hierarchy** (section 2.2.5.4.5) is 0, the **stUnique** field of the **SXPIEx record** (section $\underline{2.4.299}$) specifies an **OLAP member** to filter by.

If the value of the **fEnableMultiplePageItems** field of the **SXTH record** (section 2.4.308) of the **pivot hierarchy** (section 2.2.5.4.5) is 1, then the specification depends on the **PivotCache Functionality Level** (section 2.2.5.3.1) of the **associated PivotCache** (section 2.2.5.4.1) of the **PivotTable view** (section 2.2.5.4), as specified in the following table:

PivotCache Functionality Level	Filtering Behavior
Less than 3	Specifies that the SXAddl_SXCHierarchy_SXDFilterMember records (section 2.4.273.44) of the pivot hierarchy (section 2.2.5.4.5) specify the OLAP members to filter by.
Greater than or equal to 3	Specifies that the filtering is applied as specified by Manual Filters (section 2.2.5.4.7) and OLAP Manual Filters (section 2.2.5.4.5).

2.2.5.4.9.2 Row Axis

The **row axis** contains the **pivot fields** (section 2.2.5.4.3) and an optional **data field** (section 2.2.5.4.9.5.2) used to populate the **row area** (section 2.2.5.4.10.1.1) of the **PivotTable report** (section 2.2.5), as specified by the <u>PivotTable Layout</u> section.

The **pivot fields** (section 2.2.5.4.3) on the **row axis** are specified by the first **SxIvd record** (section 2.4.292) in the sequence of records that conform to the **PIVOTCORE rule** (section 2.1.7.20.5) as defined by the Worksheet Substream **ABNF**, which specifies an array of **SxIvdRw structures** (section 2.5.258). The order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) are referenced from the **SxIvd record** (section 2.4.292) specifies the order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) display on the row axis. The order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) display on the row axis corresponds to the order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) are placed in the **row area** (section 2.2.5.4.10.1.1) of the **PivotTable report** (section 2.2.5).

For adjacent **SxIvdRw structures** (section 2.5.258) in the **rgSxivd** field of the **SxIvd record** (section 2.4.292), the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) that the first **SxIvdRw references** (section 2.5.258) is defined to be an outer field with respect to the **pivot field** (section 2.2.5.4.3) or the **data field** (section 2.2.5.4.9.5.2) that the second **SxIvdRw references** (section 2.5.258). The **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) that the second **SxIvdRw references** (section 2.5.258) is defined to be an inner field with respect to the **pivot field** (section 2.2.5.4.3) or the **data field** (section 2.2.5.4.9.5.2) that the first **SxIvdRw references** (section 2.5.258).

For **OLAP PivotTables** (section 2.2.5), all **SxIvdRw records** (section 2.5.258) in the **rgSxivd** field of the **SxIvd record** (section 2.4.292) that reference **pivot fields** (section 2.2.5.4.3) that are associated with the same **pivot hierarchy** (section 2.2.5.4.5) MUST be adjacent. **Pivot fields** (section 2.2.5.4.3) associated with **member properties** (section 2.2.5.4.6) of the **pivot hierarchy** (section 2.2.5.4.3) associated with the same **pivot hierarchy** (section 2.2.5.4.5). **Pivot fields** (section 2.2.5.4.3) not associated with **member properties** (section 2.2.5.4.6) of the **pivot hierarchy** (section 2.2.5.4.5) MUST appear on the row axis in an order such that the zero-based ordinal of the **OLAP level** of each **pivot field** (section 2.2.5.4.3) associated with the same **pivot hierarchy** (section 2.2.5.4.5) is ascending. The zero-based ordinal of the **OLAP** level of a **pivot field** (section 2.2.5.4.3) is specified by the **isxtl** field of the **SXVDTEx record** (section 2.4.311).

For OLAP **PivotTables** (section 2.2.5), the **SXTH record** (section <u>2.4.308</u>) specifies information about a **pivot hierarchy** (section 2.2.5.4.5), including which axis the **pivot hierarchy** (section 2.2.5.4.5) is on.

See the Nesting section for more information.

2.2.5.4.9.3 Column Axis

The column axis contains the **pivot fields** (section <u>2.2.5.4.3</u>) and an optional **data field** (section <u>2.2.5.4.9.5.2</u>) used to populate the **column area** (section <u>2.2.5.4.10.1.2</u>) of the **PivotTable report** (section <u>2.2.5</u>), as specified by the <u>PivotTable Layout section</u>.

The **pivot fields** (section 2.2.5.4.3) on the row axis are specified by the second **SxIvd record** (section 2.4.292) in the sequence of records that conform to the **PIVOTCORE rule** (section 2.1.7.20.5) as defined by the Worksheet Substream **ABNF**, which specifies an array of **SxIvdCol structures** (section 2.5.257).

The order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) are referenced from the **SxIvd record** (section 2.4.292) specifies the order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) display on the column axis. The order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) display on the column axis corresponds to the order that the **pivot fields** (section 2.2.5.4.3) and the optional **data field** (section 2.2.5.4.9.5.2) are placed in the **column area** (section 2.2.5.4.10.1.2) of the **PivotTable report** (section 2.2.5).

For adjacent **SxIvdCol structures** (section 2.5.257) in the **rgSxivd** field of the **SxIvd record** (section 2.4.292), the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) that the first **SxIvdCol references** (section 2.5.257) is defined to be an outer field with respect to the **pivot field** (section 2.2.5.4.3) or the **data field** (section 2.2.5.4.9.5.2) that the second **SxIvdCol references** (section 2.5.257). The **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) that the second **SxIvdCol references** (section 2.5.257) is defined to be an inner field with respect to the **pivot field** (section 2.2.5.4.3) or the **data field** (section 2.2.5.4.9.5.2) that the first **SxIvdCol references** (section 2.5.257).

For **OLAP PivotTables** (section 2.2.5), all **SxIvdCol structures** (section 2.5.257) in the **rgSxivd** field of the **SxIvd record** (section 2.4.292) that reference **pivot fields** (section 2.2.5.4.3) that are associated with the same **pivot hierarchy** (section 2.2.5.4.5) MUST be adjacent. **Pivot fields** (section 2.2.5.4.3) associated with **member properties** (section 2.2.5.4.6) of the **pivot hierarchy** (section 2.2.5.4.5) MUST be located on the column axis after other types of **pivot fields** (section 2.2.5.4.3) associated with the same **pivot hierarchy** (section 2.2.5.4.5). **Pivot fields** (section 2.2.5.4.3) not associated with **member properties** (section 2.2.5.4.6) of the **pivot hierarchy** (section 2.2.5.4.5) MUST appear on the column axis in an order such that the zero-based ordinal of the **OLAP level** of each **pivot field** (section 2.2.5.4.3) associated with the same **pivot hierarchy** (section 2.2.5.4.5) is ascending. The zero-based ordinal of the OLAP level of a **pivot field** (section 2.2.5.4.3) is specified by the **isxtl** field of the **SXVDTEx record** (section 2.4.311).

For OLAP **PivotTables** (section 2.2.5), the **SXTH record** (section 2.4.308) specifies information about a **pivot hierarchy** (section 2.2.5.4.5), including which axis the **pivot hierarchy** (section 2.2.5.4.5) is on.

See the **Nesting** section for more information.

2.2.5.4.9.4 Nesting

This section applies to both the **row axis** (section 2.2.5.4.9.2) and **column axis** (section 2.2.5.4.9.3) unless otherwise specified. Within this section, axis means the **row axis** (section 2.2.5.4.9.2) or the **column axis** (section 2.2.5.4.9.3) as appropriate; fields means **pivot fields** (section 2.2.5.4.3), the **data field** (section 2.2.5.4.9.5.2), or both on the axis; area means the in **row area** (section 2.2.5.4.10.1.1) and **column area** (section 2.2.5.4.10.1.2) as appropriate; items means **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) as appropriate.

The axes specify an order that the fields are represented in the areas, see the PivotTable layout section for more information about the areas. **Pivot lines** (section 2.2.5.4.10.3) within the areas have references to items. Usually a **pivot line** (section 2.2.5.4.10.3) including an item of an outer field only includes items in the inner fields that exist with the item of the outer field in the **source data** (section

<u>2.2.5.3.2</u>), subject to the filtering on the PivotTable view. Usually all the instances of an item in the area are grouped together, with grouping on the outer fields taking precedence over grouping on the inner fields. This process is called **nesting**.

A nested item group is specified to be the contiguous set of **pivot lines** (section 2.2.5.4.10.3) that have the same item in an outer field.

The following example shows nested item groups for Country, State and City.

Country	State	City
USA	Illinois	Chicago
USA	Illinois	Springfield
USA	Louisiana	New Orleans
USA	Louisiana	Baton Rouge
Mexico	Jalisco	Guadalajara

The first two lines are a nested item group for Illinois. The next two lines are a nested item group for Louisiana. The first four lines are a nested item group for USA. The last line is both a nested item group for Jalisco and Mexico. Note that often in a **PivotTable report** (section 2.2.5) the repeated item labels will be omitted.

For an **OLAP PivotTable view** (section 2.2.5.4.2), nesting can be the result of either:

- Items in the inner field that are in a different pivot hierarchy (section 2.2.5.4.5), or,
- Items in an inner pivot field that is associated with the same **pivot hierarchy** (section 2.2.5.4.5) and that are child OLAP members.

2.2.5.4.9.4.1 Collapsing

Settings in the file format can specify that a **pivot item** (section 2.2.5.4.4) of an outer **pivot field** (section 2.2.5.4.3), rather than having inner nested **pivot items** (section 2.2.5.4.4) of inner **pivot fields** (section 2.2.5.4.3), is collapsed. Usually when a **pivot item** (section 2.2.5.4.4) on an outer **pivot field** (section 2.2.5.4.3) is collapsed, it does not have a nested **pivot item** (section 2.2.5.4.4) group and when it appears in a **pivot line** (section 2.2.5.4.10.3), the **pivot items** (section 2.2.5.4.4) of the inner **pivot fields** (section 2.2.5.4.3) for the collapsed **pivot item** (section 2.2.5.4.4) do not appear in the **pivot line** (section 2.2.5.4.10.3).

If Illinois and Mexico were collapsed in the preceding table, the result might look like the following table.

Country	State	City
USA	Illinois	
USA	Louisiana	New Orleans
USA	Louisiana	Baton Rouge
Mexico		

For a non-**OLAP PivotTable view** (section 2.2.5.4.2), the collapsed state is specified by the **fHideDetail** field of the **SXVI record** (section 2.4.312).

For an **OLAP PivotTable views**(section 2.2.5.4.2), there are two types of collapsing: child **collapsing** and **attribute hierarchy collapsing**.

Child **collapsing** is when the child **pivot items** (section 2.2.5.4.4), corresponding to child **OLAP members**, of a **pivot item** (section 2.2.5.4.4) corresponding to a parent OLAP member in an **OLAP hierarchy** are not shown.

If a **pivot field** (section 2.2.5.4.3) is the first **pivot field** (section 2.2.5.4.3) of the **pivot hierarchy** (section $\underline{2.2.5.4.5}$) on the axis then the **fDrilledLevel** field of the **SXVDTEx record** (section $\underline{2.4.311}$) **pivot field** (section 2.2.5.4.3) MUST be 1.

If a pivot field (section 2.2.5.4.3) is not the first pivot field (section 2.2.5.4.3) of the pivot hierarchy (section 2.2.5.4.5) on the axis and if the fDrilledLevel field of the SXVDTEx record (section 2.4.311) of the pivot field (section 2.2.5.4.3) is 1, then there is no child collapsing for the preceding pivot field (section 2.2.5.4.3) of the pivot hierarchy (section 2.2.5.4.5) on the axis and the fDrilledMember field of the SXVIFlags structure (section 2.5.263) for the pivot items (section 2.2.5.4.4) of the preceding pivot field (section 2.2.5.4.3) of the pivot hierarchy (section 2.2.5.4.5) on the axis MUST be 0. If a pivot field (section 2.2.5.4.3) is followed by another pivot field (section 2.2.5.4.3) of the same pivot hierarchy (section 2.2.5.4.5) on the axis, and the fDrilledLevel field of the SXVDTEx record (section 2.4.311) of the inner pivot field (section 2.2.5.4.3) is equal to 0 and the fDrilledMember field of the SXVIFlags structure (section 2.5.263) of the pivot item (section 2.2.5.4.4) associated with the SXVIFlags structure (section 2.5.263) is collapsed using child collapsing.

Attribute hierarchy **collapsing** only occurs when a **pivot field** (section 2.2.5.4.3) is associated with a **pivot hierarchy** (section 2.2.5.4.5) that is an attribute hierarchy and the **pivot field** (section 2.2.5.4.3) immediately following that outer **pivot field** (section 2.2.5.4.3) is associated with a different **pivot hierarchy** (section 2.2.5.4.5) that is an attribute hierarchy. In that case, if a **pivot item** (section 2.2.5.4.4) is attribute hierarchy collapsed, **pivot items** (section 2.2.5.4.4), corresponding to OLAP members, will not be shown for the inner **pivot field** (section 2.2.5.4.3). The attribute hierarchy collapsed state of a **pivot item** (section 2.2.5.4.4) is specified by the **fCollapsedMember** flag of the **SXVIFlags structure** (section 2.5.263). The **fItemsDrilledByDefault** flag of the **SXVDTEx record** (section 2.4.311) provides a default value for **pivot items** (section 2.2.5.4.4) in the **pivot field** (section 2.2.5.4.3).

For an **OLAP PivotTable view** (section 2.2.5.4.2), there can be **pivot items** (section 2.2.5.4.4) for an inner **pivot field** (section 2.2.5.4.3) on the **pivot line** (section 2.2.5.4.10.3) if either the outer **pivot field** (section 2.2.5.4.3) is collapsed and the inner **pivot field** (section 2.2.5.4.3) and outer **pivot field** (section 2.2.5.4.3) are in different **pivot hierarchies** (section 2.2.5.4.5) and attribute hierarchy **collapsing** is not being used or if the **pivot items** (section 2.2.5.4.4) are **member properties** (section 2.2.5.4.6).

2.2.5.4.9.4.2 Subtotalling

A nested item group, as specified in the <u>Nesting</u> section, can have summaries of the values for the items in the nested item group, called subtotals. A subtotal is typically an aggregation such as a sum, count or average of the values of the items.

The creation of subtotals is specified by the **fDefault**, **fSum**, **fCounta**, **fAverage**, **fMax**, **fMin**, **fProduct**, **fCount**, **fStdev**, **fStdevp**, **fVariance** and **fVariance** fields of the **Sxvd record** (section 2.4.309) of the **pivot field** (section 2.2.5.4.3). If none of the fields are equal to 1, then no subtotals exist for the **pivot field** (section 2.2.5.4.3). If the **fDefault** field is equal to 1 the subtotal calculation for each item is done according to the **aggregation functions** of the **data items** (section 2.2.5.4.9.5.1) on the **data axis** (section 2.2.5.4.9.5), as specified by the **iiftab** field of the **SXDI record** (section 2.4.278) for each **data item** (section 2.2.5.4.9.5.1).

For example, the subtotal is calculated as the sum of the relevant values of the nested item group for a **data item** (section 2.2.5.4.9.5.1) with a sum aggregation function and subtotal is calculated as the average of the relevant values of the nested item group for a **data item** (section 2.2.5.4.9.5.1) with an average aggregation function.

The other subtotal fields are called custom subtotals because they override the **data item** (section 2.2.5.4.9.5.1) aggregation function when calculating subtotals.

In some cases, such as for certain **OLAP PivotTable views** (section <u>2.2.5.4.2</u>), the **source data** (section <u>2.2.5.3.2</u>) is not able to provide a requested subtotal.

The **fOutline** field of the **SXVDEx record** (section 2.4.310) specifies that an extra **pivot line** (section 2.2.5.4.10.3) is added at the logical top of the nested item groups if the **pivot field** (section 2.2.5.4.3) is on the **row axis** (section 2.2.5.4.9.2). This **pivot line** (section 2.2.5.4.10.3) contains the item and any items of **member properties** (section 2.2.5.4.6) **pivot fields** (section 2.2.5.4.3), if they are shown, but no other items for inner **pivot fields** (section 2.2.5.4.3) of this **pivot field** (section 2.2.5.4.3).

The **fOutlineData** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) specifies that an extra **pivot line** (section 2.2.5.4.10.3) is added at the logical top of the nested item groups if the **data field** (section 2.2.5.4.9.5.2) is on the **row axis** (section 2.2.5.4.9.2). This **pivot line** (section 2.2.5.4.10.3) contains the **data item** (section 2.2.5.4.9.5.1), but no other items for inner **pivot fields** (section 2.2.5.4.3) of this **data field** (section 2.2.5.4.9.5.2).

If the **fDefault** field of the **Sxvd record** (section 2.4.309) of the **pivot field** (section 2.2.5.4.3) is equal to 1, the **fOutline** field of the **SXVDEx record** (section 2.4.310) of the **pivot field** (section 2.2.5.4.3) is equal to 1, the **pivot field** (section 2.2.5.4.3) is on the **row axis** (section 2.2.5.4.9.2), and the **data field** (section 2.2.5.4.9.5.2) is not placed inner of the **pivot field** (section 2.2.5.4.3) on the **row axis** (section 2.2.5.4.9.2), then the following is specified for the **fSubtotalAtTop** field of the **SXVDEx record** (section 2.4.310) of the **pivot field** (section 2.2.5.4.3):

Value of fSubtotalAtTop	Meaning
0x0	Specifies that subtotal pivot lines (section 2.2.5.4.10.3) are added at the bottom of the nested item groups. See the subName.stSubName field of the SXVDEx record (section 2.4.310) for details of the label used.
0x1	Specifies that the pivot lines (section 2.2.5.4.10.3) added as specified by the fOutline flag of the SXVDEx record (section 2.4.310) being equal to 1 are used for displaying the subtotals in the data area (section 2.2.5.4.10.1.4).

In the following figure, the Category, Subcategory, and Product columns represent **pivot fields** (section 2.2.5.4.3) on the **row axis** (section 2.2.5.4.9.2) and the Color column represents a **member properties** (section 2.2.5.4.6) **pivot field** (section 2.2.5.4.3) associated with the Product **pivot field** (section 2.2.5.4.3). Subtotals are displayed at the logical top of the nested item groups for Clothing, Caps, and Gloves.

Category Subcategory	Product	Color	Internet Sales Amount
□ Clothing			\$54,708.80
□ Caps			\$19,688.10
	AWC Logo Cap	Multi	\$19,688.10
■ Gloves			\$35,020.70
	Half-Finger Gloves, S	Black	\$11,951.12
	Half-Finger Gloves, M	Black	\$12,220.51
	Half-Finger Gloves, L	Black	\$10,849.07
Grand Total			\$54,708.80

Figure 14: PivotTable report with Category and Subcategory pivot fields with fOutline and fSubtotalAtTop fields of the SXVDEx record equal to 1

2.2.5.4.9.5 Data Axis

The **data axis** contains the **pivot field** (section 2.2.5.4.3) values that are used to populate the **data area** (section 2.2.5.4.10.1.4) of the **PivotTable report** (section 2.2.5) as specified by the <u>PivotTable Layout</u> section. The **data axis** also specifies additional information related to summarizing and presenting the values as specified by the <u>Data Items</u> section. The **data axis** is specified by the collection of **SXDI records** (section 2.4.278) that conform to the **PIVOTCORE rule** (section 2.1.7.20.5) as defined by the Worksheet Substream **ABNF**.

2.2.5.4.9.5.1 Data Items

A **data item** is a **pivot field** (section 2.2.5.4.3) placed on the **data axis** (section 2.2.5.4.9.5). Each **data item** is specified by an **SXDI record** (section 2.4.278).

The **isxvdData** field of the **SXDI record** (section 2.4.278) specifies a reference to the **pivot field** (section 2.2.5.4.3) that is associated with a **data item**. It also specifies additional information that is used to produce or present summarized values.

A **data item** can be referenced by a data item index, which is the zero-based index of an **SXDI record** (section 2.4.278) in the sequence of records that conforms to the **PIVOTCORE rule** (section 2.1.7.20.5) as defined by the Worksheet Substream **ABNF**.

2.2.5.4.9.5.2 Data Field

The **data field** is a conceptual field that represents all **data items** (section $\underline{2.2.5.4.9.5.1}$) and enables them to be referenced as a single object. The **data field** is intended to enable all **data items** (section 2.2.5.4.9.5.1) to be placed on the **row axis** (section $\underline{2.2.5.4.9.2}$) or **column axis** (section $\underline{2.2.5.4.9.3}$).

If the **PivotTable view** (section 2.2.5.4) has more than one **data item** (section 2.2.5.4.9.5.1), then the **data field** MUST be located on either the **row axis** (section 2.2.5.4.9.2) as specified by the **rgSxivd** field of the first **SxIvd record** (section 2.4.292), or the **column axis** (section 2.2.5.4.9.3) as specified by the **rgSxivd** field of the second **SxIvd record** (section 2.4.292).

2.2.5.4.10 PivotTable Layout

The **PivotTable report** (section 2.2.5) in the **sheet (2)** has four main areas: the **row area** (section 2.2.5.4.10.1.1), the **column area** (section 2.2.5.4.10.1.2), the **data area** (section 2.2.5.4.10.1.4), and the **page area** (section 2.2.5.4.10.1.3).

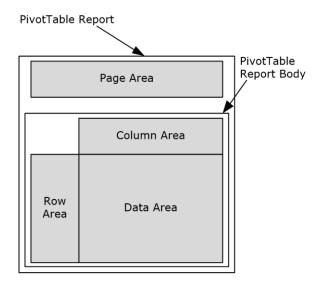

Figure 15: PivotTable report illustrating the four different areas

All the records described here MUST exist in the same worksheet substream (section 2.1.7.20.5).

2.2.5.4.10.1 Location and Body

The **column area** (section 2.2.5.4.10.1.2) is located immediately above the **data area** (section 2.2.5.4.10.1.4). The **cell** in the **column area** (section 2.2.5.4.10.1.2) containing the **pivot item** (section 2.2.5.4.4) **caption** or **data item** (section 2.2.5.4.9.5.1) caption to the farthest **logical left** is in the same column as the **logical top-left** cell of the **data area** (section 2.2.5.4.10.1.4).

The **row area** (section 2.2.5.4.10.1.1) is located immediately to the logical left of the **data area** (section 2.2.5.4.10.1.4). The cell in the **row area** (section 2.2.5.4.10.1.1) containing the top-most **pivot item** (section 2.2.5.4.4) caption or **data item** (section 2.2.5.4.9.5.1) caption is in the same row as the logical top-left cell of the **data area** (section 2.2.5.4.10.1.4).

The **PivotTable report** (section 2.2.5) body is the rectangular area defined by the union of the **row area** (section 2.2.5.4.10.1.1), **column area** (section 2.2.5.4.10.1.2), and **data area** (section 2.2.5.4.10.1.4).

The **page area** (section <u>2.2.5.4.10.1.3</u>), if it is not empty, is located above the **PivotTable report** (section 2.2.5) body. There is one row between the top-most cell of the **PivotTable report** (section 2.2.5) body and the bottom-most cell of the **page area** (section 2.2.5.4.10.1.3).

The **PivotTable report** (section 2.2.5) is a **non-contiguous range** containing the union of the **PivotTable report** (section 2.2.5) body and the **page area** (section 2.2.5.4.10.1.3).

An <u>SxView</u> record and the **SXEx record** (section <u>2.4.282</u>) specify details about the location of the **PivotTable report** (section 2.2.5) in the **sheet** and the sizes of the areas of the **PivotTable report** (section 2.2.5) as specified by the following. All fields are of the **SxView record** (section 2.4.313) unless otherwise specified.

The **column area** (section 2.2.5.4.10.1.2) of the **PivotTable report** (section 2.2.5) is specified to be the following range of cells:

Column Area	Row or Column Index	
Top row	ref.rwFirst	
Bottom row	rwFirstData - 1	
Logical left column	colFirstData	
Logical right column	ref.colLast	

If **colFirstData** is greater than **ref.colLast**, the **column area** (section 2.2.5.4.10.1.2) does not exist for this **PivotTable report** (section 2.2.5).

The **row area** (section 2.2.5.4.10.1.1) of the **PivotTable report** (section 2.2.5) is specified to be the following range of cells:

Row Area	Row or Column Index		
Top row	rwFirstData		
Bottom row	ref.rwLast		
Logical left column	ref.colFirst		

Row Area	Row or Column Index	
Logical right column	colFirstData - 1	

If **colFirstData** – 1 is less than **rfxGeom.colFirstData**, the **row area** (section 2.2.5.4.10.1.1) does not exist for this **PivotTable report** (section 2.2.5).

The **data area** (section 2.2.5.4.10.1.4) of the **PivotTable report** (section 2.2.5) is specified to be the following range of cells:

Data Area	Row or Column Index	
Top row	rwFirstData	
Bottom row	ref.rwLast	
Logical left column	colFirstData	
Logical right column	ref.colLast	

If the **row area** (section 2.2.5.4.10.1.1) or the **column area** (section 2.2.5.4.10.1.2) does not exist for this **PivotTable report** (section 2.2.5), the **data area** (section 2.2.5.4.10.1.4) does not exist for this **PivotTable report** (section 2.2.5).

The **page area** (section 2.2.5.4.10.1.3) of the **PivotTable report** (section 2.2.5) is specified to be the following range of cells. The **cRwPage** field and the **cColPage** field are of the **SXEx record** (section 2.4.282):

Page Area	Row or Column Index		
Top row	ref.rwFirst - cRwPage - 1		
Bottom row	ref.rwFirst - 2		
Logical left column	ref.colFirst		
Logical right column	ref.colFirst + cColPage - 1		

If the **cRwPage** field of the **SXEx record** (section 2.4.282) is equal to 0 and the **fNewDropZones** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is equal to 1 the **page area** (section 2.2.5.4.10.1.3) does not exist for this **PivotTable report** (section 2.2.5).

If the **cRwPage** field is equal to 0 and the **fNewDropZones** field is equal to 0, then the **page area** (section 2.2.5.4.10.1.3) of the **PivotTable report** (section 2.2.5) is specified to be the following **range** of cells:

Page Area	Row or Column Index		
Top row	ref.rwFirst - 2		
Bottom row	ref.rwFirst - 2		
Logical left column	ref.colFirst		

Page Area	Row or Column Index	
Logical right column	ref.colLast	

2.2.5.4.10.1.1 Row Area

The **row area** contains **pivot fields** (section 2.2.5.4.3), the optional **data field** (section 2.2.5.4.9.5.2), or both that are placed on the **row axis** (section 2.2.5.4.9.2), along with associated **pivot items** (section 2.2.5.4.4) and **data items** (section 2.2.5.4.9.5.1). The first row of the **row area** can contain **pivot field** (section 2.2.5.4.3) captions, **data field** (section 2.2.5.4.9.5.2) captions, or both as specified by the **fNoHeaders** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109). If the **fNoHeaders** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is equal to 0 or the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is not present, the **pivot field** (section 2.2.5.4.3) and **data field** (section 2.2.5.4.9.5.2) captions are located above their **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1).

Pivot items (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) of the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) that has a position of 0 on the **row axis** (section 2.2.5.4.9.2) are placed in the first column of the **row area**. For every other **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) on the **row axis** (section 2.2.5.4.9.2), placement of **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) are calculated as follows:

- If the previous **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) is not in **compact axis** mode, then **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) of the current **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) are placed in the next column of the **row area**. **Pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) are grouped by the parent **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1), which is the **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) on the immediate **logical left**. To achieve this, **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) of the parent **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) can be repeated multiple times. In this case, when **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) are repeated, the caption is not necessarily displayed in every **cell** that contains a **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1). For more details, see the **Pivot Lines** section.
- If the previous **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) is in compact axis mode, then the **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) of the current **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) are placed in the same column as **pivot items** (section 2.2.5.4.4) of the previous **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2). **Pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1) are grouped by the parent **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) and placed immediately under the parent **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1).

For the **data field** (section 2.2.5.4.9.5.2), if the **fCompactData** field and the **fOutlineData** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) are equal to 1, this specifies that the **data field** (section 2.2.5.4.9.5.2) is in compact axis mode. If the **SXAddl_SXCView_SXDVer12Info** (section 2.4.273.109) is not present, the **data field** (section 2.2.5.4.9.5.2) is not in compact axis mode.

For **pivot fields** (section 2.2.5.4.3), if the **fCompact** flag on the **SXAddl_SXCField12_SXDVer12Info record** (section <u>2.4.273.33</u>) is equal to 1 and **fOutline** field of the <u>SXVDEx</u> record is equal to 1, this specifies that the **pivot field** (section 2.2.5.4.3) is in compact axis mode. If the **SXAddl_SXCField12_SXDVer12Info record** (section 2.4.273.33) is not present, the **pivot field** (section 2.2.5.4.3) is not in compact axis mode.

The **row area** can have special entries at the end for **grand totals**. If there are no **pivot fields** (section 2.2.5.4.3) and no **data field** (section 2.2.5.4.9.5.2) on the **row axis** (section 2.2.5.4.9.2), then the **row area** is empty.

2.2.5.4.10.1.2 Column Area

The **column area** contains **pivot fields** (section 2.2.5.4.3), the optional **data field** (section 2.2.5.4.9.5.2), or both placed on the **column axis** (section 2.2.5.4.9.3), along with associated **pivot items** (section 2.2.5.4.4) or **data items** (section 2.2.5.4.9.5.1). The first row of the **column area** can contain **pivot field** (section 2.2.5.4.3) captions, **data field** (section 2.2.5.4.9.5.2) captions, or both as specified by the **fNoHeaders** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109).

If the **fNoHeaders** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is equal to 0, and no **pivot fields** (section 2.2.5.4.3) are in **compact axis** mode, and the **data field** (section 2.2.5.4.9.5.2) is not in compact axis mode, then the **pivot field** (section 2.2.5.4.3) and **data field** (section 2.2.5.4.9.5.2) captions are placed sequentially in **cells** of the first row of the **column area** according to their placement on the **column axis** (section 2.2.5.4.9.3).

If the **fNoHeaders** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is equal to 0, and any **pivot field** (section 2.2.5.4.3) is in compact axis mode or the **data field** (section 2.2.5.4.9.5.2) is in compact axis mode, the **pivot field** (section 2.2.5.4.3) and **data field** (section 2.2.5.4.9.5.2) captions are placed in the top **logical left** cell of the **column area**.

For the **data field** (section 2.2.5.4.9.5.2), if the **fCompactData** field and the **fOutlineData** field of the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) are equal to 1, this specifies that the **data field** (section 2.2.5.4.9.5.2) is in compact axis mode. If the **SXAddl_SXCView_SXDVer12Info record** (section 2.4.273.109) is not present, the **data field** (section 2.2.5.4.9.5.2) is not in compact axis mode.

For **pivot fields** (section 2.2.5.4.3), if the **fCompact** flag on the **SXAddl_SXCField12_SXDVer12Info record** (section 2.4.273.33) is equal to 1 and **fOutline** field of the <u>SXVDEx</u> record is equal to 1, this specifies that the **pivot field** (section 2.2.5.4.3) is in compact axis mode. If the **SXAddl_SXCField12_SXDVer12Info record** (section 2.4.273.33) is not present, the **pivot field** (section 2.2.5.4.3) is not in compact axis mode.

The second row in the **column area** contains **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) labels for the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) placed first on the **column axis** (section 2.2.5.4.9.3), and each subsequent row contains the **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) labels for **pivot fields** (section 2.2.5.4.3) or **data fields** (section 2.2.5.4.9.5.2) that occur later on the **column axis** (section 2.2.5.4.9.3). The row containing **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) labels for the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) at position n is row (n +1) of the **column area**.

If the **fNoHeaders** field is equal to 1, the **pivot field** (section 2.2.5.4.3) and **data field** (section 2.2.5.4.9.5.2) captions are not displayed. The row containing **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1) labels for the **pivot field** (section 2.2.5.4.3) or **data field** (section 2.2.5.4.9.5.2) at position n on the **column axis** (section 2.2.5.4.9.3) is row n of the **column area**.

The **column area** can have special entries at the end for **grand totals**.

2.2.5.4.10.1.3 Page Area

The **page area** contains **pivot fields** (section 2.2.5.4.3) that are placed on the **page axis** (section 2.2.5.4.9.1) for non-**OLAP PivotTable views** (section 2.2.5.4.2) and **pivot hierarchies** (section 2.2.5.4.5) that are placed on the **page axis** (section 2.2.5.4.9.1) for **OLAP PivotTable views** (section 2.2.5.4.2). For each **pivot field** (section 2.2.5.4.3) or **pivot hierarchy** (section 2.2.5.4.5) on the **page axis** (section 2.2.5.4.9.1), the page area contains a caption and information about the

current filtering associated with the **pivot field** (section 2.2.5.4.3) or **pivot hierarchy** (section 2.2.5.4.5) in the next **cell** at the **logical right**. The relative position of pairs of caption and filtering information is specified by the **SxView record** (section 2.4.313) and the **SXEx record** (section 2.4.282). For more details, see the <u>Location and Body</u> section.

2.2.5.4.10.1.4 Data Area

The **data area** contains summarized values for the **PivotTable view** (section 2.2.5.4). **Cells** in the **data area** contain summarized values for associated **data items** (section 2.2.5.4.9.5.1). The summarized value in a cell is restricted by all the **pivot items** (section 2.2.5.4.4) in the **column area** (section 2.2.5.4.10.1.2) that are located in the same column, by all the **pivot items** (section 2.2.5.4.4) in the **row area** (section 2.2.5.4.10.1.1) that are located in the same row, and by any page filter applied, as specified in the <u>Page Axis</u> section.

If the **row area** (section 2.2.5.4.10.1.1) has a **grand total**, then the value in that row is not restricted by **pivot items** (section 2.2.5.4.4) from the **row area** (section 2.2.5.4.10.1.1). If the **column area** (section 2.2.5.4.10.1.2) has a grand total, then the value in that column is not restricted by **pivot items** (section 2.2.5.4.4) from the **column area** (section 2.2.5.4.10.1.2). If the **PivotTable view** (section 2.2.5.4) has more than one **data item** (section 2.2.5.4.9.5.1), then the associated **data item** (section 2.2.5.4.9.5.1) is the one that is located in the same column in the **column area** (section 2.2.5.4.10.1.2) or the same row in the **row area** (section 2.2.5.4.10.1.1) as the cell with the summarized value.

If a **PivotTable view** (section 2.2.5.4) has zero **data items** (section 2.2.5.4.9.5.1) then the **data area** is empty.

2.2.5.4.10.2 Truncation

When a **PivotTable report** (section 2.2.5) does not fit within the boundaries of the **sheet (2)** it is truncated from the **logical right** and the bottom. It is truncated such that a part of the **PivotTable report** (section 2.2.5) is displayed within the sheet boundaries.

2.2.5.4.10.3 Pivot Lines

A **pivot line** specifies a collection of **pivot line entries** (section <u>2.2.5.4.10.4</u>) for a single row or column in the **PivotTable report** (section <u>2.2.5</u>).

A pivot line in the column area (section 2.2.5.4.10.1.2) is the range defined by the intersection of:

- A column.
- A set of cells in the column area (section 2.2.5.4.10.1.2). These are cells that contain pivot items (section 2.2.5.4.4), data items (section 2.2.5.4.9.5.1), blank cells, or a grand total.

A **pivot line** in the **row area** (section 2.2.5.4.10.1.1) is the range defined by the intersection of:

- A row.
- A set of cells in the **row area** (section 2.2.5.4.10.1.1). These are cells that contain **pivot items** (section 2.2.5.4.4), **data items** (section 2.2.5.4.9.5.1), blank cells, or a grand total.

A **pivot line** is specified by a sequence of records that conforms to the **PIVOTLI rule** (section 2.1.7.20.5). If either the **cRw** field or the **cCol** field of the associated **SxView record** (section 2.4.313) is greater than 0, then two **PIVOTLI rules** (section 2.1.7.20.5) MUST exist in the sequence of records that conforms to the **PIVOTCORE rule** (section 2.1.7.20.5), otherwise a **PIVOTLI rule** (section 2.1.7.20.5) MUST NOT exist in the **PIVOTCORE rule** (section 2.1.7.20.5).

If **PIVOTLI rules** (section 2.1.7.20.5) for a **PivotTable view** (section 2.2.5.4) exist, the first **PIVOTLI rule** (section 2.1.7.20.5) specifies the collection of **pivot lines** for the **row area** (section

2.2.5.4.10.1.1). The order of the **SXLIItem structures** (section 2.5.259) in the **rgsxli** field of the **SXLI record** (section 2.4.293) specifies the top to bottom order of the **pivot lines** of the **row area** (section 2.2.5.4.10.1.1).

If **PIVOTLI** rules (section 2.1.7.20.5) for a **PivotTable view** (section 2.2.5.4) exist, the second **PIVOTLI** rule (section 2.1.7.20.5) specifies the collection of **pivot lines** for the **column area** (section 2.2.5.4.10.1.2). The order of the **SXLIItem structures** (section 2.5.259) in the **rgsxli** field of the **SXLI** record (section 2.4.293) specifies the **logical left** to **logical right** order of the **pivot lines** of the **column area** (section 2.2.5.4.10.1.2).

Each individual **pivot line** is specified by an **SXLIItem structure** (section 2.5.259) in the **rgsxli** field of the associated **SXLI record** (section 2.4.293). Each **pivot line** contains a number of **pivot line entries** (section 2.2.5.4.10.4) are specified by the **rgisxvi** field of the **SXLIItem structure** (section 2.5.259).

The first **pivot line** in the **row area** (section 2.2.5.4.10.1.1) or the **column area** (section 2.2.5.4.10.1.2) MUST have a **cSic** field of its associated **SXLIItem structure** (section 2.5.259) equal to 0.

The following shows an example of a **PivotTable report** (section 2.2.5) and the pivot lines corresponding to each row in the **row area** (section 2.2.5.4.10.1.1).

Country	State	City .T	Sales	Pivot Line
■ Australia	■ Queensland	Brisbane	\$295,353.58	{Australia, Queensland, Brisbane}
		Hawthorne	\$226,706.44	{Australia, Queensland, Hawthorne}
	Queensland Total		\$522,060.02	{Australia, Queensland Total}
Australia Total			\$522,060.02	{Australia Total}
■ United States	□ California	San Francisco	\$68,659.12	{United States, California, San Francisco}
	California Total		\$68,659.12	{United States, California Total}
	■Washington	Seattle	\$75,164.86	{United States, Washington, Seattle}
		Tacoma	\$101,862.27	{United States, Washinton, Tacoma}
	Washington Total		\$177,027.13	{United States, Washington Total}
United States Total			\$245,686.26	{United States Total}
Grand Total			\$767,746.28	{Grand Total}

Figure 16: PivotTable and a table illustrating each pivot line

2.2.5.4.10.4 Pivot Line Entries

Pivot line entries specify references to the **pivot items** (section 2.2.5.4.4), **data items** (section 2.2.5.4.9.5.1), or blank items of a **pivot line** (section 2.2.5.4.10.3). **Pivot line entries** are specified by the records that conform to the **PIVOTLI rules** (section 2.1.7.20.5) in the **PIVOTCORE rule** (section 2.1.7.20.5). A **pivot line entry** is an element in the array specified by the **rgisxvi** field of the **SXLIItem structure** (section 2.5.259).

All **pivot line entries** that have an index less than the value specified by the **cSic** field of the **SXLIItem structure** (section 2.5.259) of a given **pivot line** (section 2.2.5.4.10.3) are identical to those of the **pivot line** (section 2.2.5.4.10.3).

For the purposes of the rest of this section, *n* specifies a position of the **pivot line entry** of a given **pivot line** (section 2.2.5.4.10.3).

If the value of n is less than the **cSic** field of the **SXLIItem structure** (section 2.5.259) of a given **pivot line** (section 2.2.5.4.10.3), then the **pivot line entry** at position n is identical to the corresponding **pivot line entry** of the **pivot line** (section 2.2.5.4.10.3) preceding the given **pivot line** (section 2.2.5.4.10.3).

If the value of n is greater than or equal to the **cSic** field of the **SXLIItem structure** (section 2.5.259) of a given **pivot line** (section 2.2.5.4.10.3), then the value of n is equal to the sum of the **cSic** field of the **SXLIItem structure** (section 2.5.259) and the current index in the **rgisxvi** field of the **SXLIItem structure** (section 2.5.259) of the given **pivot line** (section 2.2.5.4.10.3).

If a **pivot line entry** is in a **pivot line** (section 2.2.5.4.10.3) in the **row area** (section 2.2.5.4.10.1.1), each **pivot line entry** at a position *n* specifies a **pivot item** (section 2.2.5.4.4) index of a **pivot item** (section 2.2.5.4.4) in the *n*th **pivot field** (section 2.2.5.4.3) on the **row axis** (section 2.2.5.4.9.2) or specifies a **data item** (section 2.2.5.4.9.5.1) index, if the *n*th field of the **row axis** (section 2.2.5.4.9.2) is the **data field** (section 2.2.5.4.9.5.2).

If a **pivot line entry** is in a **pivot line** (section 2.2.5.4.10.3) in the **column area** (section 2.2.5.4.10.1.2), each pivot line entry at a position *n* specifies the **pivot item** (section 2.2.5.4.4) index of a **pivot item** (section 2.2.5.4.4) in the *n*th **pivot field** (section 2.2.5.4.3) on the **column axis** (section 2.2.5.4.9.3) or specifies a **data item** (section 2.2.5.4.9.5.1) index, if the *n*th field on the **column area** (section 2.2.5.4.10.1.2) is the **data field** (section 2.2.5.4.9.5.2).

If the *n*th **pivot field** (section 2.2.5.4.3) on the **row axis** (section 2.2.5.4.9.2) or **column axis** (section 2.2.5.4.9.3) is the **data field** (section 2.2.5.4.9.5.2), the **pivot line entry** is a **data items** (section 2.2.5.4.9.5.1) index, as specified by the Data Items section.

Pivot items (section 2.2.5.4.4) are specified sequentially from **logical left** to **logical right** for row **pivot lines** (section 2.2.5.4.10.3), and from top to bottom for column **pivot lines** (section 2.2.5.4.10.3).

A value of 0x7FFF is used to specify the absence of a **pivot item** (section 2.2.5.4.4) or **data item** (section 2.2.5.4.9.5.1).

2.2.5.4.11 PivotTable Rules

A **PivotTable rule** is used to specify **ranges** of **cells** in the **PivotTable report** (section 2.2.5). A **PivotTable rule** is specified by the sequence of records that conform to the **PIVOTRULE rule** (section 2.1.7.20.6) or by an **SxcSXRule class** (section 2.2.5.1.1.1.11). Each **PivotTable rule** has references to specific area of a **PivotTable report** (section 2.2.5), **pivot fields** (section 2.2.5.4.3), **pivot items** (section 2.2.5.4.4), **data items** (section 2.2.5.4.9.5.1), or **cache items** (section 2.2.5.3.6). These references are used to determine the ranges of cells in the **PivotTable report** (section 2.2.5). The various areas of the **PivotTable report** (section 2.2.5) specified in the **Location** and Body section and the **pivot lines** (section 2.2.5.4.10.3) can be used in this determination.

The **SxRule** (section <u>2.4.301</u>) or **SXAddl_SXCSXrule_SXDSXrule** (section <u>2.4.273.99</u>) records specify information for a **PivotTable rule**, including restrictions such as what areas of the **PivotTable report** (section 2.2.5) the **PivotTable rule** applies to. In the case of the **SxRule record** (section 2.4.301) the fCacheBased field specifies whether the **PivotTable rule** specifies **cache items** (section 2.2.5.3.6) instead of **pivot items** (section 2.2.5.4.4).

A **PivotTable rule** can have PivotTable rule filters. A PivotTable rule filter is specified by the sequence of records that conform to a **PRFILTER rule** (section 2.1.7.20.6) or an **SxcSXFilt class** (section 2.2.5.1.1.1.12). A PivotTable rule filter specifies a set of **pivot items** (section 2.2.5.4.4), **data items** (section 2.2.5.4.9.5.1), or **cache items** (section 2.2.5.3.6) for an individual **pivot field** (section 2.2.5.4.3), **data field** (section 2.2.5.4.9.5.2), or **cache field** (section 2.2.5.3.5).

Ranges of cells that are associated, in the **PivotTable report** (section 2.2.5), with any **pivot item** (section 2.2.5.4.4), **data item** (section 2.2.5.4.9.5.1), or **cache item** (section 2.2.5.3.6) from a PivotTable rule filter and that meet other restrictions as specified by the **SxFilt** (section 2.4.285) or **SXAddl_SXCSXfilt_SXDSXfilt** (section 2.4.273.77) record are associated with the PivotTable rule filter. Ranges of cells that are associated with every PivotTable rule filter of the PivotTable **rule** and that meet other restrictions of the **PivotTable rule** are the ranges of cells specified by the **PivotTable rule**.

A range of cells is associated with a particular **cache item** (section 2.2.5.3.6) if it is associated with the **pivot item** (section 2.2.5.4.4) that has an association with that **cache item** (section 2.2.5.3.6).

2.2.6 Styles

This overview describes how formatting and protection information for **cells** in a **sheet (1)** is specified.

Cell formatting is composed of several sets of properties:

- Font properties (bold, italic, font color, font size, etc...)
- Fill properties (foreground color, background color, pattern, gradient, etc...)
- Alignment properties (left, center, right alignment, etc...)
- Border properties (left, right, top, bottom, thick or thin, color, etc...)
- Number formatting properties (date, time, number of decimal places, etc...)
- Protection properties (locked, hidden, etc...)

These properties, as a whole, describe how a particular cell is displayed and printed.

There are two types of objects that contain formatting properties. They are **XFs** (section <u>2.2.6.1</u>) and **DXFs** (section <u>2.2.6.2</u>). In general, **XFs** (section 2.2.6.1) describe the formatting directly associated with a cell, and **DXFs** (section 2.2.6.2) describe additional formatting properties that can be applied to one or more cells.

2.2.6.1 XFs

XFs specify formatting for **cells** and **cell styles** (section 2.2.6.1.2). **XFs** are specified by records in the **XFS collection** (section 2.1.7.20.3). This collection contains **XF** (section 2.4.353) and **XFExt** (section 2.4.355) records, which specify formatting properties.

2.2.6.1.1 Cell XFs

A **cell XF** is specified by an **XF** record (section <u>2.4.353</u>) (and an optional **XFExt record** (section <u>2.4.355</u>)) where the **fStyle** field of the **XF** record (section 2.4.353) equals 0. Each **cell** MUST reference a **cell XF**. These records specify the complete set of formatting properties for the cells that reference them.

2.2.6.1.2 Cell Styles

Cell styles specify a set of formatting properties that can be associated with one or more **cells**. **Cell styles** provide two benefits:

- The set of formatting properties in a cell style can be applied to one or more cells in a single operation.
- After a cell style is applied to a cell, subsequent changes to the formatting properties in the cell style can be propagated to the cell automatically.

For example, if it is desired that multiple cells in a **sheet (1)** share a common set of formatting properties, like bold **font** with a blue **fill**, then **cell styles** make it convenient to apply this set of formatting, and potentially modify the set later.

Supporting information for a **cell style** is specified in a **Style** record (section 2.4.269) (and optional **StyleExt** record (section 2.4.270)). This information includes a **friendly name** for the **cell style** and an index to the **cell style XF** (section 2.2.6.1.2.1) that specifies the formatting for the **cell style**.

2.2.6.1.2.1 Cell Style XFs

A **cell style XF** is specified by an **XF** record (section 2.4.353) (and an optional **XFExt record** (section 2.4.355)) where the **fStyle** field of the **XF** record (section 2.4.353) equals 1. Each **cell** MUST reference a **cell XF** (section 2.2.6.1.1), and each **cell XF** (section 2.2.6.1.1) MUST reference a **cell style XF** with the **ixfParent** field.

2.2.6.1.2.2 Normal Style

At least one **cell style** (section 2.2.6.1.2) MUST be included in the **STYLES collection** (section 2.1.7.20.3) and this **cell style** (section 2.2.6.1.2) is called the **Normal style**. The **Normal style** MUST reference the first **XF** record (section 2.4.353) in the **XFS collection** (section 2.1.7.20.3), and this **XF** record (section 2.4.353) MUST be a **cell style XF** (section 2.2.6.1.2.1), where the **fStyle** field equals 1.

The **Normal style**, being the only required **cell style** (section 2.2.6.1.2), ensures that all **cells** have a **cell style** (section 2.2.6.1.2) to reference. The **Normal style** also provides a convenient object in which to store default cell formatting properties for an entire **workbook**, because all cells will typically reference the **Normal style** by default, until they are modified to reference a different **cell style** (section 2.2.6.1.2).

2.2.6.2 Differential Formatting (DXFs)

Like **XFs** (section <u>2.2.6.1</u>), **DXFs** define a set of formatting properties. Unlike **XFs** (section 2.2.6.1), **DXFs** can define any number of formatting properties, from just one to all of them.

DXFs provide a way for features to reference a set of formatting properties. How those properties are used depends on the feature. The subsections that follow describe each of these features and how they use **DXFs**.

DXFs can be specified in several different ways. The following records and structures specify a **DXF**:

- DXF (section <u>2.4.97</u>)
- DXFN (section <u>2.5.95</u>)
- DXFN12 (section <u>2.5.96</u>)
- DXFN12List (section <u>2.5.97</u>)
- DXFN12NoCB (section <u>2.5.98</u>)

DXF records (section 2.4.97) are saved into a collection as specified by <u>Globals Substream</u> **ABNF** and referenced with a **DXFId** (section 2.5.94).

The remaining structures are saved within containing records, such as **CF** (section 2.4.42) and **SxDXF** (section 2.4.280). **DXFN12** (section 2.5.96), **DXFN12List** (section 2.5.97), and **DXFN12NoCB** (section 2.5.98) are extensions of the **DXFN structure** (section 2.5.95).

2.2.6.2.1 Conditional Formatting

Some **conditional formatting** rules, as specified by the records in the **CONDFMT collection** (section <u>2.1.7.20.5</u>), reference a **DXF** (section <u>2.2.6.2</u>). That **DXF** (section 2.2.6.2) describes additional formatting applied to **cells** within the bounds of the rule, if the rule's condition is TRUE for those cells.

2.2.6.2.2 Table Style Elements

Table style elements, as specified by **TableStyleElement** (section <u>2.4.321</u>), can reference a **DXF** (section <u>2.2.6.2</u>). That **DXF** (section 2.2.6.2) describes additional formatting applied to **cells** within the bounds of the **table style element**.

2.2.6.2.3 Table Block-Level Formatting

Table block-level formatting, as specified by **List12BlockLevel** (section 2.5.174), can reference one or more **DXFs** (section 2.2.6.2). These **DXFs** (section 2.2.6.2) represent formatting that can be applied to the **cells** within the appropriate regions of the **table**.

2.2.6.2.4 PivotTable Areas

A **PivotTable format** (section 2.2.5), as specified by an **SxFormat** record (section 2.4.287), can specify a **DXF** (section 2.2.6.2). This **DXF** (section 2.2.6.2) represents formatting that can be applied to the **cells** within the appropriate area of the **PivotTable view** (section 2.2.5.4).

2.2.6.2.5 Sorting and Filtering

Sorting, as specified by **SortCond12** (section 2.5.242), and filtering, as specified by **AutoFilter12** (section 2.4.7), can include formatting properties as part of their criteria. These properties are stored as **DXFs** (section 2.2.6.2). For example, a **filter** criteria that is "filter only **cells** with red **font** color" will reference a **DXF** (section 2.2.6.2) with the property "font color = red".

2.2.6.3 Table Styles

Table styles specify additional formatting for **cells** inside **tables** or **PivotTable views** (section 2.2.5.4).

Tables can specify an applied **table style** with the **List12TableStyleClientInfo** record (section 2.5.176). **PivotTable views** (section 2.2.5.4) specify an applied **table style** with the **SXAddI_SXCView_SXDTableStyleClient** record (section 2.4.273.107). These two records reference a **table style** by name with the **stListStyleName** and **stName** fields, respectively.

Table styles are either built-in or custom. Built-in **table styles** are specified in [ECMA-376] part 4, 3.8.40. Custom **table styles** used in a **workbook** are specified in the collection of records beginning with **TableStyles** (section 2.4.322).

A **table style** consists of a collection of **table style elements** (section $\underline{2.2.6.2.2}$). For custom **table styles**, these elements are specified by the collection of **TableStyleElement** records (section $\underline{2.4.321}$) following the **TableStyle** record (section $\underline{2.4.320}$).

Each **table style element** (section 2.2.6.2.2) specifies the formatting to be applied to cells in a particular region of the table or **PivotTable view** (section 2.2.5.4). These regions are specified by the possible values of the **tseType** field of the **TableStyleElement** record (section 2.4.321).

2.2.6.4 Format Conflicts

As described previously, the formatting to be displayed or printed for a particular **cell** can be specified in several independent records. It is up to the application to resolve conflicting formatting properties for a particular cell.

As an example, say a cell has a **conditional format** (section 2.2.6.2.1) applied and also falls within the bounds of a **table** with a **table style** (section 2.2.6.3). Furthermore, say the **cell XF** (section 2.2.6.1.1), **conditional format** (section 2.2.6.2.1) and **table style element** (section 2.2.6.2.2) all specify a different **font** color. It is up to the application to decide the appropriate font color to use in this situation.

2.2.7 External References

The **external references** infrastructure exists to support **formulas** (section <u>2.2.2</u>) which reference **data sources** outside the scope of the **sheet** (1) on which the **formula** (section 2.2.2) resides. These sources could be other sheets (1) in the same **workbook**, data in another workbook, **DDE** links or **Object Linking and Embedding (OLE)** links. A workbook that uses **external references** contains a collection of **XTI records** (section <u>2.5.344</u>) that in turn reference **SupBook records** (section <u>2.4.271</u>) that specify the source of the data.

2.2.7.1 External Reference Consumers

Within the formula, only certain **formula elements** (section 2.2.2.6) can contain external references. These specific **formula elements** (section 2.2.2.6) contain an **XtiIndex structure** (section 2.5.198.119) specifying an **XTI** (section 2.5.344), which in turn specifies the location and type of the external reference data. Only the following **Ptg structures** (section 2.5.198.25) can be **external reference consumers:**

- **PtgRef3d** (section <u>2.5.198.85</u>)
- PtgRefErr3d (section <u>2.5.198.87</u>)
- PtgArea3d (section 2.5.198.28)
- PtgAreaErr3d (section 2.5.198.30)
- PtgNameX (section 2.5.198.77)

2.2.7.2 Supporting Link

Each **formula element** (section 2.2.2.6) which references external data refers to a **XTI** (section 2.5.344). The **XTI** (section 2.5.344) references a **SupBook record** (section 2.4.271) that specifies the type of **supporting link** and, in certain cases, specifies additional data about the **supporting link**.

There are several types of **supporting links**. The type of the **supporting link** used is specified by the **cch** and **virtPath** fields of the **SupBook record** (section 2.4.271). **Supporting link** types are specified in the following table:

Supporting Link Type	Meaning
Self-Referencing	A reference to the current workbook .
	This supporting link type supports cross- sheet (1) references, where the target sheets (1) are specified by the XTI (section 2.5.344). This record also supports defined name or User Defined Function (UDF) references on the same book.
Same-Sheet Referencing	A reference to the active sheet in the context of the consuming formula (section 2.2.2).
	This supporting link type is used by formulas in macro sheets and in defined names to reference the sheet (1) of the caller.
Add-in Referencing	A reference to a UDF on any Excel Linked Library (XLL) or COM add-in.
External Workbook Referencing	A reference to an External Workbook (section <u>2.2.7.3</u>).
DDE Data Source Referencing	A reference to a DDE Data Source (section <u>2.2.7.6</u>).
OLE Data Source Referencing	A reference to an OLE Data Source (section <u>2.2.7.8</u>).
Unused	An unused supporting link . A reference to this type of supporting link can be specified by an XTI (section 2.5.344), but that XTI (section 2.5.344) MUST NOT be

Supporting Link Type	Meaning
	used by any external reference consumer (section <u>2.2.7.1</u>).

2.2.7.3 External Workbook

An external workbook link is a reference to a **workbook** other than the one in which the source **formula** (section 2.2.2) resides. It contains the referencing **expression**, and data relating to that expression. This data includes the workbook location, **sheet (1)** names, **external defined names** (section 2.2.7.4), and an **external cell cache** (section 2.2.7.5) for referenced cells in that workbook.

2.2.7.4 External Defined Name

An external defined name is a reference to a **defined name** in an **external workbook** (section 2.2.7.3). The records specifying the external defined name will provide the name, scope, and **formula** (section 2.2.2) of the defined name on that **workbook**. The restrictions on the types of **formulas** (section 2.2.2) supported in **external defined names** are described in **ExtNameParsedFormula** (section 2.5.198.10).

2.2.7.5 External Cell Cache

To allow external cell references to be calculated without opening the referenced **workbook**, an **external** cell **cache** is stored in the file which contains cached values for cells in a **sheet (1)** in an **external workbook** (section 2.2.7.3). The **external** cell **cache** contains **cell** values of the specific cells that are referenced in that sheet (1). The beginning of an **external** cell **cache** is specified by the **XCT** record (section 2.4.352).

The **external** cell **cache** is composed of a collection of sequences of cells that correspond to cells in the source sheet (1). Each cell sequence is specified by a **CRN** record (section 2.4.65).

2.2.7.6 DDE Data Source

A **DDE data source** specifies information about the **DDE server** and **DDE topic** name of a **Dynamic Data Exchange (DDE)** connection. A **DDE data source** is specified by the **SupBook record** (section 2.4.271).

2.2.7.7 DDE Data Item

A **DDE data** item specifies the name and properties of a **DDE** item. It also contains cached values from the most recent DDE data update. A **DDE data** item is specified by the **ExternName** record (section 2.4.105).

2.2.7.8 OLE Data Source

An **OLE data source** specifies information about an **OLE2** data connection. It specifies the path to the OLE2 **data source** file and the **ProgID** of the application handler. An **OLE data source** is specified by the **SupBook record** (section <u>2.4.271</u>).

2.2.7.9 OLE Data Item

An **OLE data** item specifies the name and properties of a connection to an **OLE2** data object. Unlike **DDE Data Sources** (section 2.2.7.6), **OLE Data Sources** (section 2.2.7.8) do not store cached data returned by OLE2 data objects. An **OLE data** item is specified by the **ExternName** record (section 2.4.105).

2.2.8 External Connections

A workbook often pulls in data from external data sources, such as a database or an OLAP cube. An external connection represents a link between a workbook and a particular external data source. It contains properties about the way that the application establishes the connection to the data source and retrieves the data, such as the type of data provider (OLE DB, ODBC, and so on), a server name, security information, and a command to execute on the server. In addition, the external connection contains details about the way the connection is used in the workbook, such as how often to refresh the data.

A data connection object contains **external connection** information for an external data source that a workbook uses. Data connection objects are independent of the constructs in the workbook that display data, such as **tables** or **PivotTables** (section 2.2.5).

A connection definition can be established in an **external connection** file for easier sharing and reuse, but this overview describes the representation for external data connections that are directly embedded within a workbook file. This embedded representation is required whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

An **external** connection is specified by a combination of the records defined in **DBQUERY_WORKBOOK** (section 2.1.7.20.3), **DBQUERY_WORKSHEET** (section 2.1.7.20.5), **DBQUERYEXT** (section 2.1.7.20.5) and **SXADDLDBQUERY** (section 2.1.7.20.6), and the **DConn** record (section 2.4.84).

If an **external** connection is not used by any workbook object, it is represented only by a **DConn** record (section 2.4.84) and the **fStandAlone** field of the **DConn** record (section 2.4.84) is set to 1.

2.2.8.1 Connection Name

Each external connection has a unique name, which can be used by the application as a user-friendly name for the connection, for example, for UI purposes. The **c**onnection **name** is specified by the **rgchConnectionName** field of the **DConn** record (section 2.4.84).

2.2.8.2 External Connection Files

An **external connection** file specifies an external connection in a separate file (external to the **workbook**). An **external connection** file enables managing connection information separately from a specific workbook and sharing it among multiple workbooks. It is used for creating a new data connection in a workbook or for restoring a lost connection. The **stSourceConnectionFile** field of the **SXAddl_SXCQuery_SXDSrcConnFile record** (section <u>2.4.273.65</u>) and the **rgchSourceConnectionFile** field of the **DConn** record (section <u>2.4.84</u>) specify a path to an external connection file.

2.2.8.3 OLE DB Connections

An **OLE DB connection** is a connection to an **OLE DB data provider**. An external connection is an **OLE DB connection** if the **dbt** field of the **DbQuery** record (section 2.4.80) is 0x5, the **dbt** field of the **DbQueryExt** record (section 2.4.81) is **DBT_OLEDB** (section 2.5.64), and the **dbt** field of the **DConn** record (section 2.4.84) is **DBT_OLEDB** (section 2.5.64). For more information about OLE DB, see [MSDN-OLEDBP-OI].

2.2.8.3.1 OLAP Connections

An **OLAP connection** is a connection to an **OLE DB** for **OLAP data provider**. An OLE DB connection is an **OLAP connection** if the **dbost** field of the **ConnGrbitDbtOledb** structure (section 2.5.59) is 0x1.

2.2.8.4 ODBC Connections

An **ODBC connection** is a connection to an **ODBC data provider**. An external connection is an **ODBC connection** if the **dbt** field of the **DbQuery** record (section 2.4.80) is 0x1, the **dbt** field of the **DBQueryExt** record (section 2.4.81) is **DBT_ODBC** (section 2.5.64), and the **dbt** field of the **DConn** record (section 2.4.84) is **DBT_ODBC** (section 2.5.64). For more information about ODBC, see [MSFT-ODBCODCO].

2.2.8.5 Web Connections

A **Web connection** pulls the content of a Web page, or part of a Web page (an **HTML** table), into the **workbook**. An external connection is a **Web** connection if the **dbt** field of the **DbQuery** record (section 2.4.80) is 0x4, the **dbt** field of the **DBQueryExt** record (section 2.4.81) is **DBT_WEB** (section 2.5.64), and the **dbt** field of the **DConn** record (section 2.4.84) is **DBT_WEB** (section 2.5.64).

2.2.8.6 Text Import Connections

A **text import connection** pulls in data from a structured text file into the **workbook**. An external connection is a **text import connection** if the **dbt** field of the **DbQuery** record (section $\underline{2.4.80}$) is 0x6, the **dbt** field of the **DbQueryExt** record (section $\underline{2.4.81}$) is **DBT_TXT** (section $\underline{2.5.64}$), and the **dbt** field of the **DConn** record (section $\underline{2.4.84}$) is **DBT_TXT** (section 2.5.64).

2.2.8.7 ADO Recordset Connections

An **ADO** recordset pulls in data from a set of records in an ADO **data provider**. An external connection is an **ADO** recordset connection if the **dbt** field of the **DbQuery** record (section 2.4.80) is 0x7, the **dbt** field of the **DbQueryExt** record (section 2.4.81) is **DBT_ADO** (section 2.5.64), and the **dbt** field of the **DConn** record (section 2.4.84) is **DBT_ADO** (section 2.5.64).

Note: For this type of connection, the file format does not contain sufficient information for establishing the connection and fetching a recordset. Data is provided to the application through another mechanism, for example by script code using an **object model**.

2.2.8.8 DAO Recordset Connections

A DAO recordset pulls in data from a set of records in a DAO **data provider**. An external connection is a **DAO recordset connection** if the **dbt** field of the **DbQuery** record (section $\underline{2.4.80}$) is 0x2, the **dbt** field of the **DbQueryExt** record (section $\underline{2.4.81}$) is **DBT_DAO** (section $\underline{2.5.64}$), and the **dbt** field of the **DConn** record (section $\underline{2.4.84}$) is **DBT_DAO** (section 2.5.64).

Note: For this type of connection, the file format does not contain sufficient information for establishing the connection and fetching a recordset. Data is provided to the application through another mechanism, for example by script code using an **object model**.

2.2.9 Password Verifier Algorithm

Several records (Password (section 2.4.191), FileSharing (section 2.4.118), Prot4RevPass (section 2.4.206), FeatProtection (section 2.5.124), and FilePass (section 2.4.117)) use a password verifier to provide a locking and unlocking system for viewing or editing parts of the workbook. This password verifier is used to prevent accidental editing, and is not designed to be used as a security feature. The verifier value is calculated in two stages. First, the provided Unicode password string is converted to a new character string in the American National Standards Institute (ANSI) character set code page of the current system using the algorithm specified in the revisionsPassword attribute in [ECMA-376] part 4, 3.2.29. Second, this string is input into the XOR

obfuscation algorithm specified in [MS-OFFCRYPTO], 2.3.7.1, Binary Document Password Verifier Derivation Method 1 to produce a 16-bit password verifier value.

See the <u>Security Considerations</u> section for information about security concerns related to the use of this algorithm for password verification in this file format.<19>

2.2.10 Encryption (Password to Open)

Workbook files can contain sensitive information that needs to be protected. A file can be protected by **encrypting** it using a password <20>. Once a file is **encrypted**, the data can only be accessed by decrypting the file using the same password.

If a file in this format is saved with **encryption** it MUST be saved with **XOR obfuscation** <21> as specified in [MS-OFFCRYPTO] section 2.3.7, or RC4 **encryption** as specified in [MS-OFFCRYPTO] section 2.3.6, or one of a number of RC4 CryptoAPI **encryption** <22> algorithms as specified in [MS-OFFCRYPTO] section 2.3.5. The specific obfuscation or **encryption** method being used, and the associated obfuscation or **encryption** information, is specified in the **FilePass** record (section 2.4.117).

If RC4 CryptoAPI **encryption** is used, certain storages and **streams** are stored in the **Encryption Stream** (section 2.1.7.6) as specified in [MS-OFFCRYPTO] section 2.3.5.3. See the following table for details.

Storage/Stream	XOR obfuscation or RC4 encryption	RC4 CryptoAPI encryption
Component Object Stream (section 2.1.7.1)	Not encrypted	Not encrypted.
Control Stream (section 2.1.7.2)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6).
Data Spaces Storage (section 2.1.7.3)	Not encrypted	Not encrypted.
Document Summary Information Stream (section 2.1.7.4)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6) if and only if flag is set **
Embedding Storage (section 2.1.7.5)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6).
Link Storage (section 2.1.7.7)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6).
List Data Stream (section 2.1.7.8)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6).
Office Data Store Storage (section 2.1.7.9)	Not encrypted	Not encrypted.
Office Toolbars Stream (section 2.1.7.10)	Not encrypted	Not encrypted.
OLE Stream (section <u>2.1.7.11</u>)	Not encrypted	Not encrypted.
Pivot Cache Storage (section 2.1.7.12)*	Encrypted	Encrypted.

Summary Information Stream (section 2.1.7.16)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6) if and only if flag is set **

Storage/Stream	XOR obfuscation or RC4 encryption	RC4 CryptoAPI encryption
User Names Stream (section 2.1.7.17)*	Not encrypted	Not encrypted.
VBA Storage (section 2.1.7.18)	Not encrypted	Not encrypted.
Viewer Content Stream (section 2.1.7.19)	Not encrypted	Not encrypted
Workbook Stream (section 2.1.7.20)*	Encrypted	Encrypted.
XML Signatures Storage (section 2.1.7.21)	Not encrypted	Not encrypted.
XML Stream (section 2.1.7.22)	Not encrypted	Encrypted in encryption stream (section 2.1.7.6)

^{*} The indicated items specify either streams that contain **BIFF** records as specified in **Record** (section 2.1.4) or storages that contain streams that contain BIFF records as specified in **Record** (section 2.1.4). When obfuscating or **encrypting** BIFF records in these streams the record type and record size components MUST NOT be obfuscated or encrypted. In addition the following records MUST NOT be obfuscated or **encrypted**: **BOF** (section 2.4.21), **FilePass** (section 2.4.117), **UsrExcl** (section 2.4.339), **FileLock** (section 2.4.116), **InterfaceHdr** (section 2.4.146), **RRDInfo** (section 2.4.227), and **RRDHead** (section 2.4.226). Additionally, the **IbPlyPos** field of the **BoundSheet8 record** (section 2.4.28) MUST NOT be **encrypted**.

For XOR obfuscation, the obfuscation key is generated as specified in the <u>Password Verifier Algorithm</u> section. The algorithm for XOR obfuscation is specified in [MS-OFFCRYPTO] section 2.3.7. The **Unicode** password string is converted to a new character string in the ANSI code page of the current system using the algorithm specified in the **revisionsPassword** attribute in [ECMA-376] part 4, 3.2.29. The new string is then provided as input into the XOR obfuscation array initialization as specified in [MS-OFFCRYPTO] section 2.3.7.2. The initialized array is then used by the algorithm specified in [MS-OFFCRYPTO] section 2.3.7.3 to obfuscate the file data.

For RC4 **encryption** and RC4 CryptoAPI **encryption**, the Unicode password string is used to generate the **encryption** key as specified in [MS-OFFCRYPTO] section 2.3.6.2 or [MS-OFFCRYPTO] section 2.3.5.2 depending on the RC4 algorithm used. The record data is then **encrypted** by the specific RC4 algorithm in 1024-byte blocks. The block number is set to zero at the beginning of every BIFF record stream, and incremented by one at each 1024-byte boundary. Bytes to be encrypted are passed into the RC4 **encryption** function and then written to the stream. For unencrypted records and the record headers consisting of the record type and record size, a byte buffer of all zeros, of the same size as the section of unencrypted bytes, is passed into the RC4 **encryption** function. The results are then ignored and the unencrypted bytes are written to the stream.

See the <u>Security Considerations</u> section for information about security concerns relating to file **encryption** for this file format.

2.2.11 Shared Workbooks

The **shared workbook** infrastructure is used to enable multiple users to make changes to a **workbook** at the same time as well as track changes that certain users make. A **shared workbook** contains a collection of users that currently have the document open and a set of **revision logs** (section 2.2.11.2) that contain the changes that users have made to the workbook. Each of these logs has a corresponding revision header associated with it and contains either a set of **revision records** (section 2.2.11.3) that have been made to the **shared workbook** because it has been shared or no

^{**} The indicated streams for the indicated **encryption** method MUST be **encrypted** if and only if the 0x08 bit of **EncryptionHeader.flags** is equal to 0. **EncryptionHeader.flags** is specified in [MS-OFFCRYPTO] section 2.3.5.1.

revision records (section 2.2.11.3). A workbook is a **shared workbook** if and only if the **user names stream** (section 2.1.7.17) exists.

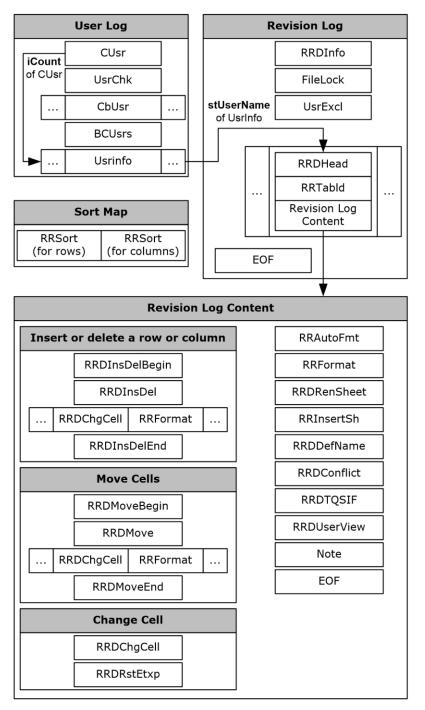

Figure 17: Structure of shared workbooks

The following sections define terms used in this diagram.

2.2.11.1 User Log

The **user log** contains the set of users who currently have the **workbook** open. The **iCount** field of **CUsr** (section <u>2.4.72</u>) specifies the number of **UsrInfo records** (section <u>2.4.340</u>) that this section contains. Each **UsrInfo** record (section 2.4.340) corresponds to a user that currently has the workbook open. The **guid** field of the **UsrInfo maps** (section 2.4.340) to the **guid** field of **RRDHead** (section <u>2.4.226</u>) that specifies which **revision log** (section <u>2.2.11.2</u>) the user is currently synchronized to.

2.2.11.2 Revision Logs

The revision **logs** section contains a set of revision **logs**. Each revision **log** contains various **revision records** (section 2.2.11.3) that a single user has made to a **shared workbook** (section 2.2.11) or a user action. Each revision **log** has a revision header (**RRDHead** (section 2.4.226)) and a tab identifier map (**RRTabId** (section 2.4.241)) that describes general information. The **stUserName** field of **RRDHead** (section 2.4.226)is the name of the user who made changes or performed an action for that particular log. If the revision **log** is meant to describe user changes (and not a user action), it will also contain other revision **log** content that will describe all the changes made by that user. This **revision log stream ABNF** also contains general information about the **shared workbook** (section 2.2.11) in **RRDInfo** (section 2.4.227), **FileLock** (section 2.4.116), and **UsrExcl** (section 2.4.339).

2.2.11.3 Revision Records

A **revision record** describes changes, or revisions, that a single user has made to a **shared workbook** (section <u>2.2.11</u>). The following changes can be recorded by the **shared workbook** (section 2.2.11):

- Inserting or deleting a row or column (RRDInsDel (section 2.4.228))
- Moving a cell (RRDMove (section 2.4.231))
- Changing a cell (RRDChgCell (section 2.4.223))
- Adding or removing a custom view (RRDUserView (section 2.4.237))
- Renaming an existing sheet (1) (RRDRenSheet (section <u>2.4.234</u>))
- Inserting a new sheet (1) (RRInsertSh (section 2.4.239))
- Changing a defined name (RRDDefName ()section 2.4.225)
- Changing a comment (Note (section <u>2.4.179</u>))
- Conflict resolution from previous conflicting changes (RRDConflict (section 2.4.224))
- Removing a query table (RRDTQSIF (section <u>2.4.236</u>))
- Changing the format (RRFormat (section <u>2.4.238</u>))
- Changing the AutoFormat information for a table (RRAutoFmt (section <u>2.4.222</u>))

2.2.11.4 Insertion / Deletion of Rows / Columns Revision

This revision corresponds to an insertion or deletion of a row or column. In between **RRDInsDel** (section 2.4.228) and **RRDInsDelEnd** (section 2.4.230), any number of **RRFormat** (section 2.4.238) and **RRDChgCell records** (section 2.4.223) can appear as well as the other records associated with **RRDChgCell** (section 2.4.223) (**RRDRstEtxp** (section 2.4.235)). These records describe the **cell** and format changes as a result of inserting or deleting the row or column.

2.2.11.5 Move Cells Revision

This revision corresponds to moving a **range** of **cells**. In between **RRDMove** (section <u>2.4.231</u>) and **RRDMoveEnd** (section <u>2.4.233</u>), any number of **RRFormat** (section <u>2.4.238</u>) and **RRDChgCell records** (section <u>2.4.223</u>) can appear as well as the other records associated with **RRDChgCell** (section 2.4.223) (**RRDRstEtxp** (section <u>2.4.235</u>)). These records describe the cell and format changes as a result of moving a range of cells.

2.2.11.6 Change Cells Revision

This revision (**RRDChgCell** (section <u>2.4.223</u>)) corresponds to a change or edit of a **cell**. It can be followed by any number of **RRDRstEtxp records** (section <u>2.4.235</u>). These specify **font** information for the **formatting run** as specified in **RRDChgCell** (section 2.4.223).

2.2.11.7 Sort Map

The **Sort Map** contains changes to sorting done on the **sheet (1)** level in a **shared workbook** (section 2.2.11). Each sheet (1) can have a **Sort Map**. The **Sort Map** is made of up to two sorts (**RRSort** (section 2.4.240)). One specifies sheet (1) level sort changes in rows followed by sheet (1) level sort changes in columns. If there are no changes in sort for rows or columns, the sort map does not exist for rows or columns respectively.

2.2.12 Shared Feature

A **shared feature** is a mechanism that enables different application features to share a common set of record types. For an enumeration of the types of **shared features**, see **SharedFeatureType** (section <u>2.5.237</u>). For each type of **shared feature** the required records vary. All **shared features** use the following:

- Common information stored in a FeatHdr (section 2.4.112) or FeatHdr11 (section 2.4.113) record. There MUST be one FeatHdr (section 2.4.112) or FeatHdr11 (section 2.4.113) record for each type of shared feature used in one of the Workbook substreams (section 2.1.7.20).
- Instance specific feature data stored in a Feat (section 2.4.111), Feature11 (section 2.4.114), or Feature12 (section 2.4.115) record. There MUST be one or more Feat (section 2.4.111), Feature11 (section 2.4.114), or Feature12 (section 2.4.115) records for each instance of a shared feature.

Some **shared features** require other feature-specific records. See **FEAT** (section <u>2.1.7.20.6</u>) and **FEAT11** (section 2.1.7.20.6) records for additional records used for **shared features**.

2.3 Record Enumeration

This section specifies the record name associated with a given record type value. For more information about record types, see the section on **Records** (section 2.1.4).

These associations between record name and record type are listed by record name as well as by record type.

The type-specific meaning and fields for each record type are specified in the subsection of the **Records section** (section 2.4) corresponding to the record name.

2.3.1 By Name

Name	Record type (number)

2.4 Records

2.4.1 AlRuns

The **AlRuns** record specifies Rich Text Formatting within **chart titles** (section <u>2.2.3.3</u>), **trendline** (section <u>2.2.3.12</u>), and **data labels** (section <u>2.2.3.11</u>).

cRuns (2 bytes): An unsigned integer that specifies the number of Rich Text Format runs. MUST be greater than or equal to 3 and less than or equal to 256.

rgRuns (variable): An array of **FormatRun structures** (section 2.5.132) that specifies the Rich Text Format runs. The number of elements in the array MUST be equal to **cRuns**.

2.4.2 Area

The **Area** record specifies that the **chart group** (section 2.2.3.7) is an area **chart group** (section 2.2.3.7) and specifies the **chart group** (section 2.2.3.7) attributes.

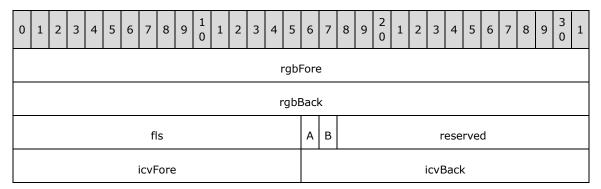

A - fStacked (1 bit): A bit that specifies whether the data points (section 2.2.3.10) in the chart group (section 2.2.3.7) that share the same category (2) are stacked.

- **B f100 (1 bit):** A bit that specifies whether the **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) are displayed as a percentage of the sum of all **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) that share the same category (2). MUST be 0 if **fStacked** is 0.
- **C fHasShadow (1 bit):** A bit that specifies whether one or more **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) has shadows.

reserved (13 bits): MUST be zero, and MUST be ignored.

2.4.3 AreaFormat

The **AreaFormat** record specifies the patterns and colors used in a filled region of a **chart** (section 2.2.3.3). If this record is not present in the sequence of records that conforms to the **SS rule** (section 2.1.7.20.1) of the Chart Sheet Substream **ABNF**, the patterns and colors used are specified by the default values of the fields of this record.

- **rgbFore (4 bytes):** A **LongRGB structure** (section <u>2.5.177</u>) that specifies the **foreground color** of the **fill pattern**.<a href="mailto: The default value of this field is automatically selected from the next available color in the **chart** (section 2.2.3.3) color table.
- **rgbBack (4 bytes):** A **LongRGB structure** (section 2.5.177) that specifies the **background color** of the fill pattern.<a href="mailto: The default value of this field is 0xFFFFFF.
- fls (2 bytes): An unsigned integer that specifies the type of fill pattern. If fls is neither 0x0000 nor 0x0001, this record MUST be immediately followed by a corresponding GelFrame record (section 2.4.131) that specifies the fill pattern. The fillType as specified in [MS-ODRAW] section 2.3.7.1 of the OPT1 field of the corresponding GelFrame record (section 2.4.131) MUST be msofillPattern as specified in [MS-ODRAW] section 2.4.11. The default value of this field is 0x0001. fls MUST be a value from the following table:

Value	Meaning
0x0000	The fill pattern is none (no fill). When rgbFore or rgbBack are specified, a pattern of 'none' overrides and means there is no fill.
0x0001	The fill pattern is solid. When solid is specified, rgbFore is the only color rendered, even when rgbBack is also specified.
0x0002	The fill pattern is medium gray. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following gray patterns is used.
	Percent50 - Specifies a 50 percent hatch. The ratio of foreground color to background color is 50:100.
0x0003	The fill pattern is dark gray. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following dark gray patterns is used.

Value	Meaning
	Percent60 - Specifies a 60 percent hatch. The ratio of foreground color to background color is 60:100.
	Percent70 - Specifies a 70 percent hatch. The ratio of foreground color to background color is 70:100.
	Percent75 - Specifies a 75 percent hatch. The ratio of foreground color to background color is 75:100.
	Percent80 - Specifies a 80 percent hatch. The ratio of foreground color to background color is 80:100.
	Percent90 - Specifies a 90 percent hatch. The ratio of foreground color to background color is 90:100.
0x0004	The fill pattern is light gray. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light gray patterns is used.
	Percent25 - Specifies a 25 percent hatch. The ratio of foreground color to background color is 25:100.
0x0005	The fill pattern is horizontal stripes. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following horizontal stripe pattern is used.
	DarkHorizontal - Specifies a pattern of horizontal lines.
0x0006	The fill pattern is vertical stripes. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following vertical stripes patterns is used.
	DarkVertical - Specifies a pattern of vertical lines.
0x0007	The fill pattern is downward diagonal stripes. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following diagonal stripes patterns is used.
	DarkDownwardDiagonal - Specifies diagonal lines that slant to the right from top points to bottom points. This hatch pattern is not anti-aliased.
	WideDownwardDiagonal - Specifies diagonal lines that slant to the right from top points to bottom points, are 1.5 times the width of DarkDownwardDiagonal, but are not anti-aliased.
0x0008	The fill pattern is upward diagonal stripes. Additional properties in the

Value	Meaning
	corresponding GelFrame record (section 2.4.131) specify which of the following diagonal stripes patterns is used.
	DarkUpwardDiagonal - Specifies diagonal lines that slant to the left from top points to bottom points, but the lines are not anti-aliased.
	WideUpwardDiagonal - Specifies diagonal lines that slant to the left from top points to bottom points, are 1.5 times the width of DarkUpwardDiagonal, but are not anti-aliased.
0x0009	The fill pattern is grid. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following grid patterns is used.
	LargeCheckerBoard - Specifies a hatch that has the appearance of a checkerboard with squares that are twice the size of SmallCheckerBoard.
	Plaid - Specifies a hatch that has the appearance of a plaid material.
	SmallCheckerBoard - Specifies a hatch that has the appearance of a checkerboard.
	SolidDiamond - Specifies a hatch that has the appearance of a checkerboard placed diagonally.
	Sphere - Specifies a hatch that has the appearance of spheres laid adjacent to one another.
0x000A	The fill pattern is trellis. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following trellis patterns is used.
	Trellis - Specifies a hatch that has the appearance of a trellis.
0x000B	The fill pattern is light horizontal stripes. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light horizontal stripes patterns is used.
	DashedHorizontal - Specifies dashed horizontal lines.
	LightHorizontal - Specifies a pattern of horizontal lines.
	NarrowHorizontal - Specifies horizontal lines that are spaced 25 percent closer together than LightHorizontal.
0x000C	The fill pattern is light vertical stripes. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light vertical stripes patterns is used.

Value	Meaning
	DashedVertical - Specifies dashed vertical lines.
	LightVertical - Specifies a pattern of vertical lines.
	NarrowVertical - Specifies vertical lines that are spaced 25 percent closer together than LightVertical.
0x000D	The fill pattern is light down. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light down patterns is used.
	DashedDownwardDiagonal – Specifies dashed diagonal lines that slant to the right from top points to bottom points.
	DiagonalBrick – Specifies a hatch that has the appearance of layered bricks that slant to the left from top points to bottom points.
	DottedGrid – Specifies horizontal and vertical lines (each of which is composed of dots) that cross.
	LightDownwardDiagonal - Specifies diagonal lines that slant to the right from top points to bottom points, but are not anti-aliased.
	OutlinedDiamond - Specifies forward diagonal and backward diagonal lines that cross but are not anti-aliased.
	Shingle - Specifies a hatch that has the appearance of diagonally layered shingles that slant to the right from top points to bottom points.
	Wave - Specifies horizontal lines that is composed of tildes.
	ZigZag - Specifies horizontal lines that are composed of zigzags.
0x000E	The fill pattern is light up. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light up patterns is used.
	DashedUpwardDiagonal – Specifies dashed diagonal lines that slant to the left from top points to bottom points.
	Divot - Specifies a hatch that has the appearance of divots.

Value	Meaning
	LightUpwardDiagonal - Specifies diagonal lines that slant to the left from top points to bottom points, but they are not anti-aliased.
	Weave - Specifies a hatch that has the appearance of a woven material.
0x000F	The fill pattern is light grid. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light grid patterns is used.
	HorizontalBrick - Specifies a hatch that has the appearance of horizontally layered bricks.
	LargeGrid - Specifies horizontal and vertical lines that cross.
	SmallGrid - Specifies horizontal and vertical lines that cross and are spaced 50 percent closer together than hatch style LargeGrid.
0x0010	The fill pattern is light trellis. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following light trellis patterns is used.
	Percent30 - Specifies a 30 percent hatch. The ratio of foreground color to background color is 30:100.
	Percent40 - Specifies a 40 percent hatch. The ratio of foreground color to background color is 40:100.
	LargeConfetti - Specifies a hatch that has the appearance of confetti, and is composed of larger pieces than SmallConfetti.
0x0011	The fill pattern is grayscale of 0.125 (1/8) value. Additional properties in the corresponding GelFrame record (section 2.4.131) specify which of the following grayscale patterns is used.
	Percent20 - Specifies a 20 percent hatch. The ratio of foreground color to background color is 20:100.
	DottedDiamond - Specifies forward diagonal and backward diagonal lines (each of which is composed of dots) that cross.
0x0012	SmallConfetti - Specifies a hatch that has the appearance of confetti. The fill pattern is grayscale of 0.0625 (1/16) value. Additional properties in the
	corresponding GelFrame record (section 2.4.131) specify which of the following grayscale patterns is used.

Value	Meaning
	Percent5 - Specifies a 5 percent hatch. The ratio of foreground color to background color is 5:100.
	Percent10 - Specifies a 10 percent hatch. The ratio of foreground color to background color is 10:100.

- **A fAuto (1 bit):** A bit that specifies whether the fill colors are automatically set. If **fls is equal to** 0x1 formatting is automatic. The default value of this field is 1.
- **B fInvertNeg (1 bit):** A bit that specifies whether the foreground and background are swapped when the data value of the filled area is negative. This field MUST be ignored if the formatting is not being applied to a **data points** (section 2.2.3.10) on a bar or column **chart group** (section 2.2.3.7). The default value of this field is 0.

reserved (14 bits): MUST be zero, and MUST be ignored.

icvFore (2 bytes): An **IcvChart structure** (section <u>2.5.162</u>) that specifies the foreground color of the fill pattern. The default value of this field is automatically selected from the next available color in the **chart** (section 2.2.3.3) color table.

icvBack (2 bytes): An **IcvChart structure** (section 2.5.162) that specifies the background color of the fill pattern. The default value of this field is 0x0009.

2.4.4 Array

The **Array** record specifies an array **formula** (section 2.2.2) for a **range** of **cells** that performs calculations on one or more sets of values, and then returns either a single result or multiple results across a continuous range of cells. This record is preceded by a single **Formula** record (section 2.4.127) that defines the first cell in the range that uses this array **formula** (section 2.2.2). Other **Formula** records (section 2.4.127) that use this array **formula** (section 2.2.2) follow later in the file, not necessarily in a contiguous sequence. **Formula** records (section 2.4.127) that use this array **formula** (section 2.2.2) MUST have a **cell** field that is within the range specified in the **ref** field of this record and MUST have their **formula** begin with **PtgExp** (section 2.5.198.58). Also, each cell specified in the **ref** field MUST have a **Formula** (section 2.4.127) that uses this array **formula** (section 2.2.2).

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ref																														
	A reserved																														
	unused																														
	formula (variable)																														

- **ref (6 bytes):** A **Ref structure** (section $\underline{2.5.207}$) that specifies the range of the array **formula** (section 2.2.2).
- A fAlwaysCalc (1 bit): A bit that specifies whether the array formula (section 2.2.2) needs to be calculated during the next recalculation.

reserved (15 bits): MUST be zero, and MUST be ignored.

unused (4 bytes): Undefined and MUST be ignored.

formula (variable): An **ArrayParsedFormula structure** (section <u>2.5.198.1</u>) that specifies the array **formula** (section 2.2.2).

2.4.5 AttachedLabel

The **AttachedLabel** record specifies properties of a **data label** (section 2.2.3.11) on a **chart group** (section 2.2.3.7), **series** (section 2.2.3.9), or **data point** (section 2.2.3.10). Refer to the **data label** (section 2.2.3.11) overview for additional information about how this record is used and when this record is ignored.

A - fShowValue (1 bit): A bit that specifies whether the value, or the vertical value on bubble or scatter **chart groups** (section 2.2.3.7), is displayed in the **data label** (section 2.2.3.11).

This value MUST be 0 if this record is in a **chart group** (section 2.2.3.7) and either **fShowLabelAndPerc** or **fShowPercent** is equal to 1.

B - fShowPercent (1 bit): A bit that specifies whether the value, represented as a percentage of the sum of the values of the **series** (section 2.2.3.9) the **data label** (section 2.2.3.11) is associated with, is displayed in the **data label** (section 2.2.3.11).

MUST equal 0 if the **chart group** (section 2.2.3.7) type of the corresponding **chart group** (section 2.2.3.7), **series** (section 2.2.3.9), or **data point** (section 2.2.3.10), is not bar of pie, doughnut, pie, or pie of pie **chart group** (section 2.2.3.7).

If this record is contained in a **chart group** (section 2.2.3.7) and **fShowLabelAndPerc** is equal to 1 then this field MUST equal 1.

C - fShowLabelAndPerc (1 bit): A bit that specifies whether the category (2) name and value, represented as a percentage of the sum of the values of the series (section 2.2.3.9) the data label (section 2.2.3.11) is associated with, are displayed in the data label (section 2.2.3.11).

MUST equal 0 if the **chart group** (section 2.2.3.7) type of the corresponding **chart group** (section 2.2.3.7), **series** (section 2.2.3.9), or **data point** (section 2.2.3.10), is not bar of pie, doughnut, pie, or pie of pie **chart group** (section 2.2.3.7).

- **D unused (1 bit):** Undefined and MUST be ignored.
- **E fShowLabel (1 bit):** A bit that specifies whether the category (2), or the horizontal value on bubble or scatter **chart groups** (section 2.2.3.7), is displayed in the **data label** (section 2.2.3.11) on a non-area **chart group** (section 2.2.3.7), or the **series** (section 2.2.3.9) name is displayed in the **data label** (section 2.2.3.11) on an area **chart group** (section 2.2.3.7).

This field MUST equal 0 if this record is contained in a **chart group** (section 2.2.3.7) and one of the following conditions is satisfied:

- The **fShowValue** field is equal to 1.
- The fShowLabelAndPerc field is equal to 0 and the fShowPercent field is equal to 1.
- **F fShowBubbleSizes (1 bit):** A bit that specifies whether the **bubble size** is displayed in the **data label** (section 2.2.3.11).

MUST equal 0 if the **chart group** (section 2.2.3.7) type of the corresponding **chart group** (section 2.2.3.7), **series** (section 2.2.3.9), or **data point** (section 2.2.3.10) is not bubble **chart group** (section 2.2.3.7).

If the current record is contained in a **chart group** (section 2.2.3.7) and **fShowPercent**, **fShowValue**, or **fShowLabel** equal 1, this field MUST equal 0.

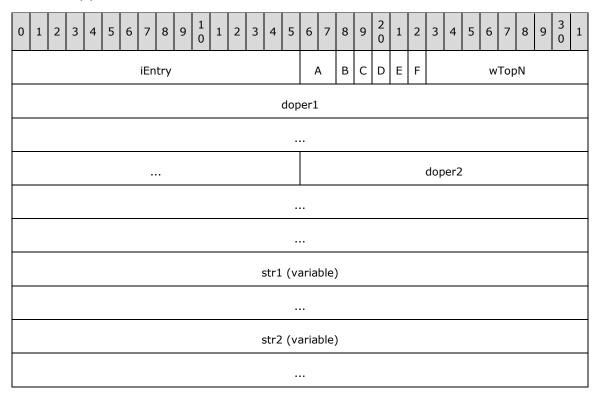

G - fShowSeriesName (1 bit): A bit that specifies whether the **data label** (section 2.2.3.11) contains the name of the **series** (section 2.2.3.9).

If the current record is contained in a **chart group** (section 2.2.3.7) and **fShowLabelAndPerc**, **fShowPercent**, **fShowValue**, **fShowValue**, **fShowLabel**, or **fShowBubbleSizes** equal 1 then this MUST equal to 0.

reserved (9 bits): MUST be zero, and MUST be ignored.

2.4.6 AutoFilter

The **AutoFilter** record specifies an **AutoFilter**. An **Lbl record** (section 2.4.150) where the **Name** field has a value of 0x0D (_FilterDatabase) MUST exist for the current **sheet (1)**. The **rgce.rgce** field of the **Lbl record** (section 2.4.150) MUST consist of a single **PtgArea3d operand** (section 2.5.198.28).)

iEntry (2 bytes): An unsigned integer that specifies the sheet (1) column that this AutoFilter applies to. The column index is determined by the following formula:

- ((the area.columnFirst field of the PtgArea3d (section 2.5.198.28) in the rgce.rgce field of the Lbl record (section 2.4.150) where the Name field is equal to 0x0D (_FilterDatabase) and the Lbl record (section 2.4.150) is for the current sheet (1)) + iEntry).
- The value of **iEntry** MUST be less than the **cEntries** field of the proceeding **AutoFilterInfo** record (section 2.4.8).
- **A wJoin (2 bits):** A **Boolean** (section 2.5.14) that specifies whether **doper1** and **doper2** are combined using a logical AND operation or a logical OR operation. MUST be a value from the following table:

Value	Meaning
0	doper1 and doper2 are combined using a logical AND operation.
1	doper1 and doper2 are combined using a logical OR operation.

If **fTopN** is 1, **wJoin** is undefined and MUST be ignored.

- **B fSimple1 (1 bit):** A bit that specifies whether an application-specific performance optimization can be used to compute this AutoFilter. MUST be 1 if and only if **doper1.vt** is 0x06 and **doper1.vtValue** is not a regular expression string, or **doper1.vt** is 0x0C, or **doper1.vt** is 0x0E. If **fTopN** is 1, **fSimple1** is undefined and MUST be ignored.
- C fSimple2 (1 bit): A bit that specifies whether an application-specific performance optimization can be used to compute this AutoFilter. MUST be 1 if and only if doper2.vt is 0x06 and doper2.vtValue is not a regular expression string, or doper2.vt is 0x0C, or doper2.vt is 0x0E. If fTopN is 1, fSimple2 is undefined and MUST be ignored.
- **D fTopN (1 bit):** A bit that specifies whether the AutoFilter is a **Top N filter**.
- **E fTop (1 bit):** A bit that specifies whether the Top N filter selects the bottom items or the top items. MUST be a value from the following table:

Value	Meaning
0	Top N filter selects the bottom items.
1	Top N filter selects the top items.

If **fTopN** is 0, **fTop** is undefined and MUST be ignored.

F - fPercent (1 bit): A bit that specifies whether the Top N filter selects a count of items or a percent of items. MUST be a value from the following table:

Value	Meaning
0	Top N filter selects a count of items.
1	Top N filter selects a percent of items.

If **fTopN** is 0, **fPercent** is undefined and MUST be ignored.

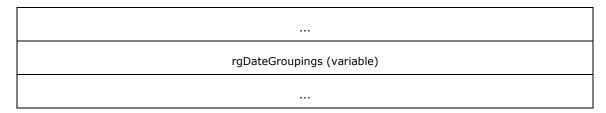

- wTopN (9 bits): An unsigned integer that specifies the number of Top N filter items to show. If fTopN is 0, wTopN MUST be ignored. If fTopN is 1, wTopN MUST be greater than or equal to 1 and less than or equal to 500.
- **doper1 (10 bytes):** An **AFDOper structure** (section 2.5.5) that specifies the first AutoFilter condition. If **fTopN** is 1, **doper1** is undefined and MUST be ignored.

- **doper2 (10 bytes):** An **AFDOper structure** (section 2.5.5) that specifies the second AutoFilter condition. If **fTopN** is 1, **doper2** is undefined and MUST be ignored.
- **str1 (variable):** An optional **XLUnicodeStringNoCch structure** (section <u>2.5.296</u>) that specifies the string comparison constant for **doper1**. MUST exist if and only if **doper1.vt** is equal to 0x06. The length MUST be equal to **doper1.vtValue.cch**.
- **str2 (variable):** An optional **XLUnicodeStringNoCch structure** (section 2.5.296) that specifies the string comparison constant for **doper2**. MUST exist if and only if **doper2.vt** is equal to 0x06. The length MUST be equal to **doper2.vtValue.cch**.

2.4.7 AutoFilter12

The AutoFilter12 record specifies AutoFilter properties.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	E ,	5 6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtRefHeader

																	A B unused1														
														ι	ın	used	2														
															ic	dList															
												Ç	guic	lSv	iev	w (16	b by	tes)												
	rgb (variable)																														
													rgC	Crite	eri	ia (va	rial	ole)													

frtRefHeader (12 bytes): An FrtRefHeader structure (section 2.5.137). The frtRefHeader.rt MUST be 0x087E. frtRefHeader.grbitFrt.fFrtRef MUST be 0x1. The frtRefHeader.ref8 field MUST refer to the range of cells associated with this record.

iEntry (2 bytes): An unsigned integer that specifies the **sheet (1)** column that this AutoFilter applies to. The column index is determined by the following formula:

frtRefHeader.ref8.colFirst + iEntry.

The value of **iEntry** MUST be less than or equal to 255.

- **fHideArrow (4 bytes):** A **Boolean** (section <u>2.5.14</u>) that specifies whether the user interface used to display AutoFilter settings is **hidden**.
- **ft (4 bytes):** An unsigned integer that specifies the **filter** type. MUST be one of the values in the table specified in **rgb.**
- **cft (4 bytes):** An unsigned integer that specifies the **custom filter** type. MUST be one of the values in the following table:

Value	Meaning
0x0000000	No custom filter
0x0000001	The custom filter displays items that are above average.
0x00000002	The custom filter displays items that are below average.
0x0000008	The custom filter displays items that are from tomorrow.
0x0000009	The custom filter displays items that are from today.
0x000000A	The custom filter displays items that are from yesterday.
0x000000B	The custom filter displays items that are from next week.
0x000000C	The custom filter displays items that are from this week.
0x000000D	The custom filter displays items that are from last week
0x000000E	The custom filter displays items that are from next month.
0x000000F	The custom filter displays items that are from this month.
0x0000010	The custom filter displays items that are from last month.
0x0000011	The custom filter displays items that are from next quarter.
0x0000012	The custom filter displays items that are from this quarter.
0x0000013	The custom filter displays items that are from last quarter.
0x00000014	The custom filter displays items that are from next year.
0x0000015	The custom filter displays items that are from this year.
0x0000016	The custom filter displays items that are from last year.
0x0000017	The custom filter displays items that are from year-to-date.
0x0000018	The custom filter displays items that are from the 1st quarter.
0x0000019	The custom filter displays items that are from the 2 nd quarter.
0x000001A	The custom filter displays items that are from the 3 rd quarter.
0x0000001B	The custom filter displays items that are from the 4 th quarter.
0x000001C	The custom filter displays items that are from the 1st month.
0x000001D	The custom filter displays items that are from the 2 nd month.

Value	Meaning
0x0000001E	The custom filter displays items that are from the 3 rd month.
0x000001F	The custom filter displays items that are from the 4 th month.
0x00000020	The custom filter displays items that are from the 5 th month.
0x00000021	The custom filter displays items that are from the 6 th month.
0x00000022	The custom filter displays items that are from the 7 th month.
0x00000023	The custom filter displays items that are from the 8 th month.
0x00000024	The custom filter displays items that are from the 9 th month.
0x00000025	The custom filter displays items that are from the 10 th month.
0x00000026	The custom filter displays items that are from the 11 th month.
0x00000027	The custom filter displays items that are from the 12 th month.

- **cCriteria (4 bytes):** An unsigned integer that specifies the number of items in **rgCriteria**. MUST be ignored if **ft** is nonzero.
- **cDateGroupings (4 bytes):** An unsigned integer that specifies the number of items in **rgDateGroupings**. MUST be ignored if **ft** is nonzero.
- A reserved1 (3 bits): MUST be zero, and MUST be ignored.
- **B fWorksheetAutoFilter (1 bit):** A bit that specifies whether this filter is a sheet (1) AutoFilter. A sheet (1) AutoFilter filters items in the sheet specified by the **Worksheet part** (section 2.1.7.20.5) that contains this record. MUST be 1 if and only if **idList** is equal to 0xFFFFFFFF.
- unused1 (12 bits): Undefined and MUST be ignored.
- unused2 (4 bytes): Undefined and MUST be ignored.
- **idList (4 bytes):** An unsigned integer that specifies the **table** with items that are filtered by this AutoFilter. MUST either be equal to the **idList** field of the associated **TableFeatureType structure** (section <u>2.5.266</u>) or MUST be 0xFFFFFFFF if this filter is a sheet (1) AutoFilter.
- **guidSview (16 bytes):** A **GUID** as specified by [MS-DTYP] that specifies the associated **UserSViewBegin** record (section 2.4.334). MUST be 0, or MUST be equal to the **guid** field of the preceding **UserSViewBegin** record (section 2.4.334).
- **rgb (variable):** A variable type field whose type and meaning is specified by the value of **ft**, as defined in the following table:

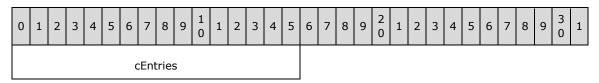

Value of ft	Type of rgb
0x00000000	rgb does not exist. Either cCriteria or cDateGroupings MUST be greater than zero.
0x0000001	rgb is a DXFN12NoCB structure (section <u>2.5.98</u>) that specifies the cell color to use for the filter.
0x00000002	rgb is a DXFN12NoCB structure (section 2.5.98) that specifies the cell font to use for the filter.
0x00000003	rgb is an AF12CellIcon structure (section $\underline{2.5.2}$) that specifies the cell icon to use for the filter.

rgCriteria (variable): An optional array of **AF12Criteria structures** (section 2.5.3). The length of the array MUST be equal to **cCriteria**. MUST exist if and only if **ft** is zero and **cCriteria** is nonzero. Each element of the array MUST be specified in a separate **ContinueFrt12** record (section 2.4.62).

rgDateGroupings (variable): An optional array of **AF12DateInfo structures** (section <u>2.5.4</u>). The length of the array MUST be equal to **cDateGroupings**. MUST exist if and only if **ft** is zero and **cDateGroupings** is nonzero. Each element of the array MUST be specified in a separate **ContinueFrt12** record (section 2.4.62).

2.4.8 AutoFilterInfo

The **AutoFilterInfo** record specifies the number of columns that have **AutoFilter** enabled and specifies the beginning of a collection of records as defined by the <u>Macro Sheet Substream</u> **ABNF** and <u>Worksheet Substream</u> ABNF. The collection of records specifies AutoFilter information and data used for sorting a **range**.

cEntries (2 bytes): An unsigned integer that specifies the number of columns that have AutoFilter enabled. MUST be greater than or equal to 1 and less than or equal to 256.

2.4.9 AxcExt

The **AxcExt** record specifies additional extension properties of a date **axis** (section 2.2.3.6), along with a **CatSerRange record** (section 2.4.39).

0	0 1 2 3 4 5 6 7 8 9 1 1 2 3 4 5 6 7 8 9 1 1 2 3 4 5 6 7 8 9 2 1 2 3 4 5 6 7 8 9 3 1							1												
	catMin catMax																			
	catMajor					duMajor														
	catMinor												(duM	ino	r				
	duBase											cat	Cro	ssD	ate					
Α	В	С	D	Е	F	G	Н			re	eser	rve	d							

catMin (2 bytes): An unsigned integer that specifies the minimum date, as a date in the date system specified by the Date1904 record (section 2.4.77), in the units defined by duBase. SHOULD<25> be less than or equal to catMax. If fAutoMin is set to 1, MUST be ignored. If fDateAxis is set to 0, MUST be ignored.

catMax (2 bytes): An unsigned integer that specifies the maximum date, as a date in the date system specified by the **Date1904 record** (section 2.4.77), in the units defined by **duBase**. SHOULD<a><26> be greater than or equal to **catMin**. If **fAutoMax** is set to 1, MUST be ignored. If **fDateAxis** is set to 0, MUST be ignored.

catMajor (2 bytes): An unsigned integer that specifies the interval at which the major tick marks are displayed on the axis (section 2.2.3.6), in the unit defined by duMajor. MUST be greater than or equal to catMinor when duMajor is equal to duMinor. If fAutoMajor is set to 1, MUST be ignored. If fDateAxis is set to 0, MUST be ignored.

- **duMajor (2 bytes):** A **DateUnit enumeration** (section 2.5.66) that specifies the unit of time to use for **catMajor** when the **axis** (section 2.2.3.6) is a date **axis** (section 2.2.3.6). If **fDateAxis** is set to 0, MUST be ignored.
- catMinor (2 bytes): An unsigned integer that specifies the interval at which the minor tick marks are displayed on the axis (section 2.2.3.6), in a unit defined by duMinor. MUST be less than or equal to catMajor when duMajor is equal to duMinor. If fAutoMinor is set to 1, MUST be ignored. If fDateAxis is set to 0, MUST be ignored.
- **duMinor (2 bytes):** A **DateUnit enumeration** (section 2.5.66) that specifies the unit of time to use for **catMinor** when the **axis** (section 2.2.3.6) is a date **axis** (section 2.2.3.6). If **fDateAxis** is set to 0, MUST be ignored.
- **duBase (2 bytes):** A **DateUnit enumeration** (section 2.5.66) that specifies the smallest unit of time used by the **axis** (section 2.2.3.6). If **fAutoBase** is set to 1, this field MUST be ignored. If **fDateAxis** is set to 0, MUST be ignored.
- catCrossDate (2 bytes): An unsigned integer that specifies at which date, as a date in the date system specified by the Date1904 record (section 2.4.77), in the units defined by duBase, the value axis (section 2.2.3.6) crosses this axis (section 2.2.3.6). If fDateAxis is set to 0, MUST be ignored. If fAutoCross is set to 1, MUST be ignored.
- A fAutoMin (1 bit): A bit that specifies whether catMin is calculated automatically. If fDateAxis is set to 0, MUST be ignored. MUST be a value from the following table:

Value	Meaning
0	The value specified by catMin is used and catMin is not calculated automatically.
1	catMin is calculated such that the minimum data points (section 2.2.3.10) value can be displayed.

B - fAutoMax (1 bit): A bit that specifies whether **catMax** is calculated automatically. If **fDateAxis** is set to 0, then **fAutoMax** MUST be ignored. If the value of the **fMaxCross** field in the **CatSerRange** (section 2.4.39) record is 1, then **fAutoMax** MUST be ignored. MUST be a value from the following table:

Value	Meaning
0	The value specified by catMax is used and catMax is not calculated automatically.
1	catMax is calculated such that the minimum data points (section 2.2.3.10) value can be displayed.

C - fAutoMajor (1 bit): A bit that specifies whether **catMajor** is calculated automatically. If **fDateAxis** is set to 0, MUST be ignored.

Value	Meaning
0	The value specified by catMajor is used and catMajor is not calculated automatically.
1	catMajor is calculated automatically.

D - fAutoMinor (1 bit): A bit that specifies whether **catMinor** is calculated automatically. If **fDateAxis** is set to 0, MUST be ignored.

Value	Meaning
0	The value specified by catMinor is used and catMinor is not calculated automatically.
1	catMinor is calculated automatically.

E - fDateAxis (1 bit): A bit that specifies whether the **axis** (section 2.2.3.6) is a date **axis** (section 2.2.3.6). MUST be a value from the following table:

Value	Meaning
0	The axis (section 2.2.3.6) is not a date axis (section 2.2.3.6).
1	The axis (section 2.2.3.6) is a date axis (section 2.2.3.6).

F - fAutoBase (1 bit): A bit that specifies whether the units of the date **axis** (section 2.2.3.6) are chosen automatically. If **fDateAxis** is set to 0, MUST be ignored. MUST be a value from the following table:

Value	Meaning
0	The value specified by duBase is used and duBase is not computed automatically.
1	duBase is calculated automatically.

G - fAutoCross (1 bit): A bit that specifies whether **catCrossDate** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by catCrossDate is used and catCrossDate is not calculated automatically.
1	catCrossDate is calculated automatically such that it can be displayed.

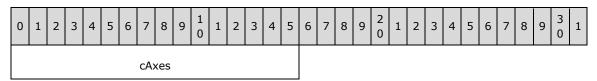

H - fAutoDate (1 bit): A bit that specifies whether the **axis** (section 2.2.3.6) type is detected automatically. MUST be a value from the following table:

Value	Meaning
0	The axis (section 2.2.3.6) will stay as specified by the fDateAxis field.
1	The axis (section 2.2.3.6) will automatically become a date axis (section 2.2.3.6) when the data it is related to contains date values. Otherwise, the axis (section 2.2.3.6) will be a category (2) axis (section 2.2.3.6).

reserved (8 bits): MUST be zero, and MUST be ignored.

2.4.10 AxesUsed

The **AxesUsed** record specifies the number of **axis groups** (section 2.2.3.5) on the **chart** (section 2.2.3.3).

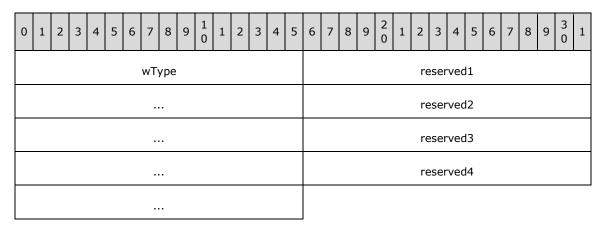

cAxes (2 bytes): An unsigned integer that specifies the number of **axis groups** (section 2.2.3.5) on the **chart** (section 2.2.3.3). MUST be a value from the following table:

Value	Axis present
0x0001	A single primary axis group (section 2.2.3.5) is present.
0x0002	Both a primary axis group (section 2.2.3.5) and a secondary axis group (section 2.2.3.5) are present.

If no **chart groups** (section 2.2.3.7) are present on the **chart** (section 2.2.3.3), MUST be 0x0001. If the **chart sheet substream** (section 2.1.7.20.1) contains a **Chart3d record** (section 2.4.46), MUST be 0x0001.

2.4.11 Axis

The **Axis** record specifies properties of an **axis** (section 2.2.3.6) and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF** that specifies an **axis** (section 2.2.3.6).

wType (2 bytes): An unsigned integer that specifies the type of axis (section 2.2.3.6). The value MUST be 0x0000 if the record is the first axis (section 2.2.3.6) in the axis group (section 2.2.3.5). The value MUST be 0x0001 if the record is the second axis (section 2.2.3.6) in the axis group (section 2.2.3.5). The value MUST be 0x0002 if the record is the third axis (section 2.2.3.6) in the axis group (section 2.2.3.5). MUST be a value from the following table:

Value	Axis type
0x0000	Axis (section 2.2.3.6) type is a horizontal value axis (section 2.2.3.6)

Value	Axis type
	for a scatter chart group (section 2.2.3.7) or a bubble chart group (section 2.2.3.7), or category (2) axis (section 2.2.3.6) for all other chart group (section 2.2.3.7) types.
0x0001	Axis (section 2.2.3.6) type is a vertical value axis (section 2.2.3.6) for a scatter chart group (section 2.2.3.7) or a bubble chart group (section 2.2.3.7), or value axis (section 2.2.3.6) for all other chart group (section 2.2.3.7) types.
0x0002	Axis (section 2.2.3.6) type is a series axis (section 2.2.3.6).

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

reserved3 (4 bytes): MUST be zero, and MUST be ignored.

reserved4 (4 bytes): MUST be zero, and MUST be ignored.

2.4.12 AxisLine

The **AxisLine** record specifies which part of the **axis** (section 2.2.3.6) is specified by the **LineFormat** record (section 2.4.156) that follows.

id (2 bytes): An unsigned integer that specifies which part of the axis (section 2.2.3.6) is defined by the LineFormat record (section 2.4.156) that follows be unique among all other id field values in AxisLine records in the current axis (section 2.2.3.6). MUST be greater than the id field values in preceding AxisLine records in the current axis (section 2.2.3.6). MUST be a value from the following table:

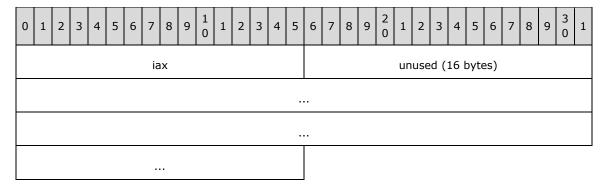

Value	Part of the axis defined
0x0000	The axis (section 2.2.3.6) line itself.
0x0001	The major gridlines along the axis (section 2.2.3.6).
0x0002	The minor gridlines along the axis (section 2.2.3.6).
0x0003	The walls or floor of a 3-D chart (section 2.2.3.3).

In the case where **id** is set to 0x0003, this record MUST be preceded by an **Axis** record (section 2.4.11) with the **wType** set to a value from the following table:

Value of wType Formatted object					
0x0000	The walls of a 3-D chart (section 2.2.3.3).				
0x0001	The floor of a 3-D chart (section 2.2.3.3).				

2.4.13 AxisParent

The **AxisParent** record specifies properties of an **axis group** (section <u>2.2.3.5</u>) and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF** that specifies an **axis group** (section 2.2.3.5).

iax (2 bytes): A Boolean (section 2.5.14) that specifies whether the axis group (section 2.2.3.5) is primary or secondary. MUST be a value from the following table. This field MUST equal 0 when in the first AxisParent record in the Chart Sheet Substream ABNF. This field MUST equal 1 when in the second AxisParent record in the Chart Sheet Substream ABNF.

Value	Meaning
0x0000	Axis group (section 2.2.3.5) is primary.
0x0001	Axis group (section 2.2.3.5) is secondary.

unused (16 bytes): Undefined and MUST be ignored.

2.4.14 Backup

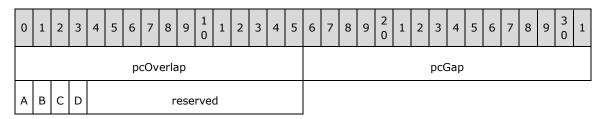

The **Backup** record specifies whether to save a backup copy of the **workbook**.

fBackup (2 bytes): A **Boolean** (section 2.5.14) that specifies whether to save a backup file. The value 1 means that a backup copy of the workbook is saved when the workbook is saved.

2.4.15 Bar

The **Bar** record specifies that the **chart group** (section 2.2.3.7) is a bar **chart group** (section 2.2.3.7) or a column **chart group** (section 2.2.3.7), and specifies the **chart group** (section 2.2.3.7) attributes.

pcOverlap (2 bytes): A signed integer that specifies the overlap between **data points** (section 2.2.3.10) in the same **category (2)** as a percentage of the **data points** (section 2.2.3.10) width. MUST be greater than or equal to -100 and less than or equal to 100. MUST be a value from the following table:

Value	Meaning
-100 to -1	Size of the separation between data points (section 2.2.3.10).
0	No overlap.
1 to 100	Size of the overlap between data points (section 2.2.3.10).

pcGap (2 bytes): An unsigned integer that specifies the width of the gap between the categories (2) and the left and right edges of the **plot area** as a percentage of the **data point** (section 2.2.3.10) width divided by 2. It also specifies the width of the gap between adjacent categories (2) as a percentage of the **data point** (section 2.2.3.10) width. MUST be less than or equal to 500.

A - fTranspose (1 bit): A bit that specifies whether the **data points** (section 2.2.3.10) and value **axis** (section 2.2.3.6) are horizontal (for a bar **chart group** (section 2.2.3.7)) or vertical (for a column **chart group** (section 2.2.3.7)). MUST be a value from the following table:

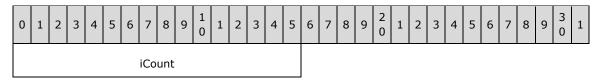

Value	Meaning
0	Data points (section 2.2.3.10) and value axis (section 2.2.3.6) are vertical.
1	Data points (section 2.2.3.10) and value axis (section 2.2.3.6) are horizontal.

- **B fStacked (1 bit):** A bit that specifies whether the **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) that share the same category (2) are stacked.
- **C f100 (1 bit):** A bit that specifies whether the **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) are displayed as a percentage of the sum of all **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) that share the same category (2). MUST be 0 if **fStacked** is 0.
- **D fHasShadow (1 bit):** A bit that specifies whether one or more **data points** (section 2.2.3.10) in the **chart group** (section 2.2.3.7) has shadows.

reserved (12 bits): MUST be zero, and MUST be ignored.

2.4.16 BCUsrs

The **BCUsrs** record specifies the beginning of a collection of **UsrInfo records** (section <u>2.4.340</u>) as defined the <u>user names</u> stream **ABNF**. The collection of **UsrInfo records** (section 2.4.340) specifies information about a user who currently has the **shared workbook** (section <u>2.2.11</u>) open.

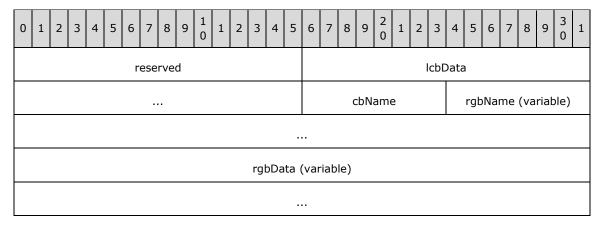

iCount (2 bytes): An unsigned integer that specifies the number of users of an operating system **Briefcase** who have the current **workbook** open.

2.4.17 Begin

The **Begin** record specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream ABNF</u>. The collection of records specifies properties of a <u>chart</u>.

2.4.18 BigName

The **BigName** record specifies a name/value pair of arbitrary user-defined data that is associated with the current **sheet (1)**.

reserved (2 bytes): MUST be 0x1000, and MUST be ignored.

IcbData (4 bytes): A signed integer that specifies the byte count for **rgbData**. MUST be greater than or equal to zero.

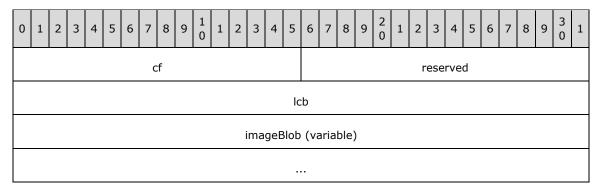

cbName (1 byte): An unsigned integer that specifies the byte count for rgbName.

rgbName (variable): An array of ANSI characters whose length is specified by **cbName** that specifies the name of the custom property.

rgbData (variable): An array of bytes that specifies the value of the custom property. It can continue with the ContinueBigName records.

2.4.19 BkHim

The **BkHim** record specifies image data for a **sheet (1)** background.

cf (2 bytes): A signed integer that specifies the image format. MUST be a value from the following table:

Value	Meaning
0x0009	Bitmap format. The image data is stored in a bitmap format as described in [MSDN-BMP] .

Value	Meaning
0x000E	Native format. The image data is stored in the native format of another application and cannot be directly processed.

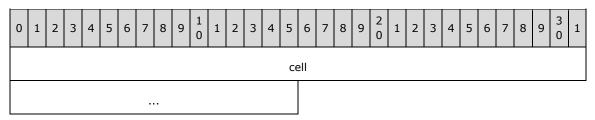

reserved (2 bytes): MUST be 0x0001, and MUST be ignored.

Icb (4 bytes): A signed integer that specifies the size of **imageBlob** in bytes. MUST be greater than or equal to 1.

imageBlob (variable): An array of bytes that specifies the image data for the given format.

2.4.20 Blank

The **Blank** record specifies an empty **cell** with no formula (section 2.2.2) or value.

cell (6 bytes): A Cell structure that specifies the cell.

2.4.21 BOF

The **BOF** record specifies the beginning of the individual substreams as specified by the <u>workbook</u> section. It also specifies history information for the substreams.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8 9 2 1 2 3 4 5 6 7 8 9 3 1						1					
	vers dt																												
						r	upE	Build	d													ı	up\	⁄eaı	r				
Α	В	С	D	Е	F	C	ĵ	Н	Ι	J	k	(L					N	reserved1										
verLowestBiff O														re	eser	vec	12												

vers (2 bytes): An unsigned integer that specifies the **BIFF** version of the file. The value MUST be 0×0600 .

dt (2 bytes): An unsigned integer that specifies the document type of the substream of records following this record. For more information about the layout of the sub-streams in the workbook stream see File Structure. MUST be a value from the following table:

Value	Meaning
0x0005	Specifies the workbook substream.
0x0010	Specifies the <u>dialog sheet</u> substream or the <u>worksheet</u> substream.

Value	Meaning
	The sheet (1) substream that starts with this BOF record MUST contain one WsBool record. If the fDialog field in that WsBool is 1 then the sheet (1) is dialog sheet otherwise the sheet (1) is a worksheet .
0x0020	Specifies the <u>chart sheet</u> substream.
0x0040	Specifies the macro sheet substream.

rupBuild (2 bytes): An unsigned integer that specifies the build identifier.

- rupYear (2 bytes): An unsigned integer that specifies the year when this BIFF version was first created. The value MUST be 0x07CC<27> or 0x07CD.
- A fWin (1 bit): A bit that specifies whether this file was last edited on a Windows platform. The value MUST be 1.
- **B fRisc (1 bit):** A bit that specifies whether the file was last edited on a RISC platform. The value MUST be 0.
- **C fBeta (1 bit):** A bit that specifies whether this file was last edited by a **beta** version of the application. The value MUST be 0.
- **D fWinAny (1 bit):** A bit that specifies whether this file has ever been edited on a Windows platform. The value SHOULD<28> be 1.
- **E fMacAny (1 bit):** A bit that specifies whether this file has ever been edited on a Macintosh platform. The value MUST be 0.
- **F fBetaAny (1 bit):** A bit that specifies whether this file has ever been edited by a beta version of the application. The value MUST be 0.
- G unused1 (2 bits): Undefined and MUST be ignored.
- **H fRiscAny (1 bit):** A bit that specifies whether this file has ever been edited on a RISC platform. The value MUST be 0.
- I fOOM (1 bit): A bit that specifies whether this file had an out-of-memory failure.
- **J fGIJmp (1 bit):** A bit that specifies whether this file had an out-of-memory failure during rendering.
- K unused2 (2 bits): Undefined, and MUST be ignored.
- L fFontLimit (1 bit): A bit that specified that whether this file hit the 255 font limit<29>.
- **M verXLHigh (4 bits):** An unsigned integer that specifies the highest version of the application that once saved this file. MUST be a value from the following table:

Value	Meaning
0x0	Specifies the highest version of the application that has ever saved this file. <30>
0x1	Specifies the highest version of the application that has ever saved this file. <31>
0x2	Specifies the highest version of the application that has ever saved this file. <32>
0x3	Specifies the highest version of the application that has ever saved this file. <33>
0x4	Specifies the highest version of the application that has ever saved this file. <34>
0x6	Specifies the highest version of the application that has ever saved this file. <35>
0x7	Specifies the highest version of the application that has ever saved this file. <36>

N - unused3 (1 bit): Undefined, and MUST be ignored.

reserved1 (13 bits): MUST be zero, and MUST be ignored.

verLowestBiff (8 bits): An unsigned integer that specifies the BIFF version saved. The value MUST be 6.

O - verLastXLSaved (4 bits): An unsigned integer that specifies the application that saved this file most recently. The value MUST be the value of field **verXLHigh** or less. MUST be a value from the following table:

Value	Meaning
0x0	Specifies the highest version of the application that has ever saved this file. \leq 37>
0x1	Specifies the highest version of the application that has ever saved this file. <38>
0x2	Specifies the highest version of the application that has ever saved this file. <a><39>
0x3	Specifies the highest version of the application that has ever saved this file. <40>
0x4	Specifies the highest version of the application that has ever saved this file. $<41>$
0x6	Specifies the highest version of the application that has ever saved this file. <a><42>
0x7	Specifies the highest version of the application that has ever saved this file. <43>

reserved2 (20 bits): MUST be zero, and MUST be ignored.

2.4.22 BookBool

The **BookBool** record specifies some of the properties associated with a **workbook**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е	ı	F	G	Н		reserved2																					

A - fNoSaveSup (1 bit): A bit that specifies that external link values are saved in the workbook.

MUST be a value from the following table:

Value	Meaning					
0	External link values are saved.					
1	External link values are not saved.					

- **B reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- C fHasEnvelope (1 bit): A bit that specifies whether the workbook has an envelope as a result of sending the workbook to a mail recipient. If fEnvelopeVisible is 1 or fEnvelopeInitDone is 1, then this bit MUST be 1.

- D fEnvelopeVisible (1 bit): A bit that specifies whether the envelope is visible.
- E fEnvelopeInitDone (1 bit): A bit that specifies whether the envelope has been initialized.
- **F grUpdateLinks (2 bits):** An unsigned integer that specifies when the application updates external links in the workbook. The value MUST be one of the following:

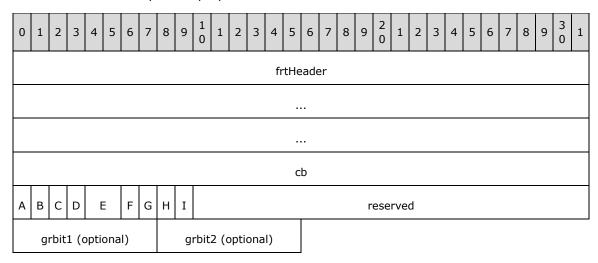

Value	Meaning
0	Prompt user to update.
1	Do not update, and do not prompt user.
2	Silently update external links. The application can choose to prompt the user because of security concerns<44>.

- **G unused (1 bit):** Undefined and MUST be ignored.
- **H fHideBorderUnselLists (1 bit):** A bit that specifies whether to hide borders of **tables** that do not contain the **active cell**<45>.

reserved2 (7 bits): MUST be zero, and MUST be ignored.

2.4.23 BookExt

The **BookExt** record specifies properties of a **workbook** file.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0863.

- cb (4 bytes): An unsigned integer that specifies the size of the record in bytes.
- A fDontAutoRecover (1 bit): A bit that specifies whether AutoRecover is disabled for the workbook.
- **B fHidePivotList (1 bit):** A bit that specifies whether the PivotTable field list is **hidden** for this workbook.
- C fFilterPrivacy (1 bit): A bit that specifies whether personal information is removed from this workbook on save.
- **D fEmbedFactoids (1 bit):** A bit that specifies whether **smart tags** are embedded in this workbook on save.

E - mdFactoidDisplay (2 bits): A bit that specifies how smart tags are displayed in the workbook. The value MUST be one of the following:

Value	Meaning
0x00	The application will display the smart tag actions button and the smart tag indicator .
0x01	The application will display the smart tag actions button only. The smart tag indicators will not be displayed.
0x02	The application will not display the smart tag actions button or the smart tag indicator.

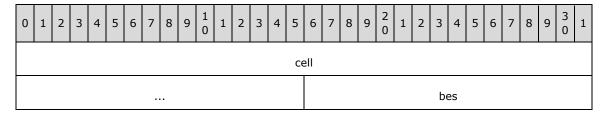

- **F fSavedDuringRecovery (1 bit):** A bit that specifies whether the workbook was saved during AutoRecover.
- **G fCreatedViaMinimalSave (1 bit):** A bit that specifies whether the workbook was created by a **minimal save** during **data recovery**.
- **H fOpenedViaDataRecovery (1 bit):** A bit that specifies whether the workbook was opened by means of data recovery.
- I fOpenedViaSafeLoad (1 bit): A bit that specifies whether the workbook was opened in safe load mode.

reserved (22 bits): MUST be zero, and MUST be ignored.

- **grbit1 (1 byte):** A <u>BookExt Conditional11</u> structure that specifies additional workbook-specific information. This structure MUST exist when **cb** is greater than 20.
- **grbit2 (1 byte):** A <u>BookExt Conditional12</u> structure that specifies additional workbook-specific information. This structure MUST exist when **cb** is greater than 21.

2.4.24 BoolErr

The BoolErr record specifies a cell that contains either a Boolean value or an error value.

cell (6 bytes): A Cell structure that specifies the cell.

bes (2 bytes): A Bes structure that specifies a Boolean or an error value.

2.4.25 BopPop

The **BopPop** record specifies that the <u>chart group</u> is a bar of pie chart group or a pie of pie chart group and specifies the chart group attributes.

iSplitPos	pcSplitPercent		
pcPie2Size	pcGap		
numSplitValue			
A reserved			

pst (1 byte): An unsigned integer that specifies whether this chart group is a bar of pie chart group or a pie of pie chart group. MUST be a value from the following table:

Value	Subtype
0x01	Pie of pie chart group
0x02	Bar of pie chart group

fAutoSplit (1 byte): A Boolean (section 2.5.14) that specifies whether the split point of the chart group is determined automatically. If the value is 1, when a bar of pie chart group or pie of pie chart group is initially created the <u>data points</u> from the **primary pie** are selected and inserted into the **secondary bar/pie** automatically.

split (2 bytes): An unsigned integer that specifies what determines the split between the primary pie and the secondary bar/pie. MUST be ignored if **fAutoSplit** is set to 1. MUST be a value from the following table:

Value	Type of split	Meaning
0x0000	Position	The data is split based on the position of the data point in the <u>series</u> as specified by iSplitPos .
0x0001	Value	The data is split based on a threshold value as specified by numSplitValue.
0x0002	Percent	The data is split based on a percentage threshold and the data point values represented as a percentage as specified by pcSplitPercent .
0x0003	Custom	The data is split as arranged by the user. Custom split is specified in a following BopPopCustom record.

iSplitPos (2 bytes): A signed integer that specifies how many data points are contained in the secondary bar/pie. Data points are contained in the secondary bar/pie starting from the end of the series. For example, if the value is 2, the last 2 data points in the series are contained in the secondary bar/pie. MUST be a value greater than or equal to 0 and less than or equal to 32000. If the value is more than the number of data points in the series, the entire series will be in the secondary bar/pie, except for the first data point. If **split** is not set to 0x0000 or **fAutoSplit** is set to 1, this value MUST be ignored.

pcSplitPercent (2 bytes): A signed integer that specifies the percentage below which each data point is contained in the secondary bar/pie as opposed to the primary pie. The percentage value of a data point is calculated using the following formula:

(value of the data point x 100) / sum of all data points in the series

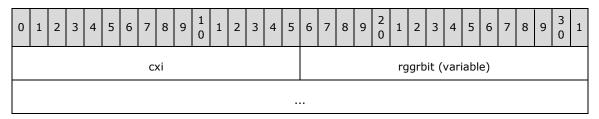

If **split** is not set to 0x0002 or if **fAutoSplit** is set to 1, this value MUST be ignored

- **pcPie2Size (2 bytes):** A signed integer that specifies the size of the secondary bar/pie as a percentage of the size of the primary pie. MUST be a value greater than or equal to 5 and less than or equal to 200.
- **pcGap (2 bytes):** A signed integer that specifies the distance between the primary pie and the secondary bar/pie. The distance is specified as a percentage of the average width of the primary pie and secondary bar/pie. MUST be a value greater than or equal to 0 and less than or equal to 500, where 0 is 0% of the average width of the primary pie and the secondary bar/pie, and 500 is 250% of the average width of the primary pie and the secondary bar/pie.
- **numSplitValue (8 bytes):** An Xnum (section 2.5.342) value that specifies the split when the **split** field is set to 0x0001. The value of this field specifies the threshold that selects which data points of the primary pie move to the secondary bar/pie. The secondary bar/pie contains any data points with a value less than the value of this field. If **split** is not set to 0x0001 or if **fAutoSplit** is set to 1, this value MUST be ignored.
- A fHasShadow (1 bit): A bit that specifies whether one or more data points in the chart group have shadows.

reserved (15 bits): MUST be zero, and MUST be ignored.

2.4.26 BopPopCustom

The **BopPopCustom** record specifies which <u>data points</u> in the <u>series</u> are contained in the **secondary bar/pie** instead of the **primary pie**. MUST follow a <u>BopPop</u> record that has its **split** field set to Custom (0x0003).

- **cxi (2 bytes):** An unsigned integer that specifies to the number of data points in the series plus one. MUST be less than 32000.
- **rggrbit (variable):** A sequence of bits that specifies whether each data point in the series is contained in the primary pie or the secondary bar/pie. For each data point a corresponding bit specifies whether a data point is contained in the secondary bar/pie or primary pie as specified in the following table:

Value	Meaning
0	Data point is contained in the primary pie.
1	Data point is contained in the secondary bar/pie.

The size of this field, in bytes, is calculated using the following formula:

size of **rggrbit** in bytes = 1+floor(**cxi** / 8)

The padding of this field, in bits, is calculated using the following formula:

padding = size of rggrbit in bits - cxi

The position of each bit in the sequence corresponds to the position of each data point in the series arranged as follows:

- Any padding is placed in the most significant bits of the first byte. The next most significant bit of the first byte corresponds to the first data point in the series. If there are any more unused bits in the first byte, the next most significant bit corresponds to the second data point in the series. This pattern continues until there are no remaining unused bits in the first byte.
- The most significant bit of the next byte corresponds to the next data point in the series. The next most significant bit contains the next data point in the series. This pattern continues for each byte in the sequence.
- The least significant bit of the final byte is an additional bit that specifies whether the secondary bar/pie does not contain data points. If the value of the additional bit is 1, the value of every other bit MUST be 0.

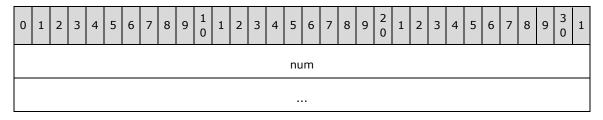

The following figure demonstrates this order:

Byte 0							
0 (LSB)	1	2	3	4	5	6	7
Data Point 3	Data Point 2	Data Point 1	Data Point 0		Pad	ding	

Byte 1							
8	9	10	11	12	13	14	15 (MSB)
Additional Bit	Data Point 10	Data Point 9	Data Point 8	Data Point 7	Data Point 6	Data Point 5	Data Point 4

2.4.27 BottomMargin

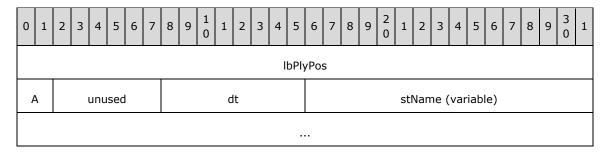

The **BottomMargin** record specifies the bottom margin of the current **sheet (1)**.

num (8 bytes): An Xnum (section <u>2.5.342</u>) value that specifies the bottom margin of the current sheet (1) in inches. The value MUST be greater than or equal to 0 and less than or equal to 49.

2.4.28 BoundSheet8

The **BoundSheet8** record specifies basic information about a **sheet (1)**, including the sheet (1) name, **hidden** state, and type of sheet (1).

IbPlyPos (4 bytes): A FilePointer as specified in [MS-OSHARED] section 2.2.1.5 that specifies the stream position of the start of the BOF record for the sheet (1).

A - hsState (2 bits): An unsigned integer that specifies the hidden state of the sheet (1). MUST be a value from the following table:

Value	Meaning
0x00	Visible
0x01	Hidden
0x02	Very Hidden; the sheet (1) is hidden and cannot be displayed using the user interface.

unused (6 bits): Undefined and MUST be ignored.

dt (8 bits): An unsigned integer that specifies the sheet (1) type. MUST be a value from the following table:

Value	Meaning
0x00	Worksheet or dialog sheet
	The sheet substream that starts with the BOF record specified in IbPlyPos MUST contain one <u>WsBool</u> record. If the fDialog field in that WsBool is 1 then the sheet is dialog sheet. Otherwise, the sheet is a worksheet.
0x01	Macro sheet
0x02	Chart sheet
0x06	VBA module

stName (variable): A <u>ShortXLUnicodeString</u> structure that specifies the unique case-insensitive name of the sheet (1). The character count of this string, **stName.cch**, MUST be greater than or equal to 1 and less than or equal to 31. The string MUST NOT contain the any of the following characters:

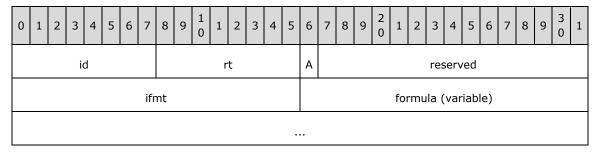

- 0x0000
- 0x0003

- colon (:)
- backslash (\)
- asterisk (*)
- question mark (?)
- forward slash (/)
- opening square bracket ([)
- closing square bracket (])

The string MUST NOT begin or end with the single quote (') character.

2.4.29 BRAI

The **BRAI** record specifies a reference to data in a sheet that is used by a part of a <u>series</u>, <u>legend</u> <u>entry</u>, <u>trendline</u> or <u>error bars</u>.

id (1 byte): An unsigned integer that specifies the part of the series, trendline, or error bars the referenced data specifies. MUST be a value from the following table:

Value	Meaning
0x00	Referenced data specifies the series, legend entry, or trendline name. Error bars name MUST be empty.
0x01	Referenced data specifies the values or horizontal values on bubble and scatter <u>chart groups</u> of the series and error bars.
0x02	Referenced data specifies the categories (2) or vertical values on bubble and scatter chart groups of the series and error bars.
0x03	Referenced data specifies the bubble size values of the series.

rt (1 byte): An unsigned integer that specifies the type of data that is being referenced. MUST be a value from the following table:

Value	Meaning
0×00	The data source is a category (2) name, series name or bubble size that was automatically generated.
0x01	The data source is the text or value as specified by the formula field.
0x02	The data source is the value from a range of cells in a sheet specified by the formula field.

A - fUnlinkedIfmt (1 bit): A bit that specifies whether the part of the <u>chart</u> specified by the **id** field uses number formatting from the referenced data. MUST be a value from the following table:

Value	Meaning
0x0	The data uses the number formatting of the referenced data.
0x1	The data uses the custom number formatting specified in the ifmt field.

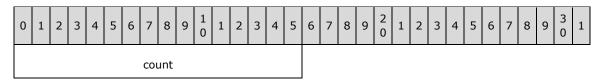

reserved (15 bits): MUST be zero, and MUST be ignored.

ifmt (2 bytes): An IFmt structure that specifies the number format to use for the data.

formula (variable): A <u>ChartParsedFormula</u> structure that specifies the formula (section <u>2.2.2</u>) that specifies the reference.

2.4.30 BuiltInFnGroupCount

The **BuiltInFnGroupCount** record specifies the beginning of a collection of records as defined by the <u>Globals Substream</u> **ABNF**. The collection of records specifies information about the built-in **function categories** in the **workbook**.

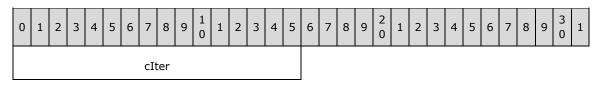

count (2 bytes): An unsigned integer that specifies the number of built-in function categories in the workbook. The sum of count, the count of FnGroupName (section 2.4.120) records and the count of FnGrp12 (section 2.4.121) records in the current workbook MUST be less than or equal to 256. The user-defined function categories include those defined in FnGroupName records and FnGrp12 records. The value MUST be one of the following:

Value	Meaning
0x0E	There are 14 built-in function categories in the workbook. This implies that the file was last saved by a specific version of the application <46>.
	The following 9 built-in function categories are visible to the end-user: Financial, Date & Time, Math & Trig, Statistical, Lookup & Reference, Database, Text, Logical, Information.
	The following 5 built-in function categories are not visible to the end-user: UserDefined, Commands, Customize, MacroControl, DDEExternal.
0x10	There are 16 built-in function categories in the workbook. This implies that the file was last saved by a specific version of the application <47>.
	The following 11 built-in function categories are visible to the end-user: Financial, Date & time, Math & Trig, Statistical, Lookup & Reference, Database, Text, Logical, Information, Engineering, Cube.
	The following 5 built-in function categories are not

Value	Meaning
	visible to the end-user: UserDefined, commands,
	Customize, MacroControl, DDEExternal

2.4.31 CalcCount

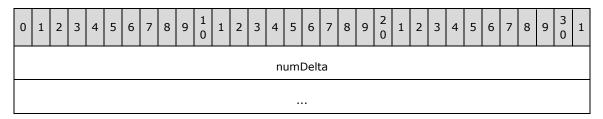

The CalcCount record specifies the iteration count for a calculation in iterative calculation mode.

cIter (2 bytes): A signed integer that specifies the maximum number of iterations that can occur for a calculation in iterative calculation mode. MUST be greater than or equal to one and less than or equal to 32767.

2.4.32 CalcDelta

The **CalcDelta** record specifies the minimum value change required for **iterative calculation** to continue.

numDelta (8 bytes): An Xnum (section <u>2.5.342</u>) value that specifies the amount of change in value for a given **cell** from the previously calculated value for that cell that MUST exist for the iteration to continue. The value MUST be greater than or equal to 0.

2.4.33 CalcIter

The CalcIter record specifies the state of iterative calculation.

vfIter (2 bytes): A **Boolean** (section 2.5.14) that specifies whether to enable iterative calculation.

If the value is 0, iterative calculation is disabled. If the value is 1, iterative calculation is enabled.

2.4.34 CalcMode

The **CalcMode** record specifies the **calculation mode** for the workbook.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
						fA	utol	Rec	alc																						

fAutoRecalc (2 bytes): A signed integer that specifies whether the calculation mode is automatic or manual.

The value MUST be one of the following:

Value	Meaning
0	Manual
1	Automatic
2	Automatic, except for tables

2.4.35 CalcPrecision

The **CalcPrecision** record specifies the calculation precision mode for the **workbook**.

fFullPrec (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether the **precision as displayed** mode is **selected**.

If the value is 0, the precision as displayed mode is selected. If the value is 1, the precision as displayed mode is not selected.

2.4.36 CalcRefMode

The **CalcRefMode** record specifies the **reference style** for the workbook.

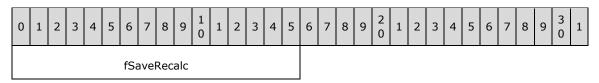

fRefA1 (2 bytes): A Boolean (section 2.5.14) that specifies the reference style for all formulas.

If the value is 0, the mode is **R1C1**. If the value is 1, the mode is **A1**.

2.4.37 CalcSaveRecalc

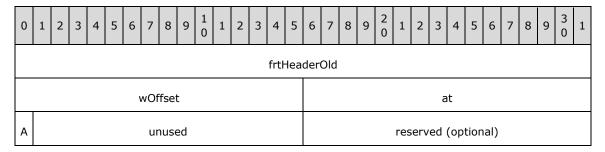

The **CalcSaveRecalc** record specifies the recalculation behavior.

fSaveRecalc (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether to **recalculate** the **workbook** before it is saved, when in manual **calculation mode**. If the value is 0, the workbook is not recalculated before it is saved. If the value is 1, the workbook is recalculated before it is saved.

2.4.38 CatLab

The **CatLab** record specifies the attributes of the axis label.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0856.

wOffset (2 bytes): An unsigned integer that specifies the distance between the axis and axis label. It contains the offset as a percentage of the default distance. The default distance is equal to 1/3 the height of the **font** calculated in pixels. MUST be a value greater than or equal to 0 (0%) and less than or equal to 1000 (1000%).

at (2 bytes): An unsigned integer that specifies the alignment of the axis label. MUST be a value from the following table:

Value	Alignment
0x0001	Top-aligned if the trot field of the <u>Text</u> record of the axis is not equal to 0. Left-aligned if the iReadingOrder field of the Text record of the axis specifies left-to-right reading order ; otherwise, right-aligned.
0x0002	Center-alignment
0x0003	Bottom-aligned if the trot field of the Text record of the axis is not equal to 0. Right-aligned if the iReadingOrder field of the Text record of the axis specifies left-to-right reading order; otherwise, left-aligned.

A - cAutoCatLabelReal (1 bit): A bit that specifies whether the number of categories (2) between axis labels is set to the default value. MUST be a value from the following table:

Value	Description
0	The value is set to catLabel field as specified by <u>CatSerRange</u> record.
1	The value is set to the default value. The number of category (2) labels is automatically calculated by the application based on the data in the <u>chart</u> .

unused (15 bits): Undefined, and MUST be ignored.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.39 CatSerRange

The CatSerRange record specifies the properties of a category (2) axis, a date axis, or a series axis.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
catCross																			C	atL	abe	ıl									
catMark												Α	В	С						res	serv	ed									

catCross (2 bytes): A signed integer that specifies where the value axis crosses this axis, based on the following table. If fMaxCross is set to 1, the value this field MUST be ignored.

Axis Type	catCross Range
Category (2) axis	This field specifies the category (2) at which the value axis crosses. For example, if this field is 2, the value axis crosses this axis at the second category (2) on this axis. MUST be greater than or equal to 1 and less than or equal to 31999.
Series axis	MUST be 0.
Date axis	catCross MUST be equal to the value given by the following formula:
	<pre>catCross = catCrossDate - catMin + 1</pre>
	Where catCrossDate is the catCrossDate field of the <u>AxcExt</u> record and catMin is the catMin field of the AxcExt record.

- **catLabel (2 bytes):** A signed integer that specifies the interval between axis labels on this axis. MUST be greater than or equal to 1 and less than or equal to 31999. MUST be ignored for a date axis.
- catMark (2 bytes): A signed integer that specifies the interval at which major tick marks and minor tick marks are displayed on the axis. Major tick marks and minor tick marks that would have been visible are hidden unless they are located at a multiple of this field. MUST be greater than or equal to 1, and less than or equal to 31999. MUST be ignored for a date axis.
- **A fBetween (1 bit):** A bit that specifies whether the value axis crosses this axis between major tick marks. MUST be a value from to following table:

Value	Meaning
0	The value axis crosses this axis on a major tick mark.
1	The value axis crosses this axis between major tick marks.

B - fMaxCross (1 bit): A bit that specifies whether the value axis crosses this axis at the last category (2), the last series, or the maximum date. MUST be a value from the following table:

Value	Meaning
0	The value axis crosses this axis at the value specified by catCross .
1	The value axis crosses this axis at the last category (2), the last series, or the maximum date.

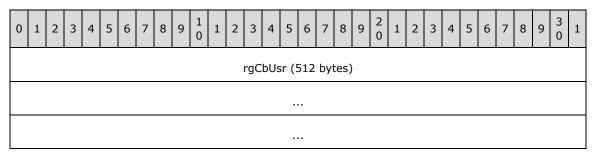

C - fReverse (1 bit): A bit that specifies whether the axis is displayed in reverse order. MUST be a value from the following table:

Value	Meaning
0	The axis is displayed in order.
1	The axis is display in reverse order.

reserved (13 bits): MUST be zero, and MUST be ignored.

2.4.40 CbUsr

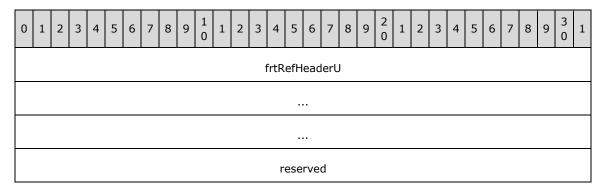

The **CbUsr** record specifies the size of each <u>UsrInfo</u> record stored as part of a <u>shared workbook</u>.

rgCbUsr (512 bytes): An array of 2-byte unsigned integers. Each element in the array specifies the byte count for the UsrInfo record whose index in the collection of UsrInfo records following CbUsr corresponds to the index of the element. Array elements with a zero-based index greater than or equal to the count of users specified in the **iCount** field in <u>CUsr</u> MUST be zero and MUST be ignored.

2.4.41 CellWatch

The CellWatch record specifies a reference to a watched cell.

frtRefHeaderU (12 bytes): An FrtRefHeaderU structure that specifies the cell to be watched. The frtRefHeaderU.rt field MUST be 0x086C. The frtRefHeaderU.grbitFrt.fFrtRef MUST be 1. The frtRefHeaderU.ref8 specifies the cell.

reserved (4 bytes): MUST be zero, and MUST be ignored.

2.4.42 CF

The **CF** record specifies a **conditional formatting** rule.

0	0 1 2 3 4 5 6 7 8 9 1 1 2 3 4 5 6 7 8 9 3 0													4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
ct cp														cce1																	
	cce2 rgbdxf (variable)																														
													r	gce:	1 (v	aria	able	e)													
	rgce2 (variable)																														

ct (1 byte): An unsigned integer that specifies the type of condition. MUST be a value from the following table:

Value	Meaning
0x01	Apply the conditional formatting when the comparison function specified by cp applied to the cell value, rgce1 and rgce2 , evaluates to TRUE.
0x02	Apply the conditional formatting when the formula (section 2.2.2) specified by rgce1 evaluates to TRUE.

cp (1 byte): An unsigned integer that specifies the comparison function used when ct is equal to 0x01. In the following table, v represents the cell value, and v1 and v2 represent the results of evaluating the formulas specified by rgce1 and rgce2. The value of this field MUST be a value from the following table:

Value	Apply the conditional formatting if
0x01	v2 is greater than or equal to $v1$, and v is greater than or equal to $v1$ and less than or equal to $v2$ –Or–
	v1 is greater than $v2$, and v is greater than or equal to $v2$ and less than or equal to $v1$
0x02	v2 is greater than or equal to $v1$, and v is less than $v1$ or greater than $v2$ -Or-
	v1 is greater than $v2$, and v is less than $v2$ or greater than $v1$
0x03	v is equal to v1
0x04	v is not equal to v1
0x05	v is greater than v1
0x06	v is less than v1

Value	Apply the conditional formatting if
0x07	v is greater than or equal to $v1$
0x08	v is less than or equal to $v1$

- cce1 (2 bytes): An unsigned integer that specifies the size of rgce1 in bytes. MUST be less than or equal to 16409.
- cce2 (2 bytes): An unsigned integer that specifies the size of rgce2 in bytes. MUST be zero when ct is equal to 0x02. MUST be zero when ct is equal to 0x01 and cp is greater than 0x02. MUST be less than or equal to 16409.
- **rgbdxf (variable):** A <u>DXFN</u> structure that specifies the formatting to apply to a cell that fulfills the condition.
- rgce1 (variable): A CFParsedFormulaNoCCE structure that specifies the first formula. If ct is equal to 0x01, this field is the first operand of the comparison. If ct is equal to 0x02, this formula is used to determine if the conditional formatting is applied. The size of rgce1 in bytes MUST be equal to cce1.
- **rgce2** (variable): A CFParsedFormulaNoCCE structure that specifies the formula that is the second operand of the comparison if **ct** is equal to 0x01 and **cp** is either equal to 0x01 or 0x02. The size of **rgce2** in bytes MUST be equal to **cce2**.

2.4.43 CF12

The **CF12** record specifies a **conditional formatting** rule.

All CF12 records MUST follow a CondFmt12 record, another CF12 record, or a CFEx record.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	5 6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														frtF	Ref	fHead	der														
	ct cp cce1																														
							CC	e2														dxf	(va	ırial	ole)						
													r	gce:	1 ((varia	able	e)													
	rgce2 (variable)																														

	fmlaActive (variable)												
Α	A B C D E ipriority icfTemplate												
	cbTemplateParm rgbTemplateParms (16 bytes)												
rgbCT (variable)													

frtRefHeader (12 bytes): An <u>FrtRefHeader</u>. The **frtRefHeader.rt** field MUST be 0x087A. The **frtRefHeader.grbitFrt.fFrtRef** field MUST be zero. All of the fields of the **frtRefHeader.ref8** structure MUST be zero and MUST be ignored.

ct (1 byte): An unsigned integer that specifies the type of condition. This field determines the type of the **rgbCT** field as specified in the following table. MUST be a value from the following table:

Value	Meaning
0x01	Apply the conditional formatting if the comparison operation specified by cp evaluates to TRUE
	rgbCT MUST be omitted.
0x02	Apply the conditional formatting if the formula (section 2.2.2) specified by rgce1 evaluates to TRUE.
	rgbCT MUST be omitted.
0x03	Use color scale formatting.
	rgbCT is a <u>CFGradient</u> .
0x04	Use data bar formatting.
	rgbCT is a CFDatabar.
0x05	Apply the conditional formatting when the cell value passes a filter specified in the rgbCT structure.
	rgbCT is a <u>CFFilter</u> .
0x06	Use icon set formatting
	rgbCT is a <u>CFMultistate</u> .

cp (1 byte): An unsigned integer that specifies the comparison **function** used when **ct** is equal to 0x01. In the following table, *v* represents the cell value, and *v1* and *v2* represent the results of evaluating **rgce1** and **rgce2**. The value of this field MUST be a value from the following table:

Value	Apply the conditional formatting if									
0x01	v2 is greater than or equal to $v1$, and v is greater than or equal to $v1$ and less than or equal to $v2$									

Value	Apply the conditional formatting if
	-Or-
	v1 is greater than $v2$, and v is greater than or equal to $v2$ and less than or equal to $v1$
0x02	v2 is greater than or equal to $v1$, and v is less than $v1$ or greater than $v2$ $-Or-$
	v1 is greater than $v2$, and v is less than $v2$ or greater than $v1$
0x03	v is equal to v1
0x04	v is not equal to v1
0x05	v is greater than v1
0x06	v is less than v1
0x07	v is greater than or equal to v1
0x08	v is less than or equal to v1

- **cce1 (2 bytes):** An unsigned integer that specifies the size of **rgce1** in bytes. MUST be zero unless **ct** is equal to 0x01 or 0x02. MUST be less than or equal to 16409.
- cce2 (2 bytes): An unsigned integer that specifies the size of rgce2 in bytes. MUST be zero unless ct is equal to 0x01 and cp is equal to 0x01 or 0x02. MUST be less than or equal to 16409.
- **dxf (variable):** A <u>DXFN12</u> that specifies the formatting to apply to a cell that fulfills the condition. If **ct** is equal to 0x03, 0x04 or 0x06, then **dxf.cbDxf** MUST be equal to 0x00000000.
- **rgce1 (variable):** A <u>CFParsedFormulaNoCCE</u> that specifies the formula used to evaluate the first operand in a comparison when **ct** is 0x01. If **ct** is 0x02 **rgce1** MUST be a Boolean function.
- **rgce2 (variable):** A CFParsedFormulaNoCCE that specifies the formula used to evaluate the second operand of the comparison when **ct** is 0x01 and **cp** is either 0x01 or 0x02.
- **fmlaActive (variable):** A <u>CFParsedFormula</u> that specifies the formula that specifies an activity condition for the color scale, data bar and icon set formatting rule types. If **ct** is equal to 0x03, 0x04 or 0x06, then the conditional formatting is applied if **fmlaActive** evaluates to TRUE.
- A unused1 (1 bit): Undefined and MUST be ignored.
- **B fStopIfTrue (1 bit):** A bit that specifies whether, when a cell fulfills the condition corresponding to this rule, the lower priority conditional formatting rules that apply to this cell are evaluated. MUST be one of the following values:

Value	Meaning
0x0	Evaluate lower priority conditional formatting rules that apply to this cell
0x1	If the cell fulfills the condition corresponding to this rule, do not evaluate lower priority conditional formatting rules that apply to this cell

MUST be zero when ct is equal to 0x03, 0x04 or 0x06.

C - reserved1 (2 bits): MUST be zero and MUST be ignored.

D - unused2 (1 bit): Undefined and MUST be ignored.

E - reserved2 (3 bits): MUST be zero and MUST be ignored.

ipriority (2 bytes): An unsigned integer that specifies the priority of the rule. Rules that apply to the same cell are evaluated in increasing order of **ipriority**. MUST be unique across all CF12 records and CFExNonCF12 structures in the worksheet substream.

icfTemplate (2 bytes): An unsigned integer that specifies the **template** from which the rule was created. MUST be a value from the following table:

Value	Meaning
0x0000	Cell value
0x0001	Formula
0x0002	Color scale formatting
0x0003	Data bar formatting
0x0004	Icon set formatting
0x0005	Filter
0x0007	Unique values
0x0008	Contains text
0x0009	Contains blanks
0x000A	Contains no blanks
0x000B	Contains errors
0x000C	Contains no errors
0x000F	Today
0x0010	Tomorrow
0x0011	Yesterday
0x0012	Last 7 days
0x0013	Last month
0x0014	Next month
0x0015	This week
0x0016	Next week
0x0017	Last week
0x0018	This month
0x0019	Above average
0x001A	Below Average
0x001B	Duplicate values
0x001D	Above or equal to average
0x001E	Below or equal to average

cbTemplateParm (1 byte): An unsigned integer that specifies the size of the **rgbTemplateParms** field in bytes. MUST be 16.

rgbTemplateParms (16 bytes): A CFExTemplateParams that specifies the parameters for the rule.

rgbCT (variable): A field that specifies the parameters of this rule. The type of **rgbCT** depends on the value of **ct**.

2.4.44 CFEx

The **CFEx** record extends a <u>CondFmt</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
													f	rtR	efH	ead	lerU	J													
														f	IsC	F12	<u>)</u>														
							nI	D												r	gb0	Conf	ten	t (v	aria	ble)				

frtRefHeaderU (12 bytes): An FrtRefHeaderU. The frtRefHeaderU.rt field MUST be 0x087B. The frtRefHeaderU.grbitFrt.fFrtRef MUST be 1. The frtRefHeaderU.ref8 MUST be equal to the sqref field of the associated CondFmt record specified by nID.

fIsCF12 (4 bytes): A Boolean (section 2.5.14) that specifies what type of rule this record extends. MUST be one of the following values:

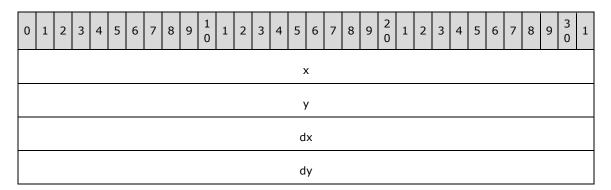

Value	Meaning
0x0000000	This record extends a rule specified by a <u>CF</u> record and MUST NOT be followed by a <u>CF12</u> record.
0x0000001	This record extends a rule specified by a CF12 record and MUST be followed by the CF12 record it extends.

nID (2 bytes): An unsigned integer that specifies which CondFmt record is being extended. It MUST be equal to the **nID** field of one of the CondFmt records in the Worksheet substream.

rgbContent (variable): A <u>CFExNonCF12</u> structure that specifies the extensions to an existing CF record. MUST be omitted when **fIsCF12** is not equal to 0x00.

2.4.45 Chart

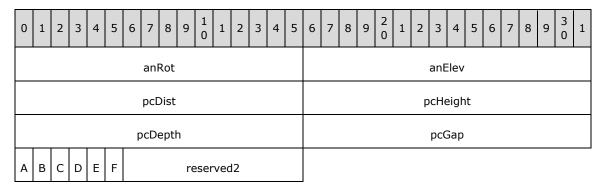

The **Chart** record specifies the position and size of the **chart area** (section <u>2.2.3.17</u>) and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a <u>chart</u>. The position information MUST be ignored if the chart is embedded in a sheet.

- x (4 bytes): A FixedPoint as specified in [MS-OSHARED] section 2.2.1.6 that specifies the horizontal position of the upper-left corner of the chart in points. SHOULD<48> be greater than or equal to zero.
- y (4 bytes): A FixedPoint as specified in [MS-OSHARED] section 2.2.1.6 that specifies the vertical position of the upper-left corner of the chart in points. SHOULD<49> be greater than or equal to zero.
- **dx (4 bytes):** A FixedPoint as specified in [MS-OSHARED] section 2.2.1.6 that specifies the width in points. SHOULD<50> be greater than or equal to zero.
- **dy (4 bytes):** A FixedPoint as specified in [MS-OSHARED] section 2.2.1.6 that specifies the height in points. SHOULD<51> be greater than or equal to zero.

2.4.46 Chart3d

The **Chart3d** record specifies that the **plot area** of the <u>chart group</u> is rendered in a 3-D scene and also specifies the attributes of the 3-D plot area. The preceding chart group type MUST be of type bar, pie, line, area, or surface.

- anRot (2 bytes): A signed integer that specifies the clockwise rotation, in degrees, of the 3-D plot area around a vertical line through the center of the 3-D plot area. MUST be greater than or equal to 0 and MUST be less than or equal to 360. If chart group type is bar and the value of field fTranspose in the record Bar is 1, then MUST be less than or equal to 44.
- anElev (2 bytes): A signed integer that specifies the rotation, in degrees, of the 3-D plot area around a horizontal line through the center of the 3-D plot area. MUST be greater than or equal to -90 and MUST be less than or equal to 90. If the chart group type is bar and the value of field fTranspose in the record Bar is 1, or the chart group type is pie then MUST be greater than or equal to 0. If the chart group type is bar and the value of field fTranspose in the record Bar is 1, then the value MUST be less than or equal to 44.
- **pcDist (2 bytes):** A signed integer that specifies the field of view angle for the 3-D plot area. MUST be greater than or equal to zero and less than 200. SHOULD<52> be less than or equal to 100.
- **pcHeight (2 bytes):** If **fNotPieChart** is 0, then this is an unsigned integer that specifies the thickness of the pie for a pie chart group. If **fNotPieChart** is 1, then this is a signed integer that specifies the height of the 3-D plot area as a percentage of its width. SHOULD<53> be greater than or equal to 5, MUST be less than 65535 and SHOULD<54> be less than or equal to 500.
- **pcDepth (2 bytes):** A signed integer that specifies the depth of the 3-D plot area as a percentage of its width. MUST be greater than or equal to 1 and less than or equal to 2000.
- **pcGap (2 bytes):** An unsigned integer that specifies the width of the gap between the <u>series</u> and the front and back edges of the 3-D plot area as a percentage of the <u>data point</u> depth divided by 2. If

fCluster is not 1 and chart group type is not a bar then **pcGap** also specifies distance between adjacent series as a percentage of the data point depth. MUST be less than or equal to 500.

A - fPerspective (1 bit): A bit that specifies whether the 3-D plot area is rendered with a vanishing point. If fNotPieChart is 0 the value MUST be 0. If fNotPieChart is 1 then the value MUST be a value from the following table:

Value	Meaning
0	No vanishing point applied.
1	Perspective vanishing point applied based on value of pcDist.

B - fCluster (1 bit): A bit that specifies whether data points are clustered together in a bar chart group. If chart group type is not bar or pie, value MUST be ignored. If chart group type is pie, value MUST be 0. If chart group type is bar, then the value MUST be a value from the following table:

Value	Meaning							
0	Data points are not clustered.							
1	Data points are clustered.							

C - f3DScaling (1 bit): A bit that specifies whether the height of the 3-D plot area is automatically determined. If **fNotPieChart** is 0 then this MUST be 0. If **fNotPieChart** is 1 then the value MUST be a value from the following table:

Value	Meaning
0	The value of pcHeight is used to determine the height of the 3-D plot area
1	The height of the 3-D plot area is automatically determined

- **D reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **E fNotPieChart (1 bit):** A bit that specifies whether the chart group type is pie. MUST be a value from the following table:

Value	Meaning								
0	Chart group type MUST be pie.								
1	Chart group type MUST NOT be pie.								

F - fWalls2D (1 bit): A bit that specifies whether the **walls** are rendered in 2-D<55>. If **fPerspective** is 1 then this MUST be ignored. If the chart group type is not bar, area or pie this MUST be ignored. If the chart group is of type bar and **fCluster** is 0, then this MUST be ignored. If the chart group type is pie this MUST be 0 and MUST be ignored. If the chart group type is bar or area, then the value MUST be a value from the following table:

Value	Meaning
0	Chart walls and floor are rendered in 3D.
1	Chart walls are rendered in 2D and the chart floor is not rendered.

reserved2 (10 bits): MUST be zero, and MUST be ignored.

2.4.47 Chart3DBarShape

The **Chart3DBarShape** record specifies the shape of the <u>data points</u> in a bar or column <u>chart group</u>. This record is only used for a bar or column chart group and MUST be ignored for all other chart groups. This record MUST be ignored if the current substream does not contain a <u>Chart3d</u> record.

riser (1 byte): A Boolean (section 2.5.14) that specifies the shape of the base of the data points in a bar or column chart group. MUST be a value from the following table:

Value	Meaning
0x00	The base of the data point is a rectangle.
0x01	The base of the data point is an ellipse.

taper (1 byte): An unsigned integer that specifies how the data points in a bar or column chart group taper from base to tip. MUST be a value from the following table:

Value	Meaning
0x00	The data points of the bar or column chart group do not taper. The shape at the maximum value of the data point is the same as the shape at the base.
0x01	The data points of the bar or column chart group taper to a point at the maximum value of each data point.
0x02	The data points of the bar or column chart group taper towards a projected point at the position of the maximum value of all of the data points in the chart group, but are clipped at the value of each data point.

2.4.48 ChartFormat

The **ChartFormat** record specifies properties of a <u>chart group</u> and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a chart group.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	reserved1																														
	reserved2																														
														re	eser	vec	13														
														re	eser	vec	14														
A reserved5																		ic	rt												

reserved1 (4 bytes): MUST be zero, and MUST be ignored.
reserved2 (4 bytes): MUST be zero, and MUST be ignored.
reserved3 (4 bytes): MUST be zero, and MUST be ignored.
reserved4 (4 bytes): MUST be zero, and MUST be ignored.

A - fVaried (1 bit): A bit that specifies whether the color for each data point and the color and type for each data marker varies. If the chart group has multiple series, or the chart group has one series and the type is either a surface, stock, or area chart group, then this field MUST be ignored, and the data points do not vary. For all other chart group types, if the chart group has one series, then a value of 0x1 specifies that the data points vary. MUST be a value from the following table:

Value	Meaning
0x0	The color for each data point and the color and type for each data marker does not vary.
0x1	The color for data points or the color or type for data markers varies.

reserved5 (15 bits): MUST be zero, and MUST be ignored.

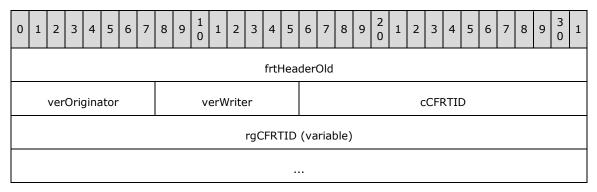

icrt (2 bytes): An unsigned integer that specifies the drawing order of the chart group relative to the other chart groups, where 0x0000 is the bottom of the **z-order**. This value MUST be unique for each instance of this record and MUST be less than or equal to 0x0009.

2.4.49 ChartFrtInfo

The **ChartFrtInfo** record specifies the versions of the application that originally created and last saved the file, and the <u>Future Record</u> identifiers that are used in the file. This property was introduced by a version of the application <56> as a Future Record for a <u>chart</u>.

In a file written by some versions of the application ≤ 57 , this record appears before the end of the <u>Chart</u> record block and before any other Future Record in the record stream. This record does not exist in a file created by certain versions of the application ≤ 58 , but appears after the <u>End</u> record of the Chart record block in a file updated by other versions of the application ≤ 59 , in which case the **verWriter** field MUST be a certain version of the application ≤ 60 regardless of the actual value in the record.

If a <u>CrtMIFrt</u> record exists in a sequence of records that conforms to the <u>CRTMLFRT</u> rule of the chart sheet substream, then this record MUST immediately precede the sequence of records that conforms to the <u>PAGESETUP</u> rule for the chart sheet substream. Otherwise, it MUST immediately precede the first chart-specific future record, which is a <u>record</u> that has a record number greater than or equal to 2048 and less than or equal to 2303 according to <u>Record Enumeration</u>.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0850.

verOriginator (1 byte): An unsigned integer that specifies the application version that originally created the file. MUST be a value from the following table:

Value	Meaning
0x9	Specifies the application version<61>
0xA	Specifies the application version<62>
0xC	Specifies the application version<63>
0xE	Specifies the application version<64>
0xF	Specifies the application version<65>

verWriter (1 byte): An unsigned integer that specifies the application version that last saved the file. MUST be a value from the following table:

Value	Meaning
0x9	Specifies the application version<66>
0xA	Specifies the application version<67>
0xC	Specifies the application version<68>
0xE	Specifies the application version<69>
0xF	Specifies the application version<70>

cCFRTID (2 bytes): An unsigned integer that specifies the number of elements in **rgCFRTID**. The value depends on the value in **verWriter**. It MUST be 0x1 if **verWriter** is 0x9; 0x3 if **verWriter** is 0xA; 0x4 if **verWriter** is 0xC or 0xE.

rgCFRTID (variable): An array of <u>CFrtId</u> structures. This field specifies the range of Future Record Type identifiers used in the chart. The range of values is determined by the value of **verWriter** as specified in the following table:

verWriter value	Value range(first,last)									
0x9	0x0850, 0x085A									
0xA	0x0850, 0x085A 0x0861, 0x0861 0x086A, 0x086B									
0xC or 0xE	0x0850, 0x085A 0x0861, 0x0861 0x086A, 0x086B 0x089D, 0x08A6									

2.4.50 CIrtClient

The **CirtClient** record specifies a **custom color palette** for a chart.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ccv															rg	Col	or (var	iabl	e)										

...

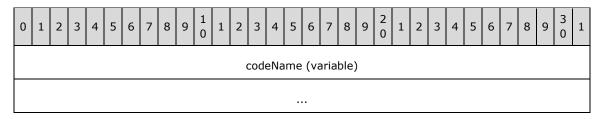

ccv (2 bytes): A signed integer that specifies the number of colors in the rgColor array. The value MUST be 3.

rgColor (variable): An array of <u>LongRGB</u> structures. The array specifies the colors of the **color palette**. The elements MUST contain the following values:

Index	Element	Value
0	Foreground color	This value MUST be equal to the system window text color.
1	Background color	This value MUST be equal to the system window color.
2	Neutral color	This value MUST be black.

2.4.51 CodeName

The **CodeName** record specifies the name of a **workbook** object, a sheet object in the **VBA project** located in this file. If this record is in the <u>Globals Substream</u>, the name is for the workbook object. If this record is in a <u>Chart Sheet Substream</u>, the name is for the **chart sheet** object representing the sheet. If this record is in a <u>Macro Sheet Substream</u>, the name is for the **macro sheet** object representing the sheet. If this record is in a <u>Dialog Sheet Substream</u>, the name is for the **dialog sheet** object representing the sheet. If this record is in a <u>Worksheet Substream</u>, the name is for the **worksheet** object representing the sheet.

codeName (variable): An <u>XLUnicodeString</u> structure that specifies the name used to identify the workbook object or sheet object in the VBA project embedded in this file. The value of **codename.cch** MUST be less than or equal to 31.

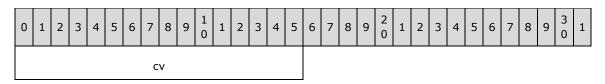

If this string is not empty, it MUST contain only the characters that can be mapped from **Unicode** to a multiple-byte **ANSI character set** specified by the system **locale**. If the system locale is Chinese, Japanese, or Korean, then the full-width characters in the resulting ANSI string are further mapped to corresponding half-width characters where applicable.

In the resulting ANSI string, the first character MUST be a letter, a single-byte character with a code greater than 0x7F, or multiple-byte character. The subsequent characters in the resulting ANSI string MUST be a digit, an underscore, a single-byte character with a code greater that 0x7F, or a multiple-byte character.

If the system locale is Japanese, the original Unicode string MUST NOT contain a character with a code equal to 0xFFE3.

2.4.52 CodePage

The **CodePage** record specifies **code page** information for the **workbook**.

cv (2 bytes): An unsigned integer that specifies the workbook's code page. The value MUST be one of the code page values specified in [CODEPG] or the special value 1200, which means that the workbook is Unicode.

2.4.53 ColInfo

The **ColInfo** record specifies the column formatting for a **range** of columns.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	colFirst colLast																														
							col	ldx															ix	fe							
Α	A B C D E F G H I unused2																														

colFirst (2 bytes): A Col256U structure that specifies the first formatted column.

colLast (2 bytes): A Col256U structure that specifies the last formatted column. The value MUST be greater than or equal to colFirst.

coldx (2 bytes): An unsigned integer that specifies the column width in units of 1/256th of a character width. Character width is defined as the maximum digit width of the numbers 0, 1, 2, ... 9 as rendered in the Normal style's **font**.

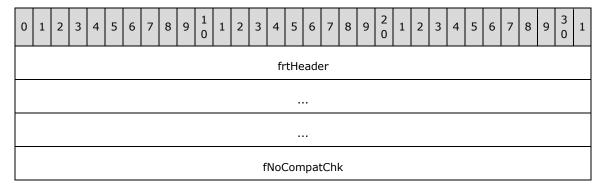

ixfe (2 bytes): An IXFCell structure that specifies the default format for the column cells.

- A fHidden (1 bit): A bit that specifies whether the column range defined by colFirst and colLast is hidden.
- **B fUserSet (1 bit):** A bit that specifies that the column width was either manually set by the user or is different from the default column width as specified by DefColWidth. If the value is 1, the column width was manually set or is different from DefColWidth.
- **C fBestFit (1 bit):** A bit that specifies whether the column range defined by **colFirst** and **colLast** is set to "best fit." "Best fit" implies that the column width resizes based on the **cell** contents, and that the column width does not equal the default column width as specified by DefColWidth.
- **D fPhonetic (1 bit):** A bit that specifies whether **phonetic information** is displayed by default for the column range defined by **colFirst** and **colLast**.
- **E reserved1 (4 bits):** MUST be zero, and MUST be ignored.
- **F iOutLevel (3 bits):** An unsigned integer that specifies the **outline level** of the column range defined by **colFirst** and **colLast**.
- **G unused1 (1 bit):** Undefined and MUST be ignored.
- **H fCollapsed (1 bit):** A bit that specifies whether the column range defined by **colFirst** and **colLast** is in a **collapsed outline state**.
- I reserved2 (3 bits): MUST be zero, and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

2.4.54 Compat12

The **Compat12** record specifies whether to check for compatibility with earlier application versions when saving the **workbook** from a version of the application <71> to the binary formats of other versions of the application <72>.

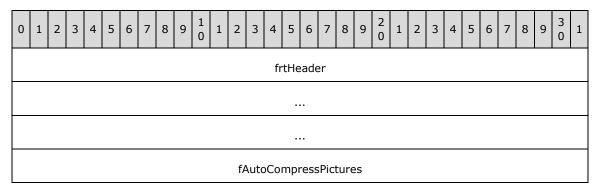

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x088C.

fNoCompatChk (4 bytes): A Boolean (section 2.5.14) that specifies whether to check compatibility with earlier versions when saving the workbook. The value MUST be one of the following:

Value	Meaning
0x0000	When saving the workbook to a binary format of a version of the application <73>, the user is given the message that some newer features could be lost during the save and prompted to continue or cancel the save.
0x0001	When saving the workbook to a binary format of a version of the application <74>, the user is given no message or prompt before the workbook is saved.

2.4.55 CompressPictures

The **CompressPictures** record specifies a recommendation for picture compression when saving.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x89B.

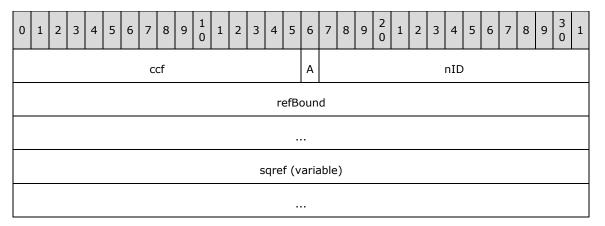

fAutoCompressPictures (4 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether picture compression is recommended. MUST be a value from the following table:

Value	Meaning						
0x00000000	000000 Compression is not recommended.						
0x00000001 Compression is recommended.							

2.4.56 CondFmt

The CondFmt record specifies conditional formatting rules that are associated with a set of cells.

This record specifies the beginning of a collection of <u>CF</u> records as defined in the <u>Worksheet Substream</u> **ABNF**. The collection of CF records specifies conditional formatting rules.

- **ccf (2 bytes):** An unsigned integer that specifies the count of CF records that follow this record. MUST be greater than or equal to 0x0001, and less than or equal to 0x0003.
- **A fToughRecalc (1 bit):** A bit that specifies that the appearance of the cell requires significant processing. This information can be used to optimize the redraw of conditional formatting when data values change.

For example, an application could determine that a conditional formatting rule that contains certain functions or a conditional formatting rule that takes more than a predetermined amount of time to calculate designates that the conditional formatting requires significant processing, and could set this bit to 1.

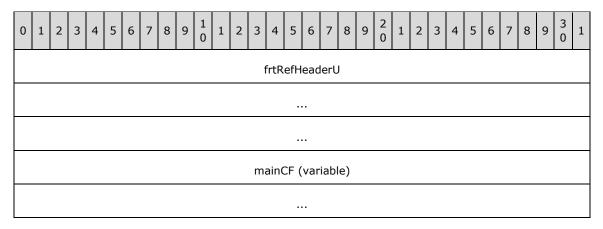

- **nID (15 bits):** An unsigned integer that identifies this record. The <u>CFEx</u> record uses this identifier to specify which CondFmt it extends.
- **refBound (8 bytes):** A <u>Ref8U</u> structure that specifies the bounds of the set of cells to which the conditional formatting rules apply. The set of cells that this field represents MUST include all of the cells represented by the **sqref** field.
- **sqref (variable):** A <u>SqRefU</u> structure that specifies the cells to which the conditional formatting rules apply. **sqref.cref** MUST be greater than zero and less than or equal to 1026.

2.4.57 CondFmt12

The **CondFmt12** record specifies **conditional formatting** rules that are associated with a set of **cells**, when all the rules are specified using <u>CF12</u> records.

This record specifies the beginning of a collection of CF12 records as defined in the <u>Worksheet Substream</u> **ABNF**.

This record MUST be followed by the number of CF12 records specified by mainCF.ccf

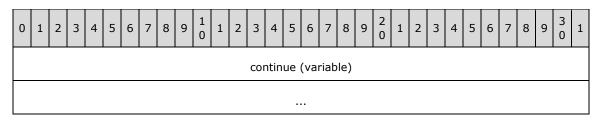

frtRefHeaderU (12 bytes): An FrtRefHeaderU structure. The frtRefHeaderU.rt field MUST be 0x0879. The frtRefHeaderU.grbitFrt.fFrtRef field MUST be 1. Each field of the frtRefHeaderU.ref8 structure MUST be equal to the corresponding field of the mainCF.refBound structure.

mainCF (variable): A <u>CondFmtStructure</u> structure that specifies properties of a set of conditional formatting rules.

2.4.58 Continue

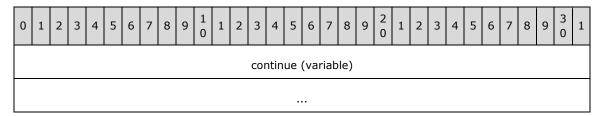

The **Continue** record specifies a continuation of the data in a preceding record. Records with data longer than 8,224 bytes MUST be split into several records. The first section of the data appears in the base record and subsequent sections appear in one or more **Continue** records that appear after the base record. Records with data shorter than 8,225 bytes can also store data in the base record and following **Continue** records. For example, the size of $\underline{\mathsf{TxO}}$ record is less than 8,225 bytes, but it is always followed by **Continue** records that store the string data and **formatting runs**.

continue (variable): A binary stream that specifies the structure data. The number of bytes in this stream MUST be less than 8225.

2.4.59 ContinueBigName

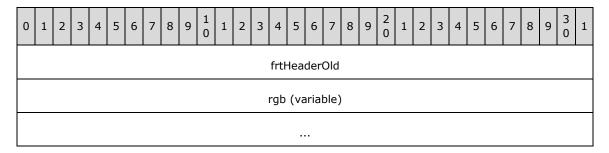

The **ContinueBigName** record specifies a continuation of the data in a preceding BigName record.

continue (variable): A binary stream that specifies the structure data. The number of bytes in this stream MUST be less than 8225.

2.4.60 ContinueFrt

The **ContinueFrt** record specifies a continuation of the data in a preceding <u>Future Record Type</u> record that has data longer than 8,224 bytes. Such records are split into several records. The first section of the data appears in the base record and subsequent sections appear in one or more **ContinueFrt** records that appear after the base record. How the data is split varies for different types of records. The base record can have data size shorter than 8,224 bytes after splitting. <u>SXTH</u> is such an example. The preceding base record MUST contain an <u>FrtHeaderOld</u> or an <u>FrtHeader field</u>.

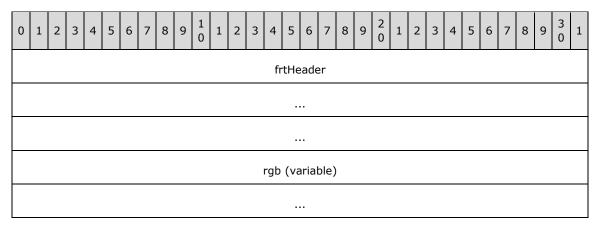

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0812.

rgb (variable): A binary stream that specifies the record data. The number of bytes in this stream MUST be less than 8,221.

2.4.61 ContinueFrt11

The **ContinueFrt11** record specifies a continuation of the data in a preceding <u>Future Record Type</u> record that has data longer than 8,224 bytes. Such records are split into several records. The first section of the data appears in the base record and subsequent sections appear in one or more **ContinueFrt11** records that appear after the base record. The preceding base record MUST contain a <u>FrtRefHeaderU</u> field.

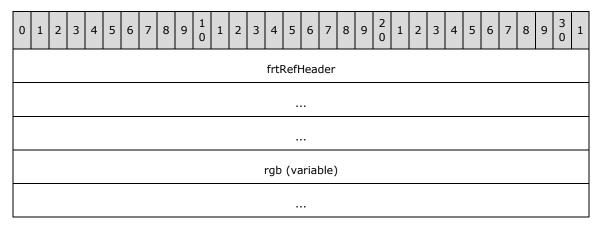

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0875.

rgb (variable): A binary stream that specifies the record data. The number of bytes in this stream MUST be less than 8,213.

2.4.62 ContinueFrt12

The **ContinueFrt12** record specifies a continuation of the data in a preceding <u>Future Record Type</u> record that has data longer than 8,224 bytes. Such records are split into several records. The first section of the data appears in the base record and subsequent sections appear in one or more **ContinueFrt12** records that appear after the base record. The preceding base record MUST contain a <u>FrtRefHeader</u> or a <u>FrtHeader</u> field.

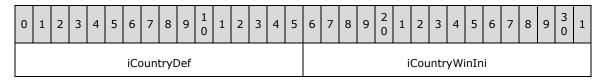

frtRefHeader (12 bytes): An FrtRefHeader structure. The frtRefHeader.rt field MUST be 0x087F. If frtRefHeader.grbitFrt.fFrtRef is 1 then the frtRefHeader.ref8 MUST refer to the range of cells associated with this record. If frtRefHeader.grbitFrt.fFrtRef is 0 then all of the fields of the frtRefHeader.ref8 structure MUST be zero and MUST be ignored.

rgb (variable): A binary stream that specifies the record data. The number of bytes in this stream MUST be less than 8,213.

2.4.63 Country

The **Country** record specifies **locale** information for a **workbook**.

iCountryDef (2 bytes): An unsigned integer that specifies the country/region code determined by the locale in effect when the workbook was saved. MUST be greater than or equal to 1 and less than or equal to 981 and MUST be a value from the table in **iCountryWinIni**.

iCountryWinIni (2 bytes): An unsigned integer that specifies the system **regional settings** country/region code in effect when the workbook was saved. MUST greater than or equal to 1 and less than or equal to 981 and MUST be a value from the table of Country/Region codes in this section.

Country/Region codes are defined as follows:

Code	Country/Region							
1	United States							
2	2 Canada							
3	Latin America, except Brazil							
7	Russia							
20	Egypt							

Code	Country/Region
30	Greece
31	Netherlands
32	Belgium
33	France
34	Spain
36	Hungary
39	Italy
41	Switzerland
43	Austria
44	United Kingdom
45	Denmark
46	Sweden
47	Norway
48	Poland
49	Germany
52	Mexico
55	Brazil
61	Australia
64	New Zealand
66	Thailand
81	Japan
82	Korea
84	Viet Nam
86	People's Republic of China
90	Turkey
213	Algeria
216	Morocco
218	Libya
351	Portugal
354	Iceland
358	Finland
420	Czech Republic
886	Taiwan
961	Lebanon
962	Jordan
963	Syria
964	Iraq
965	Kuwait
966	Saudi Arabia
971	United Arab Emirates
972	Israel
974	Qatar
981	Iran

2.4.64 CrErr

The **CrErr** record specifies the errors detected during crash recovery of a **workbook**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	eade	er														
															•																
															•																
															С	b															
							C	ch													r	gch	ı (v	aria	ble)					

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0865.

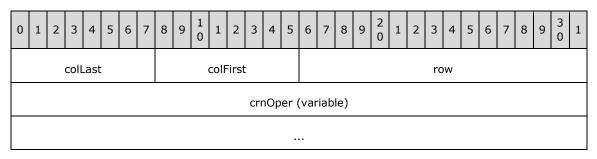

cb (4 bytes): An unsigned integer that specifies the fixed size of this record. MUST be set to 0x0013.

cch (2 bytes): An unsigned integer that specifies the number of characters in the crash recovery error message stored in the **rgch** field. MUST be greater than zero.

rgch (variable): An XLUnicodeString structure that specifies the localized text of a crash recovery error message. If the cch field is greater than 8211 this record MUST be followed by one or more Continue records, which specify the continuation of the crash recovery error message. If the text is extended with Continue records a value from the table for rgch.fHighByte MUST be specified in the first byte of the continue field of the Continue record followed by the remaining portions of the text.

2.4.65 CRN

The **CRN** record specifies the values of **cells** in a sheet in an <u>external cell cache</u>.

colLast (1 byte): A <u>ColByteU</u> structure that specifies the zero-based column index of the last cell whose value is contained within this record. MUST be greater than or equal to the value of colFirst.

colFirst (1 byte): A ColByteU structure that specifies the zero-based column index of the first cell whose value is contained within this record. MUST be less than or equal to the value of colLast.

row (2 bytes): A <u>RwU</u> structure that specifies the zero-based row index of the cells whose values are contained within this record.

crnOper (variable): An array of <u>SerAr</u> structures that specifies the cell values for the cells in the row starting at **colFirst**. The number of elements in this array MUST equal the following formula:

colLast - colFirst + 1

2.4.66 CrtLayout12

The **CrtLayout12** record specifies the layout information for <u>attached label</u>, when contained in the sequence of records that conforms to the <u>ATTACHEDLABEL</u> rule, or <u>legend</u>, when contained in the sequence of records that conforms to the LD rule.

0	1	2	3	4	5	6	7	8	3 9	1 0	1	2	3	4		5 6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
	frtHe								Head	er																					
														dwo	Cŀ	hecks	Sum														
Α		E	3						res	erv	ed1					wXMode															
	A B reserved1 wYMode								wWidthMode																						
	wYMode wHeightMode									x																					
						VVII	eigi	ICI	·loue																						
																 T															
							•									У															
																···															
															d	X															
							•																d	У							
														re	eser	vec	12														

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x089D.

dwCheckSum (4 bytes): An unsigned integer that specifies the **checksum** of the values in the order as follows, if the checksum is incorrect, the layout information specified in this record MUST be ignored.

Checksum for type	Values
<u>AttachedLabel</u>	
	1. x1 field of the Pos record in the sequence of records that contains this

Checksum for type	Values
	CrtLayout12 record and conforms to the ATTACHEDLABEL rule.
	2. y1 field of the Pos record in the in the sequence of records that contains this CrtLayout12 record and conforms to the ATTACHEDLABEL rule.
	3. An unsigned integer that specifies whether the attached label is at its default position. MUST be 1 if the dlp field of the <u>Text</u> record in the in the sequence of records that contains this CrtLayout12 record and conforms to the ATTACHEDLABEL rule is equal to 0xA. Otherwise, MUST be zero.
Legend	x1 field of the Pos record in the in the sequence of records that contains this CrtLayout12 record and conforms to the LD rule.
	y1 field of the Pos record in the in the sequence of records that contains this CrtLayout12 record and conforms to the LD rule.
	3. Width of the legend in pixels.
	4. Height of the legend in pixels.
	5. The fAutoPosX field of Legend record.
	6. The fAutoPosY field of Legend record.
	7. The fAutoSize of the <u>Frame</u> record in the in the sequence of records that contains this CrtLayout12 record and conforms to the LD rule.

The checksum is calculated using the following algorithm:

FUNCTION SimpleCheckSum values

SET dwChecksum to 0x0000

FOR each value in values

SET dwChecksum TO (dwChecksum XOR value)

RETURN dwChecksum

The width and height of legend in pixels are calculated with the following steps:

- 1. Get **chart area** width in pixels as indicated by section 2.2.3.17 "Chart Area"
- 2. Get chart area height in pixels as indicated by section 2.2.3.17 "Chart Area"
- 3. Compute legend size in pixels

legend width in pixels = dx field of Legend / 4000 * chart area width in pixels

legend height in pixels = **dy** field of Legend / 4000 * chart area height in pixels

- A unused (1 bit): Undefined and MUST be ignored.
- **B autolayouttype (4 bits):** An unsigned integer that specifies the automatic layout type of the legend. MUST be ignored when this record is in the sequence of records that conforms to the ATTACHEDLABEL rule. MUST be a value from the following table:

Value	Meaning
0x0	Align to the bottom
0x1	Align to top right corner

Value	Meaning
0x2	Align to the top
0x3	Align to the right
0x4	Align to the left

reserved1 (11 bits): MUST be zero, and MUST be ignored.

wXMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of x.

wYMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of y.

wWidthMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of dx.

wHeightMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of dy.

- **x (8 bytes):** An Xnum (section <u>2.5.342</u>) value that specifies a horizontal offset. The meaning is determined by **wXMode**.
- y (8 bytes): An Xnum value that specifies a vertical offset. The meaning is determined by wYMode.
- dx (8 bytes): An Xnum value that specifies a width or an horizontal offset. The meaning is determined by wWidthMode.
- **dy (8 bytes):** An Xnum value that specifies a height or an vertical offset. The meaning is determined by **wHeightMode**.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.67 CrtLayout12A

The CrtLayout12A record specifies layout information for a plot area.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
frtHe									leade	er

yTL										xBR																					
yBR										wXMode																					
wYMode										wWidthMode																					
wHeightMode															>	<															

	У						
	dx						
	dy						
	reserved2						

frtHeader (12 bytes): An FrtHeader structure. The frtheader.rt field MUST be 0x08A7.

dwCheckSum (4 bytes): An unsigned integer that specifies the **checksum**. MUST be a value from the following table:

fManPlotArea field of ShtProps	fAlwaysAutoPlotArea field of ShtProps	dwCheckSum
0x0	0x0	0x0000001
0x0	0x1	0×00000000
0x1	0x0	0×00000000
0x1	0x1	0×0000001

A - fLayoutTargetInner (1 bit): A bit that specifies the type of plot area for the layout target.

Value	Meaning
0x0	Outer plot area - The bounding rectangle that includes the <u>axis</u> labels, axis titles, data table (2) and plot area of the <u>chart</u> .
0x1	Inner plot area – The rectangle bounded by the chart axes.

reserved1 (15 bits): MUST be zero, and MUST be ignored.

xTL (2 bytes): A signed integer that specifies the horizontal offset of the plot area's upper-left corner, relative to the upper-left corner of the **chart area** (section <u>2.2.3.17</u>), in <u>SPRC</u>.

yTL (2 bytes): A signed integer that specifies the vertical offset of the plot area's upper-left corner, relative to the upper-left corner of the chart area (section 2.2.3.17), in SPRC.

xBR (2 bytes): A signed integer that specifies the width of the plot area, in SPRC.

yBR (2 bytes): A signed integer that specifies the height of the plot area, in SPRC.

wXMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of x.

wYMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of y.

wWidthMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of dx.

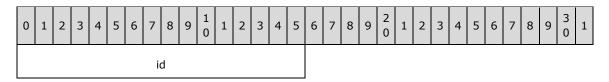

wHeightMode (2 bytes): A CrtLayout12Mode structure that specifies the meaning of dy.

- **x (8 bytes):** An Xnum (section <u>2.5.342</u>) value that specifies a horizontal offset. The meaning is determined by **wXMode**.
- y (8 bytes): An Xnum value that specifies a vertical offset. The meaning is determined by wYMode.
- **dx (8 bytes):** An Xnum value that specifies a width or a horizontal offset. The meaning is determined by **wWidthMode**.
- **dy (8 bytes):** An Xnum value that specifies a height or a vertical offset. The meaning is determined by **wHeightMode**.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.68 CrtLine

The **CrtLine** record specifies the presence of **drop lines**, **high-low lines**, **series lines** or **leader lines** on the <u>chart group</u>. This record is followed by a <u>LineFormat</u> record which specifies the format of the lines.

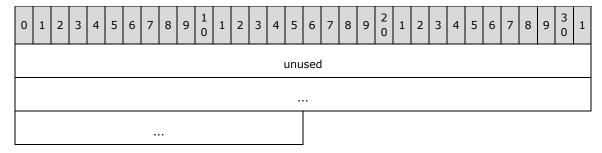

id (2 bytes): An unsigned integer that specifies the type of line that is present on the chart group. This field value MUST be unique among the other id field values in CrtLine records in the current chart group. This field MUST be greater than the id field values in preceding CrtLine records in the current chart group. MUST be a value from the following table:

Value	Type of Line
0x0000	Drop lines below the <u>data points</u> of line, area, and stock chart groups.
0x0001	High-low lines around the data points of line and stock chart groups.
0x0002	Series lines connecting data points of stacked column and bar chart groups, and the primary pie to the secondary bar/pie of bar of pie and pie of pie chart groups.
0x0003	Leader lines with non-default formatting connecting data labels to the data point of pie and pie of pie chart groups.

2.4.69 CrtLink

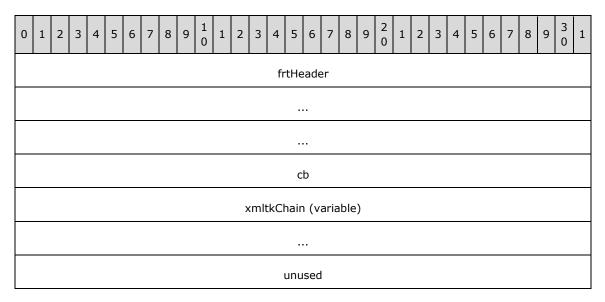

The **CrtLink** record is written but unused.

unused (10 bytes): Undefined and MUST be ignored.

2.4.70 CrtMIFrt

The **CrtMIFrt** record specifies additional properties for <u>chart</u> elements, as specified by the <u>Chart Sheet Substream</u> **ABNF**. These properties complement the record to which they correspond, and are stored as a structure chain defined in <u>XmITkChain</u>. An application can ignore this record without loss of functionality, except for the additional properties. If this record is longer than 8224 bytes, it MUST be split into several records. The first section of the data appears in this record and subsequent sections appear in one or more <u>CrtMIFrtContinue</u> records that follow this record.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x089E.

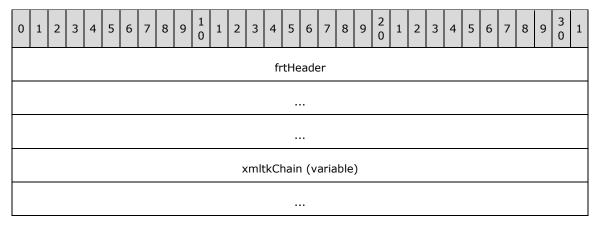

cb (4 bytes): An unsigned integer that specifies the size, in bytes, of the XmlTkChain structure starting in the **xmltkChain** field, including the data contained in the optional CrtMlFrtContinue records. MUST be less than or equal to 0x7FFFFFEB.

xmltkChain (variable): An XmlTkChain structure that specifies a chain of structures. The size of the XmlTkChain is specified by the **cb** field.

unused (4 bytes): Undefined, and MUST be ignored.

2.4.71 CrtMIFrtContinue

The **CrtMIFrtContinue** record specifies additional data for a <u>CrtMIFrt</u> record, as specified in the CrtMIFrt record.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x089F.

xmltkChain (variable): An array of bytes that contains the continuation of the **xmltkChain** field of the CrtMlFrt record associated with this record. If the length of this record is greater than 8224 bytes, additional CrtMlFrtContinue records follow.

2.4.72 CUsr

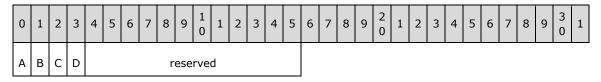

The **CUsr** record specifies the number of unique users that have this <u>shared workbook</u> open.

iCount (2 bytes): An unsigned integer that specifies the number of unique users that have this shared workbook open. MUST be greater than or equal to 0 and less than or equal to 255.

2.4.73 Dat

The **Dat** record specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies the options of the <u>data table</u> which can be displayed within a **chart area** (section <u>2.2.3.17</u>).

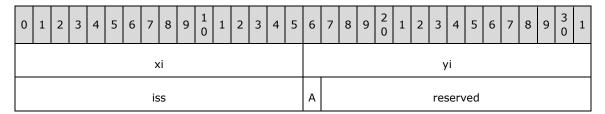

- A fHasBordHorz (1 bit): A bit that specifies whether horizontal cell borders are displayed within the data table.
- **B fHasBordVert (1 bit):** A bit that specifies whether vertical cell borders are displayed within the data table.
- C fHasBordOutline (1 bit): A bit that specifies whether an outside outline is displayed around the data table.

D - fShowSeriesKey (1 bit): A bit that specifies whether the **legend key** is displayed next to the name of the <u>series</u>. If the value is 1, the legend key symbols are displayed next to the name of the series.

reserved (12 bits): MUST be zero, and MUST be ignored.

2.4.74 DataFormat

The **DataFormat** record specifies the <u>data point</u> or <u>series</u> that the formatting information that follows applies to and specifies the beginning of a collection of records as defined by the <u>Chart Sheet</u> <u>Substream</u> **ABNF**. This collection of records specifies formatting properties for the data point or series.

- xi (2 bytes): An unsigned integer that specifies the zero-based index of the data point within the series specified by yi. If this value is 0xFFFF, the formatting information that follows applies to the series. Otherwise, the formatting information that follows applies to a data point. This value MUST be less than or equal to 31999. This value MUST be less than or equal to 3999 for a chart that contains a Chart3d record. This value MUST be 0xFFFF if the formatting information in this record is applied to a trendline or error bar.
- yi (2 bytes): An unsigned integer that specifies the zero-based index of a <u>Series</u> record in the collection of Series records in this chart sheet substream. SHOULD
 <75> be less than or equal to 254.
- **iss (2 bytes):** An unsigned integer that specifies properties of the data series, trendline or error bar, depending on the type of records in sequence of records that conforms to the SERIESFORMAT rule that contains the sequence of records that conforms to the SS rule that contains this record.
- If the SERIESFORMAT rule does not contain a <u>SerAuxTrend</u> or <u>SerAuxErrBar</u> record, then this field specifies the plot order of the data series. If the series order was changed, this field can be different from **yi**. MUST<<u>76></u> be less than or equal to the number of series in the chart. MUST be unique among **iss** values for all instances of this record contained in the SERIESFORMAT rule that does not contain a SerAuxTrend or SerAuxErrBar record.
- If the SERIESFORMAT rule contains a SerAuxTrend record on the chart group, then this field specifies the trendline number for the series.
- If the SERIESFORMAT rule contains a SerAuxErrBar record on the chart group, then this field specifies a zero-based index into a Series record in the collection of Series records in the current chart sheet substream for which the error bar applies to.

A - fXL4iss (1 bit): MUST be zero, and MUST be ignored.

reserved (15 bits): MUST be zero, and MUST be ignored.

2.4.75 DataLabExt

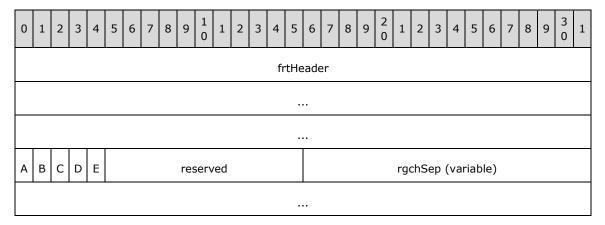

The **DataLabExt** record specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection specifies an extended <u>data label</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtHeader																														

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x086A.

2.4.76 DataLabExtContents

The **DataLabExtContents** record specifies the contents of an extended <u>data label</u>.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x086B.

- **A fSerName (1 bit):** A bit that specifies whether the name of the <u>series</u> is displayed in the extended data label.
- **B fCatName (1 bit):** A bit that specifies whether the **category (2)** name, or the horizontal value on bubble or scatter <u>chart groups</u>, is displayed in the extended data label. MUST be a value from the following table:

Value	Meaning
0	Neither of the data values are displayed in the extended data label.
1	If bubble or scatter chart group, the horizontal value is displayed in the extended data label. Otherwise, the category (2) name is displayed in the extended data label.

C - fValue (1 bit): A bit that specifies whether the data value, or the vertical value on bubble or scatter chart groups, is displayed in the extended data label. MUST be a value from the following table:

Value	Meaning
0	Neither of the data values are displayed in the data label.
1	If bubble or scatter chart group, the vertical value is displayed in the extended data label. Otherwise, the data value is displayed in the extended data label.

D - fPercent (1 bit): A bit that specifies whether the value of the corresponding <u>data point</u>, represented as a percentage of the sum of the values of the series the data label is associated with, is displayed in the extended data label.

MUST equal 0 if the chart group type of the corresponding chart group, series, or data point is not a bar of pie, doughnut, pie, or pie of pie chart group.

E - fBubSizes (1 bit): A bit that specifies whether the bubble size is displayed in the data label.

MUST equal 0 if the chart group type of the corresponding chart group, series, or data point is not a bubble chart group.

reserved (11 bits): MUST be zero, and MUST be ignored.

rgchSep (variable): A case-sensitive <u>XLUnicodeStringMin2</u> structure that specifies the string that is inserted between every data value to form the extended data label. For example, if fCatName and fValue are set to 1, the labels will look like "Category Name<value of rgchSep>Data Value". The length of the string is contained in the cch field of the XLUnicodeStringMin2 structure.

2.4.77 Date1904

The **Date1904** record specifies the **date system** that the **workbook** uses.

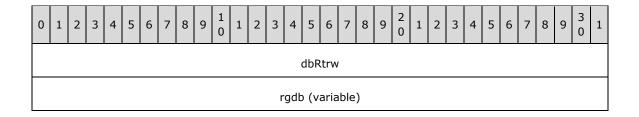

f1904DateSystem (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies the date system used in this workbook. MUST be a value from the following table:

Value	Meaning
0x0000	The workbook uses the 1900 date system. The first date of the 1900 date system is 00:00:00 on January 1, 1900, specified by a serial value of 1.
0x0001	The workbook uses the 1904 date system. The first date of the 1904 date system is 00:00:00 on January 1, 1904, specified by a serial value of 0.

2.4.78 DBCell

The **DBCell** record specifies a row block, which is a series of up to 32 consecutive rows.

DBCell, combined with the <u>Index</u> record, is used to optimize the <u>lookup of cells</u> in a <u>cell table</u>.

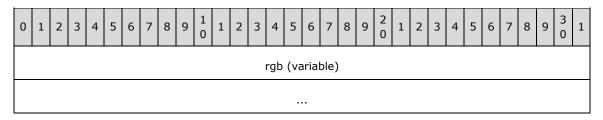

...

dbRtrw (4 bytes): An unsigned integer that specifies the offset in bytes from the starting file position of this record to the file position of the first Row record. If the value is 0, the referenced row block does not contain any rows that contain cells that have data.

rgdb (variable): An array of 2-byte unsigned integers that specify the file offset in bytes to the first record that specifies a <u>CELL</u> in each row that is a part of this row block. For the first array element, the starting position of the file offset is specified relative to the file position of the end of the first Row record in the row block. For all other elements, the file offset is specified relative to the file position of the CELL record specified by the previous element in this array. The number of elements in the array MUST be less than or equal to 32.

2.4.79 DbOrParamQry

The **DbOrParamQry** record specifies a <u>DbQuery</u> or <u>ParamQry</u> record depending on the record that precedes this record.

rgb (variable): A variable type field that specifies a DbQuery or ParamQry record depending on the record that precedes this record as specified by the following table:

Preceding Record	Record Type
SXString	ParamQry
DbOrParamQry of type ParamQry	ParamQry
Any other record	DbQuery

2.4.80 DbQuery

The **DbQuery** record specifies information about an <u>external connection</u>. This record is followed by <u>SXString</u> and <u>ParamQry</u> records that specify the strings and parameters. The records MUST be in the following order:

- If and only if fSql equals 1, zero or more SXString records as specified by cstQuery.
- If and only if **fOdbcConn** equals 1, zero or more SXString records as specified by **cstOdbcConn**.
- If and only if fWeb equals 1, zero or more SXString records as specified by cstQuery.
- If and only if **fWeb** equals 1, zero or more SXString records as specified by **cstWebPost**.
- Zero or more SXString and ParamQry pairs as specified by cparams.
- If and only if fSqlSav equals 1, zero or more SXString records as specified by cstSQLSav.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	dbt		Α	В	С	D	Е	F			ur	านร	ed			cparams															
cstQuery												cst	tWe	bPo	st																
cstSQLSav														cst	Odb	сСо	onn														

dbt (3 bits): An unsigned integer that specifies the **data source** type. MUST be a value from the following table:

Value	Meaning
0x1	ODBC data source
0x2	DAO record set
0x4	Web query
0x5	OLE DB database
0x6	Text query
0x7	ADO query

- A fOdbcConn (1 bit): A bit that specifies whether the data source type is ODBC. MUST be 1 if dbt is equal to 0x1.
- **B fSql (1 bit):** A bit that specifies whether there is a database command string. MUST be 0 if **fWeb** is 1. If the value of **dbt** is 5 see the **grbitDbt** field of the <u>DBQueryExt</u> record for details on what the database command string specifies. Otherwise the database command string specifies an **Structured Query Language (SQL) query** string. The database command string is contained by zero or more SXString records following this record, as specified by **cstQuery**.
- C fSqlSav (1 bit): A bit that specifies whether there is a SQL query string for server-based fields. For more information about server-based fields see the <u>source data</u> section. If and only if fSqlSav equals 1, the SQL query string for server-based fields is contained by zero or more SXString records following this record, as specified by cstSQLSav.
- **D fWeb (1 bit):** A bit that specifies whether there is a **Uniform Resource Locator (URL)** for a **Web query**. MUST be 1 if **dbt** is equal to 0x4. The URL is the command string contained in zero or more SXString records following this record, as specified by **cstQuery**.
- **E fSavePwd (1 bit):** A bit that specifies whether the password is saved with the ODBC **connection string** specified by SXString records following this record. MUST be a value from the following table:

Value	Meaning
0	Password is removed from the ODBC connection string.
1	Password is not removed from the ODBC connection string.

MUST be ignored if **dbt** is not equal to 0x1.

F - fTablesOnlyHTML (1 bit): A bit that specifies whether Web queries only works on HTML tables.

unused (7 bits): Undefined and MUST be ignored.

- **cparams (2 bytes):** A signed integer that specifies the number of SQL parameters. Each parameter consists of an SXString record followed by a ParamQry record. The SXString record specifies the name of the parameter and the ParamQry record specifies the query parameters. MUST be greater than or equal to zero.
- **cstQuery (2 bytes):** A signed integer that specifies the number of SXString records that contain the command string, see **fWeb** and **fSqI** for more details. Each SXString record specifies up to 255 characters of the complete command string. MUST be greater than or equal to zero.
- **cstWebPost (2 bytes):** A signed integer that specifies the number of SXString records that contain the Web query statement. Each SXString record specifies up to 255 characters of the complete query statement. MUST be greater than or equal to zero. MUST be 0 if **fWeb** is equal to 0.
- **cstSQLSav (2 bytes):** A signed integer that specifies the number of SXString records that contain the SQL statement for server-based fields. For more information about server-based fields see the source data section. Each SXString record specifies up to 255 characters of the complete SQL statement. MUST be greater than or equal to zero. MUST be 0 if **fSqlSav** is equal to 0.
- **cstOdbcConn (2 bytes):** A signed integer that specifies the number of SXString records that contain the ODBC connection string. Each SXString record specifies up to 255 characters of the complete connection string. MUST be greater than or equal to zero. MUST be 0 if **fOdbcConn** is equal to 0.

2.4.81 DBQueryExt

The **DBQueryExt** record specifies information about an <u>external connection</u>. This record specifies the beginning of a collection of records as specified by the <u>Worksheet Substream</u> **ABNF**. The collection specifies more information about the external connection. See the <u>QsiSXTag</u> record for details about how the **query table** or <u>PivotCache</u> for the external connection is determined. The records of the collection MUST be in the following order:

- The first record MUST be an <u>ExtString</u> record that specifies the comma-delimited list of **table** names to import, if and only if **TableNames** is equal to 1.
- The next record MUST be a <u>TxtQry</u> record, if and only if **fTxtWiz** is equal to 1.
- The next record or records MUST be zero or more OleDbConn records as specified by coledb.

0	1	2	3	4	5	6	7	8	9	1	1	2	З	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	0	1

cwParamFlags	rgPbt (variable)								
rgbFutureBytes (variable)									

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0803.

dbt (2 bytes): A <u>DataSourceType</u> enumeration that specifies the database source.

- **A fMaintain (1 bit):** A bit that specifies whether the connection with the database remains open once established.
- **B fNewQuery (1 bit):** A bit that specifies whether the connection was not refreshed. MUST be a value from the following table:

Value	Meaning							
0	Connection was refreshed one or more times							
1	Connection was not refreshed							

C - fImportXmlSource (1 bit): A bit that specifies whether the underlying **XML** source or the Web page table is imported. MUST be ignored if **dbt** is not equal to 0x0004. MUST be a value from the following table:

Value	Meaning							
0	Web page table is imported							
1	XML source is imported							

- **D fSPListSrc (1 bit):** A bit that specifies if the external connection is using the Web based **data provider**.
- **E fSPListReinitCache (1 bit):** A bit that specifies whether the Web based data is reinitialized rather than refreshed. MUST be ignored if **fSPListSrc** is equal to 0. MUST be a value from the following table:

Value	Meaning
0	Web based data is refreshed.
1	Web based data is reinitialized by reconnecting to the Web based data provider.

- F unused (2 bits): Undefined and MUST be ignored.
- G fSrcIsXml (1 bit): A bit that specifies whether the external connection source is XML.

reserved1 (8 bits): MUST be zero, and MUST be ignored.

grbitDbt (variable): A ConnGrbitDbt structure that specifies external connection properties specific
to dbt.

- **H fTxtWiz (1 bit):** A bit that specifies whether this is a **text query**. If the value is equal to 1, this record MUST be followed by a TxtQry record.
- **I fTableNames (1 bit):** A bit that specifies whether the tables to import are specified in the ExtString record that follows this record.
- J reserved2 (1 bit): MUST be zero, and MUST be ignored.
- reserved3 (13 bits): MUST be zero, and MUST be ignored.
- **bVerDbqueryEdit (1 byte):** A <u>DataFunctionalityLevel</u> value that specifies the <u>data functionality level</u> the external connection was last edited with.
- **bVerDbqueryRefreshed (1 byte):** A DataFunctionalityLevel value that specifies the data functionality level the external connection was last refreshed with. MUST be ignored if **fNewQuery** is equal to 1.
- **bVerDbqueryRefreshableMin (1 byte):** A DataFunctionalityLevel value that specifies the minimum data functionality level that the application is required to support refreshing the external connection. MUST be ignored if **fNewQuery** is equal to 1.
- reserved4 (1 byte): MUST be zero, and MUST be ignored.
- reserved5 (2 bytes): MUST be zero, and MUST be ignored.
- **coledb (2 bytes):** An unsigned integer that specifies the count of OleDbConn records that follow this record. MUST be zero if **dbt** is not equal to DBT_OLEDB.
- **cstFuture (2 bytes):** An unsigned integer that specifies the count of bytes in **rgbFutureBytes**.
- **wRefreshInterval (2 bytes):** An unsigned integer that specifies the number of minutes to wait between automatic refreshes of the external connection. The value MUST be greater than or equal to 0. A value of 0 specifies that the timed **refresh** is off.
- **wHtmlFmt (2 bytes):** An unsigned integer that specifies the HTML formatting to apply to the imported data for a **Web query**. MUST be ignored if **dbt** is not equal to 0x0004. MUST be a value from the following table:

Value	Meaning
0x0001	No formatting is applied
0x0002	Rich text formatting only
0x0003	Full HTML formatting, including cell formatting

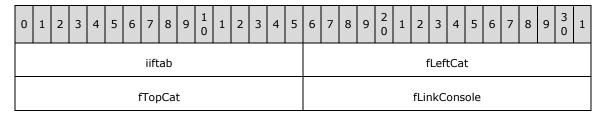

cwParamFlags (2 bytes): An unsigned integer that specifies the count of PBT items in rgPbt.

- **rgPbt (variable):** An array of PBT items, each of which specifies information about the **query** parameters. The PBT items in the array specify information about same query parameters as the collection of ParamQry records of the external connection. The nth PBT item in this array corresponds to the nth ParamQry record within the collection.
- **rgbFutureBytes (variable):** Information from future versions. The byte count MUST be equal to **cstFuture**.

2.4.82 DCon

The **DCon** record specifies the **data consolidation** settings of the associated **sheet** and specifies the beginning of a collection of records as defined by the <u>Macro Sheet Substream</u> **ABNF** and <u>Worksheet</u>

<u>Substream</u> ABNF. The collection of records specifies the **source data ranges**. Data consolidation settings can exist in a sheet that does not have a data consolidation range.

iiftab (2 bytes): An unsigned integer that specifies the **function** used to aggregate the source data. MUST be a value from the following table:

Value	Function Name	Meaning
0x0000	Average	The average (arithmetic mean).
0x0001	Count Numbers	The count of the numeric values.
0x0002	Count	The count of data values.
0x0003	Maximum	The largest value.
0x0004	Minimum	The smallest value.
0x0005	Product	The product of the values.
0x0006	Standard Deviation	An estimate of the standard deviation of a population, where the sample is a subset of the entire population.
0x0007	Standard Deviation Population	The standard deviation based on the entire population.
0x0008	Sum	The summation of the numeric values.
0x0009	Variance	An estimate of the variance of a population, where the sample is a subset of the entire population.
0x000A	Variance Population	The variance of a population, where the population is all of the data to be summarized.

fLeftCat (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies how to identify rows for data consolidation. MUST be a value from the following table:

Value	Meaning
0x0000	Data consolidation is based on the position of the row in the source data ranges.
0x0001	Data consolidation is based on row labels from the leftmost column of the source data ranges. String comparison is case independent and the consolidated data contains a row for each unique row label. The unique row labels appear in the first column in the consolidation range , if it exists.

fTopCat (2 bytes): A Boolean that specifies how to identify columns for data consolidation. MUST be a value from the following table:

Value	Meaning
0x0000	Data consolidation is based on the position of the column in the source data ranges.

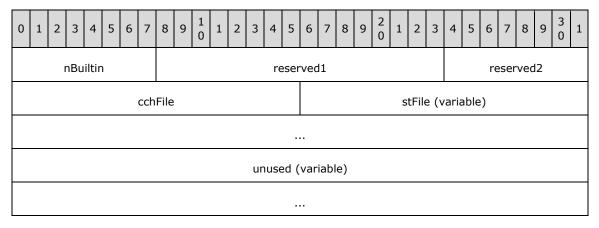

Value	Meaning
0x0001	Data consolidation is based on column labels from the top row of the source data ranges. String comparison is case independent and the consolidated data contains a column for each unique column label. The unique column labels appear in the top row of the consolidation range, if it exists.

fLinkConsole (2 bytes): A Boolean that specifies whether data consolidation will create references to the source data. MUST be a value from the following table:

Value	Meaning
0x0000	References are not created to the source data.
0x0001	References are created to the source data.

2.4.83 DConBin

The **DConBin** record specifies a built-in **named range** that is a **data source** for a <u>PivotTable</u> or a data source for the **data consolidation** settings of the associated **sheet**.

nBuiltin (1 byte): An unsigned integer that specifies the built-in **defined name** for the **range**. MUST be a value from the following table:

Value	Meaning
0x00	"Consolidate_Area"
0x01	"Auto_Open"
0x02	"Auto_Close"
0x03	"Extract"

Value	Meaning
0x04	"Database"
0x05	"Criteria"
0x06	"Print_Area"
0x07	"Print_Titles"
0x08	"Recorder"
0x09	"Data_Form"
0x0A	"Auto_Activate"
0x0B	"Auto_Deactivate"
0x0C	"Sheet_Title"
0x0D	"_FilterDatabase"

reserved1 (2 bytes): MUST be zero and MUST be ignored.

reserved2 (1 byte): MUST be zero and MUST be ignored.

cchFile (2 bytes): An unsigned integer that specifies the character count of **stFile.** MUST be 0x0000, or greater than or equal to 0x0002. A value of 0x0000 specifies that the built-in defined name specified in **nBuiltin** has a **workbook** scope and is contained in this file.

stFile (variable): An <u>DConFile</u> structure that specifies the workbook or workbook and sheet that contains the range specified in **nBuiltin.** This field MUST exist if and only if the value of **cchFile** is greater than zero. If the built-in defined name has workbook scope this field specifies the workbook file that contains the built-in defined name and its associated range. If the built-in defined name has a sheet-level scope this field specifies both the sheet name and the workbook file that contains the built-in defined name and its associated range.

unused (variable): An array of bytes that is unused and MUST be ignored. MUST exist if and only if
 cchFile is greater than 0 and stFile specifies a self-reference (the value of stFile.stFile.rgb[0] is
 2). If the value stFile.stFile.fHighByte is 0 the size of this array is 1. If the value of
 stFile.stFile.fHighByte is 1 the size of this array is 2.

2.4.84 DConn

The **DConn** record specifies information for a single data connection.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	4	5 6		7	8	9	2	1	2	3	4	5	6	7	8	9	3 0 1

rgbSQL (variable)
rgbSQLSav (variable)
rgbEditWebPage (variable)
id (variable)

frtHeaderOld (4 bytes): An FrtHeaderOld. The frtHeaderOld.rt field MUST be 0x0876.

dbt (2 bytes): A DataSourceType that specifies the type of this data connection.

- **A fSavePwd (1 bit):** A bit that specifies whether a password is saved for this data connection. This field MUST be ignored if **dbt** is not equal to 0x0001 or 0x0005.
- **B fTablesOnlyHtml (1 bit):** A bit that specifies whether web queries retrieve data from HTML tables only. MUST be ignored if **dbt** is not equal to 0x0004. MUST be a value from the following table:

Value	Meaning
0x0	Web queries retrieve data from the entire page.
0x1	Web queries retrieve data from HTML tables only.

- **C fTableNames (1 bit):** A bit that specifies whether there are any HTML tables saved for this data connection. MUST be ignored if **dbt** is not equal to 0x0004. Value MUST equal 1 if **fTablesOnlyHtml** is equal to 1.
- **D fDeleted (1 bit):** A bit that specifies whether the data connection associated with the **workbook** has been deleted.
- **E fStandAlone (1 bit):** A bit that specifies whether the data connection is used by the workbook.
- **F fAlwaysUseConnectionFile (1 bit):** A bit that specifies whether the data connection information in the connection file is used when the data is refreshed. This field MUST be ignored if **dbt** is not equal to 0x0001 or 0x0005.
- **G fBackgroundQuery (1 bit):** A bit that specifies whether the data connection is refreshed asynchronously.
- **H fRefreshOnLoad (1 bit):** A bit that specifies whether the data connection is refreshed after the file is loaded.
- I fSaveData (1 bit): A bit that specifies if the data for the data connection is persisted in the workbook.

unused1 (7 bits): Undefined and MUST be ignored.

cParams (2 bytes): An unsigned integer that specifies the number of parameters for a **parameterized query**. The value MUST equal 0 if **fStandAlone** equals 0.

reserved1 (2 bytes): MUST be zero and MUST be ignored.

- **J fMaintain (1 bit):** A bit that specifies whether the data connection remains open once it is established.
- **K fNewQuery (1 bit):** A bit that specifies whether the data connection has been refreshed. MUST be a value from the following table:

Value	Meaning							
0	Connection has been refreshed one or more times							
1	Connection has not yet been refreshed							

L - fImportXmlSource (1 bit): A bit that specifies whether the underlying **XML** source or the Web page table has been imported. MUST be ignored if **dbt** is not equal to 0x0004. MUST be a value from the following table:

Value	Meaning						
0	Web page table has been imported						
1	XML source has been imported						

- **M fSPListSrc (1 bit):** A bit that specifies whether the query is using a Web-based **data provider**. MUST be ignored if **dbt** is not equal to 0x0005.
- **N fSPListReinitCache (1 bit):** A bit that specifies whether the Web based data is reinitialized rather than refreshed. MUST be ignored if **dbt** is not equal to 0x0005. MUST be a value from the following table:

Value	Meaning
0	List is refreshed
1	List is reinitialized by reconnecting to the data provider

- O unused2 (2 bits): Undefined and MUST be ignored.
- **P fSrcIsXml (1 bit):** A bit that specifies whether the query source is XML. MUST be ignored if **dbt** is not equal to 0x0004.

reserved2 (8 bits): MUST be zero and MUST be ignored.

grbitDbt (variable): A <u>ConnGrbitDbt</u> that specifies the query flags.

bVerDbqueryEdit (1 byte): A <u>DataFunctionalityLevel</u> that specifies the <u>data functionality level</u> the **query** was last edited with.

bVerDbqueryRefreshed (1 byte): A DataFunctionalityLevel that specifies the data functionality level the query was last refreshed with.

bVerDbqueryRefreshableMin (1 byte): A DataFunctionalityLevel that specifies the minimum data functionality level that the application is required to support to **refresh** the query.

- **wRefreshInterval (2 bytes):** An unsigned integer that specifies the number of minutes to wait between automatic refreshes of the query. The value MUST be greater than or equal 0.
- **wHtmlFmt (2 bytes):** An unsigned integer that specifies the HTML formatting to apply to the imported data for a **Web query**. MUST be ignored if **dbt** is not equal to 0x0004. MUST be a value from the following table:

Value	Meaning
0x0001	None
0x0002	Rich text formatting only
0x0003	Full HTML formatting

rcc (4 bytes): An unsigned integer that specifies the reconnection method. MUST be a value from the following table:

Value	Meaning									
0x00000000	0x00000000 Reconnection method is determined by the application.									
0x0000001	Reconnect. When the data connection is refreshed, the updated connection information is retrieved if it is available. This information is used instead of the persisted connection information.									
0x00000002	Never reconnect. Updated connection information is never used even if the information is available and the existing connection information is invalid.									

credMethod (1 byte): An unsigned integer that specifies the credentials used during reconnection. MUST be a value from the following table:

Value	Meaning						
0x00	tegrated authentication						
0x01	Use no credentials						
0x02	Use stored credentials						
0x03	Prompt for credentials						

- reserved3 (1 byte): MUST be zero and MUST be ignored.
- **rgchSourceDataFile (variable):** A <u>DConnUnicodeStringSegmented</u> that specifies the database file to use if the existing **OLE DB** connection fails. MUST be ignored if **dbt** does not equal 0x0005.
- **rgchSourceConnectionFile (variable):** A DConnUnicodeStringSegmented that specifies the **Office data connection (ODC) file** to use if the existing connection fails.
- **rgchConnectionName (variable):** A DConnUnicodeStringSegmented that specifies the name of the data connection associated with the workbook.
- **rgchConnectionDesc (variable):** A DConnUnicodeStringSegmented that specifies the description of the data connection associated with the workbook.
- **rgchSSOApplicationID** (variable): A DConnUnicodeStringSegmented that specifies the **single sign-on** (SSO) identifier string. MUST be ignored if **dbt** does not equal 0x0001 or 0x0005.
- **tableNames (variable):** A DConnUnicodeStringSegmented that specifies the list of **table** names as a comma-separated list. This field only exists when **fTableNames** is equal to 1. The total number of characters MUST be less than or equal to 255.

params (variable): An array of <u>DConnParameter</u> that specifies the parameters of a parameterized query. The size of the array is determined by **cParams**. MUST NOT exist if **fStandAlone** is equal to 0

connection (variable): A variable type field. The data type and meaning vary depending on the value of **dbt**.

Value of dbt	Meaning
1	connection is a DConnUnicodeStringSegmented that specifies the connection string . If field fStandAlone is 0, then connection. st.cch MUST be 0.
4	connection is a <u>DConnConnectionWeb</u> that specifies the connection information for a Web query.
5	connection is a <u>DConnConnectionOleDb</u> that specifies the connection information for an OLE DB connection string.
6	connection is a <u>TxtQry</u> that specifies information for a text query .
Any other value	connection does not exist.

rgbSQL (variable): A <u>DConnStringSequence</u> that specifies the database command. For an OLE DB **data source**, the meaning of the **dbost** field of <u>ConnGrbitDbtOledb</u> determines the meaning of this field. For an **ODBC** data source, this string specifies the **SQL** statement. MUST be ignored if **dbt** does not equal 0x0001 or 0x0005.

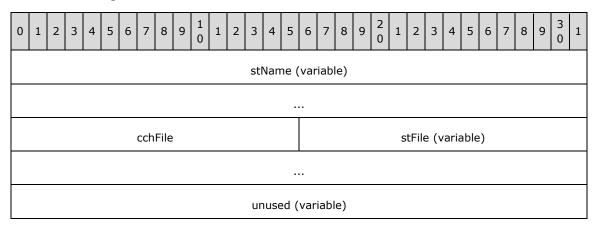

rgbSQLSav (variable): A DConnStringSequence that specifies the original, non-parameterized SQL statement for an ODBC data source. MUST be ignored if **dbt** does not equal 0x0001.

rgbEditWebPage (variable): A DConnStringSequence that specifies the **URL** for the Web query edit query dialog. MUST be ignored if **dbt** does not equal 0x0004.

id (variable): A <u>DConnId</u> that specifies the object that this connection is associated with.

2.4.85 DConName

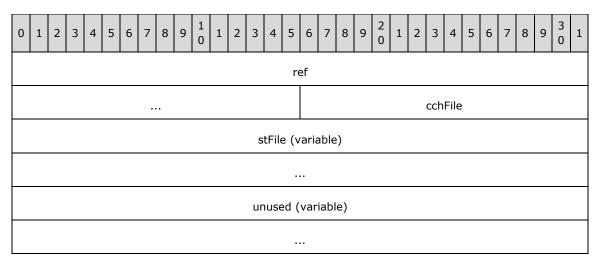

The **DConName** record specifies a **named range** that is a **data source** for a <u>PivotTable</u> or a data source for the **data consolidation** settings of the associated **sheet**. The **range** is specified as a reference to an <u>external workbook</u> or a **defined name** in this **workbook**. If the named range is in an external workbook, this record specifies the path to the external workbook. If the named range has a defined name that has a sheet-level scope, this record also specifies the name of the sheet that contains the range.

- **stName (variable):** An <u>XLNameUnicodeString</u> structure that specifies a defined name for the source range.
- **cchFile (2 bytes):** An unsigned integer that specifies the character count of **stFile**. MUST be 0x0000, or greater than or equal to 0x0002. A value of 0x0000 specifies that the defined name in **stName** has a workbook scope and is contained in this file.
- **stFile (variable):** A <u>DConFile</u> structure that specifies the workbook, or workbook and sheet, that contains the range specified in **stName**. This field exists only if the value of **cchFile** is greater than zero. If the defined name in **stName** has workbook scope, this field specifies the workbook file that contains the defined name and its associated range. If the defined name in **stName** has a sheet-level scope, this field specifies both the sheet name and the workbook that contains the defined name and its associated range.
- unused (variable): An array of bytes that is unused and MUST be ignored. MUST exist if and only if
 cchFile is greater than 0 and stFile specifies a self-reference (the value of stFile.stFile.rgb[0] is
 2). If the value stFile.stFile.fHighByte is 0, the size of this array is 1. If the value of
 stFile.stFile.fHighByte is 1, the size of this array is 2.

2.4.86 DConRef

The **DConRef** record specifies a **range** in this **workbook** or in an <u>external workbook</u> that is a **data source** for a <u>PivotTable</u> or a data source for the **data consolidation** settings of the associated **sheet**. If the range specified is in an external workbook this record also specifies the path to the external workbook.

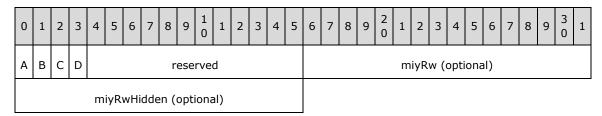

- ref (6 bytes): A RefU structure that specifies the range. If this record is part of an SXTBL production as specified in the Globals Substream ABNF and this field has a rwFirst equal to 0 and a rwLast equal to 16383, this reference specifies all rows within the columns specified by colFirst and colLast.
- **cchFile (2 bytes):** An unsigned integer that specifies the count of characters in **stFile**. MUST be greater than or equal to 0x0002.
- **stFile (variable):** A <u>DConFile</u> structure that specifies the workbook and sheet that contains the range specified in the **ref** field.

unused (variable): An array of bytes that is unused and MUST be ignored. MUST exist if and only if
stFile specifies a self reference (the value of stFile.stFile.rgb[0] is 2). If the value
stFile.stFile.fHighByte is 0 the size of this array is 1. If the value of stFile.stFile.fHighByte is
1 the size of this array is 2.

2.4.87 DefaultRowHeight

The **DefaultRowHeight** record specifies the height of all empty rows in the current **sheet**. An empty row is a row that only contains **cells** without data or formatting.

- A fUnsynced (1 bit): A bit that specifies whether the default settings for the row height have been changed.
- B fDyZero (1 bit): A bit that specifies whether empty rows have a height of zero.
- **C fExAsc (1 bit):** A bit that specifies whether all empty rows have a thick **border style** applied to the top **border** (as specified in field **fExAsc** of record Row).
- **D fExDsc (1 bit):** A bit that specifies whether all empty rows have a thick border style applied to the bottom border (as specified in field **fExDes** of record Row).

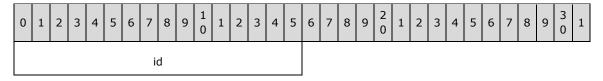

reserved (12 bits): MUST be zero, and MUST be ignored.

- miyRw (2 bytes): A signed integer that specifies the default row height, in twips, for empty rows.

 MUST exist if and only if fDyZero is 0. MUST be greater than or equal to 1 and less than or equal to 8179.
- **miyRwHidden (2 bytes):** A signed integer that specifies the default row height, in twips, to apply to a **hidden** row when unhidden. MUST exist if and only if **fDyZero** is 1. MUST be greater than or equal to 0 and less than or equal to 8179.

2.4.88 DefaultText

The **DefaultText** record specifies the text elements that are formatted using the information specified by the <u>Text</u> record immediately following this record.

id (2 bytes): An unsigned integer that specifies the text elements that are formatted using the position and appearance information specified by the Text record immediately following this record. MUST be a value from the following table.

If this record is in a sequence of records that conforms to the <u>CRT</u> rule as specified by the Chart Sheet Substream **ABNF**, then this field MUST be 0x0000 or 0x0001. If this record is not in a sequence of records that conforms to the CRT rule as specified by the Chart Sheet Substream ABNF, then this field MUST be 0x0002 or 0x0003.

Value	Meaning
0x0000	Format all Text records in the <u>chart group</u> where fShowPercent is equal to 0 or fShowValue is equal to 0.
0x0001	Format all Text records in the chart group where fShowPercent is equal to 1 or fShowValue is equal to 1.
0x0002	Format all Text records in the <u>chart</u> where the value of fScaled of the associated <u>FontInfo</u> structure is equal to 0.
0x0003	Format all Text records in the chart where the value of fScaled of the associated FontInfo structure is equal to 1.

2.4.89 DefColWidth

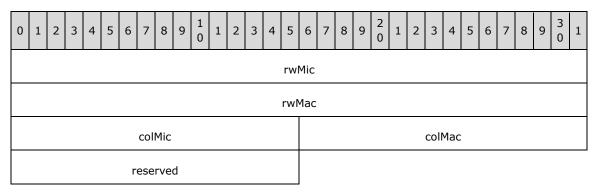

The **DefColWidth** record specifies the default column width of a **sheet** and specifies the beginning of a collection of <u>ColInfo</u> records as defined by the <u>Macro Sheet Substream</u> **ABNF** and <u>Worksheet Substream</u> ABNF. The collection of ColInfo records specifies the column formatting for a **range** of columns.

cchdefColWidth (2 bytes): An unsigned integer that specifies the default width, in number of characters, of the columns in the sheet. MUST be less than or equal to 255.

2.4.90 Dimensions

The **Dimensions** record specifies the used **range** of the **sheet**. It specifies the row and column bounds of used **cells** in the sheet. Used cells include all cells with formulas (section 2.2.2) or data. Used cells also include all cells with formatting applied directly to the cell. Cells can also be formatted by default row or column formatting. If a row has default formatting then the used range includes that row in its row bounds, but does not affect the used range column bounds, unless the used range would otherwise be empty, in which case the column bounds are set to include the first column. If a column has default formatting then the used range includes that column in its column bounds, but does not affect the used range row bounds, unless the used range would otherwise be empty, in which case the row bounds are set to include the first row.

rwMic (4 bytes): A <u>RwLongU</u> structure that specifies the first row in the sheet that contains a used cell.

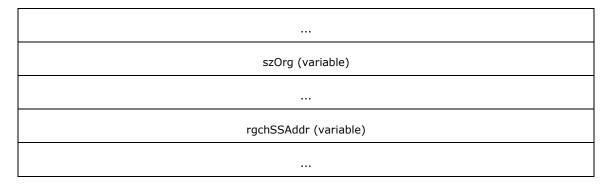

- **rwMac (4 bytes):** An unsigned integer that specifies the zero-based index of the row after the last row in the sheet that contains a used cell. MUST be less than or equal to 0x00010000. If this value is 0x00000000, no cells on the sheet are used cells.
- **colMic (2 bytes):** A <u>ColU</u> structure that specifies the first column in the sheet that contains a used cell.
- **colMac (2 bytes):** An unsigned integer that specifies the zero-based index of the column after the last column in the sheet that contains a used cell. MUST be less than or equal to 0x0100. If this value is 0x0000, no cells on the sheet are used cells.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.91 DocRoute

The **DocRoute** record specifies the document routing information for a **routing slip**<77> that is used to send a document in an e-mail message and specifies the beginning of a collection of RecipName records as defined by the Globals Substream ABNF. The collection of RecipName records specifies the recipients of the routing slip.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1			
							iSt	age															cRe	ecip										
						d	elO	ptio	n							Α	В	С	D		Е		F			u	ınu	sed2	2					
cchSubject																			ccl	nМе	ssa	ge												
cchRouteID												cchCustType																						
cchBookTitle cchOrg																																		
														u	IEI	Siz	:e																	
													szS	Subj	ect	(va	rial	ole)

												9	szR	out	eID	(va	aria	ble))															
•••																																		
	szCustType (variable)																																	
																															-			
	szBookTitle (variable)																																	

- **iStage (2 bytes):** An unsigned integer that specifies the **routing stage** of the slip. This value MUST be less than or equal to the **cRecip** field +1.
- **cRecip (2 bytes):** An unsigned integer that specifies the number of recipients. MUST equal the actual number of RecipName records that follow this record.
- **delOption (2 bytes):** An unsigned integer that specifies the delivery option. MUST be a value from the following table:

Value	Meaning Meaning								
0x00	Deliver to one recipient at a time								
0x01	Deliver to all recipients at once								

- A fRouted (1 bit): A bit that specifies whether the document has been routed.
- **B fReturnOrig (1 bit):** A bit that specifies whether the document is returned to the originator after being routed to the last recipient.
- **C fTrackStatus (1 bit):** A bit that specifies whether a status message is sent to the originator after the document is routed.
- **D fCustomType (1 bit):** A bit that specifies whether there is a custom message type defined by **szCustType**.
- **E unused1 (3 bits):** Undefined and MUST be ignored.
- **F fSaveRouteInfo (1 bit):** A bit that specifies whether the routing information is saved with the document. MUST equal 1.
- unused2 (8 bits): Undefined and MUST be ignored.
- **cchSubject (2 bytes):** An unsigned integer that specifies the count of characters in the **szSubject** field string. MUST be less than or equal to 256.
- **cchMessage (2 bytes):** An unsigned integer that specifies the count of characters in the **szMessage** field string. MUST be less than or equal to 256.
- **cchRouteID (2 bytes):** An unsigned integer that specifies the count of characters in the **szRouteID** field string. MUST be less than or equal to 256.
- cchCustType (2 bytes): An unsigned integer that specifies the count of characters in the szCustType field string. MUST be less than or equal to 256. MUST equal 0 if the fCustomType field equals 0.
- **cchBookTitle (2 bytes):** An unsigned integer that specifies the count of characters in the **szBookTitle** field string. MUST be less than or equal to 256.

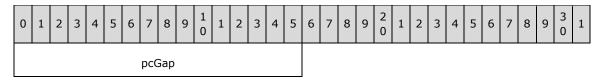

- **cchOrg (2 bytes):** An unsigned integer that specifies the count of characters in the **szOrg** field string. MUST be less than or equal to 256.
- **ulEIDSize (4 bytes):** An unsigned integer that specifies the count of characters in the **rgchSSAddr** field string. When combined with the values of **cchSubject**, **cchMessage**, **cchRouteID**, **cchCustType**, **cchBookTitle**, and **cchOrg** fields, the value MUST be less than or equal to 8202.
- **szSubject (variable):** A NULL terminated array of ANSI characters that specifies the subject of the routed document. The length of the string MUST be specified by the **cchSubject** field. The field MUST NOT exist if the **cchSubject** field is 0.
- **szMessage (variable):** A NULL terminated array of ANSI characters that specifies the message of the routed document. The length of the string MUST be specified by the **cchMessage** field. The field MUST NOT exist if the **cchMessage** field is 0.
- **szRouteID** (variable): A NULL terminated array of ANSI characters that specifies the name of the routing identifier. The length of the string MUST be specified by the **cchRouteID** field. The field MUST NOT exist if the **cchRouteID** field is 0.
- **szCustType (variable):** A NULL terminated array of ANSI characters that specifies a custom message. The length of the string MUST be specified by the **cchCustType** field. The field MUST NOT exist if the field **cchCustType** is 0.

For more information about the MapiMessage structure, see [MSDN-MapiMessage].

- **szBookTitle (variable):** A NULL terminated array of ANSI characters that specifies the **workbook** title. The length of the string MUST be specified by the **cchBookTitle** field. The field MUST NOT exist if the **cchBookTitle** field is 0.
- szOrg (variable): A NULL terminated array of ANSI characters that specifies the originator's friendly name. The length of the string MUST be specified by the cchOrg field. The field MUST NOT exist if the cchOrg field is 0.
- **rgchSSAddr (variable):** A NULL terminated array of ANSI characters that specifies the identifier used by the **messaging system service provider** to identify the originator's e-mail address. The length of the string MUST be specified by the **ulEIDSize** field. The field MUST NOT exist if the **ulEIDSize** field is 0.

2.4.92 DropBar

The **DropBar** record specifies the attributes of the **up bars** or the **down bars** between multiple <u>series</u> of a line <u>chart group</u> and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream ABNF</u>. The first of these collections in the line chart group specifies the attributes of the up bars. The second specifies the attributes of the down bars. If this record exists, then the chart group type MUST be line and the field **cSer** in the record <u>SeriesList MUST</u> be greater than 1.

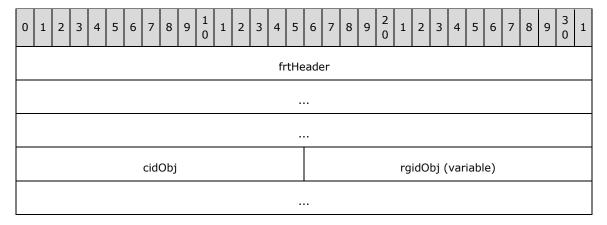

pcGap (2 bytes): A signed integer that specifies the width of the gap between the up bars or the down bars. MUST be a value between 0 and 500. The width of the gap in SPRCs can be calculated by the following formula:

Width of the gap in SPRCs = 1 + pcGap

2.4.93 DropDownObjIds

The **DropDownObjIds** record specifies the object identifiers that can be reused by the application when creating the dropdown objects for the **AutoFilter** at runtime in a **sheet**.

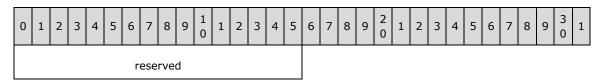

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0874.

cidObj (2 bytes): An unsigned integer that specifies the count of the object identifiers in rgidObj.

rgidObj (variable): An array of 2-byte unsigned integers that specifies the object identifiers that can be reused by the application when creating the dropdown objects for the AutoFilter at runtime in a sheet. These object identifiers MUST NOT equal an existing <u>ObjId</u> structure in the <u>worksheet</u> substream.

2.4.94 DSF

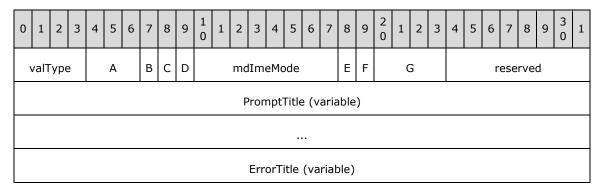

The **DSF** record is reserved and MUST be ignored.

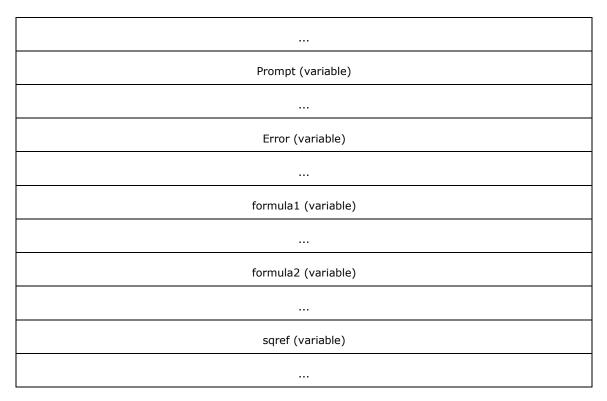

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.95 Dv

The **Dv** record specifies a single set of **data validation** criteria defined for a **range** on this **sheet**.

valType (4 bits): An unsigned integer that specifies the type of data validation. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the data validation allows any type of value and does not check for a type or range of values.
0x1	Specifies that the data validation checks for and allows whole number values satisfying the given condition.
0x2	Specifies that the data validation checks for and allows decimal values satisfying the given condition.
0x3	Specifies that the data validation checks for and allows a value that matches one in a list of values.
0x4	Specifies that the data validation checks for and allows date values satisfying the given condition.
0x5	Specifies that the data validation checks for and allows time values satisfying the given condition.
0x6	Specifies that the data validation checks for and allows text values whose length satisfies the given condition.
0x7	Specifies that the data validation uses a custom formula (section <u>2.2.2</u>) to check the cell value.

A - errStyle (3 bits): An unsigned integer that specifies the style of error alert to be used in the error message which is shown if the fShowErrorMsg bit is set to 1. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the data validation error style uses a stop icon in the error alert.
0x1	Specifies that the data validation error style uses a warning icon in the error alert.

Value	Meaning
0x2	Specifies that the data validation error style uses an information icon in the error alert

- **B fStrLookup (1 bit):** A bit that specifies whether a list of valid inputs was specified for data validation. MUST be ignored if **valType** is not equal to 3.
- C fAllowBlank (1 bit): A bit that specifies whether the data validation treats empty or blank entries as valid.
- **D fSuppressCombo (1 bit):** A bit that specifies whether to suppress the display of the in-cell drop-down when the cell is **selected**. MUST be ignored if **valType** is not equal to 3.
- **mdImeMode (8 bits):** An unsigned integer that specifies the **Input Method Editor (IME)** mode enforced by this data validation. This value is only used when the **input language** is one of the following languages:
- Chinese Simplified (Locale identifier = 2052)
- Chinese Traditional (Locale identifier = 1028)
- Japanese (Locale identifier = 1041)
- Korean (Locale identifier = 1042)

The input for the cell can be restricted to specific sets of characters, as specified by the value of **mdImeMode**. MUST be a value from the following table:

Value	Meaning
0x00	No Control
0x01	On
0x02	Off (English)
0x04	Hiragana
0x05	wide katakana
0x06	narrow katakana
0x07	Full-width alphanumeric
0x08	Half-width alphanumeric
0x09	Full-width hangul
0x0A	Half-width hangul

- **E fShowInputMsg (1 bit):** A bit that specifies whether to show an input prompt when the cell is selected.
- **F fShowErrorMsg (1 bit):** A bit that specifies whether to display an error message when the data validation fails.
- **G typOperator (4 bits):** An unsigned integer that specifies the relational operator used with this data validation. If **valType** is equal to 0, 3 or 7, the value of the **typOperator** field is undefined and MUST be ignored. MUST be a value from the following table:

Value	Meaning
0x0	Between
0x1	Not Between
0x2	Equals

Value	Meaning
0x3	Not Equals
0x4	Greater Than
0x5	Less Than
0x6	Greater Than or Equal To
0x7	Less Than or Equal To

reserved (8 bits): MUST be zero, and MUST be ignored.

PromptTitle (variable): An <u>XLUnicodeString</u> structure that specifies the title of the input prompt that is displayed when the cell is selected. The number of characters in this string MUST be less than or equal to 32.

ErrorTitle (variable): An XLUnicodeString structure that specifies the title of the error that is displayed when the cell value entered fails the data validation criteria. The number of characters in this string MUST be less than or equal to 32.

Prompt (variable): An XLUnicodeString structure that specifies the message shown in the input prompt that is displayed when the cell is selected. The number of characters in this string MUST be less than or equal to 255.

Error (variable): An XLUnicodeString structure that specifies the error message that is displayed when the cell value entered fails the data validation criteria. The number of characters in this string MUST be less than or equal to 225.

formula1 (variable): A <u>DVParsedFormula</u> structure that specifies the first formula (section 2.2.2) used in data validation.

If valType is equal to 0, this formula MUST be ignored and formula1.cce MUST be zero.

If **valType** is not one of 0, 3, or 7 and **typOperator** is equal to 0 or 1, this formula is used as the lesser of two bounding values and **formula1.cce** MUST be greater than or equal to 1.

Otherwise, this formula is the only formula for those cases, and **formula1.cce** MUST be greater than or equal to 1.

formula2 (variable): A DVParsedFormula structure that specifies the second formula used in data validation.

If **typOperator** is greater than or equal to 2 or **valType** is equal to 0, 3 or 7, this formula MUST be ignored and **formula2.cce** MUST be zero.

Otherwise, this formula is used as the greater of two bounding values and **formula2.cce** MUST be greater than or equal to 1.

sqref (variable): A <u>SqRefU</u> structure that specifies all the ranges over which data validation is applied. The value of **sqref.cref** MUST be greater than 0 and less than or equal to 432.

2.4.96 DVal

The **DVal** record specifies **data validation** information that is common to all cells in a **sheet** that have data validation applied and specifies the beginning of a collection of <u>Dv</u> records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of Dv records specifies data validation criteria for individual **ranges** in the sheet.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	A B C reserved2														xLeft																
															уТор																
																idObj															
														idvMac																	

A - fWnClosed (1 bit): A bit that specifies whether the window used for input is closed.

B - reserved1 (1 bit): MUST be zero, and MUST be ignored.

C - unused (1 bit): Undefined and MUST be ignored.

reserved2 (13 bits): MUST be zero, and MUST be ignored.

- **xLeft (4 bytes):** An unsigned integer that specifies the X-coordinate of the top left corner of the window used for input relative to the window used to display the sheet, in pixels. MUST be less than or equal to 65535.
- **yTop (4 bytes):** An unsigned integer that specifies the Y-coordinate of the top left corner of the window used for input relative to the window used to display the sheet, in pixels. MUST be less than or equal to 65535.
- idObj (4 bytes): A signed integer that specifies a reference to an Obj that represents the drop-down button displayed if a cell with a drop-down button is the selected cell at the time the file is saved. The value of this field specifies the value of the cmo.id field of the associated Obj record. MUST be greater than 0 and less than or equal to 32767 if the drop-down button is displayed. MUST be -1 if there is no drop-down button being displayed in the selected cell at the time the file is saved.
- **idvMac (4 bytes):** An unsigned integer that specifies the number of Dv records that follow this record. MUST be greater than or equal to 0 and less than or equal to 65534. There MUST be exactly that many Dv records following this record.

2.4.97 DXF

The **DXF** record specifies a <u>differential format</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	eade	er														
	•••																														
Α	A B C reserved xfprops (variable)																														

...

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 2189.

A - unused1 (1 bit): Undefined and MUST be ignored. <78>

B - fNewBorder (1 bit): A bit that specifies whether it is possible to specify internal **border formatting** in **xfprops**. Internal border formatting is formatting that applies to borders that lie between a **range** of **cells**.

Value	Meaning
0x0	Specifies that internal border formatting cannot be used in xfprops .
0x1	Specifies that internal border formatting can be used in xfprops .

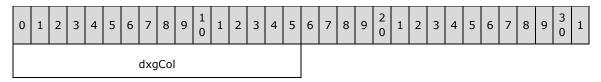

C - unused2 (1 bit): Undefined and MUST be ignored.

reserved (13 bits): MUST be zero, and MUST be ignored.

xfprops (variable): An <u>XFProps</u> structure that specifies the formatting properties.

2.4.98 DxGCol

The **DxGCol** record specifies the default column width for all **sheet** columns that do not have a column width explicitly specified. If an explicit column width was specified for a column, it is stored in a <u>ColInfo</u> record.

dxgCol (2 bytes): An unsigned integer that specifies the default column width. For the purposes of this field specification, a standard digit is defined to be the widest digit in the Normal style font. The default column width is measured in the number of standard digits that fit in the column multiplied by 256 and rounded down. The value MUST be less than or equal to 65535 or be equal to 0xFFFFFFFF. If the value is 0xFFFFFFFF, this value MUST be ignored.

2.4.99 End

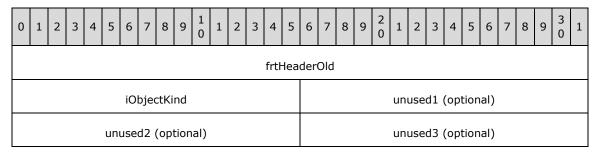

The **End** record specifies the end of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies properties of a <u>chart</u>.

2.4.100 EndBlock

The **EndBlock** record specifies the end of a collection of records. <u>Future records</u> contained in this collection specify saved features to allow applications that do not support the feature to preserve the information. This record MUST have an associated <u>StartBlock</u> record. StartBlock and EndBlock pairs can be nested. Up to 100 levels of blocks can be nested.

EndBlock records MUST be written according to the following rules:

- If there exists a StartBlock record with iObjectKind equal to 0x0000 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current Axis Group.
- If there exists a StartBlock record with iObjectKind equal to 0x0002 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current AttachedLabel.
- If there exists a StartBlock record with **iObjectKind** equal to 0x0004 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current Axis.
- If there exists a StartBlock record with **iObjectKind** equal to 0x0005 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current chart group.
- If there exists a StartBlock record with **iObjectKind** equal to 0x0006 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the sequence of records containing the StartBlock and conforming to the <u>DAT</u> rule.
- If there exists a StartBlock record with **iObjectKind** equal to 0x0007 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the sequence of records containing the StartBlock and conforming to the FRAME rule.
- If there exists a StartBlock record with iObjectKind equal to 0x0009 without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current <u>Legend</u>.
- If there exists a StartBlock record with **iObjectKind** equal to 0x000A without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current <u>Begin</u> and End collection that exists immediately after <u>LegendException</u> in the sequence of records conforming to the SERIESFORMAT rule.
- If there exists a StartBlock record with **iObjectKind** equal to 0x000C without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current Series.
- If there exists a StartBlock record with **iObjectKind** equal to 0x000D without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current Sheet.
- If there exists a StartBlock record with **iObjectKind** equal to 0x000E without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the current SS production.
- If there exists a StartBlock record with **iObjectKind** equal to 0x000F without a matching EndBlock, then a matching EndBlock record MUST exist immediately before the End record of the sequence of records containing the StartBlock and conforming to the DROPBAR rule.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0853.

iObjectKind (2 bytes): An unsigned integer that specifies the type of object that is encompassed by the block. MUST equal the **iObjectKind** field of the associated StartBlock record. MUST be a value from the following table:

Value	Object Type
0x0000	Axis Group
0x0002	AttachedLabel
0x0004	Axis
0x0005	chart group
0x0006	Dat
0x0007	Frame
0x0009	Legend
0x000A	LegendException
0x000C	Series
0x000D	Sheet
0x000E	DataFormat
0x000F	DropBar

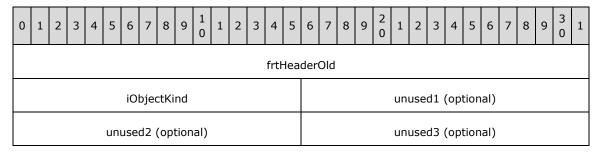

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

unused3 (2 bytes): Undefined and MUST be ignored.

2.4.101 EndObject

The **EndObject** record specifies properties of an <u>Future Record Type (FRT)</u> as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a feature saved as an FRT such that an application not supporting the feature can preserve it. This record MUST have an associated <u>StartObject</u> record. StartObject and EndObject pairs can be nested. Up to 100 levels of blocks can be nested.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0855.

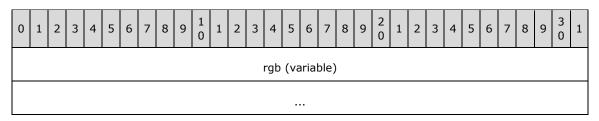

iObjectKind (2 bytes): An unsigned integer that specifies the type of object that is encompassed by the block. MUST equal the **iObjectKind** field of the associated StartObject record. MUST be a value from the following table:

Value	Object Type
0x0010	YMult
0x0011	<u>FrtFontList</u>
0x0012	DataLabExt

unused1 (2 bytes): Undefined and MUST be ignored.unused2 (2 bytes): Undefined and MUST be ignored.unused3 (2 bytes): Undefined and MUST be ignored.

2.4.102 EntExU2

The **EntExU2** record specifies an application-specific cache of information. SHOULD NOT
Very be written, and SHOULD
Very be ignored.

rgb (variable): An array of bytes that specifies an application-specific cache of information. This cache exists for performance reasons only, and can be rebuilt based on information stored elsewhere in the file without affecting calculation results.

2.4.103 EOF

The **EOF** record specifies the end of a collection of records as defined by <u>Globals Substream</u> **ABNF**, <u>Worksheet Substream</u> ABNF, <u>Dialog Sheet Substream</u> ABNF, <u>Chart Sheet Substream</u> ABNF, <u>macro sheet</u> substream ABNF, <u>revision</u> stream ABNF, and <u>pivot cache</u> storage ABNF.

2.4.104 Excel9File

The **Excel9File** record is optional and is unused. It doesn't exist on files that were last saved in a specific version of the application <81>.

2.4.105 ExternName

The **ExternName** record specifies an <u>external defined name</u>, a User Defined Function (**UDF**) reference on a **XLL** or **COM add-in**, a <u>DDE data item</u> or an <u>OLE data item</u>, depending on the value of the **virtPath** field in the preceding <u>SupBook</u> record. If the **cch** field in the preceding SupBook record is 0x3A01, then this record specifies a UDF reference. Otherwise if the **virtPath** field in the preceding SupBook record conforms to the ole-link rule specified in the <u>VirtualPath</u> ABNF, then this record specifies a DDE data item or an OLE data item. Otherwise, this record specifies an external defined name.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	U	D	Е	cf									F body (variable)																	
	•••																														

A - fBuiltIn (1 bit): A bit that specifies whether this record specifies a user-defined or built-in external defined name. The value MUST be 0 if this record specifies a DDE data item, an OLE data item or a UDF reference on a XLL or COM add-in. Otherwise, MUST be one of the following:

Value	Meaning
0	The external defined name is user-defined.
1	The external defined name is built-in.

B - fWantAdvise (1 bit): A bit that specifies whether this record is an automatic DDE data item or OLE data item. MUST be one of the following:

Value	Meaning
0	The record is an external defined name, a manual DDE data item, a manual OLE data item or a UDF reference on a XLL or COM add-in.
1	The record is either an automatic DDE data item or an automatic OLE data item.

- C fWantPict (1 bit): A bit that specifies whether this record's linked data uses a picture format. The value MUST be 0 if this record specifies an external defined name or a UDF reference on a XLL or COM add-in.
- **D fOle (1 bit):** A bit that, together with the value of **fOleLink**, specifies the structure of **body**. The value MUST be 0 if this record is an external defined name, an OLE data item or a UDF reference on a XLL or COM add-in. If this value is 1, **fOleLink** MUST be 0.
- **E fOleLink (1 bit):** A bit that, together with the value of **fOle**, specifies the structure of **body**. The value MUST be 0 if this record is an external defined name or a UDF reference on a XLL or COM add-in. If this value is 1, **fOle** MUST be 0 and this record specifies an OLE data item.
- **cf (10 bits):** A signed integer that specifies the type of the cached clipboard format for a DDE data item or an OLE data item. The value MUST be 0 if this record is an external defined name or a UDF reference on a XLL or COM add-in. The value MUST be one of the values in the following table:

Value	Meaning
-1	There is no cached clipboard format.
0	This record is an external defined name or the cached clipboard format is text. For the text format, each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

Value	Meaning				
2	Cached clipboard format is Enhanced Metafile.				
5	Cached clipboard format is CSV (comma-delimited).				
6	Cached clipboard format is Microsoft Symbolic Link (SYLK). SYLK is a format used to exchange data between applications.				
7	Cached clipboard format is rich text (RTF).				
8	Cached clipboard format is BIFF8 .				
9	Cached clipboard format is Bitmap.				
16	Cached clipboard format is a table created using a specific application <82>.				
20	Cached clipboard format is BIFF3 .				
30	Cached clipboard format is BIFF4 .				
36	Cached clipboard format is Metafile Picture Format.				
44	Cached clipboard format is Unicode text. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.				
63	Cached clipboard format is BIFF12.				

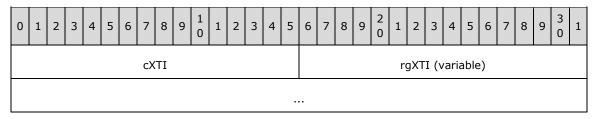

F - fIcon (1 bit): A bit that specifies whether linked data is displayed as an **icon**. The value MUST be 0 if this record is an external defined name, a DDE data item or a UDF reference on a XLL or COM add-in.

body (variable): A variable type field whose type and meaning is dictated by the values of **fOle** and **fOleLink**, as specified in the following table:

cch in the preceding SupBook	DDE data item or OLE data item	fOle	fOleLink	Meaning
!= 0x3A01	no	0	0	body is an ExternDocName that specifies an external defined name.
!= 0x3A01	yes	0	0	body is an ExternOleDdeLink that specifies an OLE data item or DDE data item.
!= 0x3A01	yes	0	1	
!= 0x3A01	yes	1	0	body is an ExternDdeLinkNoOper that specifies a DDE data item.
0x3A01	no	0	0	Body is an AddinUdf that specifies a UDF reference on a XLL or COM add-in.

2.4.106 ExternSheet

The **ExternSheet** record specifies a collection of XTI structures.

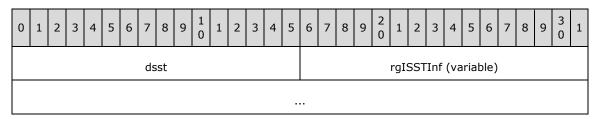

cXTI (2 bytes): An unsigned integer that specifies the number of elements in the rgXTI array.

rgXTI (variable): An array of XTI structures. The number of elements in this array MUST be cXTI.

2.4.107 ExtSST

The **ExtSST** record specifies the location of sets of strings within the shared string table, specified in the <u>SST</u> record. This record is used to perform a quick lookup of a string within the shared string table, given the string's index into the table (as specified in <u>LabelSst</u>). To do that, first use the string's index and the value of **dsst** to find the set the string is in, then use the corresponding element in **rgISSTInf** to find the beginning of that set, and finally search incrementally forward in that set to locate the string.

dsst (2 bytes): An unsigned integer that specifies the number of strings in each set specified by ISSTInf. Number of strings in each set except the last set MUST be equal to the value specified by the following formula:

max(((SST.cstUnique / 128) + 1),8)

Number of strings in the last set MUST be less than or equal to the value specified by the following formula:

max(((SST.cstUnique / 128) + 1),8)

rgISSTInf (variable): An array of ISSTInf structures. Each array element specifies the location of a set of strings within the SST record. The number of elements is determined by first evaluating the following formula <83>:

(SST.cstUnique mod ExtSST.dsst)

If the result of the previous formula is equal to 0, then the number of elements MUST be equal to the value as specified by the following formula:

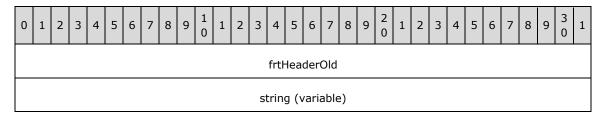

(SST.cstUnique / ExtSST.dsst)

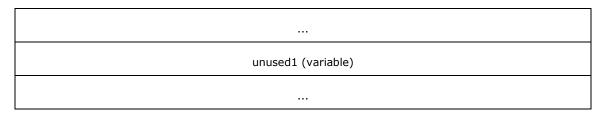

Otherwise, the number of elements MUST be equal to the value as specified by the following formula:

(SST.cstUnique / ExtSST.dsst) + 1

2.4.108 ExtString

The **ExtString** record specifies the **connection string** for a **query** that retrieves **external data**.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 2052.

string (variable): A XLUnicodeString structure that specifies the connection string.

unused1 (variable): Undefined and MUST be ignored. MUST exist if and only if the value of the following formula is less than 12 bytes:

size of string + size of frtHeaderOld

The size of this field, in bytes, is calculated using the following formula:

12 - (size of **string** + size of **frtHeaderOld**)

2.4.109 Fbi

The **Fbi** record specifies the **font** information at the time the scalable font is added to the chart. <84>

If the scaled font size matches the font size of the <u>Font</u> record (as specified by **ifnt** and Font.**dyHeight**), then that Font record is used to render the scaled fonts. If the scaled font size doesn't match the size of the Font record (as specified by **ifnt**), then a new Font record is added to the font table and the following **font scaling** algorithm is used to determine the scaled font size:

- 1. Start with the current **chart area** (section 2.2.3.17) in dots or pixels at 96 DPI. Convert this size to Twips by multiplying width and height by 1440 Twips per inch / 96 dots per inch. Call this dmix and dmiy respectively.
- 2. If the scale basis **scab** is plot area (1), then apply the plot area scaling factors PlotGrowth.**dxPlotGrowth**/65536 and PlotGrowth.**dyPlotGrowth**/65536 to dmix and dmiy respectively.
- 3. Determine the scaled height basis by multiplying **twpHeightBasis** by dmix / **dmixBasis**; name this twpX.
- 4. Multiply twpHeightBasis by dmiy / dmiyBasis; call this twpY.
- 5. Take the smaller of twpX and twpY and name this twpNew. If this value is less than 10, set it equal to 10.
- 6. Round this value to the nearest quarter **point**.
- 7. If the value of **twpHeightBasis** is between 160 (inclusive) and 240 (inclusive), and the value of twpNew is between 120 (inclusive) and 160, make twpNew equal to 160. If the value of Fbi.**twpHeightBasis** is between 160 (inclusive) and 240 (inclusive), and value of twpNew is between 240 and 280 (inclusive), make twpNew equal to 240.
- 8. twpNew is the new scaled font size. If the **dyHeight** field of the Font record (as specified by Fbi.**ifnt**) is the same as the value of twpNew, then load that Font record for the scaled font. If it isn't the same, twpNew is the new scaled font size and a new Font record is added to the font table.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
dmixBasis										dmiyBasis																					
twpHeightBasis											scab																				
ifnt																															

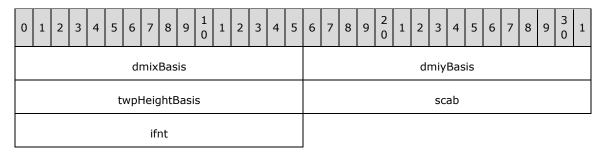

- **dmixBasis (2 bytes):** An unsigned integer that specifies the font width, in **twips**, when the font was first applied. MUST be greater than or equal to 0 and less than or equal to 0x7FFF.
- **dmiyBasis (2 bytes):** An unsigned integer that specifies the font height, in twips, when the font was first applied. MUST be greater than or equal to 0 and less than or equal to 0x7FFF.
- **twpHeightBasis (2 bytes):** An unsigned integer that specifies the default font height in twips. MUST be greater than or equal to 20 and less than or equal to 8180.
- **scab (2 bytes):** A Boolean (section <u>2.5.14</u>) that specifies the scale to use. The value MUST be one of the following values:

Value	Meaning
0x0000	Scale by chart area (section 2.2.3.17)
0x0001	Scale by plot area

ifnt (2 bytes): A <u>FontIndex</u> structure that specifies the font. MUST be used when **ifnt** is less than or equal to 255.

2.4.110 Fbi2

The **Fbi2** record specifies the **font** information at the time the scalable font is added to the chart. $\leq 85 \geq$

- **dmixBasis (2 bytes):** An unsigned integer that specifies the font width, in **twips**, when the font was first applied. MUST be greater than or equal to 0 and less than or equal to 0x7FFF.
- **dmiyBasis (2 bytes):** An unsigned integer that specifies the font height, in twips, when the font was first applied. MUST be greater than or equal to 0 and less than or equal to 0x7FFF
- **twpHeightBasis (2 bytes):** An unsigned integer that specifies the default font height in twips. MUST be greater than or equal to 20 and less than or equal to 8180.
- **scab (2 bytes):** A Boolean (section 2.5.14) that specifies the scale to use. The value MUST be one of the following values:

Value	Meaning
0x0000	Scale by chart area (section 2.2.3.17)
0x0001	Scale by plot area

ifnt (2 bytes): A <u>FontIndex</u> structure that specifies the font. MUST be used when **ifnt** is greater than 255.

2.4.111 Feat

The **Feat** record specifies **Shared Feature** data.

0 1 2 3 4 5 6 7	8 9 1 1 2 3 4 5	6 7 8 9 2 1 2 3	4 5 6 7 8 9 3 1								
	frtHeader										
i	sf	reserved1	reserved2								
			cref								
		cbFeatData									
	resei	rved3	refs (variable)								
	rgbFeat (variable)										

frtHeader (12 bytes): An FrtHeader structure. frtHeader.rt MUST be 0x0868.

isf (2 bytes): A <u>SharedFeatureType</u> enumeration that specifies the type of Shared Feature data stored in the **rgbFeat** field. MUST NOT be ISFLIST.

reserved1 (1 byte): Reserved and MUST be zero.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

cref (2 bytes): An unsigned integer that specifies the number of elements in the refs field.

cbFeatData (4 bytes): An unsigned integer whose meaning is determined by the value of **isf**. If **isf** is ISFFEC2, this field specifies the size in bytes of Shared Feature data that is stored in the **rgbFeat** field. Otherwise, this field MUST be zero and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

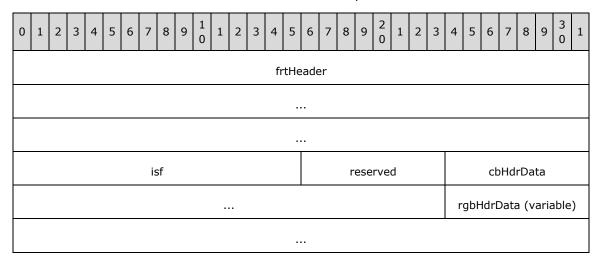

refs (variable): An array of <u>Ref8U</u> structures. Specifies the **ranges** referenced by the Shared Feature. The number of elements in the array is specified by **cref**.

rgbFeat (variable): A variable type field that specifies Shared Feature data. The type is dictated by the value of **isf**, as specified in the following table:

Value of isf	Meaning								
ISFPROTECTION	Value is a <u>FeatProtection</u> structure.								
ISFFEC2	Value is a <u>FeatFormulaErr2</u> structure.								
ISFFACTOID	Value is a <u>FeatSmartTag</u> structure.								

2.4.112 FeatHdr

The **FeatHdr** record specifies common information for <u>Shared Features</u> and specifies the beginning of a collection of records as defined by the <u>Globals Substream</u> **ABNF**, <u>macro sheet</u> substream ABNF and <u>worksheet</u> substream ABNF. The collection of records specifies Shared Feature data.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt MUST be 0x0867.

isf (2 bytes): A <u>SharedFeatureType</u> enumeration that specifies the type of Shared Feature. MUST be ISFPROTECTION, ISFFEC2 or ISFFACTOID.

reserved (1 byte): Reserved and MUST be 1.

cbHdrData (4 bytes): An unsigned integer that specifies whether **rgbHdrData** exists. MUST be a value from the following table:

Value	Meaning
0x00000000	rgbHdrData MUST NOT exist.
0xFFFFFFF	rgbHdrData MUST exist.

rgbHdrData (variable): A variable type field containing data whose type and meaning is dictated by the value of the **isf** field of this record and the value of the **dt** field of the <u>BOF</u> record preceding this record, as specified in the following table:

Value of isf	Containing substream	Meaning of rgbHdrData
ISFPROTECTIO N	Globals	An <u>EnhancedProtection</u> structure that specifies common protection rule settings.
ISFFEC2	Globals	rgbHdrData MUST NOT exist.

Value of isf	Containing substream	Meaning of rgbHdrData						
ISFFACTOID	Globals	A PropertyBagStore as defined in [MS-OSHARED] section 2.3.4.1 that specifies smart tag header data.						
	Worksheet or Macro Sheet	rgbHdrData MUST NOT exist.						

2.4.113 FeatHdr11

The **FeatHdr11** record specifies common information for all **tables** on a **sheet** and specifies the beginning of a collection as specified by the <u>Worksheet Substream</u> **ABNF**. The collection of records specifies table information, **AutoFilter** information and data used for sorting a **range**

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtHeader																														
							is	sf								reserved1							reserved2								
												•														re	eser	vec	13		
												•														id	List	Ne	xt		
																										re	ser	vec	14		
																								•							

frtHeader (12 bytes): An FrtHeader. The frtHeader.rt field MUST be 0x0871.

isf (2 bytes): A <u>SharedFeatureType</u> enumeration that specifies the type of <u>Shared Feature</u>. MUST be ISFLIST.

reserved1 (1 byte): Reserved and MUST be 1.

reserved2 (4 bytes): MUST be 0xFFFFFFF and MUST be ignored.

reserved3 (4 bytes): MUST be 0xFFFFFFF and MUST be ignored.

idListNext (4 bytes): An unsigned integer that specifies the next identifier to try when assigning a unique identifier to a new table.

reserved4 (2 bytes): MUST be zero, and MUST be ignored.

2.4.114 Feature11

The **Feature11** record specifies specific <u>shared feature</u> data. The only shared feature type stored in this record is a **table** in a <u>worksheet</u>.

feature (variable): A <u>TableFeatureType</u> structure.

If this record is not a <a>Feature12 record, then these rules apply:

- The feature.frtRefHeaderU.rt field MUST be 0x0872.
- It of the embedded TableFeatureType MUST NOT be LTEXTERNALDATA.
- If **crwHeader** of the embedded TableFeatureType is zero then and **fSingleCell** of the embedded TableFeatureType MUST be zero.
- fLoadTotalFmla and fLoadTotalStr of all embedded Feat11FieldDataItem MUST be zero.

0 1 2 3 4 5 6 7	8 9 1 1 2 3 4 5	6 7 8 9 2 1 2 3	4 5 6 7 8 9 3 1								
	frtRefHeaderU										
is	sf	reserved1	reserved2								
			cref2								
		cbFeatData									
	reser	rved3	refs2 (variable)								
	rgbFeat (variable)										

frtRefHeaderU (12 bytes): An <u>FrtRefHeaderU</u>. The **frtRefHeaderU.rt** field MUST be 0x0872. The **frtRefHeaderU.ref8** MUST refer to a **range** of cells associated with this record.

isf (2 bytes): A <u>SharedFeatureType</u> enumeration that specifies the type of Shared Feature data stored in the **rgbFeat** field. MUST be ISFLIST.

reserved1 (1 byte): Reserved and MUST be zero.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

cref2 (2 bytes): An unsigned integer that specifies the count of Ref8U records within the refs2 field.

cbFeatData (4 bytes): An unsigned integer that specifies the size in bytes of the **rgbFeat** variable-size field. If the value is 0x0000, the size of the **rgbFeat** field is calculated by the following formula:

size of rgbFeat = total size of record in bytes - size of refs2 in bytes - 27 bytes

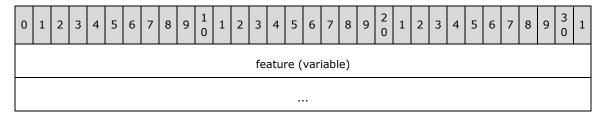

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

refs2 (variable): An array of Ref8U structures that specifies references to ranges of **cells** within the worksheet associated with the feature. The count of records within this field is specified by the **cref2** field.

rgbFeat (variable): A variable-size structure that contains feature specific data. The size of the structure is specified by the **cbFeatData** field. This field MUST contain a TableFeatureType structure.

2.4.115 Feature12

The **Feature12** record specifies <u>shared feature</u> data that is used to describe a table in a <u>worksheet</u>. This record is used to encapsulate a table that has properties not supported by the <u>Feature11</u> record.

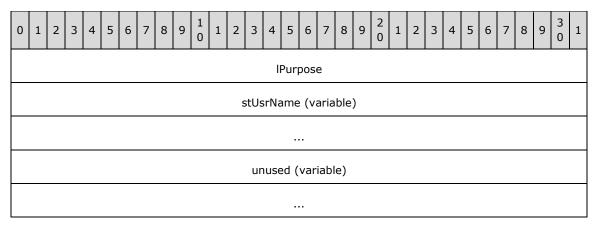

feature (variable): A Feature11 record with additional properties enabled. The **feature.frtRefHeaderU.rt** field MUST be 0x0878.

On or more of these additional properties MUST be present in a Feature12 record:

- It of the embedded <u>TableFeatureType</u> structure is LTEXTERNALDATA.
- crwHeader and fSingleCell of the embedded TableFeatureType structure are zero.
- An embedded <u>Feat11FieldDataItem</u> structure has **fLoadTotalFmla** or **fLoadTotalStr** equal to 1.

2.4.116 FileLock

The **FileLock** record specifies that the **shared workbook** was **locked** by a particular user.

IPurpose (4 bytes): An unsigned integer that specifies the purpose of the file lock. MUST be one of the following:

Value	Meaning
0x00000000	The shared workbook is not locked.
0x00010001	The shared workbook is locked for writing or releasing user information.
0×00010002	The shared workbook is locked for merging two revisions.
0x00010004	The shared workbook is locked to make it exclusive.

Value	Meaning
0x00010008	The shared workbook is locked to be deleted or renamed.

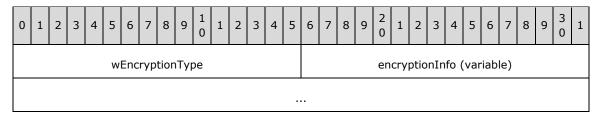

stUsrName (variable): An <u>XLUnicodeString</u> structure that specifies the **user name**. The string length MUST be less than or equal to 52.

unused (variable): Undefined and MUST be ignored. This size of this field in bytes is specified by the following formula:

size = 158 - (byte count of **stUsrName**)

2.4.117 FilePass

The **FilePass** record specifies the encryption algorithm used to encrypt the **workbook** and the structure that is used to verify the password provided when attempting to open the workbook. If this record exists, the workbook MUST be encrypted. Refer to the <u>Encryption (Password to Open)</u> overview to understand the details of workbook files that have been encrypted.

wEncryptionType (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies the encryption type. MUST be a value from the following table: <86>

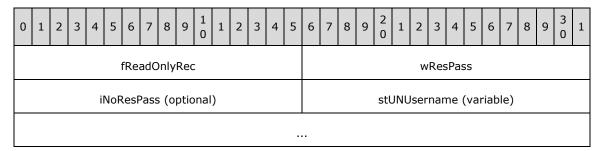

Value of wEncryptionType	Meaning
0x0000	XOR obfuscation
0x0001	RC4 encryption. For more information about RC4 encryption, see [SCHNEIER] section 17.1

encryptionInfo (variable): A variable type field. The type and meaning of this field is dictated by the value of **wEncryptionType**. If **wEncryptionType** is equal to 0x0000, this field is an <u>XORObfuscation</u> structure. If **wEncryptionType** is equal to 0x0001, this field is an RC4 encryption header structure as specified in <u>[MS-OFFCRYPTO]</u>, 2.3.5.1 or [MS-OFFCRYPTO], 2.3.6.1 depending on the value of the first two bytes. The first two bytes of the RC4 encryption header structure MUST be a value from the following table:

Value of the first two bytes of encryptionInfo	Type of encryptionInfo
0x0001	RC4 encryption header structure [MS-OFFCRYPTO], 2.3.6.1
0x0002, 0x0003, or 0x0004	RC4 CryptoAPI encryption header structure [MS-OFFCRYPTO], 2.3.5.1

2.4.118 FileSharing

The **FileSharing** record specifies file sharing options.

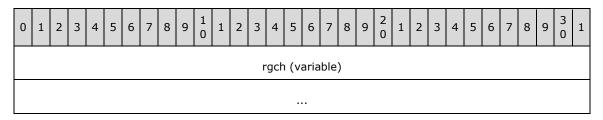

- **fReadOnlyRec (2 bytes):** A Boolean (section <u>2.5.14</u>) that specifies whether the **read-only recommended** option is selected for this file. If the value is 1, the read-only recommended is selected for this file.
- **wResPass (2 bytes):** An unsigned integer that specifies the password verifier for **write reservation**. If the value is 0, there is no write reservation password. The algorithm is specified in <u>Password Verifier Algorithm</u>.
- **iNoResPass (2 bytes):** An unsigned integer that specifies that there is no write reservation password. This field exists if and only if **wResPass** is 0. The value MUST be 0.
- **stUNUsername (variable):** An <u>XLUnicodeString</u> structure that specifies the **user name** that added the write reservation password. This field exists if and only if **wResPass** is not 0. The value of **stUNUsername.cch** MUST be less than or equal to 54.

2.4.119 FilterMode

The **FilterMode** record specifies that the containing **sheet** data was filtered. If this record exists one or more <u>AutoFilter12</u> records MUST exist within the containing sheet.

2.4.120 FnGroupName

The **FnGroupName** record specifies a user-defined **function category** in the current **workbook**.

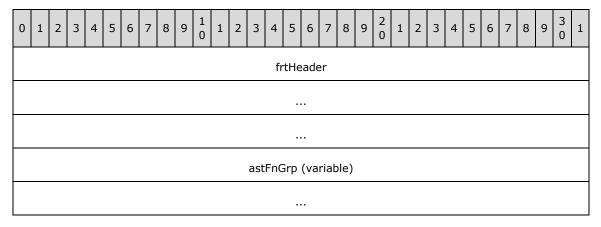

rgch (variable): An <u>XLUnicodeString</u> structure that specifies the function category name. MUST be less than or equal to 32 characters in length. The value of this field MUST NOT equal any of the **category (2)** names specified by FnGroupName and FnGrp12.

2.4.121 FnGrp12

The **FnGrp12** record specifies the name of a user-defined **function category** in the current **workbook**. The user-defined function categories include the function categories defined in both <u>FnGroupName</u> records and FnGrp12 records. The sum of the built-in function categories as specified by <u>BuiltInFnGroupCount</u> and the user defined function categories in the current workbook MUST be

less than or equal to 256. This record specifies the name of a function category after the 32nd function category.

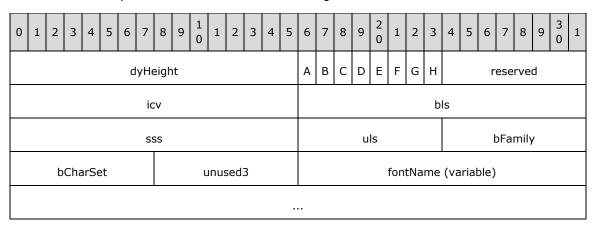

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0898.

astFnGrp (variable): An <u>XLUnicodeString</u> structure that specifies the name of the function category. The length of this string MUST be less than or equal to 32 characters. The value of this field MUST NOT equal any of the **category (2)** names specified by FnGrp12 and FnGroupName.

2.4.122 Font

The **Font** record specifies a **font** and font formatting information.

dyHeight (2 bytes): An unsigned integer that specifies the height of the font in **twips**. SHOULD<87> be greater than or equal to 20 and less than or equal to 8191. MUST be greater than or equal to 20 and less than or equal to 8191, or 0.

- A unused1 (1 bit): Undefined and MUST be ignored.
- **B fItalic (1 bit):** A bit that specifies whether the font is italic.
- C unused2 (1 bit): Undefined and MUST be ignored. MUST be 1 when uls is greater than 0x00.
- **D fStrikeOut (1 bit):** A bit that specifies whether the font has **strikethrough formatting** applied.
- E fOutline (1 bit): A bit that specifies whether the font has an outline effect applied.
- F fShadow (1 bit): A bit that specifies whether the font has a shadow effect applied.

- **G fCondense (1 bit):** A bit that specifies whether the font is condensed.
- **H fExtend (1 bit):** A bit that specifies whether the font is extended.

reserved (8 bits): MUST be zero, and MUST be ignored.

- icv (2 bytes): An unsigned integer that specifies the color of the font. The value SHOULD<88> be an IcvFont value. The value MUST be an IcvFont value, or 0.
- **bls (2 bytes):** An unsigned integer that specifies the font weight. The value SHOULD<89> be a value from the following table. This value MUST be 0, or greater than or equal to 100 and less than or equal to 1000.

Value	Meaning
400	Normal font weight
700	Bold font weight

sss (2 bytes): An unsigned integer that specifies whether superscript, subscript, or normal script is used. The value MUST be one of the following:

Value	Meaning
0x0000	Normal script
0x0001	Superscript
0x0002	Subscript

uls (1 byte): An unsigned integer that specifies the underline **style.** The value MUST be one of the following:

Value	Meaning
0x00	No underline
0x01	Single underline
0x02	Double underline
0x21	Single accounting
0x22	Double accounting

bFamily (1 byte): An unsigned integer that specifies the **font family** this font belongs to. MUST be a value from the following table: <90>

Value	Meaning
0x00	Not applicable
0x01	Roman
0x02	Swiss
0x03	Modern

Value	Meaning
0x04	Script
0x05	Decorative

For more information about font family, see the Windows API LOGFONT structure in [MSDN-FONTS].

bCharSet (1 byte): An unsigned integer that specifies the **character set**. MUST be a value from the following table:

Value	Meaning
0x00	ANSI_CHARSET
0x01	DEFAULT_CHARSET
0x02	SYMBOL_CHARSET
0x4D	MAC_CHARSET
0x80	SHIFTJIS_CHARSET
0x81	HANGEUL_CHARSET
0x81	HANGUL_CHARSET
0x82	JOHAB_CHARSET
0x86	GB2312_CHARSET
0x88	CHINESEBIG5_CHARSET
0xA1	GREEK_CHARSET
0xA2	TURKISH_CHARSET
0xA3	VIETNAMESE_CHARSET
0xB1	HEBREW_CHARSET
0xB2	ARABIC_CHARSET
0xBA	BALTIC_CHARSET
0xCC	RUSSIAN_CHARSET
0xDD	THAI_CHARSET
0xEE	EASTEUROPE_CHARSET
0xFF	OEM_CHARSET

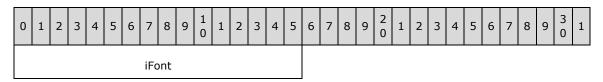

For more information about character set, see the Windows API LOGFONT structure in [MSDN-FONTS].

unused3 (1 byte): Undefined and MUST be ignored.

fontName (variable): A <u>ShortXLUnicodeString</u> structure that specifies the name of this font. String length MUST be greater than or equal to 1 and less than or equal to 31. The **fontName.fHighByte** field MUST equal 1. MUST NOT contain any null characters.

2.4.123 FontX

The **FontX** record specifies the **font** for a given text element. The <u>Font</u> record referenced by **iFont** can exist in this chart sheet substream or the **workbook**.

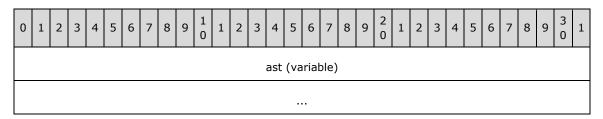

iFont (2 bytes): An unsigned integer that specifies the font to use for subsequent records. This font can either be the default font of the <u>chart</u>, part of the collection of Font records following the <u>FrtFontList</u> record, or part of the collection of Font records in the <u>Globals Substream</u>. If **iFont** is 0x0000, this record specifies the default font of the chart. If **iFont** is less than or equal to the number of Font records in the Globals Substream, **iFont** is a one-based index to a Font record in

the Globals Substream. Otherwise **iFont** is a one-based index into the collection of Font records in this chart sheet substream where the index is equal to **iFont** – n, where n is the number of Font records in the Globals Substream.

2.4.124 Footer

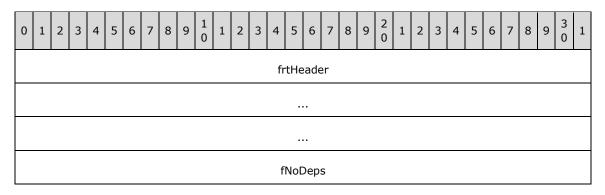

The **Footer** record specifies the footer text of the current **sheet** when printed.

ast (variable): An XLUnicodeString structure that specifies the footer text for the current sheet. It is optional and exists only if the record size is not zero. The footer text appears at the bottom of every page when printed. The length of the text MUST be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes, as specified in the **ABNF** grammar for special commands as specified in Header.

2.4.125 ForceFullCalculation

The **ForceFullCalculation** record specifies the value of the forced **calculation mode** for this **workbook**.

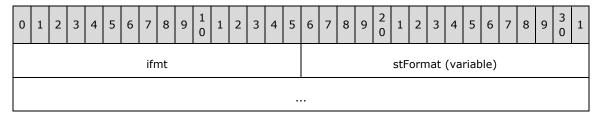

frtHeader (12 bytes): An FrtHeader. The frtHeader.rt field MUST be 0x08A3.

fNoDeps (4 bytes): A Boolean (section 2.5.14) that specifies whether all cells in the workbook are calculated or not. MUST be one of the following:

Value	Meaning
0	Dependencies are respected and only formulas (section 2.2.2) that depend on cells that changed in the workbook are calculated.
1	Dependencies are ignored and all cell formulas in this workbook fully calculate every time a calculation is triggered.

2.4.126 Format

The **Format** record specifies a **number format**.

ifmt (2 bytes): An <u>IFmt</u> structure that specifies the identifier of the **format string** specified by **stFormat**. The value of **ifmt.ifmt** SHOULD<91> be a value within one of the following ranges. The value of **ifmt.ifmt** MUST be a value within one of the following ranges or within 383 to 392.

- 5 to 8
- 23 to 26
- 41 to 44
- 63 to 66
- 164 to 382

stFormat (variable): An <u>XLUnicodeString</u> structure that specifies the format string for this number format. The format string indicates how to format the numeric value of the **cell**. The length of this field MUST be greater than or equal to 1 character and less than or equal to 255 characters. For more information about how format strings are interpreted, see [ECMA-376] Part 4: Markup Language Reference, section 3.8.31.

For a string to be considered a valid format string, it MUST be well-formed according to the following **ABNF** specification.

ABNF Grammar for number format strings

These definitions are for en-US **locale**. International consideration as specified in [ECMA-376] Part 4: Markup Language Reference, section 3.8.31 MUST be accounted for and the ABNF MUST be modified accordingly for specific international number formats.

The following rules are not expressed in the ABNF grammar, but apply to the grammar:

1. In the following ABNF specification, the following tokens in the first table that follows can occur 0 or more times anywhere in the grammar, as long as they do not break apart the elements in the second table that follows:

Token
LITERAL-STRING
LITERAL-CHAR-REPEAT
LITERAL-CHAR-SPACE

Elements	
INTL*	

Elements
LITERAL*
NFDateTimeToken
NFPartExponential
NFPartCond
NFPartLocaleID
NFPartColor
NFPartIntNum
NFPartStrColor

Elements
INTL*
LITERAL*
NFDateTimeToken
NFPartExponential
NFPartCond
NFPartLocaleID
NFPartColor
NFPartIntNum
NFPartStrColor

2. The following token MUST occur 0 or 1 times in each section as defined in [ECMA-376] Part 4: Markup Language Reference, section 3.8.31.

NFPartLocaleID

NFAbsTimeToken MUST occur 0 or 1 times in NFDateTime.

An absolute time token, such as NFPartAbsHour, MUST NOT coexist with a non-absolute equivalent token, such as NFPartHour, in NFDateTime.

Following is the ABNF grammar for number format strings.

```
NFAnyNoText = [NFPartColor] [NFPartCond] (NFNumber / NFFraction / ([NFDateTime] [NFGeneral]
       [NFDateTimel))
NFAnyNoCond = [NFPartColor] (NFNumber / NFText / NFFraction / ([NFDateTime] [NFGeneral]
       [NFDateTime]))

2.4.127 Formula

The **Formula** record specifies a formula (section 2.2.2) for a **cell**.

cell (6 bytes): A <u>Cell</u> structure that specifies a cell on the **sheet**.

val (8 bytes): A FormulaValue structure that specifies the value of the formula.

- A fAlwaysCalc (1 bit): A bit that specifies whether the formula needs to be calculated during the next recalculation.
- **B reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- C fFill (1 bit): A bit that specifies whether the cell has a fill alignment or a center-across-selection alignment.

Value	Meaning						
0	Cell does not have a fill alignment or a center-across-selection alignment.						
1	Cell has either a fill alignment or a center-across-selection alignment.						

- D fShrFmla (1 bit): A bit that specifies whether the formula is part of a shared formula as defined in <u>ShrFmla</u>. If this formula is part of a shared formula, formula.rgce MUST begin with a <u>PtgExp</u> structure.
- **E reserved2 (1 bit):** MUST be zero, and MUST be ignored.
- **F fClearErrors (1 bit):** A bit that specifies whether the formula is excluded from **formula error checking**.

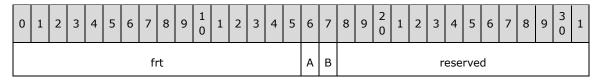

reserved3 (10 bits): MUST be zero, and MUST be ignored.

chn (4 bytes): A field that specifies an application-specific cache of information. This cache exists for performance reasons only, and can be rebuilt based on information stored elsewhere in the file without affecting calculation results.

formula (variable): A <u>CellParsedFormula</u> structure that specifies the formula.

2.4.128 Frame

The **Frame** record specifies the type, size and position of the frame around a <u>chart</u> element as defined by the <u>Chart Sheet Substream</u> **ABNF**. A chart element's frame is specified by the Frame record following it.

frt (2 bytes): An unsigned integer that specifies the type of frame to be drawn. MUST be a value from the following table:

Value	Frame Type						
0x0000	A frame surrounding the chart element.						
0x0004	A frame with a shadow surrounding the chart element.						

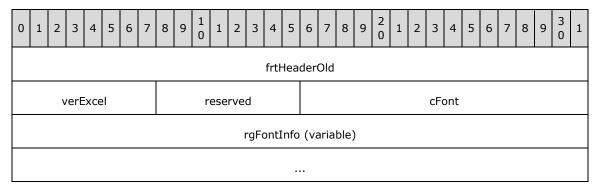

A - fAutoSize (1 bit): A bit that specifies if the size of the frame is automatically calculated. If the value is 1, the size of the frame is automatically calculated. In this case, the width and height specified by the chart element are ignored and the size of the frame is calculated automatically. If the value is 0, the width and height specified by the chart element are used as the size of the frame.

B - fAutoPosition (1 bit): A bit that specifies if the position of the frame is automatically calculated. If the value is 1, the position of the frame is automatically calculated. In this case, the (x, y) specified by the chart element are ignored, and the position of the frame is automatically calculated. If the value is 0, the (x, y) location specified by the chart element are used as the position of the frame.

reserved (14 bits): MUST be zero, and MUST be ignored.

2.4.129 FrtFontList

The **FrtFontList** record specifies **font** information used on the chart and specifies the beginning of a collection of <u>Font</u> records as defined by the <u>Chart Sheet Substream</u> **ABNF**.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x085A.

verExcel (1 byte): An unsigned integer that specifies the application version where new <u>chart</u> elements were introduced that use the font information specified by **rgFontInfo**. MUST be a value from the following table and MUST be equal to iObjectInstance1 of the <u>StartObject</u> record that immediately follows this record as defined by the Chart Sheet Substream ABNF:

Value	Meaning
0x09	This record pertains to new objects introduced in an application version<92>. rgFontInfo specifies the font information that is used by display units labels specified by YMult.
0x0A	This record pertains to new objects introduced in an application version <93>. rgFontInfo specifies the font information that is used by extended data label specified by DataLabExt.

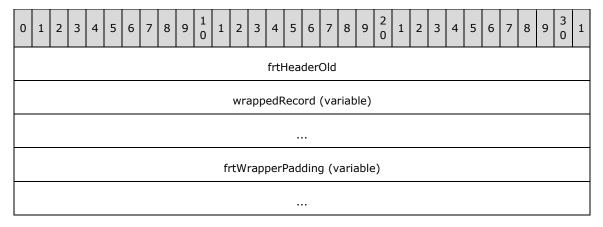

reserved (1 byte): MUST be zero, and MUST be ignored.

cFont (2 bytes): An unsigned integer that specifies the number of items in rgFontInfo.

rgFontInfo (variable): An array of <u>FontInfo</u> structures that specify the font information. The number of elements in this array MUST be equal to the value specified in **cFont**.

2.4.130 FrtWrapper

The **FrtWrapper** record wraps around a non-Future Record Type (<u>FRT</u>) record and converts it into an FRT record.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt MUST be 0x0851.

wrappedRecord (variable): A Font, Continue, LineFormat, AreaFormat, SeriesText, DefaultText, Text, FontX, ObjectLink, Frame, Begin, End, PicF, Pos, AlRuns, BRAI, Fbi, or GelFrame that specifies the record being wrapped. These records MUST be wrapped in this FrtWrapper if they are part of a collection defined by StartObject and EndObject. These records appear according to their record name and not as FrtWrapper in the ABNF specified in chart sheet substream.

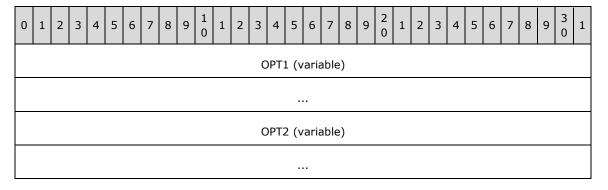

frtWrapperPadding (variable): An array of bytes that is used to pad **FrtWrapper**. Each element MUST be zero and MUST be ignored. This field MUST be present if and only if the size of the **wrappedRecord** is less than 8 bytes. If present, the size of **frtWrapperPadding** MUST be specified by the following formula:

8 bytes - (size of wrappedRecord)

The size of the padded **FrtWrapper** MUST be no less than the size of the <u>FrtHeader</u> structure (12 bytes).

2.4.131 **GelFrame**

The **GelFrame** record specifies the properties of a **fill pattern** for parts of a <u>chart</u>. The record consists of an OfficeArtFOPT, as specified in [MS-ODRAW] section 2.2.9, and an OfficeArtTertiaryFOPT, as specified in [MS-ODRAW] section 2.2.11, that both contain properties for the fill pattern applied.<94>

OPT1 (variable): An OfficeArtFOPT, as specified in [MS-ODRAW] section 2.2.9, specifies the primary properties of the fill pattern. MUST only contain the subset of OfficeArtFOPT properties specified in the following list:

- fillType, as specified in [MS-ODRAW] section 2.3.7.1
- fillColor, as specified in [MS-ODRAW] section 2.3.7.2

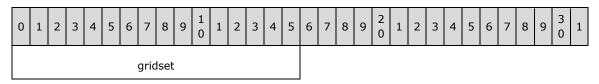

- fillOpacity, as specified in [MS-ODRAW] section 2.3.7.3
- fillBackColor, as specified in [MS-ODRAW] section 2.3.7.4
- fillBackOpacity, as specified in [MS-ODRAW] section 2.3.7.5
- fillCrMod, as specified in [MS-ODRAW] section 2.3.7.6
- fillBlip_complex, as specified in [MS-ODRAW] section 2.3.7.8
- fillBlipName_complex, as specified in [MS-ODRAW] section 2.3.7.10
- fillBlipFlags, as specified in [MS-ODRAW] section 2.3.7.11
- fillWidth, as specified in [MS-ODRAW] section 2.3.7.12
- fillHeight, as specified in [MS-ODRAW] section 2.3.7.13
- fillAngle, as specified in [MS-ODRAW] section 2.3.7.14
- fillFocus, as specified in [MS-ODRAW] section 2.3.7.15
- fillToLeft, as specified in [MS-ODRAW] section 2.3.7.16
- fillToTop, as specified in [MS-ODRAW] section 2.3.7.17
- fillToRight, as specified in [MS-ODRAW] section 2.3.7.18
- fillToBottom, as specified in [MS-ODRAW] section 2.3.7.19
- fillRectLeft, as specified in [MS-ODRAW] section 2.3.7.20
- fillRectTop, as specified in [MS-ODRAW] section 2.3.7.21
- fillRectRight, as specified in [MS-ODRAW] section 2.3.7.22
- fillRectBottom, as specified in [MS-ODRAW] section 2.3.7.23
- fillDztype, as specified in [MS-ODRAW] section 2.3.7.24
- fillShadePreset, as specified in [MS-ODRAW] section 2.3.7.25
- fillShadeColors_complex, as specified in [MS-ODRAW] section 2.3.7.27
- fillOriginX, as specified in [MS-ODRAW] section 2.3.7.28
- fillOriginY, as specified in [MS-ODRAW] section 2.3.7.29
- fillShapeOriginX, as specified in [MS-ODRAW] section 2.3.7.30
- fillShapeOriginY, as specified in [MS-ODRAW] section 2.3.7.31
- fillShadeType, as specified in [MS-ODRAW] section 2.3.7.32
- fFilled, as specified in [MS-ODRAW] section 2.3.7.43
- fHitTestFill, as specified in [MS-ODRAW] section 2.3.7.43
- fillShape, as specified in [MS-ODRAW] section 2.3.7.43
- fillUseRect, as specified in [MS-ODRAW] section 2.3.7.43
- fNoFillHitTest, as specified in [MS-ODRAW] section 2.3.7.43

OPT2 (variable): An OfficeArtTertiaryFOPT, as specified in [MS-ODRAW] section 2.2.11 specifies the additional properties of the fill pattern. MUST only contain the subset of OfficeArtTertiaryFOPT properties specified in the following list<95>:

- fillColorExt, as specified in [MS-ODRAW] section 2.3.7.33
- fillColorExtMod, as specified in [MS-ODRAW] section 2.3.7.35
- fillBackColorExt, as specified in [MS-ODRAW] section 2.3.7.37
- fillBackColorExtMod, as specified in [MS-ODRAW] section 2.3.7.39
- fRecolorFillAsPicture, as specified in [MS-ODRAW] section 2.3.7.43
- fUseShapeAnchor, as specified in [MS-ODRAW] section 2.3.7.43

2.4.132 GridSet

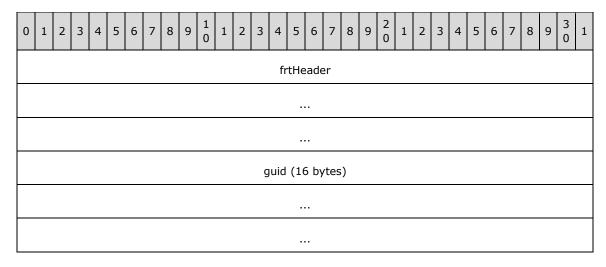

The **GridSet** record specifies a reserved value.

gridset (2 bytes): Reserved, and MUST be 1.

2.4.133 GUIDTypeLib

The **GUIDTypeLib** record specifies the **GUID** as specified by [MS-DTYP] that uniquely identifies the **type library** of the application that wrote the **Visual Basic for Applications (VBA)** project in the file.

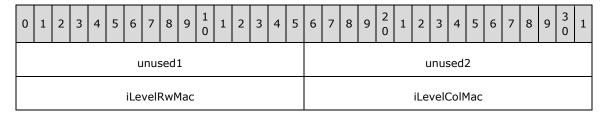

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0897.

guid (16 bytes): A GUID as specified by [MS-DTYP] that uniquely identifies the type library of the application that wrote the VBA project. The value SHOULD<96> be 0x0.

2.4.134 Guts

The **Guts** record specifies the maximum **outline** levels for row and column **gutters**.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

iLevelRwMac (2 bytes): An unsigned integer that specifies the maximum **outline level** for the row gutter. The value MUST be one of the values specified in the following table.

iLevelColMac (2 bytes): An unsigned integer that specifies the maximum outline level for the column gutter. The value MUST be one of the values specified in the following table.

Value	Maximum outline level
0x0000	0
0x0002	1
0x0003	2
0x0004	3
0x0005	4
0x0006	5
0x0007	6
0x0008	7

2.4.135 HCenter

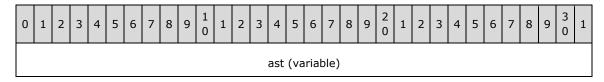

The **HCenter** record specifies whether the **sheet** is to be centered horizontally when printed.

hcenter (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether the sheet is to be centered between <u>LeftMargin</u> and <u>RightMargin</u> when printed.

2.4.136 Header

The **Header** record specifies the header text of the current **sheet** when printed.

. . .

ast (variable): An <u>XLUnicodeString</u> structure that specifies the header text for the current sheet. It is optional and exists only if the record size is not zero. The text appears at the top of every page when printed. The length of the text MUST be less than or equal to 255. The header text can contain special commands, for example a **placeholder** for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("&"). The following **ABNF** lists the possible commands and how they are used:

ABNF Grammar for Header and Footer Strings

```
headerfooter = *(left / pagenum / pagetotal / fontsize / strikethrough / superscript / subscript / center / date / time / filepath / picture / underline / doubleunderline / right / bookpath / sheetname / fontname / fonttype / font / bold / italic / ampersand / emptytoken / UNICHAR)
```

This code specifies **Unicode** characters, starting with the space character (%x0020).

DIGIT = %x0030-0039

UNICHAR = %x0020-FFFF

This code specifies a digit between 0 and 9.

```
HEXALPHA = %x0041-0046 / %x0061-0066
```

This code specifies a character between A and F or between a and f.

DQUOTE = %x0022

This code specifies a double quotation mark.

left = "&L"

This code specifies the beginning of the left section. There are three header and footer sections: left, center, and right. When two or more of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the left section.

pagenum = "&P"

This code specifies the current page number.

```
pagetotal = "&N" 0*1(("-" / "+") *DIGIT)
```

This code specifies the total number of pages.

fontsize = "&" 1*3DIGIT

This code specifies the text **font** size, where font size is measured in points.

strikethrough = "&S"

This code specifies whether the strikethrough **text style** is on or off. The first occurrence of this code MUST turn the strikethrough text style on, and the second occurrence MUST turn it off.

superscript = "&X"

This code specifies whether the superscript text style is on or off. The first occurrence of this code MUST turn the superscript text style on, and the second occurrence MUST turn it off. The superscript and subscript codes MUST NOT both be on at same time. If both codes occur in the string, the code that occurs first is applied and the other is ignored.

subscript = "&Y"

This code specifies whether the subscript text style is on or off. The first occurrence of this code MUST turn the subscript text style on, and the second occurrence MUST turn it off. The superscript and subscript codes MUST NOT both be on at same time. If both codes occur in the string, the code that occurs first is applied and the other is ignored.

center = "&C"

This code specifies the beginning of the center section. When two or more of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the center section.

date = "&D"

This code specifies a date.

time = "&T"

This code specifies a time.

picture = "&G"

This code specifies a picture.

underline = "&U"

This code specifies whether the single underline text style is on or off. The first occurrence of this code MUST turn the underline text style on, and the second occurrence MUST turn it off.

doubleunderline = "&E"

This code specifies whether the double underline text style is on or off. The first occurrence of this code MUST turn the double underline text style on, and the second occurrence MUST turn it off.

right = "&R"

This code specifies the beginning of the right section. When two or more of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the right section.

bookpath = "&Z"

This code specifies a workbook file path.

bookname = "&F"

This code specifies a workbook file name.

sheetname = "&A"

This code specifies a sheet name.

fontname = (1*UNICHAR / "-")

This code specifies the text font name. When the font name is a hyphen, no font is specified. This can be a localized string.

```
fonttype = ("italic" / "bold" / "regular" / "italic bold" / "bold italic")
```

This code specifies the text font type. This can be a localized string.

font = "&" DQUOTE fontname , fonttype DQUOTE

This code specifies the text font.

bold = "&B"

This code specifies whether the bold text style is on or off. The first occurrence of this code MUST turn the bold text style on, and the second occurrence MUST turn it off.

italic = "&I"

This code specifies whether the italic text style is on or off. The first occurrence of this code MUST turn the italic text style on, and the second occurrence MUST turn it off.

ampersand = "&&"

This code specifies an ampersand character.

emptytoken = "&" *1UNICHAR

This code specifies an unidentified token. If just "&" appears, or if there is a UNICHAR specified after "&" and it is not one of the UNICHAR characters listed in the preceding rules, then the token is interpreted as empty and nothing is rendered in the header or footer text.

2.4.137 HeaderFooter

The **HeaderFooter** record specifies the even page header and footer text, and the first page header and footer text of the current **sheet**.

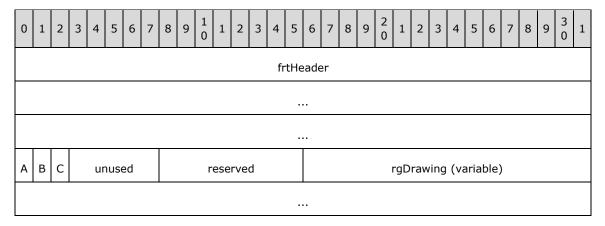

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtHeader																														
	guidSView (16 bytes, optional)																														
Α	В	С	D					ı	unu	sed											c	chl	lead	der	Eve	n					
			',		c	chi	oot	erE	ver	1											C	chŀ	lea	der	Firs	t					
					(cch	Foo	terF	irst											str	Hea	ade	rEv	en ((var	riab	le)				
												str	Foo	oter	Eve	en (var	iabl	e)												
	strHeaderFirst (variable)																														
	strFooterFirst (variable)																														

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x089C.

- **guidSView (16 bytes):** A **GUID** as specified by [MS-DTYP] that specifies the current **sheet view**. If it is zero it means the current sheet. Otherwise, this field MUST match the **guid** field of the preceding <u>UserSViewBegin</u> record.
- A fHFDiffOddEven (1 bit): A bit that specifies whether the odd and even pages use a different header and footer. If the value is 1, the <u>Header</u> and <u>Footer</u> records specify the odd page header and footer, and **strHeaderEven** and **strFooterEven** specify the even page header and footer.
- **B fHFDiffFirst (1 bit):** A bit that specifies whether the first page uses a different header and footer from the rest of the pages. If the value is 1, the Header and Footer records specify the header and footer of the rest of the pages, and **strHeaderFirst** and **strFooterFirst** specify the first page header and footer.
- C fHFScaleWithDoc (1 bit): A bit that specifies whether the header and footer is scaled with the sheet.
- **D fHFAlignMargins (1 bit):** A bit that specifies whether the left and right edges of the header and footer are lined up with the left and right margins of the sheet.
- unused (12 bits): Undefined, and MUST be ignored.
- cchHeaderEven (2 bytes): An unsigned integer that specifies the number of characters in strHeaderEven. MUST be less than or equal to 255. The value MUST be zero if fHFDiffOddEven is zero.
- cchFooterEven (2 bytes): An unsigned integer that specifies the number of characters in strFooterEven. MUST be less than or equal to 255. The value MUST be zero if fHFDiffOddEven is zero.
- cchHeaderFirst (2 bytes): An unsigned integer that specifies the number of characters in strHeaderFirst. MUST be less than or equal to 255. The value MUST be zero if fHFDiffFirst is zero.
- **cchFooterFirst** (2 bytes): An unsigned integer that specifies the number of characters in **strFooterFirst**. MUST be less than or equal to 255. The value MUST be zero if **fHFDiffFirst** is zero.
- **strHeaderEven (variable):** An <u>XLUnicodeString</u> structure that specifies the header text on the even pages. The number of characters in the string MUST be equal to **cchHeaderEven**. The string can contain special commands, for example a **placeholder** for the page number, current date or text formatting attributes. Refer to Header for more details about the string format.
- **strFooterEven (variable):** An XLUnicodeString structure that specifies the footer text on the even pages. The number of characters in the string MUST be equal to **cchFooterEven**. The string can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Refer to Header for more details about the string format.
- **strHeaderFirst (variable):** An XLUnicodeString structure that specifies the header text on the first page. The number of characters in the string MUST be equal to **cchHeaderFirst**. The string can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Refer to Header for more details about the string format.
- **strFooterFirst (variable):** An XLUnicodeString structure that specifies the footer text on the first page. The number of characters in the string MUST be equal to **cchFooterFirst**. The string can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Refer to Header for more details about the string format.

2.4.138 HFPicture

The **HFPicture** record specifies a picture used by a **sheet** header or footer. The picture MUST be specified in either an **OfficeArtDgContainer** or **OfficeArtDgContainer** record as specified in [MS-ODRAW]. The picture can be continued across multiple HFPicture records. The **OfficeArtClientAnchor** structure mentioned in [MS-ODRAW] refers to OfficeArtClientAnchorHF.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0866.

A - fIsDrawing (1 bit): A bit that specifies whether rgDrawing is an OfficeArtDgContainer record as specified in [MS-ODRAW]. MUST be a value from the following table:

Value	Meaning
0	rgDrawing is an OfficeArtDggContainer record as specified in [MS-ODRAW] and fIsDrawingGroup MUST be 1.
1	rgDrawing is an OfficeArtDgContainer record as specified in [MS-ODRAW] and fIsDrawingGroup MUST be 0.

B - fIsDrawingGroup (1 bit): A bit that specifies whether **rgDrawing** is an **OfficeArtDggContainer** record as specified in [MS-ODRAW]. MUST be a value from the following table:

Value	Meaning
0	rgDrawing is an OfficeArtDgContainer record as specified in [MS-ODRAW] and fIsDrawing MUST be 1.
1	rgDrawing is an OfficeArtDggContainer record as specified in [MS-ODRAW] and fIsDrawing MUST be 0.

C - fContinue (1 bit): A bit that specifies whether this record is continuing the previous HFPicture record. The value 0 means it is the first HFPicture record.

unused (5 bits): Undefined and MUST be ignored.

reserved (1 byte): MUST be zero, and MUST be ignored.

rgDrawing (variable): The meaning of this field is specified in the following table.

Value of fIsDrawing	Meaning of rgDrawing
0	This is an
	OfficeArtDggContainer as

Value of fIsDrawing	Meaning of rgDrawing
	specified in [MS-ODRAW] that specifies the drawing group of this picture.
1	This is an OfficeArtDgContainer as specified in [MS-ODRAW] that specifies the drawing object of this picture

2.4.139 HideObj

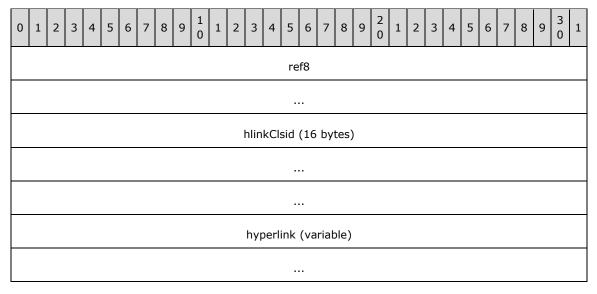

The **HideObj** record specifies how **ActiveX objects**, **OLE objects**, and **drawing objects** appear in a window that contains the **workbook**.

hideObj (2 bytes): A <u>HideObjEnum</u> enumeration that specifies how ActiveX objects, OLE objects, and drawing objects appear in a window that contains the workbook.

2.4.140 HLink

The **HLink** record specifies a **hyperlink** associated with a **range** of **cells**.

ref8 (8 bytes): A Ref8U structure that specifies the range of cells containing the hyperlink.

hlinkClsid (16 bytes): A **class identifier (CLSID)** that specifies the **COM** component which saved the Hyperlink Object (as defined by [MS-OSHARED] section 2.3.7.1) in **hyperlink**.

hyperlink (variable): A Hyperlink Object (as defined by [MS-OSHARED] section 2.3.7.1) that specifies the hyperlink and hyperlink-related information.

2.4.141 HLinkTooltip

The **HLinkTooltip** record specifies the **hyperlink ToolTip** associated with a **range** of cells.

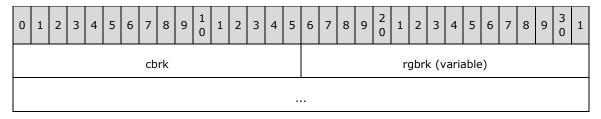

frtRefHeaderNoGrbit (10 bytes): An <u>FrtRefHeaderNoGrbit</u> structure. The **frtRefHeaderNoGrbit.rt** field MUST be 0x0800. The **frtRefHeaderNoGrbit.ref8** field MUST match a <u>Ref8U</u> field from an existing <u>HLink</u> record.

wzTooltip (variable): An array of Unicode characters that specifies the ToolTip string. String length MUST be greater than or equal to 2 and less than or equal to 256 (inclusive of null terminator) and the string MUST be null-terminated.

2.4.142 HorizontalPageBreaks

The HorizontalPageBreaks record specifies a list of explicit row page breaks.

cbrk (2 bytes): An unsigned integer that specifies the number of page breaks. The value MUST be less than or equal to 1026.

rgbrk (variable): An array of <u>HorzBrk</u> structure that specifies all of the page breaks. The array MUST be sorted first by **rgbrk.row**, and then by **rgbrk.ColStart.** Two page breaks MUST NOT overlap. The number of **HorzBrk** structures MUST equal the value of **cbrk**.

2.4.143 IFmtRecord

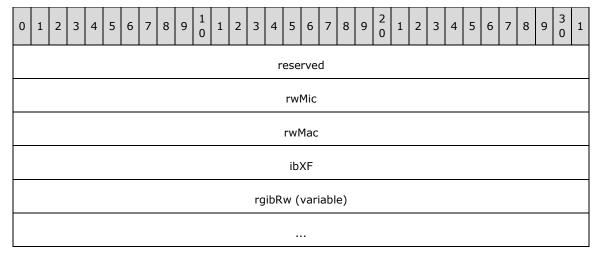

The **IFmtRecord** record specifies the **number format** to use for the text on an <u>axis</u>.

ifmt (2 bytes): An IFmt structure that specifies the number format identifier.

2.4.144 Index

The **Index** record specifies row information and the file locations for all <u>DBCell</u> records corresponding to each row block in the **sheet**. This record, combined with the DBCell records, is used to optimize the lookup of cells in a cell table.

reserved (4 bytes): MUST be zero, and MUST be ignored.

rwMic (4 bytes): A RwLongU structure that specifies the first row that has at least one cell with data in current sheet. MUST be 0 if there are no rows that have at least one cell with data.

rwMac (4 bytes): An unsigned integer that specifies one plus the zero-based index of the last row that has at least one cell with data in the sheet. MUST be 0 if there are no rows that have at least one cell with data. If not 0, MUST be greater than **rwMic**.

ibXF (4 bytes): A FilePointer as specified in [MS-OSHARED] section 2.2.1.5 that specifies the file position of the DefColWidth record in the current sheet.

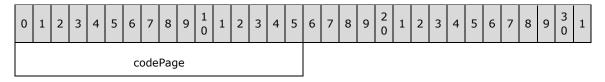

rgibRw (variable): An array of FilePointer. Each FilePointer as specified in [MS-OSHARED] section 2.2.1.5 specifies the file position of each referenced DBCell record. If the positions of DBCell records are not correct, there is no optimized method to do cell lookup and this can cause performance issues. The number of elements in the array MUST be equal to the number of row blocks in this sheet.

2.4.145 InterfaceEnd

The **InterfaceEnd** record specifies the end of a collection of records as defined by the <u>Globals</u> Substream **ABNF**. The collection of records specifies information about the user interface.

2.4.146 InterfaceHdr

The **InterfaceHdr** record specifies the **code page** of the user interface and specifies the beginning of a collection of records as defined by the <u>Globals Substream</u> **ABNF**. The collection of records specifies information about the user interface.

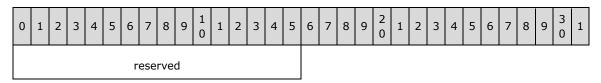

codePage (2 bytes): An unsigned integer that specifies the code page.

MUST be 0x04B0, which specifies **Unicode**.

2.4.147 Intl

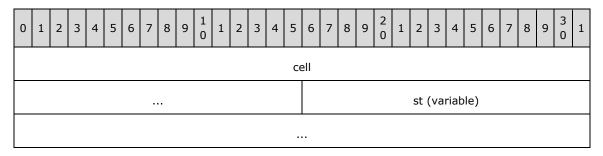

The Intl record specifies that the macro sheet is an international macro sheet.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.148 Label

The **Label** record specifies a label on the **category (2)** axis for each series.

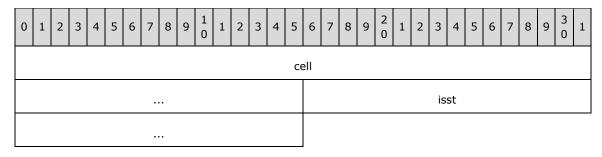

cell (6 bytes): A <u>Cell</u> structure that specifies the row and column of the label and the index of the label's format.

st (variable): A <u>XLUnicodeString</u> structure that contains the text of the label.

2.4.149 LabelSst

The **LabelSst** record specifies a **cell** that contains a string.

cell (6 bytes): A <u>Cell</u> structure that specifies the cell containing the string from the shared string table.

isst (4 bytes): An unsigned integer that specifies the zero-based index of an element in the array of XLUnicodeRichExtendedString structure in the **rgb** field of the SST record in this Workbook Stream **ABNF** that specifies the string contained in the cell. MUST be greater than or equal to zero and less than the number of elements in the **rgb** field of the SST record.

2.4.150 Lbl

The **Lbl** record specifies a **defined name**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е	F		fGrp G H I J												chk	(ey				cch							
ссе														reserved3																	
itab													reserved4 reserved5																		
		re	eser	vec	16					re	eser	vec	17			Name (variable)															
													r	gce	(v	aria	ble)													

- A fHidden (1 bit): A bit that specifies whether the defined name is not visible in the list of defined names.
- **B fFunc (1 bit):** A bit that specifies whether the defined name represents an **Excel macro (XLM)**. If this bit is 1, **fProc** MUST also be 1.
- C fOB (1 bit): A bit that specifies whether the defined name represents a Visual Basic for Applications (VBA) macro. If this bit is 1, the fProc MUST also be 1.
- D fProc (1 bit): A bit that specifies whether the defined name represents a macro.
- **E fCalcExp (1 bit):** A bit that specifies whether **rgce** contains a call to a function that can return an array.
- F fBuiltin (1 bit): A bit that specifies whether the defined name represents a built-in name.

fGrp (6 bits): An unsigned integer that specifies the **function category** for the defined name. MUST be less than or equal to 31. The values 17 to 31 are user-defined. User-defined values are specified in the <u>FnGroupName</u> record. The values 0 to 16 are defined as specified in the following table:

Value	Category
0	All
1	Financial
2	Date Time
3	Math Trigonometry
4	Statistical
5	Lookup
6	Database
7	Text

Value	Category
8	Logical
9	Info
10	Commands
11	Customize
12	Macro Control
13	DDE External
14	User Defined
15	Engineering
16	Cube

- **G reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **H fPublished (1 bit):** A bit that specifies whether the defined name is **published**. This bit is ignored if the **fPublishedBookItems** field of the BookExt Conditional12 structure is 0.
- I fWorkbookParam (1 bit): A bit that specifies whether the defined name is a workbook parameter.
- J reserved2 (1 bit): MUST be zero, and MUST be ignored.

chKey (1 byte): The unsigned integer value of the **ASCII** character that specifies the shortcut key for the macro represented by the defined name. MUST be 0 (no shortcut key) if **fFunc** is 1 or if **fProc** is 0. Otherwise MUST \leq 97 \geq be greater than or equal to 0x41 and less than or equal to 0x5A, or greater than or equal to 0x61 and less than or equal to 0x7A.

cch (1 byte): An unsigned integer that specifies the number of characters in **Name**. MUST be greater than or equal to zero.

cce (2 bytes): An unsigned integer that specifies length of rgce in bytes.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

itab (2 bytes): An unsigned integer that specifies if the defined name is a local name, and if so, which sheet it is on. If itab is not 0, the defined name is a local name and the value MUST be a one-based index to the collection of BoundSheet8 records as they appear in the Globals Substream.

reserved4 (1 byte): MUST be zero, and MUST be ignored.

reserved5 (1 byte): MUST be zero, and MUST be ignored.

reserved6 (1 byte): MUST be zero, and MUST be ignored.

reserved7 (1 byte): MUST be zero, and MUST be ignored.

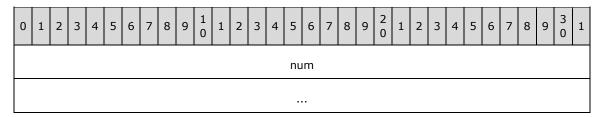

Name (variable): An XLUnicodeStringNoCch structure that specifies the name for the defined name. If fbuiltin is 0, this field MUST satisfy the same restrictions as the name field of the XLNameUnicodeString structure. If fbuiltin is 1, this field is for a built-in name. Each built-in name has a zero-based index value associated with it. A built-in name or its index value MUST be used for this field. The built-in names are defined in the following table:

Values	Names
0x00	Consolidate_Area
0x01	Auto_Open
0x02	Auto_Close
0x03	Extract
0x04	Database
0x05	Criteria
0x06	Print_Area
0x07	Print_Titles
0x08	Recorder
0x09	Data_Form
0x0A	Auto_Activate
0x0B	Auto_Deactivate
0x0C	Sheet_Title
0x0D	_FilterDatabase

rgce (variable): A NameParsedFormula structure that specifies the formula for the defined name.

2.4.151 LeftMargin

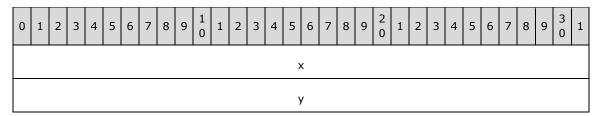

The **LeftMargin** record specifies the left margin of the current **sheet**.

num (8 bytes): An Xnum (section <u>2.5.342</u>) value that specifies the left margin of the current sheet in inches. The value MUST be greater than or equal to 0 and less than or equal to 49.

2.4.152 Legend

The **Legend** record specifies properties of a <u>legend</u>, and specifies the beginning of a collection of records defined by <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a legend. The absence of this collection of records implies that a legend does not exist on the <u>chart</u>.

dx											
		dy									
unused	А	В	С	D	Е	F	reserved2				

- x (4 bytes): An unsigned integer that specifies the x-position, in <u>SPRC</u>, of the upper-left corner of the **bounding rectangle** of the legend. MUST be ignored and the x1 field from the following <u>Pos</u> record MUST be used instead.
- y (4 bytes): An unsigned integer that specifies the y-position, in SPRC, of the upper-left corner of the bounding rectangle of the legend. MUST be ignored and the y1 field from the following Pos record MUST be used instead.
- **dx (4 bytes):** An unsigned integer that specifies the width, in SPRC, of the bounding rectangle of the legend. MUST be ignored and the **x2** field from the following Pos record MUST be used instead.
- dy (4 bytes): An unsigned integer that specifies the height, in SPRC, of the bounding rectangle of the legend. MUST be ignored and the y2 field from the following Pos record MUST be used instead.
- unused (1 byte): Undefined and MUST be ignored.
- **wSpace (1 byte):** An unsigned integer that specifies the space between **legend entries**. MUST be 0x01, which represents 40 **twips** between legend entries.
- **A fAutoPosition (1 bit):** A bit that specifies whether the legend is automatically positioned. If this field is 0x1, then **fAutoPosX** MUST be 0x1 and **fAutoPosY** MUST be 0x1.
- **B reserved1 (1 bit):** MUST be 1, and MUST be ignored.
- C fAutoPosX (1 bit): A bit that specifies whether the x-positioning of the legend is automatic.
- **D fAutoPosY (1 bit):** A bit that specifies whether the y-positioning of the legend is automatic.
- **E fVert (1 bit):** A bit that specifies the layout of the legend entries. MUST equal 0x1 if **fWasDataTable** is equal to 0x1. MUST be a value from the following table:

Value	Meaning
0x0	The legend contains multiple columns of legend entries, or the size of the legend was manually changed from the default size.
0x1	The legend contains a single column of legend entries.

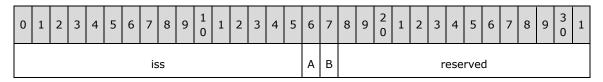

F - fWasDataTable (1 bit): A bit that specifies whether the legend is shown in a <u>data table</u>.

reserved2 (10 bits): MUST be zero, and MUST be ignored.

2.4.153 LegendException

The **LegendException** record specifies information about a **legend entry** which was changed from the default legend entry settings, and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies legend entry formatting. On a

<u>chart</u> where the <u>legend</u> contains legend entries for the <u>series</u> and <u>trendlines</u>, as defined in the legend overview, there MUST be zero instances or one instance of this record in the sequence of records that conform to the SERIESFORMAT rule.

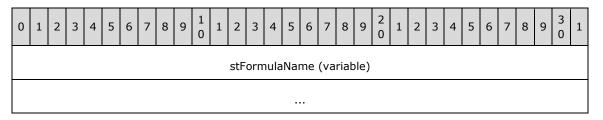

- **iss (2 bytes):** An unsigned integer that specifies the legend entry. This field has different interpretations depending on the content of the legend in the chart. The legend overview specifies the types of content the legend can contain, as follows:
- In a chart where the legend contains legend entries for the series and trendlines, this field MUST be 0xFFFF. This record specifies the legend entry of the series or trendline that contains this record.
- In a chart where the legend contains legend entries for each <u>data point</u> in the chart, this field specifies the zero-based index of a legend entry in the legend, where 0x0000 is the legend entry for the first data point in the series.
- In a chart with a surface <u>chart group</u>, this field specifies the zero-based index of a legend entry in the legend, where 0x0000 is the legend entry for the lowest band of the surface chart group.
- A fDeleted (1 bit): A bit that specifies whether the legend entry specified by iss was deleted.
- **B fLabel (1 bit):** A bit that specifies whether the legend entry specified by **iss** was formatted. If this field is 1, there MUST be a sequence of records that conform to the ATTACHEDLABEL rule in the Chart Sheet Substream ABNF following this record.

reserved (14 bits): MUST be zero, and MUST be ignored.

2.4.154 Lel

The **Lel** record specifies that a **natural language formula** was lost because of the deletion of a supporting label < 98>.

stFormulaName (variable): An <u>XLUnicodeString</u> structure that specifies the name of the deleted label. The number of characters MUST be less than 252.

2.4.155 Line

The **Line** record specifies that the <u>chart group</u> is a line chart group, and specifies the chart group attributes.

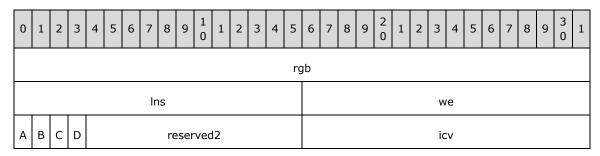

- A fStacked (1 bit): A bit that specifies whether the <u>data points</u> in the chart group that share the same category (2) are stacked.
- **B f100 (1 bit):** A bit that specifies whether the data points in the chart group are displayed as a percentage of the sum of all data points in the chart group that share the same category (2). MUST be 0 if **fStacked** is 0.
- C fHasShadow (1 bit): A bit that specifies whether one or more data markers in the chart group has shadows.

reserved (13 bits): MUST be zero, and MUST be ignored.

2.4.156 LineFormat

The **LineFormat** record specifies the appearance of a line.

rgb (4 bytes): A <u>LongRGB</u> structure that specifies the color of the line. The color MUST match the color specified by **icv**.

Ins (2 bytes): An unsigned integer that specifies the **style** of the line. MUST be a value from the following table:

Value	Meaning
0x0000	Solid
0x0001	Dash
0x0002	Dot
0x0003	Dash-dot
0x0004	Dash dot-dot
0x0005	None
0x0006	Dark gray pattern
0x0007	Medium gray pattern
0x0008	Light gray pattern

When the value of this field is 0x0005 (None), the values of **we** and **icv** MUST be set to the values specified in the following table:

Attribute	Default Value
Line thickness (we)	0xFFFF (Hairline)
Line color (icv)	0x004D

we (2 bytes): A signed integer that specifies the thickness of the line. MUST be a value from the following table:

Value	Meaning
0xFFFF (-1)	Hairline
0x0000	Narrow (single)
0x0001	Medium (double)
0x0002	Wide (triple)

A - fAuto (1 bit): A bit that specifies whether the line has default formatting.

If the value of **fAuto** is 0, the line has formatting as specified by **Ins**, **we**, and **icv**.

If the value of **fAuto** is 1, **Ins**, **we**, **icv**, and **rgb** MUST be ignored and default values are used as specified in the following table:

Attribute	Default Value
Line pattern (Ins)	0xFFFF (Hairline)
Line thickness (we)	0x0000 (Narrow)
Line color (icv)	0x004D
Line color (rgb)	Match the default color used for icv

B - reserved1 (1 bit): MUST be zero, and MUST be ignored.

C - fAxisOn (1 bit): A bit that specifies whether the axis line is displayed.

If the previous record is <u>AxisLine</u> and the value of the **id** field of the AxisLine record is equal to 0x0000, this field MUST be a value from the following table:

fAxisOn	Lns	Meaning
0	0x0005	The axis line is not displayed.
0	Any legal value except 0x0005	The axis line is displayed.
1	Any legal value	The axis line is displayed.

If the previous record is not AxisLine and the value of the **id** field of the AxisLine record is equal to 0x0000, this field MUST be zero, and MUST be ignored.

D - fAutoCo (1 bit): A bit that specifies whether **icv** is equal to 0x004D. If the value is 1, **icv** MUST equal 0x004D. If the value is 0, **icv** MUST NOT equal 0x004D.

reserved2 (12 bits): MUST be zero, and MUST be ignored.

icv (2 bytes): An <u>IcvChart</u> structure that specifies the color of the line. The color MUST match the color specified by **rgb**.

2.4.157 List12

The **List12** record specifies the additional formatting information for a **table**. These records immediately follow a <u>Feature11</u> or <u>Feature12</u> record, and specify additional formatting information for the table specified by the Feature11 or Feature12 record. This record is a <u>future record type</u> record.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtHeader																														
							ls	d								idList															
																			rgb	(va	arial	ole)									
															• •																

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0877.

Isd (2 bytes): An unsigned integer that specifies the type of data contained in the rgb field.

MUST be a value specified in the table listed under rgb.

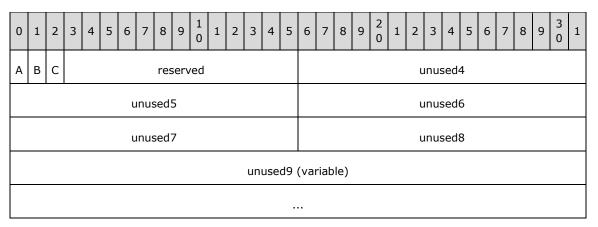

idList (4 bytes): An unsigned integer that identifies the associated table for which this record specifies additional formatting. MUST NOT be zero. MUST be equal to the **idList** field of the <u>TableFeatureType</u> structure embedded in the associated Feature11 or Feature12 record.

rgb (variable): A structure whose type and meaning are specified by the value of **lsd**, as specified in the following table:

Value of Isd	Meaning of rgb
0x0000	rgb is a <u>List12BlockLevel</u> structure that specifies the <u>table block-level formatting</u> .
0x0001	rgb is a <u>List12TableStyleClientInfo</u> structure that specifies the <u>table style</u> .
0x0002	rgb is a <u>List12DisplayName</u> structure that specifies the display name.

2.4.158 LPr

The **LPr** record specifies a record that is unused.

A - unused1 (1 bit): Undefined and MUST be ignored.

B - unused2 (1 bit): Undefined and MUST be ignored.

C - unused3 (1 bit): Undefined and MUST be ignored.

reserved (13 bits): MUST be zero, and MUST be ignored.

unused4 (2 bytes): Undefined and MUST be ignored.

unused5 (2 bytes): Undefined and MUST be ignored.

unused6 (2 bytes): Undefined and MUST be ignored.

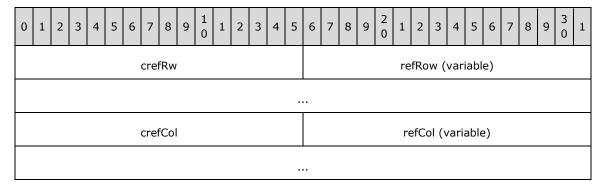

unused7 (2 bytes): Undefined and MUST be ignored.

unused8 (2 bytes): Undefined and MUST be ignored.

unused9 (variable): Undefined and MUST be ignored.

2.4.159 LRng

The **LRng** record specifies a label range for natural language formulas < 99>.

crefRw (2 bytes): An unsigned integer that specifies the number of row label ranges. When added to the value of **crefCol**, the value MUST be less than 1028.

refRow (variable): An array of <u>Ref8U</u> structures. The array specifies the row label ranges. The size of the array is specified by **crefRw**.

crefCol (2 bytes): An unsigned integer that specifies the number of column label ranges. When added to the value of **crefRw**, the value MUST be less than 1028.

refCol (variable): An array of Ref8U structures. The array specifies the column label ranges. The size of the array is specified by **crefCol**.

2.4.160 MarkerFormat

The **MarkerFormat** record specifies the color, size, and shape of the associated **data markers** that appear on line, radar, and scatter <u>chart groups</u>. The associated data markers are specified by the preceding <u>DataFormat</u> record. If this record is not present in the sequence of records that conforms to the <u>SS</u> rule of the Chart Sheet Substream **ABNF**, then the color, size, and shape of the associated data markers are specified by the default values of the fields of this record.

rgbl	Back	<			
imk	Α	В	C	D	reserved2
icvFore					icvBack
mis	Size				

- **rgbFore (4 bytes):** A <u>LongRGB</u> structure that specifies the **border** color of the data marker. The color MUST match the color specified by **icvFore**. The default value of this field is automatically selected from the next available color in the <u>chart</u> color table.
- **rgbBack (4 bytes):** A LongRGB structure that specifies the interior color of the data marker. The color MUST match the color specified by **icvBack**. The default value of this field is the same as the default value for **rgbFore** only when the default **imk** is 0x0001, 0x0002, 0x0003, or 0x0008. Otherwise, the default value is 0xFFFFFF.
- **imk (2 bytes):** An unsigned integer that specifies the type of data marker. The default value for this field is automatically selected from the list of data marker types and cannot be 0x0000. MUST be a value from the following table:

Value	Meaning
0x0000	No marker.
0x0001	Square markers.
0x0002	Diamond-shaped markers.
0x0003	Triangular markers.
0x0004	Square markers with an X.
0x0005	Square markers with an asterisk.
0x0006	Short bar markers.
0x0007	Long bar markers.
0x0008	Circular markers.
0x0009	Square markers with a plus sign.

A - fAuto (1 bit): A bit that specifies whether the data marker is automatically generated. The default value for this field is 1. MUST be a value from the following table:

Value	Meaning
0x0	The data marker is not automatically generated.
0x1	The data marker type, size, and color are automatically generated and the values are set accordingly in this record.

- **B reserved1 (3 bits):** MUST be zero, and MUST be ignored.
- **C fNotShowInt (1 bit):** A bit that specifies whether to show the data marker interior. The default value for this field is 0. MUST be a value from the following table:

Value	Meaning
0x0	The data marker interior is shown.
0x1	The data marker interior is not shown.

D - fNotShowBrd (1 bit): A bit that specifies whether to show the data marker border. The default value for this field is 0. MUST be a value from the following table:

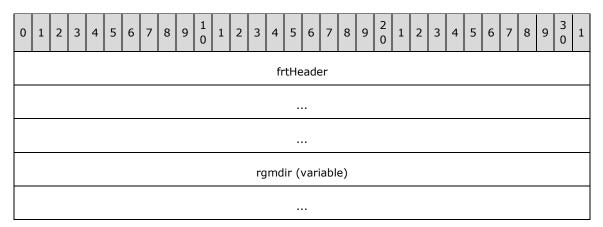

Value	Meaning
0x0	The data marker border is shown.
0x1	The data marker border is not shown.

reserved2 (10 bits): MUST be zero, and MUST be ignored.

- **icvFore (2 bytes):** An <u>IcvChart</u> structure that specifies the border color of the data marker. The color MUST match the color specified by **rgbFore**. The default value of this field is automatically set to match the color specified by **rgbFore**.
- **icvBack (2 bytes):** An IcvChart structure that specifies the interior color of the data marker. The color MUST match the color specified by **rgbBack**. The default value of this field is automatically set to match the color specified by **rgbBack**.
- **miSize (4 bytes):** An unsigned integer that specifies the size in **twips** of the data marker. MUST be greater than or equal to 40 and less than or equal to 1440. The default value for this field is 100.

2.4.161 MDB

The **MDB** record specifies a unique set of <u>MDX metadata</u> type/value pairs that are shared among all **cells** in the **workbook** that reference **MDX** metadata.

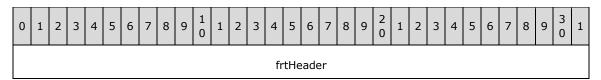

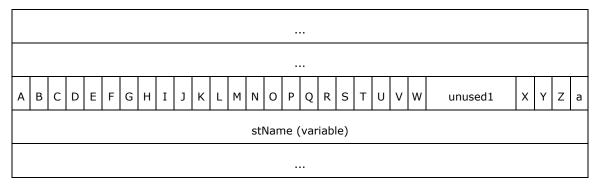

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x88A.

rgmdir (variable): An array of MDir structures that specifies a block of metadata records.

2.4.162 MDTInfo

The **MDTInfor** record specifies the information about a single type of <u>metadata</u>.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0884.

- A fGhostRow (1 bit): A bit that specifies whether the metadata is applied to all cells in newly inserted rows.
- **B fGhostCol (1 bit):** A bit that specifies whether the metadata is applied to all cells in newly inserted columns.
- C fEdit (1 bit): A bit that specifies whether the metadata is preserved when the cell is edited.
- **D fDelete (1 bit):** A bit that specifies whether the metadata is preserved when the cell's value is deleted.
- E fCopy (1 bit): A bit that specifies whether the metadata is copied when the cell is copied. MUST be 1 if one or more of the values of fPasteAll, fPasteFormulas, fPasteValues, fPasteFormats, fPasteComments, fPasteDataValidation, fPasteBorders, fPasteColWidths, or fPasteNumberFormats is 1.
- **F fPasteAll (1 bit):** A bit that specifies whether the metadata is pasted when all formulas, values, formatting, comments, and **data validation** rules are pasted from the previously copied cell.
- **G fPasteFormulas (1 bit):** A bit that specifies whether the metadata is pasted when only formulas are pasted from the previously copied cell.
- **H fPasteValues (1 bit):** A bit that specifies whether the metadata is pasted when only values are pasted from the previously copied cell.
- I fPasteFormats (1 bit): A bit that specifies whether the metadata is pasted when only formatting is pasted from the previously copied cell.
- **J fPasteComments (1 bit):** A bit that specifies whether the metadata is pasted when only comments are pasted from the previously copied cell.
- **K fPasteDataValidation (1 bit):** A bit that specifies whether the metadata is pasted when only data validation rules are pasted from the previously copied cell.
- **L fPasteBorders (1 bit):** A bit that specifies whether the metadata is pasted when only borders are pasted from the previously copied cell.
- M fPasteColWidths (1 bit): A bit that specifies whether the metadata is pasted when only column widths are pasted from the previously copied cell.
- **N fPasteNumberFormats (1 bit):** A bit that specifies whether the metadata is pasted when only number formatting is pasted from the previously copied cell.
- **O fMerge (1 bit):** A bit that specifies whether the metadata is preserved after cells are merged. If the value of this bit is 1, and the cell has the smallest row and column number of the cells that are being merged, the metadata is preserved.

- **P fSplitFirst (1 bit):** A bit that specifies whether, when a cell is split, the metadata is copied to the cell with the smallest row and column number. If **fSplitAll** is set to 1, **fSplitAll** takes precedence.
- **Q fSplitAll (1 bit):** A bit that specifies whether, when a cell is split, the metadata is copied to all the resulting cells. If the value is 1, the value of **fSplitFirst** MUST be ignored.
- **R fRowColShift (1 bit):** A bit that specifies whether the metadata is preserved when the cell is shifted because of row or column deletion or insertion.
- **S fClearAll (1 bit):** A bit that specifies whether the metadata is preserved when the contents, formatting, and comments of the cell are cleared.
- **T fClearFormats (1 bit):** A bit that specifies whether the metadata is preserved when the formatting of the cell is cleared.
- **U fClearContents (1 bit):** A bit that specifies whether the metadata is preserved when the contents of the cell is cleared.
- **V fClearComments (1 bit):** A bit that specifies whether the metadata is preserved when the comments of the cell are cleared.
- **W fAssign (1 bit):** A bit that specifies whether the metadata is preserved when the cell's value is changed by formula (section <u>2.2.2</u>) assignment.

unused1 (5 bits): Undefined and MUST be ignored.

- **X fCoerce (1 bit):** A bit that specifies whether the metadata is preserved when the cell's value is coerced to a different type.
- Y fAdjust (1 bit): A bit that specifies whether the metadata is updated when the cell's location is changed.
- **Z fCellMeta (1 bit):** A bit that specifies whether this metadata type is <u>cell metadata</u> or <u>value metadata</u>. MUST be 0 from the following table:

Value	Meaning
0	Metadata is value metadata.
1	Metadata is cell metadata.

a - unused2 (1 bit): Undefined and MUST be ignored.

stName (variable): An LPWideString type that specifies the name of the metadata type.

2.4.163 MDXKPI

The MDXKPI record specifies MDX KPI metadata.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	ade	er														

	istrCon	nName
tfnSrc	kpiprop	istrKPIName
		istrMbrKPI

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x889.

istrConnName (4 bytes): An MDXStrIndex structure that specifies the index of the connection name string.

tfnSrc (1 byte): A <u>Tag Fn MDX</u> enumeration that specifies the type of **MDX function** that generated the metadata. The value MUST be **TFNCUBEKPIPROPERTY**.

kpiprop (1 byte): A <u>KPIProp</u> enumeration that specifies the KPI type.

istrKPIName (4 bytes): An MDXStrIndex structure that specifies the index of the **MDX unique name** string.

istrMbrKPI (4 bytes): An MDXStrIndex structure that specifies the index of the key performance indicator name string.

2.4.164 MDXProp

The MDXProp record specifies member property MDX metadata.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	ade	er														
													i	str(Con	nNa	ame	į													
			tfn	Src															istr	Mbr											
																		i	strl	Prop)										

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x888.

istrConnName (4 bytes): An MDXStrIndex structure that specifies the index of the connection name string.

tfnSrc (1 byte): A <u>Tag Fn MDX</u> enumeration that specifies the type of **MDX function** that generated the metadata. The value MUST be **TFNCUBEMEMBERPROPERTY**.

istrMbr (4 bytes): An MDXStrIndex structure that specifies the index of the **MDX unique name** string.

istrProp (4 bytes): An MDXStrIndex structure that specifies the index of the property name string.

2.4.165 MDXSet

The **MDXSet** record specifies <u>MDX set metadata</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	eade	er														
													i	istr(Cor	nnNa	ame	9													
			tfn	Src							SS	60										is	trS	etD	ef						
																							cis	str							
																					r	gist	r (v	aria	able	!)					

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x887.

istrConnName (4 bytes): An MDXStrIndex structure that specifies the index of the connection name string.

tfnSrc (1 byte): A <u>Tag Fn MDX</u> enumeration that specifies the type of **cube function** that generated the metadata. The value MUST be equal to **TFNCUBESET** or **TFNCUBESETCOUNT**.

sso (1 byte): An SD SetSortOrder enumeration that specifies the set **sort order**.

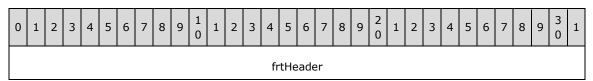

istrSetDef (4 bytes): An MDXStrIndex structure that specifies the index of the set definition string.

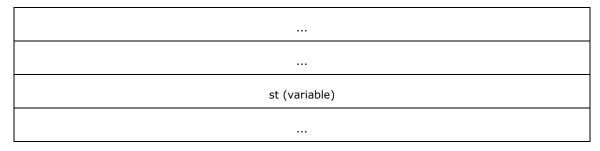

cistr (4 bytes): A signed integer that specifies the number of **MDX unique name** strings. The value MUST be greater than or equal to 0, and less than or equal to the total number of <u>MDXStr</u> records in the file.

rgistr (variable): An array of MDXStrIndex structures that specifies the indexes of the MDX unique name strings. The number of the elements in the array MUST be equal to the value of **cistr**.

2.4.166 MDXStr

The **MDXStr** record specifies a shared text string used by records specifying <u>MDX metadata</u>.

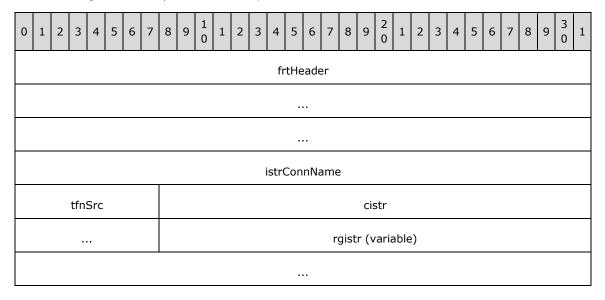

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x885.

st (variable): An <u>LPWideString</u> type that specifies the content of the string.

2.4.167 MDXTuple

The **MDXTuple** record specifies <u>MDX tuple metadata</u>.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x886.

istrConnName (4 bytes): An MDXStrIndex structure that specifies the index of the connection name string.

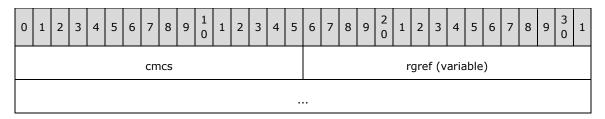

tfnSrc (1 byte): A <u>Tag Fn MDX</u> enumeration that specifies the type of **MDX function** that generated the metadata. The value MUST be equal to **TFNCUBEMEMBER**, **TFNCUBEVALUE**, or **TFNCUBERANKEDMEMBER**.

cistr (4 bytes): A signed integer that specifies the number of **MDX unique name** strings. The value MUST be greater than or equal to 0, and less than or equal to the total number of <u>MDXStr</u> records in the file.

rgistr (variable): An array of MDXStrIndex structures that specifies the indexes of the MDX unique name strings. The number of the elements in the array MUST be equal to the value of **cistr.**

2.4.168 MergeCells

The **MergeCells** record specifies **merged cells** in the document. If the count of the merged cells in the document is greater than 1026, the file will contain multiple adjacent **MergeCells** records.

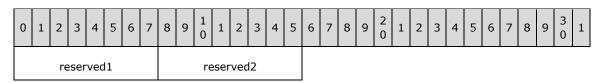

cmcs (2 bytes): An unsigned integer that specifies the count of <u>Ref8</u> structures. MUST be less than or equal to 1026.

rgref (variable): An array of Ref8 structures. Each array element specifies a **range** of **cells** that are merged into a single merged cell. These ranges MUST NOT overlap. MUST contain the number of elements specified by **cmcs**.

2.4.169 Mms

The **Mms** record is reserved and MUST be ignored.

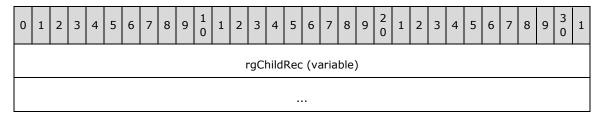

reserved1 (1 byte): MUST be zero, and MUST be ignored.

reserved2 (1 byte): MUST be zero, and MUST be ignored.

2.4.170 MsoDrawing

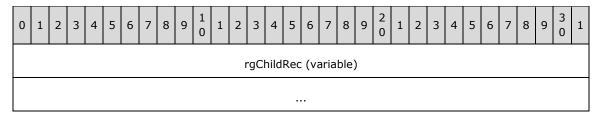

The **MsoDrawing** record specifies a **drawing**. If this record is in the <u>Worksheet</u>, <u>Macro Sheet</u>, or <u>Dialog Sheet</u> substream, the **OfficeArtClientAnchor** structure mentioned in <u>[MS-ODRAW]</u> refers to the <u>OfficeArtClientAnchorSheet</u> structure. If this record appears in the <u>Chart Sheet</u> substream, the **OfficeArtClientAnchor** structure mentioned in [MS-ODRAW] refers to the <u>OfficeArtClientAnchorChart</u> structure.

rgChildRec (variable): An OfficeArtDgContainer structure as specified in [MS-ODRAW] that specifies the drawing. If the rgChildRec has a shape structure in it as specified in [MS-ODRAW] and that shape has a clientData record in it as specified in [MS-ODRAW], then the next record following this record MUST be an Obj. The size of the clientData record does not include the size of the following Obj record. If the rgChildRec has a shape structure in it as specified in [MS-ODRAW] and that shape has a clientTextbox record in it as specified in [MS-ODRAW], then the next record following this record MUST be a TxO. The size of the clientTexbox record does not include the size of this TxO record.

2.4.171 MsoDrawingGroup

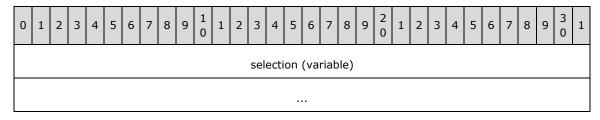

The MsoDrawingGroup record specifies a group of drawing objects.

rgChildRec (variable): An **OfficeArtDggContainer** as specified in [MS-ODRAW] that specifies the group of drawing objects.

2.4.172 MsoDrawingSelection

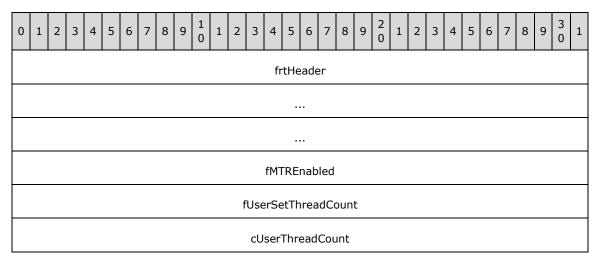

The **MsoDrawingSelection** record specifies **selected drawing objects** and the drawing objects in focus on the **sheet**.

selection (variable): An **OfficeArtFDGSL** structure as specified in [MS-ODRAW] section 2.2.33 that specifies the selected drawing objects.

2.4.173 MTRSettings

The MTRSettings record specifies multithreaded calculation settings.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x089A.

fMTREnabled (4 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether the multithreaded calculation is enabled. MUST be a value from the following table:

Value	Meaning
0x00000000	Multithreaded calculation is disabled.

Value	Meaning
0x0000001	Multithreaded calculation is enabled.

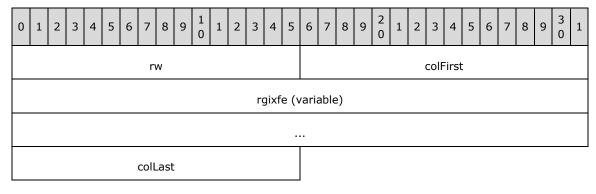

fUserSetThreadCount (4 bytes): A Boolean that specifies whether the thread count was manually specified by the user. MUST be a value from the following table:

Value	Meaning
0x00000000	The thread count cUserThreadCount was not manually specified by the user.
0x0000001	The thread count cUserThreadCount was manually specified by the user.

cUserThreadCount (4 bytes): A signed integer that specifies the count of calculation threads. MUST be greater than or equal to 0x00000001 and MUST be less than or equal to 0x00000400. If **fMTREnabled** is 0x000000000 or **fUserSetThreadCount** is 0x00000000, the value of this field MUST be ignored.

2.4.174 MulBlank

The **MulBlank** record specifies a <u>series</u> of blank **cells** in a **sheet** row. This record can store up to 256 <u>IXFCell</u> structures.

rw (2 bytes): An Rw structure that specifies a row containing the blank cells.

colFirst (2 bytes): A <u>Col</u> structure that specifies the first column in the series of blank cells within the sheet. The value of **colFirst.col** MUST be less than or equal to 254.

rgixfe (variable): An array of IXFCell structures. Each element of this array contains an IXFCell structure corresponding to a blank cell in the series. The number of entries in the array MUST be equal to the value given by the following formula:

Number of entries in **rgixfe** = (**colLast.col** – **colFirst.col** +1)

colLast (2 bytes): A Col structure that specifies the last column in the series of blank cells within the sheet. This colLast.col value MUST be greater than colFirst.col value.

2.4.175 MulRk

The **MulRk** record specifies a <u>series</u> of **cells** with numeric data in a **sheet** row. This record can store up to 256 RkRec structures.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rw colFirst																														
	rgrkrec (variable)																														
							colL	ast																							

rw (2 bytes): An Rw structure that specifies the row containing the cells with numeric data.

colFirst (2 bytes): A <u>Col</u> structure that specifies the first column in the series of numeric cells within the sheet. The value of **colFirst.col** MUST be less than or equal to 254.

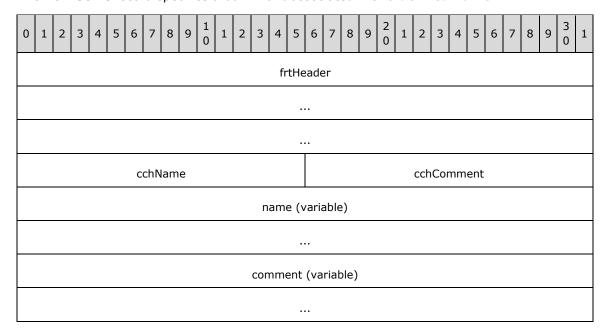

rgrkrec (variable): An array of RkRec structures. Each element in the array specifies an RkRec in the row. The number of entries in the array MUST be equal to the value given by the following formula:

Number of entries in **rgrkrec** = (**colLast.col** - **colFirst.col** +1)

colLast (2 bytes): A Col structure that specifies the last column in the set of numeric cells within the sheet. This **colLast.col** value MUST be greater than the **colFirst.col** value.

2.4.176 NameCmt

The NameCmt record specifies a comment associated with a defined name.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0894.

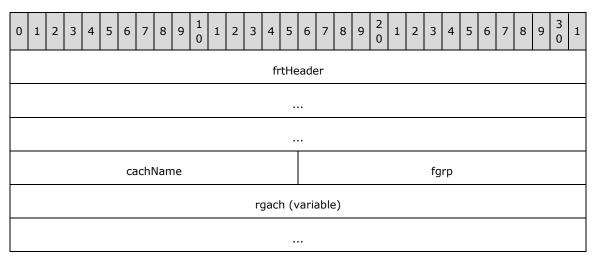

- **cchName (2 bytes):** An unsigned integer that specifies the number of characters in the **name**. The value MUST be less than or equal to 0x00FF.
- **cchComment (2 bytes):** An unsigned integer that specifies the number of characters in the **comment**. The value MUST be less than or equal to 0x00FF.
- name (variable): An <u>XLUnicodeStringNoCch</u> structure that specifies the defined name; cchName specifies the number of characters in this string. This string MUST satisfy the formatting restrictions specified in the <u>XLNameUnicodeString</u> structure. This string MUST also satisfy the following formatting restriction based on the **fBuiltin** field in the preceding <u>Lbl</u> record:

Value of fBuiltIn field in the preceding Lbl record	Restrictions on this field
0	The string in this field MUST be the same string (using case-insensitive comparison) as the string in the name field of the preceding Lbl record.
1	The string in this field MUST be the defined name associated with the built-in name number that appears in the name field in the preceding LbI record.

comment (variable): An XLUnicodeStringNoCch structure that specifies the comment;
cchComment specifies the number of characters in this string.

2.4.177 NameFnGrp12

The **NameFnGrp12** record specifies the name of a **function** in a **function category** that is specified in an **FnGrp12** record.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0899.

cachName (2 bytes): An unsigned integer that specifies the number of characters in the name of the function. The value MUST be greater than or equal to 1 and less than or equal to 255.

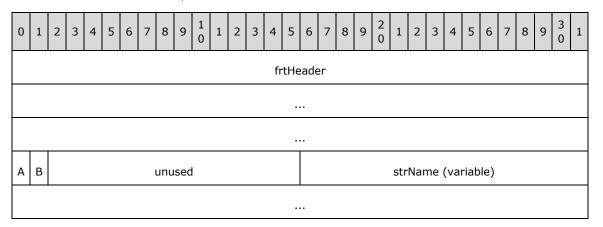

fgrp (2 bytes): An unsigned integer that specifies the zero-based index of the function category that this function belongs to. This value minus 32 specifies the zero-based index of an FnGrp12 record

in the collection of FnGrp12 records, as specified by the <u>Globals Substream</u> **ABNF**. MUST be greater than or equal to 32 and less than or equal to 255.

rgach (variable): An <u>XLNameUnicodeString</u> structure that specifies the name of the function. The length MUST be equal to **cachName**.

2.4.178 NamePublish

The NamePublish record specifies information about a defined name.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0893.

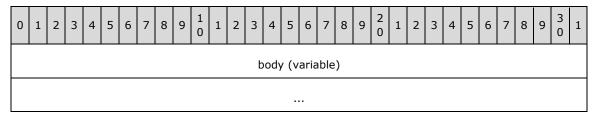

- **A fPublished (1 bit):** A bit that specifies whether the defined name is published to a server. This bit is ignored if the **fPublishedBookItems** field of the <u>BookExt Conditional12</u> structure is 0.
- **B fWorkbookParam (1 bit):** A bit that specifies whether the defined name is a **workbook parameter**.

unused (14 bits): Undefined and MUST be ignored.

strName (variable): An XLNameUnicodeString structure that specifies the defined name.

2.4.179 Note

The **Note** record specifies a **comment** associated with a **cell** or revision information about a comment associated with a cell.

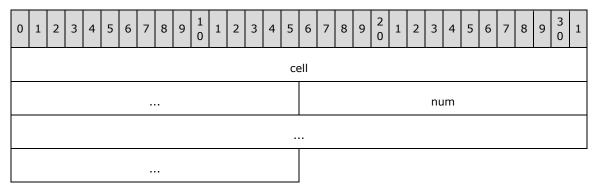

body (variable): A variable type field. The data type and meaning of this field is determined by the stream that contains this record, as specified in the following table:

Stream that contains this record	Body field data type and meaning
Workbook stream	A <u>NoteSh</u> structure that specifies a comment associated with a cell.
In the Workbook stream the record MUST be in a	
Worksheet substream, a Dialog Sheet substream, or	

Stream that contains this record	Body field data type and meaning
a <u>Macro Sheet substream</u> .	
Revision stream (revision log)	A <u>NoteRR</u> structure that specifies a <u>revision record</u> for a comment associated with a cell.

2.4.180 Number

The **Number** record specifies a **cell** that contains a **floating-point number**.

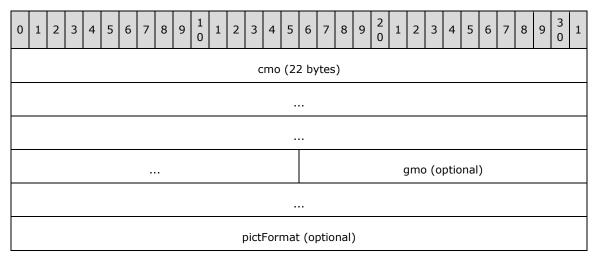

cell (6 bytes): A Cell structure that specifies the cell.

num (8 bytes): An Xnum (section 2.5.342) value that specifies the cell value.

If this record appears in a <u>SERIESDATA</u> record collection, and this record specifies a cell in the <u>chart data cache</u> that specifies data for an <u>error bar series</u>, then this field is a <u>ChartNumNillable</u> value. If a ChartNumNillable is used, a blank cell is specified by a <u>NilChartNum</u> structure that has a **type** field with a value of 0x0000, and a cell with a #N/A error is specified by a NilChartNum that has a **type** field with a value of 0x0100.

2.4.181 Obj

The **Obj** record specifies the properties of an object in a **sheet**.

	pictFlags (optional)							
cbls (16 bytes, optional)								
::								
rbo (o	rbo (optional)							
	sbs (24 bytes, optional)							
	nts (26 bytes, optional)							
macro (variable)							
pictFmla	(variable)							
linkFmla	(variable)							
checkBox (optional)								
radioButto	n (optional)							

edit (optional)								
list (variable)								
gbo (optional)								
	reserved (optional)							

cmo (22 bytes): An FtCmo structure that specifies the common properties of this object.

gmo (6 bytes): An optional <u>FtGmo</u> structure that specifies the properties of this group object. This field MUST exist if and only if **cmo.ot** is equal to 0x00.

pictFormat (6 bytes): An optional <u>FtCf</u> structure that specifies the format of this picture object. This field MUST exist if and only if **cmo.ot** is equal to 0x08.

pictFlags (6 bytes): An optional <u>FtPioGrbit</u> structure that specifies additional properties of this picture object. This field MUST exist if and only if **cmo.ot** is equal to 0x08.

cbls (16 bytes): An optional <u>FtCbls</u> structure that represents a check box or radio button. This field MUST exist if and only if **cmo.ot** is equal to 0x0B or 0x0C.

rbo (10 bytes): An optional <u>FtRbo</u> structure that represents a radio button. This field MUST exist if and only if **cmo.ot** is equal to 0x0C.

sbs (24 bytes): An optional <u>FtSbs</u> structure that specifies the properties of this spin control, scrollbar, list, or drop-down list object. This field MUST exist if and only if **cmo.ot** is equal to 0x10, 0x11, 0x12, or 0x14.

nts (26 bytes): An optional <u>FtNts</u> structure that specifies the properties of this **comment** object. This field MUST exist if and only if **cmo.ot** is equal to 0x19.

macro (variable): An optional FtMacro structure that specifies the action associated with this object.

pictFmla (variable): An optional <u>FtPictFmla</u> structure that specifies the location of the data associated with this picture object. This field MUST NOT exist unless **cmo.ot** is equal to 0x08.

linkFmla (variable): An optional ObjLinkFmla structure that specifies the formula (section 2.2.2) that specifies a **range** that has a value linked to this object. This field MUST NOT exist unless **cmo.ot** is equal to 0x0B, 0x0C, 0x10, 0x11, 0x12, or 0x14. The value of **linkFmla.ft** MUST equal 0x14 if **cmo.ot** is equal to 0x0B or 0x0C. Otherwise, **linkFmla.ft** MUST equal 0x0E.

checkBox (12 bytes): An optional <u>FtCblsData</u> structure that specifies the properties of this check box or radio button object. This field MUST exist if and only if **cmo.ot** is equal to 0x0B or 0x0C.

radioButton (8 bytes): An optional <u>FtRboData</u> structure that specifies additional properties of this radio button object. This field MUST exist if and only if **cmo.ot** is equal to 0x0C.

edit (12 bytes): An optional <u>FtEdoData</u> structure that specifies the properties of this edit box object. This field MUST exist if and only if **cmo.ot** is equal to 0x0D.

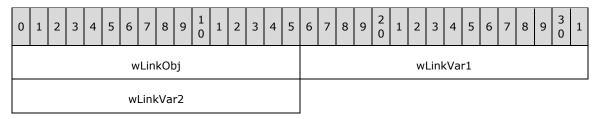

list (variable): An optional <u>FtLbsData</u> structure that specifies the properties of this list box or dropdown object. This field MUST exist if and only if **cmo.ot** is equal to 0x12 or 0x14.

gbo (10 bytes): An optional <u>FtGboData</u> structure that specifies the properties of this group box object. This field MUST exist if and only if **cmo.ot** is equal to 0x13.

reserved (4 bytes): Optional. MUST be 0, and MUST be ignored. This field MUST exist if and only if **cmt.ot** does not equal 0x12 or 0x14.

2.4.182 ObjectLink

The **ObjectLink** record specifies an object on a <u>chart</u>, or the entire chart, to which the <u>Text</u> record is linked.

wLinkObj (2 bytes): An unsigned integer that specifies the object that the Text record is linked to. MUST be a value from the following table:

Value	Meaning
0x0001	Entire chart.
0x0002	Value <u>axis</u> , or vertical value axis on bubble and scatter <u>chart groups</u>
0x0003	Category axis, or horizontal value axis on bubble and scatter chart groups.
0x0004	Series or data points.
0x0007	Series axis.
0x000C	Display units labels of an axis.

wLinkVar1 (2 bytes): An unsigned integer that specifies the zero-based index into a <u>Series</u> record in the collection of Series records in the current Chart Sheet substream. Each referenced Series record specifies a series for the chart group to which the Text record is linked. When the wLinkObj field is 4, MUST be less than or equal to 254. When the wLinkObj field is not 4, MUST be zero, and MUST be ignored.

wLinkVar2 (2 bytes): An unsigned integer that specifies the zero-based index into the category (2) within the series specified by wLinkVar1, to which the Text record is linked. When the wLinkObj field is 4, if the Text record is linked to a series instead of a single data point, the value MUST be 0xFFFF; if the Text record is linked to a data point, the value MUST be less than or equal to 31999. When the wLinkObj field is not 4, MUST be zero, and MUST be ignored.

2.4.183 ObjProtect

The **ObjProtect** record specifies the **protection** state of the objects on the **sheet**. This record exists if the sheet is **protected** and the objects on the sheet are protected.

fLockObj (2 bytes): A Boolean (section 2.5.14) that specifies that the objects are protected. MUST be 0x0001.

2.4.184 ObNoMacros

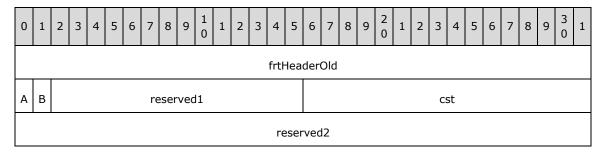

The existence of the **ObNoMacros** record specifies that an <u>ObProj</u> record exists in the file, and that there are no **forms**, **modules**, or **class modules** in the **VBA project** located in the <u>VBA storage</u> stream.

2.4.185 ObProj

The existence of the **ObProj** record specifies that there is a **VBA project** in the file. This project is located in the VBA storage stream.

2.4.186 OleDbConn

The **OleDbConn** record specifies the connection information for an **OLE DB connection string**, and specifies the beginning of a collection of <u>ExtString</u> records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of ExtString records specifies the connection string for a **query** that retrieves **external data**.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x080A.

- A fPasswd (1 bit): A bit that specifies whether the connection password is present in the connection string. A value of 1 specifies that the password was stripped from the connection string.
- **B fLocal (1 bit):** A bit that specifies whether the connection string is the main connection string or an alternate connection string. See ConnGrbitDbtOledb for more information.

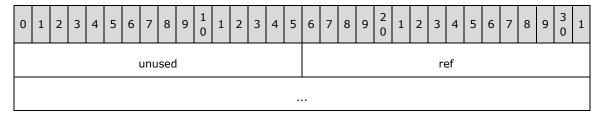

reserved1 (14 bits): MUST be zero, and MUST be ignored.

cst (2 bytes): An unsigned integer that specifies the number of ExtString records that follow this record. MUST be greater than 0. If the value is 1, the connection string is specified by ExtString.**string**. If the value is greater than 1, the connection string is determined by concatenating each of the ExtString.**string** fields of the ExtString records that follow.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

2.4.187 OleObjectSize

The **OleObjectSize** record specifies the visible **range** of **cells** when this **workbook** is displayed as an **embedded object** in another document.

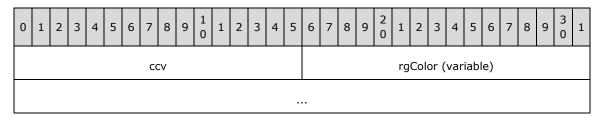

unused (2 bytes): Undefined and MUST be ignored.

ref (6 bytes): A <u>RefU</u> structure that specifies the visible range of cells, if the workbook is an embedded object and the active sheet is a worksheet, a macro sheet, or a dialog sheet as specified by the itabCur field of a <u>Window1</u> record. Otherwise, ref is undefined and MUST be ignored.

2.4.188 Palette

The **Palette** record specifies a **custom color palette**.

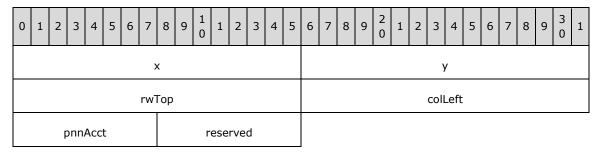

ccv (2 bytes): A signed integer that specifies the number of colors in the **rgColor** array. The value MUST be 56.

rgColor (variable): An array of <u>LongRGB</u> structures that specifies the colors of the **color palette**. The number of items in the array MUST be equal to the value specified in the **ccv** field.

2.4.189 Pane

The **Pane** record specifies the position of **frozen panes** or unfrozen panes in the window used to display the **sheet**.

x (2 bytes): An unsigned integer that specifies the horizontal position of the split in the pane. If the value of **FrozenRt** in the preceding <u>Window2</u> record is 1, the value of **x** is measured in cells and

MUST be less than or equal to 255. If the value of **fFrozenRt** in the preceding Window2 is 0, the value of \mathbf{x} is measured in **twips**, and MUST be less than or equal to 32767.

y (2 bytes): An unsigned integer that specifies the vertical position of the split in the pane. If the value of fFrozenRt in the preceding Window2 record is 1, the value of y is measured in cells. If the value of fFrozenRt in the preceding Window2 is 0, the value of y is measured in twips, and MUST be less than or equal to 32767.

rwTop (2 bytes): An RwU structure that specifies the topmost visible row in the bottom pane.

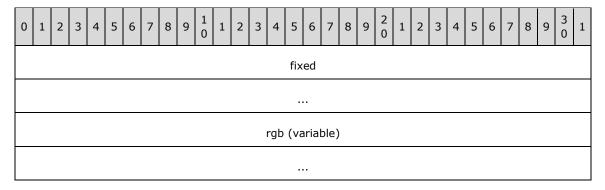

colLeft (2 bytes): A <u>ColU</u> structure that specifies the first visible **logical left** column in the **logical right** pane.

pnnAcct (1 byte): A <u>PaneType</u> enumeration that specifies the active pane.

reserved (1 byte): MUST be zero, and MUST be ignored.

2.4.190 ParamQry

The **ParamQry** record specifies the parameters for a **parameterized query**.

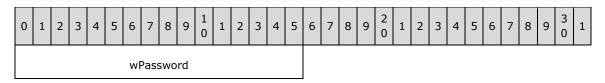

fixed (8 bytes): A PARAMORY Fixed structure that specifies the type information of the parameters.

rgb (variable): Variable type field that specifies a parameter for a parameterized query. The data type and meaning are specified in the following table:

Value of fixed.pbt	Value of fixed.grbit	Meaning
0	Any	rgb is an <u>SXString</u> followed by an unused byte.
1	0x001	rgb is an Xnum (section 2.5.342).
1	0x002	rgb is an SXString followed by an unused byte.
1	0x800	rgb is a 4-byte signed integer.
2	Any	rgb is an <u>FMSER param</u> that specifies the cell reference containing the parameter.

2.4.191 Password

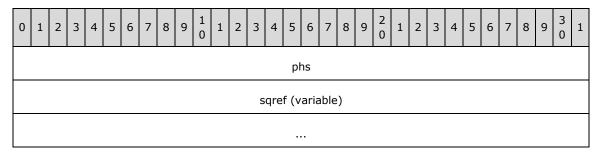

The **Password** record specifies the password verifier for the **sheet** or **workbook**. If this record exists in the <u>Globals Substream</u>, then it is a password for the workbook. If this record exists in a <u>worksheet substream</u>, <u>chart sheet substream</u>, <u>macro sheet substream</u>, or <u>dialog sheet substream</u>, then it is a password for only that sheet. This record MUST exist for the workbook. A sheet has a password if and only if this record exists.

wPassword (2 bytes): An unsigned integer that specifies the password verifier. See Password verifier Algorithm for more information. If the password is for a sheet, MUST NOT equal 0x0000. If wPassword is 0x0000 it means the workbook has no password.

2.4.192 PhoneticInfo

The **PhoneticInfo** record specifies the default format for **phonetic strings** and the **ranges** of **cells** on the **sheet** that have phonetic strings that are **visible**.

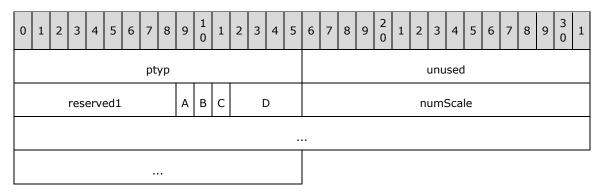

phs (4 bytes): A <u>Phs</u> structure that specifies the default format for phonetic strings on the sheet. When a phonetic string is entered into a cell that does not already contain a phonetic string, the default format is applied to the phonetic string.

sqref (variable): An <u>SqRef</u> structure that specifies the ranges of cells on the sheet that have phonetic strings that are visible.

2.4.193 PicF

The **PicF** record specifies the layout of a picture that is attached to a picture-filled chart element.

ptyp (2 bytes): An unsigned integer that specifies the picture layout. If this record is not located in the sequence of records that conform to the <u>SS</u> rule, as specified by the Chart Sheet Substream **ABNF**, then this field MUST be 0x0001. If this record is located in the sequence of records that conform to the SS rule, then this field MUST be a value from the following table:

Value	Meaning
0×0001	Stretched. The picture is scaled to fit within the dimensions of the filled areas of the chart element.

Value	Meaning
0x0002	Stacked. The pictures in the <u>data points</u> are stacked on top of each other in the direction of the value <u>axis</u> .
0x0003	Stacked and scaled. The pictures in the data points are stacked next to or on top of each other, and each picture is scaled to fit in the number of units on the value axis as specified by numScale .

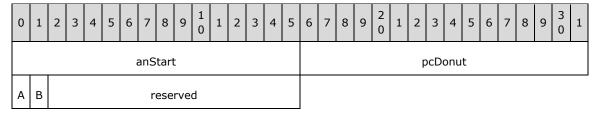

unused (2 bytes): Undefined and MUST be ignored.

reserved1 (9 bits): MUST be zero, and MUST be ignored.

- A fTopBottom (1 bit): A bit that specifies whether the picture covers the top and bottom fill areas of the data points. The top and bottom fill areas of the data points are parallel to the floor in a 3-D plot area. If a Chart3d record does not exist in the chart sheet substream, or if this record is not in an SS rule or if this record is in an SS rule that contains a Chart3DBarShape record with the riser field equal to 0x01, this field MUST be 1.
- **B fBackFront (1 bit):** A bit that specifies whether the picture covers the front and back fill areas of the data points on a bar or column <u>chart group</u>. If a Chart3d record does not exist in the chart sheet substream, or if this record is not in an SS rule or if this record is in an SS rule that contains a Chart3DBarShape record with the **riser** field equal to 0x01, this field MUST be 1.
- **C fSide (1 bit):** A bit that specifies whether the picture covers the side fill areas of the data points on a bar or column chart group. If a Chart3d record does not exist in the chart sheet substream, or if this record is not in an SS rule or if this record is in an SS rule that contains a Chart3DBarShape record with the **riser** field equal to 0x01, this field MUST be 1.
- **D reserved2 (4 bits):** MUST be zero, and MUST be ignored.
- **numScale (8 bytes):** An Xnum (section 2.5.342) that specifies the number of units on the value axis in which to fit the entire picture. The picture is scaled to fit within this number of units. If the value of **ptyp** is not 0x0003, this field is undefined and MUST be ignored.

2.4.194 Pie

The **Pie** record specifies that the <u>chart group</u> is a pie chart group or a doughnut chart group, and specifies the chart group attributes.

anStart (2 bytes): An unsigned integer that specifies the starting angle of the first <u>data point</u>, clockwise from the top of the circle. MUST be less than or equal to 360.

pcDonut (2 bytes): An unsigned integer that specifies the size of the center hole in a doughnut chart group as a percentage of the **plot area** size. MUST be a value from the following table:

Value	Meaning
0	Pie chart group.
10 to 90	Doughnut chart group.

- **A fHasShadow (1 bit):** A bit that specifies whether one data point or more data points in the chart group have shadows.
- **B fShowLdrLines (1 bit):** A bit that specifies whether the **leader lines** to the <u>data labels</u> are shown.

reserved (14 bits): MUST be zero, and MUST be ignored.

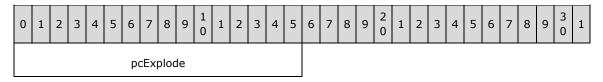

2.4.195 PieFormat

The **PieFormat** record specifies the distance of a data point or data points in a series from the center of one of the following:

- The **plot area** for a doughnut or pie <u>chart group</u>.
- The primary pie in a pie of pie or bar of pie chart group.
- The **secondary bar/pie** of a pie of pie chart group.

The data point or data points in a series are specified by the sequence of records that conforms to the SS rule in the Chart Sheet Substream **ABNF** that contains this record.

MUST NOT exist on chart group types other than pie, doughnut, bar of pie, or pie of pie. MUST NOT exist if the chart group type is doughnut and the series is not the outermost series. MUST NOT exist on the data points on the secondary bar/pie of a bar of pie chart group.

pcExplode (2 bytes): A signed integer that specifies the distance of a data point or data points in a series from the center of one of the following:

- The plot area for a doughnut or pie chart group.
- The primary pie in a pie of pie or bar of pie chart group.
- The secondary bar/pie of a pie of pie chart group.

The value of this field specifies the distance as a percentage. If this value is 0, then the data point or data points in a series is as close to the center as possible for the particular chart group type. If this value is 100, then the data point is at the edge of the **chart area** (section 2.2.3.17). If this value is greater than 100, such that the data point is beyond the edge of the chart area, then all the data points in the chart group are scaled down to fit inside the chart area such that the data point with the highest **pcExplode** value is at the edge of the chart area.

MUST be greater than or equal to 0.

2.4.196 PivotChartBits

The **PivotChartBits** record specifies the flags applicable to a <u>Pivot Chart</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rt									unused1																					
Α	A unused2									unused2 reserved1 (optional)																					
	reserved2 (optional)														res	erve	ed3	(op	otio	nal)											

rt (2 bytes): An unsigned integer that specifies the FRT record type. MUST be 0x0859.

unused1 (2 bytes): Undefined, and MUST be ignored.

A - fGXHide (1 bit): A bit that specifies whether to hide the pivot field captions in the Pivot Chart.

unused2 (15 bits): Undefined, and MUST be ignored.

reserved1 (2 bytes): This field SHOULD<101> exist. If this field exists, this value MUST be 0x0000, and MUST be ignored.

reserved2 (2 bytes): This field SHOULD<102> exist. If this field exists, this value MUST be 0x0000, and MUST be ignored.

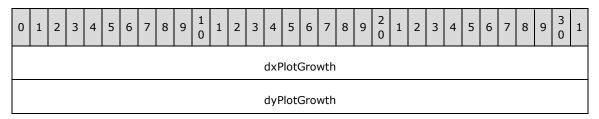

reserved3 (2 bytes): This field SHOULD<103> exist. If this field exists, this value MUST be 0x0000, and MUST be ignored.

2.4.197 PlotArea

The **PlotArea** record is empty, specifying that the <u>Frame</u> record that immediately follows this record specifies properties of the **plot area**.

2.4.198 PlotGrowth

The **PlotGrowth** record specifies the scale factors to use when calculating the **font scaling** information for a **font** in the **plot area**. If no <u>Fbi</u> record exists in the <u>chart sheet</u> where **scab** is 0x0001, this record is unused and MUST be ignored. Otherwise, the values from each Fbi record where **scab** is 0x0001 are used in conjunction with values in this record to render the scaled fonts in the plot area.

dxPlotGrowth (4 bytes): A **FixedPoint** as specified in [MS-OSHARED] section 2.2.1.6 that specifies the horizontal growth (in **points**) of the plot area for font scaling.

dyPlotGrowth (4 bytes): A **FixedPoint** as specified in [MS-OSHARED] section 2.2.1.6 that specifies the vertical growth (in points) of the plot area for font scaling.

2.4.199 Pls

The **PIs** record specifies printer settings and the printer driver information.

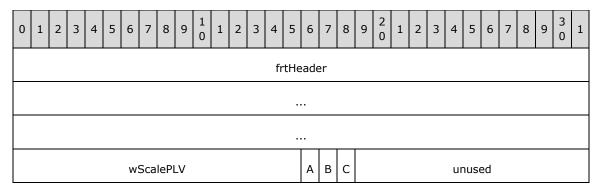

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	reserved																		rgb	(va	rial	ble)									

reserved (2 bytes): MUST be zero, and MUST be ignored.

rgb (variable): A **DEVMODE** structure, as defined in [DEVMODE], which specifies the printer settings. The size of this field is equal to the size of the current record and all of the following Continue records, excluding the record's heading and **reserved** field.

2.4.200 PLV

The **PLV** record specifies the settings of a **Page Layout view** for a **sheet**.

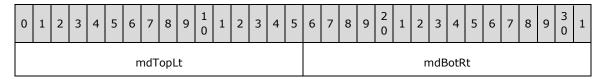

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x088B.

- wScalePLV (2 bytes): An unsigned integer that specifies zoom scale as a percentage for the Page Layout view of the current sheet. For example, if the value is 107, then the zoom scale is 107%. The value 0 means that the zoom scale is not set. If the value is nonzero, it MUST be greater than or equal to 10 and less than or equal to 400.
- A fPageLayoutView (1 bit): A bit that specifies whether the sheet is in the Page Layout view. If the fSLV in Window2 record is 1 for this sheet, it MUST be 0.
- **B fRulerVisible (1 bit):** A bit that specifies whether the application displays the **ruler**.
- C fWhitespaceHidden (1 bit): A bit that specifies whether the margins between pages are hidden in the Page Layout view.

unused (13 bits): Undefined, and MUST be ignored.

2.4.201 Pos

The **Pos** record specifies the size and position for a <u>legend</u>, an <u>attached label</u>, or the **plot area**, as specified by the primary <u>axis group</u>. This record MUST be ignored for the plot area when the **fManPlotArea** field of <u>ShtProps</u> in the associated <u>chart sheet</u> substream is set to 1.

x1	unused1
y1	unused2
x2	unused3
y2	unused4

mdTopLt (2 bytes): A PositionMode structure that specifies the positioning mode for the upper-left corner of a legend, an attached label, or the plot area. The valid combinations of mdTopLt and mdBotRt and the meaning of x1, y1, x2, y2 are specified in the Valid Combinations of mdTopLt and mdBotRt by Type table.

mdBotRt (2 bytes): A PositionMode structure that specifies the positioning mode for the lower-right corner of a legend, an attached label, or the plot area. The valid combinations of mdTopLt and mdBotRt and the meaning of x1, y1, x2, y2 are specified in the following table.

Туре	mdTopLt Position Mode	mdBotRt Position Mode	Meaning
plot area (axis group)	MDPARENT	MDPARENT	The values of x1 and y1 specify the horizontal and vertical offsets of the primary axis group's upperleft corner, relative to the upper-left corner of the chart area (section <u>2.2.3.17</u>), in <u>SPRC</u> . The values of x2 and y2 specify the width and height of the primary axis group, in SPRC.
legend	MDCHART	MDABS	The values x1 and y1 specify the horizontal and vertical offsets of the legend's upper-left corner, relative to the upper-left corner of the chart area (section 2.2.3.17) in SPRC. The values of x2 and y2 specify the width and height of the legend, in points .
legend	MDCHART	MDPARENT	The values of x1 and y1 specify the horizontal and vertical offsets of the legend's upper-left corner, relative to the upper-left corner of the chart area (section 2.2.3.17) in SPRC. The values of x2 and y2 MUST be ignored. The size of the legend is determined by the application.
legend	MDKTH	MDPARENT	The values of x1 , y1 , x2 and y2 MUST be ignored. The legend is located inside a data table.
attached label	MDPARENT	MDPARENT	The meaning of x1 and y1 is specified in the Meaning of x1 and y1 as specified by the Type of Attached Label table. x2 and y2 MUST be ignored. The size of the attached label is determined by the application.

The following table shows the meaning of x1 and y1 as specified by the type of attached label.

Type of Attached Label	Meaning
Chart title	The value of x1 and y1 specify the horizontal and vertical offset of the title, relative to its default position, in SPRC.
Axis title	The value of x1 and y1 specify the offset of the title along the direction of a specific <u>axis</u> . The value of x1 specifies an offset along the category (2) axis, date axis, or horizontal value axis. The value of y1 specifies an offset along the value axis. Both offsets are relative to the title's default position, in 1/1000 th of the axis length.

Type of Attached Label	Meaning
Data label	If the chart is not a pie chart group or a radar chart group, x1 and y1 specify the offset of the label along the direction of the specific axis. The x1 value is an offset along the category (2) axis, date axis, or horizontal value axis. The y1 value is an offset along the value axis, opposite to the direction of the value axis. Both offsets are relative to the label's default position, in 1/1000 th of the axis length. For a pie chart group, the value of x1 specifies the clockwise angle, in degrees, and the value of y1 specifies the radius offset of the label relative to its default position, in 1/1000 th of the pie radius length. A label moved toward the pie center has a negative radius offset. For a radar chart group, the values of x1 and y1 specify the horizontal and vertical offset of the label relative to its default position, in 1/1000 th
	of the axis length.

x1 (2 bytes): A signed integer that specifies a position. The meaning is specified in the earlier table showing the valid combinations **mdTopLt** and **mdBotRt** by type.

unused1 (2 bytes): Undefined and MUST be ignored.

y1 (2 bytes): A signed integer that specifies a position. The meaning is specified in the earlier table showing the valid combinations mdTopLt and mdBotRt by type.

unused2 (2 bytes): Undefined and MUST be ignored.

x2 (2 bytes): A signed integer that specifies a width. The meaning is specified in the earlier table showing the valid combinations **mdTopLt** and **mdBotRt** by type.

unused3 (2 bytes): Undefined and MUST be ignored.

y2 (2 bytes): A signed integer that specifies a height. The meaning is specified in the earlier table showing the valid combinations **mdTopLt** and **mdBotRt** by type.

unused4 (2 bytes): Undefined and MUST be ignored.

2.4.202 PrintGrid

The **PrintGrid** record specifies whether the **gridlines** are printed.

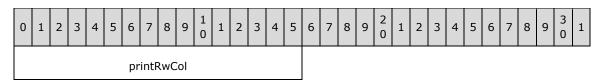

A - fPrintGrid (1 bit): A bit that specifies whether the gridlines are printed.

unused (15 bits): Undefined, and MUST be ignored.

2.4.203 PrintRowCol

The **PrintRowCol** record specifies whether the row and column headers are printed.

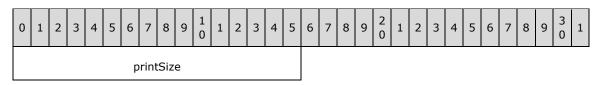

printRwCol (2 bytes): A Boolean (section 2.5.14) that specifies whether the row and column headers are printed. MUST be a value from the following table:

Value	Meaning
0x0000	Row and column headers are not printed.
0x0001	Row and column headers are not printed.

2.4.204 PrintSize

The **PrintSize** record specifies the printed size of the <u>chart</u>. This record affects the charts printed only on their own page.

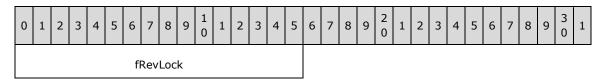

printSize (2 bytes): An unsigned integer that specifies the printed size of the chart. MUST be a value from the following table:

Value	Meaning
0x0000	The record is part of a <u>UserSViewBegin</u> block and the print settings are unchanged from the defaults specified in the workbook .
0x0001	The chart is resized to fill the entire page regardless of the original chart proportions, within page margins.
0x0002	The chart is resized proportionally to fill the entire page, within page margins.
0x0003	The printed size of the chart is defined in the Chart record.

2.4.205 Prot4Rev

The **Prot4Rev** record specifies whether removal of the shared workbook's revision logs is disallowed.

fRevLock (2 bytes): A Boolean (section 2.5.14) that specifies whether removal of the shared workbook's revision logs is disallowed. The value MUST be one of the values specified in the following table:

Value	Meaning
0x0000	Removal of the shared workbook's revision logs is allowed.
0x0001	Removal of the shared workbook's revision logs is disallowed.

2.4.206 Prot4RevPass

The **Prot4RevPass** record specifies the password verifier that is required to change the value of the **fRevLock** field of the **Prot4Rev** record that immediately precedes this record.

protPwdRev (2 bytes): An unsigned integer that specifies the password verifier that is required to change the value of the **fRevLock** field of the Prot4Rev record that immediately precedes this record<104>. The algorithm to generate the password verifier is documented in the <u>password verifier algorithm</u>. If the value is 0, there is no password. MUST be 0 if the **fRevLock** field of Prot4Rev is 0x0000.

2.4.207 Protect

The **Protect** record specifies the **protection** state for the **sheet** or **workbook**. If this record exists in the <u>Globals Substream</u>, then the protection state specified in this record applies to the workbook. If this record exists in a <u>worksheet substream</u>, <u>chart sheet substream</u>, <u>macro sheet substream</u>, or <u>dialog sheet substream</u>, then the protection state specified in this record applies to only that sheet. This record MUST exist for the workbook. For a sheet, the sheet is **protected** if and only if this record exists.

fLock (2 bytes): A Boolean (section 2.5.14) that specifies whether the sheet or workbook is protected. For a sheet, **fLock** MUST be 0x0001, and it means the sheet is protected. For the workbook, it MUST be a value from the following table:

Value	Meaning
0x0000	The workbook is not protected.
0x0001	The workbook is protected.

2.4.208 Qsi

The **Qsi** record specifies properties for a **query table**, and specifies the beginning of a collection of records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of records specifies additional information for the query table.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е	F	G	Н	Ι	J	K	L	-	М	١	١	itblAutoFmt															
0	Р	Q	R	S	Т				u	ınus	sed:	3				reserved															
																			rgcl	hNa	ıme	(va	arial	ble)	1						
	unused4																														

- A fTitles (1 bit): A bit that specifies whether the first row of the query table contains column titles.
- **B fRowNums (1 bit):** A bit that specifies whether the first column of the query table displays row numbers.
- **C fDisableRefresh (1 bit):** A bit that specifies whether the query table can be refreshed.

Value	Meaning
0	The query table can be refreshed.
1	The query table cannot be refreshed.

- **D fAsync (1 bit):** A bit that specifies whether the query table refreshes data asynchronously. MUST be set to 1 if **fNewAsync** field is set to 1.
- **E fNewAsync (1 bit):** A bit that specifies whether data has been refreshed for this query table. MUST be set to 0 if **fAsync** field is set to 0.

Value	Meaning
0	The first background data refresh was finished at the time the file was saved.
1	The first background data refresh was not finished at the time the file was saved.

- **F fAutoRefresh (1 bit):** A bit that specifies whether the query table refreshes its data automatically when the document is opened.
- **G fShrink (1 bit):** A bit that specifies the behavior when dealing with a variable number of rows of data in the query table between refresh operations. If **fOverwrite** is 1, this value MUST be 0. MUST be one of the following.

Value	Meaning
0	Unused cells are to be cleared.
1	Unused cells are to be deleted

- **H fFill (1 bit):** A bit that specifies whether formulas in columns adjacent to the query table are filled down whenever the query table is refreshed.
- I fAutoFormat (1 bit): A bit that is unused and SHOULD be set to zero<105>.

J - fSaveData (1 bit): A bit that specifies whether the query table preserves all of its data in the **sheet** when the document is saved. MUST be one of the following:

Value	Meaning							
0x0	Data in the query table will not be saved							
0x1	Data in the query table will be saved							

K - fDisableEdit (1 bit): A bit that specifies whether the content used with this query table is editable.

Value	Meaning
0	Content is editable
1	Content is locked

- L unused1 (2 bits): Undefined and MUST be ignored.
- **M fOverwrite (1 bit):** A bit that specifies the behavior when dealing with a variable number of rows of data in the query table between refresh operations. If **fShrink** is 1, this value MUST be 0. MUST be one of the following.

Va	alue	Meaning
0		Insert new cells for new data
1		Overwrite existing cells for new data

- N unused2 (2 bits): Undefined and MUST be ignored.
- **itblAutoFmt (2 bytes):** An <u>AutoFmt8</u> that specifies the **AutoFormat** to be applied to the query table. MUST be less than or equal to 0x0014.
- **O fibitAtrNum (1 bit):** A bit that specifies whether numeric cell data is formatted according to the **style** specified in **itblAutoFmt** field.
- **P fibitAtrFnt (1 bit):** A bit that specifies whether cell text is formatted according to the style specified in **itblAutoFmt** field.
- **Q fibitAtrAlc (1 bit):** A bit that specifies whether cell text alignment is set according to the style specified in **itblAutoFmt** field.
- **R fibitAtrBdr (1 bit):** A bit that specifies whether **border** is set according to the style specified in **itblAutoFmt** field.
- **S fibitAtrPat (1 bit):** A bit that specifies whether the pattern is formatted according to the style specified in **itblAutoFmt** field.
- T fibitAtrProt (1 bit): A bit that specifies whether the cell is protected according to the style specified in itblAutoFmt field.

unused3 (10 bits): Undefined and MUST be ignored.

reserved (4 bytes): MUST be zero, and MUST be ignored.

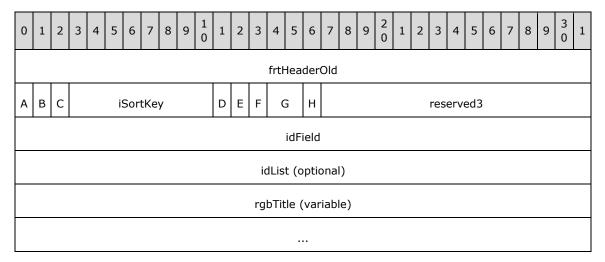

rgchName (variable): A <u>XLUnicodeString</u> string that specifies the name of the query table. The number of characters in this array MUST be less than 0x00FF. Within this <u>workbook</u>, there MUST

be a **defined name** as specified by an <u>Lbl</u> record with its **fHidden** field equal to 1 and its **Name** field matching this field's value and the **rgce** field only containing a <u>PtgArea3d</u> referencing the range of cells for the query table fields. Spaces within **rgchName** are converted to underscores for the purposes of this comparison.

unused4 (2 bytes): Undefined and MUST be ignored.

2.4.209 Qsif

The **Qsif** record specifies the properties for a **query table** field. One Qsif record is stored for each query table field.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0807.

A - fUserIns (1 bit): A bit that specifies whether this column was inserted into the query table.

Value	Meaning
0	The column is from the external data source.
1	The column was inserted into the query table and is not from the external data source.

- **B fFillDown (1 bit):** A bit that specifies whether the formula (section <u>2.2.2</u>) in this query table field is filled down on data **refresh**.
- **C fSortDes (1 bit):** A bit that specifies whether this query table field is sorted in **descending order** if it is included as part of a **sort range**.

iSortKey (8 bits): An unsigned integer that specifies the position of this query table field in the sort range. MUST be a value from the following table:

Value	Axis Description
0	This query table field does not contain sort criteria.
1	This query table field contains sort criteria for the first sort key as specified in the <u>Sort</u> record.
2	This query table field contains sort criteria for the second sort key as specified in the Sort record.

Value	Axis Description
3	This query table field contains sort criteria for the third sort key as specified in the Sort record.

- **D fRowNums (1 bit):** A bit that specifies whether this query table field contains the row numbers for the data from the external data source.
- **E reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- F fSorted (1 bit): A bit that specifies whether this query table field is part of a sort range.
- G reserved2 (2 bits): MUST be zero, and MUST be ignored.
- **H fClipped (1 bit):** A bit that specifies whether this query table field is currently outside the **sheet** bounds as specified in the <u>cell table</u>. If the **fUserIns** field is set to 1, this field MUST be set to 0.
- reserved3 (15 bits): MUST be zero, and MUST be ignored.
- **idField (4 bytes):** An unsigned integer that specifies a unique identifier of this query table field in the query table. MUST be greater than or equal to 0x0001 and less than or equal to 0xFFFF.
- **idList (4 bytes):** An optional unsigned integer that specifies the value corresponding to the **idList** field of the <u>TableFeatureType</u> structure that is linked with this query table. This field exists only if the **verLastXLSaved** field of the <u>BOF</u> records is greater than or equal to 0x4.
- **rgbTitle (variable):** An <u>XLUnicodeString</u> string that specifies the name of the query table field. The length of the query table field MUST less than or equal to 0x00FF.

2.4.210 Qsir

The **Qsir** record specifies the properties related to the formatting of a **query table**, and specifies the beginning of a collection of <u>Qsif</u> records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of Qsif records specifies properties for a query table field.

One Qsir record is stored for each query table

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	3	1
	frtRefHeaderU																													
	···																													
						cb0	Qsir	Sav	'ed							cbQsifSaved														
Α	В	С							re	ser	ved	1							D E F G H I J wVerBeforeRefr F								K			
														iSo	rtCı	usto	om													
															cQ	sif														
														сря	stDe	elet	ed													

idFieldNext											
ccolExtraLeft ccolExtraRight											
idList (optional)											
rgbTitle (variable)											

- frtRefHeaderU (12 bytes): An FrtRefHeaderU structure. The frtRefHeaderU.rt field MUST be 0x0806. The frtRefHeaderU.grbitFrt.fFrtRef field MUST be 1 and the frtRefHeaderU.ref8 field MUST refer to the range of cells associated with this record.
- **cbQsirSaved (2 bytes):** An unsigned integer that specifies the number of bytes in the Qsir record excluding the **frtRefHeaderU**, **cbQsirSaved**, and **cbQsifSaved** fields.
- **cbQsifSaved (2 bytes):** An unsigned integer that specifies the size in bytes of each Qsif record that follows this Qsir record. This value MUST be less than the difference between the size in bytes for the Qsif record and the size in bytes of the **frtHeaderOld** field in the same record.
- **A fPersist (1 bit):** A bit that specifies whether sorting, filtering, and layout is preserved for this query table after data **refresh** operations.
- **B fPersistSort (1 bit):** A bit that specifies whether the sorting is preserved for this query table after data refresh operations. MUST be equal to **fPersist**.
- **C fPersistAutoFilter (1 bit):** A bit that specifies whether **AutoFilter** is preserved for this query table after data refresh operations. MUST be equal to **fPersist**.
- reserved1 (16 bits): MUST be zero, and MUST be ignored.
- **D reserved2 (1 bit):** MUST be zero, and MUST be ignored.
- **E fSorted (1 bit):** A bit that specifies whether a **sort** was applied for this query table.
- **F fCaseSensSort (1 bit):** A bit that specifies whether the sort on the query table is case-sensitive.
- G fHdrRowSort (1 bit): A bit that specifies whether the query table sort accounted for a header row.
- **H fidWrapped (1 bit):** A bit that specifies whether the **idFieldNext** field value has exceeded its upper-bound value (0xFFFF).
- I reserved3 (1 bit): MUST be zero, and MUST be ignored.
- **J fTitlesOld (1 bit):** A bit that specifies whether the query table had titles the last time it was refreshed.
- **wVerBeforeRefreshAlert (5 bits):** An unsigned integer that specifies the oldest version of the application that is expected to correctly refresh the data in the query table without any errors. MUST be less than or equal to 0x000C. The application version is a value specified in the following table:

Value	Application Version
0x0008	Specifies the application version.<106>
0x0009	Specifies the application version. <a href="mailto:<107"><107

Value	Application Version
0x000A	Specifies the application version. <a><108>
0x000B	Specifies the application version. <109>
0x000C	Specifies the application version. <110>
0x000E	Specifies the application version.<111>
0x000F	Specifies the application version. <a><112>

- K reserved4 (1 bit): MUST be zero, and MUST be ignored.
- **iSortCustom (4 bytes):** An unsigned integer that specifies the zero-based index of the **custom list** that specifies the **sort order**. The set of custom lists is based on the current user's environment.
 - For more information about how the set of custom lists is determined, see [MSFT-XL2000].
- **cQsif (4 bytes):** An unsigned integer that specifies the count of Qsif records that immediately follow this Qsir record.
- **cpstDeleted (4 bytes):** An unsigned integer that specifies the number of elements in the **rgbTitle** array.
- **idFieldNext (4 bytes):** An unsigned integer that specifies the next unique number available for assignment to a newly created Qsif record. MUST be greater than or equal to 0x0001 and less than or equal to 0xFFFF.
- **ccolExtraLeft (2 bytes):** A <u>DCol</u> structure that specifies the number of columns that do not contain **external data** that are included at the beginning of the query table by resizing. When a sort is applied to the query table, they are also applied to these columns.
- **ccolExtraRight (2 bytes):** A DCol structure that specifies the number of columns that do not contain external data that are included at the end of the query table by resizing. When a sort is applied to the query table, they are also applied to these columns.
- **idList (4 bytes):** An optional unsigned integer that specifies the value corresponding to the **idList** field of the <u>TableFeatureType</u> structure that is linked with this query table. This field exists only if the **verLastXLSaved** field of the <u>BOF</u> record is greater than or equal to 0x3.
- **rgbTitle (variable):** An array of <u>XLUnicodeString</u> structures. This array specifies the names of the database fields in the database **query** that are not included in the query table. The number of elements in this array MUST be equal to the value of the **cpstDeleted** field. The count of characters in each name MUST be greater than or equal to 0x0001 and less than or equal to 0x00FF.

2.4.211 **QsiSXTag**

The **QsiSXTag** record specifies the name and **refresh** information for a **query table** or a <u>PivotTable</u> view, and specifies the beginning of a collection of records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of records specifies additional information for a query table or a PivotTable view.

If **fSx** is 0 and **stName** is equal to the **rgchName** field of a <u>Osi</u> record in this worksheet substream, then this collection of records applies to the query table that the Qsi record is associated with. If **fSx** is 1 and **stName** is equal to the **stName** field of an <u>SxView</u> record in this worksheet substream, then this collection of records applies to the PivotTable view that the SxView record is associated with and its <u>associated PivotCache</u>. Otherwise, this collection of records MUST be ignored.

0 1 2 3 4 5 6 7	8 9 1 1 2 3 4 5	6 7 8 9 2 1 2 3	4 5 6 7 8 9 3 1											
frtHeaderOld														
f	5x	A B C reserved1												
dwQsiFuture														
verSxLastUpdated	verSxUpdatableMin	obCchName reserved2												
	stName (variable)												
unı	used													

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0802.

fSx (2 bytes): A Boolean (section $\underline{2.5.14}$) that specifies whether this record relates to a PivotTable view or a query table.

Value	Meaning
0x0000	Specifies that this record relates to a query table.
0x0001	Specifies that this record relates to a PivotTable view.

A - fEnableRefresh (1 bit): A bit that specifies whether refresh of the PivotTable view or query table is enabled. MUST be 0 if fSx is 1 and the PivotCache functionality level of the associated PivotCache is greater than or equal to 3.

Value	Value of fSx	Meaning
0	0	Whether refresh of the query table is enabled is specified by the fDisableRefresh field of the associated Qsi record.
0	1	Whether refresh of the associated PivotCache is enabled is specified by the fEnableRefresh field in the SXDB record of the PivotCache .
1	0	Specifies that refresh of the query table is enabled.
1	1	Specifies that refresh of the associated PivotCache is enabled.

B - fInvalid (1 bit): A bit that specifies the invalid state of the <u>cache records</u> of the associated PivotCache; see Cache Records for more information. MUST be 1 if **fSx** is 1 and the PivotCache functionality level of the associated PivotCache is greater than or equal to 3.

- C fTensorEx (1 bit): A bit that specifies whether the PivotTable view is an OLAP PivotTable view. MUST be equal to 0 if fSx is 0.
- reserved1 (13 bits): MUST be zero, and MUST be ignored.
- **dwQsiFuture (4 bytes):** This structure specifies additional option flags for a query table or a PivotTable view depending on the value of the **fSx** field.

Value of fSx Field	Type of dwQsiFuture
0x0000	<u>DwQsiFuture</u>
0x0001	SXView9Save

- verSxLastUpdated (1 byte): A <u>DataFunctionalityLevel</u> value that specifies the <u>data functionality</u> <u>level</u> that the PivotTable view was last refreshed with. MUST be 0 if this record relates to a query table.
- **verSxUpdatableMin (1 byte):** A DataFunctionalityLevel value that specifies the minimum version of the application that can recalculate the PivotTable view. MUST be 0x00 or 0x03. MUST be 0 if this record is for a query table. MUST be 3 if the PivotCache functionality level of the associated PivotCache is 3.
- **obCchName (1 byte):** MUST be 0x10, and MUST be ignored.
- reserved2 (1 byte): MUST be zero, and MUST be ignored.
- **stName (variable):** An <u>XLUnicodeString</u> structure that specifies the query table or PivotTable view name.
- unused (2 bytes): Undefined and MUST be ignored.

2.4.212 Radar

The **Radar** record specifies that the <u>chart group</u> is a radar chart group and specifies the chart group attributes.

- A fRdrAxLab (1 bit): A bit that specifies whether category (2) labels are displayed.
- **B fHasShadow (1 bit):** A bit that specifies whether one or more **data markers** in the chart group has shadows.

reserved (14 bits): MUST be zero, and MUST be ignored.

unused (2 bytes): Undefined and MUST be ignored.

2.4.213 RadarArea

The **RadarArea** record specifies that the <u>chart group</u> is a filled radar chart group and specifies the chart group attributes.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	B reserved																unu	sed													

- A fRdrAxLab (1 bit): A bit that specifies whether category (2) labels are displayed.
- **B fHasShadow (1 bit):** A bit that specifies whether the <u>data points</u> in the chart group have shadows.

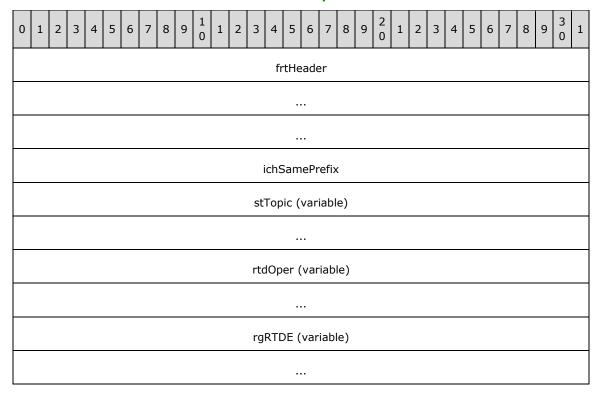

reserved (14 bits): MUST be zero, and MUST be ignored.

unused (2 bytes): Undefined and MUST be ignored.

2.4.214 RealTimeData

The **RealTimeData** record specifies the **real-time data (RTD)** information for a **workbook**.

There is one RealTimeData record for each **RTD topic** in the workbook.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0813.

ichSamePrefix (4 bytes): An unsigned integer that specifies the number of leading characters in common with the **stTopic** string in the previous RealTimeData record. MUST be 0 if there is no prefix in common or if this is the first RealTimeData record.

stTopic (variable): An <u>XLUnicodeStringSegmentedRTD</u> structure that specifies the string for the RTD topic specified by this record. The string can be stored in a compressed or uncompressed format. When **ichSamePrefix** is greater than 0, this string does not include any leading characters that are in common with the **stTopic** string in the previous RealTimeData record. The first substring specifies the **ProgID** of the **RTD server**. The second substring specifies the **server**

name that the RTD server is running on or, if this substring is empty, specifies that the RTD server is running locally. The rest of the substrings are combined to form a unique RTD topic.

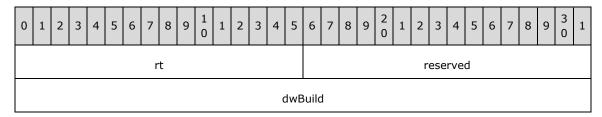

rtdOper (variable): An RTDOper structure that specifies the data returned by the RTD server.

rgRTDE (variable): An array of <u>RTDEItem</u> structures that specifies the set of **cells** associated with the RTD topic. The length of the array is specified by the following formula:

Array length = (size of this record and associated <u>ContinueFrt</u> records - 16 - size of **stTopic** - size of **rtdOper**) / 6

2.4.215 RecalcId

The **RecalcId** record specifies the identifier of the recalculation engine that performed the last recalculation.

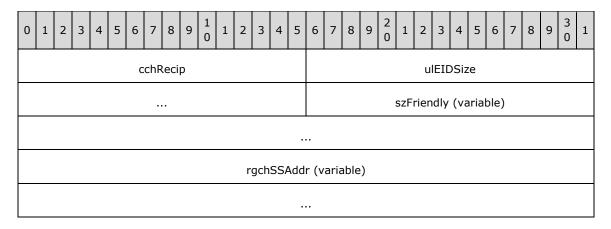

rt (2 bytes): An unsigned integer that specifies the record identifier. MUST be 449.

reserved (2 bytes): MUST be zero, and MUST be ignored.

dwBuild (4 bytes): An unsigned integer that specifies the identifier of the recalculation engine that performed the last recalculation. If the value is less than the recalculation engine identifier associated with the application, the application will **recalculate** the results of all formulas on this **workbook** immediately after loading the file.

2.4.216 RecipName

The **RecipName** record specifies information about a recipient of a **routing slip**<113>.

cchRecip (2 bytes): An unsigned integer that specifies the count of characters in the **szFriendly** field string. MUST be less than or equal to 256.

ulEIDSize (4 bytes): An unsigned integer that specifies the count of characters in the **rgchSSAddr** field string.

szFriendly (variable): A NULL-terminated array of ANSI characters that specifies the recipient's **friendly name**. The length of the string MUST be specified by the **cchRecip** field.

rgchSSAddr (variable): An array of ANSI characters whose length is specified by the **ulEIDSize** field that specifies the identifier used by the **messaging system service provider** to identify the recipient.

2.4.217 RefreshAll

The **RefreshAll** record specifies whether **external data** ranges, <u>PivotTables</u> and **XML maps** will be refreshed on **workbook** load.

refreshAll (2 bytes): A Boolean (section 2.5.14) that specifies whether to force **refresh** of external data ranges, PivotTables and XML maps on workbook load. MUST be a value from the following table:

Value	Meaning
0x0001	Force refresh of external data ranges, PivotTables and XML maps on workbook load.
0x0000	Do not force refresh of external data ranges, PivotTables and XML maps on workbook load.

MUST be 0x0000 if workbook is not a **template**.

2.4.218 RichTextStream

The **RichTextStream** record specifies additional text properties for the text in the entire <u>chart</u>, text in the current <u>legend</u>, text in the current <u>legend entry</u>, or text in the <u>attached label</u>. These text properties are a superset of the properties stored in the <u>Text</u>, <u>Font</u>, <u>FontX</u>, <u>BRAI</u>, and <u>ObjectLink</u> records based on the following table, as specified by the <u>Chart Sheet Substream</u> **ABNF**. In each case, the associated Font record is specified by the associated FontX record. <114>

Rule Containing the RichTextStream record	Meaning
CHARTFORMATS	Specifies additional Rich Text Format properties for the text of the entire chart.
	The associated Text and FontX records are contained in the attached label that is contained in the first sequence of records that conforms to the DFTTEXT rule in the chart, and not contained in the chart group .
LD	Specifies additional Rich Text Format properties for text in the current legend.
	The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule that is contained in the sequence of records that conforms to the LD rule.

Rule Containing the RichTextStream record	Meaning
SERIESFORMAT	Specifies additional Rich Text Format properties for the current legend entry.
	The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule that immediately precedes this record in the sequence of records that conforms to the SERIESFORMAT rule.
	The associated BRAI record is contained in the sequence of records that conforms to the AI rule that is contained in the sequence of records that conforms to the SERIESFORMAT rule.
ATTACHEDLABEL	Specifies additional Rich Text Format properties for the text in the attached label.
	The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule.
	The associated BRAI record is contained in the sequence of records that conforms to the ATTACHEDLABEL rule.
	The associated ObjectLink record is contained in the sequence of records that conforms to the ATTACHEDLABEL rule.

These Rich Text Format properties are stored in the **XML stream** (section <u>2.1.7.22</u>) specified in [ECMA-376] Part 4, section 5.7.2.217.

An application can choose to ignore this record without loss of functionality, but will lose access to the additional Rich Text Format properties. If an application chooses to implement this record, the application MUST implement the validation **checksum** specified by the **dwCheckSum** field.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	ade	er														
	dwCheckSum																														
															С	b															
	rgb (variable)																														

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x08A6.

dwCheckSum (4 bytes): An unsigned integer that specifies the checksum of the attributes of the Rich Text Format properties related to this record. The algorithm used to calculate the checksum is specified by [MS-OSHARED] section 2.4.3.2. The checksum MUST be calculated from every property of the property stream, taken as an array of bytes as specified by the RichTextStreamChecksumData structure.

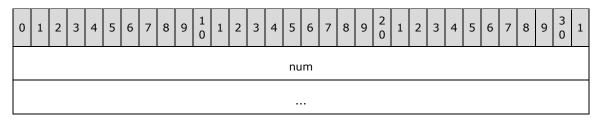

The information required to build the memory stream can be gathered from the Text, FontX, Font, BRAI, and ObjectLink records associated with this record, as previously specified.

When reading this record, the checksum is calculated as previously specified and compared to the **dwCheckSum** value stored in this record. If the calculated checksum does not match the **dwCheckSum** data, the application MUST assume that the **XML stream** (section 2.1.7.22) is out of date, and the data from the associated records MUST be used instead of the data specified by the **XML stream** (section 2.1.7.22).

- **cb** (4 bytes): An unsigned integer that specifies the size of the **rgb** field. This field MUST contain the exact length in bytes of the **rgb** field.
- **rgb (variable):** An array of ANSI characters that contains the **XML** representation of the text formatting properties, as defined in [ECMA-376] Part 4, section 5.7.2.217. The length of this field is specified by the **cb** field.

2.4.219 RightMargin

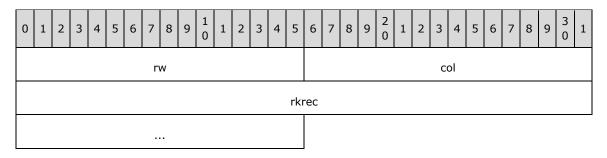

The RightMargin record specifies the right margin of the current sheet.

num (8 bytes): An Xnum (section <u>2.5.342</u>) value that specifies the right margin of the current sheet in inches. The value MUST be greater than or equal to 0 and less than or equal to 49.

2.4.220 RK

The **RK** record specifies the numeric data contained in a single cell.

rw (2 bytes): An Rw structure that specifies a row index.

col (2 bytes): A <u>Col</u> structure that specifies a column index.

rkrec (6 bytes): An RkRec structure that specifies the numeric data for a single cell.

2.4.221 Row

The **Row** record specifies a single row on a **sheet**.

0	1	2	3	4	5	6	7	8	9	1	1	2	2 3 4 5 6 7 8 9 2 1 2 3 4 5 6 7 8 9 3 0								1									
							r	w															col	Mic						
	colMac																					miy	/Rw	,						
	reserved1																		ι	ınus	sed	1								
	Α		В	С	D	Е	F			re	eserved3							i	xfe _.	_va	I				G	Н	Ι	J		

rw (2 bytes): An Rw structure that specifies the row index.

colMic (2 bytes): An unsigned integer that specifies the zero-based index of the first column that contains a cell populated with data or formatting in the current row. MUST be less than or equal to 255.

colMac (2 bytes): An unsigned integer that specifies the one-based index of the last column that contains a cell populated with data or formatting in the current row. MUST be less than or equal to 256. If **colMac** is equal to **colMic**, this record specifies a row with no CELL records.

miyRw (2 bytes): An unsigned integer that specifies the row height in **twips**. If **fDyZero** is 1, the row is **hidden** and the value of **miyRw** specifies the original row height. MUST be greater than or equal to 2 and MUST be less than or equal to 8192.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

A - iOutLevel (3 bits): An unsigned integer that specifies the outline level of the row.

B - reserved2 (1 bit): MUST be zero, and MUST be ignored.

C - fCollapsed (1 bit): A bit that specifies whether the rows that are one level of outlining deeper than the current row are included in the **collapsed outline state**.

D - fDyZero (1 bit): A bit that specifies whether the row is hidden.

E - fUnsynced (1 bit): A bit that specifies whether the row height was manually set.

F - fGhostDirty (1 bit): A bit that specifies whether the row was formatted.

reserved3 (1 byte): MUST be 1, and MUST be ignored.

ixfe_val (12 bits): An unsigned integer that specifies an XF record for the row formatting. See IXFCell for more information. If **fGhostDirty** is 0, **ixfe_val** is undefined and MUST be ignored.

G - fExAsc (1 bit): A bit that specifies whether any cell in the row has a thick top **border**, or any cell in the row directly above the current row has a thick bottom border. Thick borders are specified by the following enumeration values from BorderStyle: **THICK** and **DOUBLE**.

H - fExDes (1 bit): A bit that specifies whether any cell in the row has a medium or thick bottom border, or any cell in the row directly below the current row has a medium or thick top border. Thick borders are previously specified. Medium borders are specified by the following enumeration

values from BorderStyle: **MEDIUM, MEDIUMDASHED**, **MEDIUMDASHDOT**, **MEDIUMDASHDOTDOT**, and **SLANTDASHDOT**.

- I fPhonetic (1 bit): A bit that specifies whether the phonetic guide feature is enabled for any cell in this row.
- J unused2 (1 bit): Undefined and MUST be ignored.

2.4.222 RRAutoFmt

The **RRAutoFmt** record specifies the changes caused by **AutoFormat** actions in a <u>shared workbook</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
													ı	rrd	(14	by	tes))													
																							re	f8							
																							it	bl							
Α	B C D E F reserved										•	•																			

rrd (14 bytes): An RRD structure that specifies the revision record information used to track changes in a shared workbook. The rrd.revid MUST be 0 because this is a revision that cannot be reviewed. The rrd.revt MUST be equal to 0x000C. The rrd.tabid MUST NOT be 0xFFFF because this revision corresponds to a specific sheet.

ref8 (8 bytes): A Ref8U structure that specifies the range of cells affected by AutoFormat changes.

itbl (2 bytes): An AutoFmt8 structure that specifies which AutoFormat was applied.

- **A fApplyNumberFormats (1 bit):** A bit that specifies whether the **number format** properties contained in the AutoFormat specified by **itbl** were applied.
- **B fApplyFontFormats (1 bit):** A bit that specifies whether the **font** properties contained in the AutoFormat specified by **itbl** were applied.
- **C fApplyAlignmentFormats (1 bit):** A bit that specifies whether the text alignment properties contained in the AutoFormat specified by **itbl** were applied.
- **D fApplyBorderFormats (1 bit):** A bit that specifies whether the **border** properties contained in the AutoFormat specified by **itbl** were applied.
- **E fApplyPatternFormats (1 bit):** A bit that specifies whether the color pattern properties contained in the AutoFormat specified by **itbl** were applied.
- **F fApplyWidthHeightFormats (1 bit):** A bit that specifies whether the width or height properties contained in the AutoFormat specified by **itbl** were applied.

reserved (10 bits): MUST be zero, and MUST be ignored.

2.4.223 RRDChgCell

The **RRDChgCell** record specifies a <u>change cells revision</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

														rk	(0	ptior	nal)														
													r	nun	n (optio	nal)													
														st	(va	ariat	ole)														

bes (optional)	xpe (variable)

rrd (14 bytes): An RRD structure that specifies the <u>revision record</u> information used to track changes in a <u>shared workbook</u>. Because this **revision** corresponds to a specific **sheet**, **rrd.revt** MUST be 0x0008, **rrd.fDelAtEdgeOfSort** MUST be 0x0000, **rrd.revid** MUST be greater than or equal to 0, and **rrd.tabid** MUST NOT be 0xFFFF.

vt (3 bits): An unsigned integer that specifies the type of the new **cell** contents. MUST be a value from the following table:

Value	Meaning
0x0	New cell is blank.
0x1	New cell contains an RkNumber value.
0x2	New cell contains an Xnum (section 2.5.342) value.
0x3	New cell contains an XLUnicodeRichExtendedString value.
0x4	New cell contains a <u>Bes</u> value.
0x5	New cell contains a <u>CellParsedFormula</u> value.

vtOld (3 bits): An unsigned integer that specifies the type of the old cell contents. MUST be a value from the following table:

Value	Meaning
0x0	Old cell is blank.
0x1	Old cell contains an RkNumber value.
0x2	Old cell contains an Xnum value.
0x3	Old cell contains an XLUnicodeRichExtendedString value.
0x4	Old cell contains a Bes value.
0x5	Old cell contains a CellParsedFormula value.

- **A f123Prefix (1 bit):** A bit that specifies whether prefix characters are present in the cell. Possible prefix characters include single quotation mark (0x27), double quotation mark (0x22), caret (0x5E), and backslash (0x5C).
- **B unused (1 bit):** Undefined and MUST be ignored.
- C fOldFmt (1 bit): A bit that specifies whether there is old formatting information available for this cell. If fOldFmt is 0x1 and fOldFmtNull is 0x0, dxfOld MUST exist.
- **D fOldFmtNull (1 bit):** A bit that specifies whether the old formatting information is empty. This value MUST be ignored if **fOldFmt** is 0. If **fOldFmt** is 0x1 and **fOldFmtNull** is 0x0, **dxfOld** MUST exist. If **fOldFmt** is 0x1 and **fOldFmtNull** is 0x1, old formatting information is available for the cell, but the old formatting information is not written to disk and **dxfOld** MUST NOT exist.

- **E fXfDxf (1 bit):** A bit that specifies that the affected cells will have their format reset to the format defined by the current <u>cell style</u> before applying any format from **dxf**, if present.
- **F fStyXfDxf (1 bit):** A bit that specifies that the format of the cell will be cleared before applying any format from **dxf**, if present.
- **G fDxf (1 bit):** A bit that specifies whether there was a formatting change for this cell. If **fDxf** is 0x1 and **fDxfNull** is 0x0, **dxf** MUST exist.
- **H fDxfNull (1 bit):** A bit that specifies whether the new formatting information is empty. This value MUST be ignored if **fDxf** is 0. If **fDxf** is 0x1 and **fDxfNull** is 0x0, **dxf** MUST exist. If **fDxf** is 0x1 and **fDxfNull** is 0x1, this means that there was a formatting change for this cell, but the **dxf** describing the formatting change MUST NOT exist.
- I reserved1 (2 bits): MUST be zero, and MUST be ignored.

ifmtDisp (8 bits): An unsigned integer that specifies the identifier of the **number format** to use to display the new cell contents. MUST be a value from the following table. For more information about how **format strings** are interpreted, see [ECMA-376] Part 4: Markup Language Reference, section 3.8.31.

Value	Description	Positive Value Format	Negative Value Format	Zero Format
0x0000	Automatic	0	-0	0
0x0004	Number, two decimal places, use the 1000 separator (,)	#,##0.00	-#,##0.00	0.00
0x000B	Currency, two decimal places, use parentheses for negative values	\$#,##0.00	(\$#,##0.00)	\$0.00
0x000D	Percentage, zero decimal places	0%	-0%	0%
0x000E	Percentage, two decimal places	0.00%	-0.00%	0.00%
0x000F	Scientific	0.00E+00	-0.00E+00	0.00E+00
0x0010	Engineering	##0.0E+0	-##0.0E+0	0.0E+0
0x0011	Fraction, up to one digit numerator and denominator	# ?/?	-# ?/?	0
0x0012	Fraction, up to two digit numerator and denominator	# ??/??	-# ??/??	0
0x0013	Date (MM-DD-YY)	mm-dd-yy	mm-dd-yy	
0x0015	Date (DD-MMM)	d-mmm	d-mmm	
0x0017	Time (H:MM AM/PM)	h:mm AM/PM	h:mm AM/PM	
0x001B	Date/Time, 24 hour format (M/D/YY H:MM)	m/d/yy h:mm	m/d/yy h:mm	
0x0022	Accounting (currency with decimal point aligned, and centered minus-sign for 0-value), two decimal places, use currency symbol	_(\$* #,##0.00_)	_(\$* #,##0.00)	_(\$* "-" ??_)

- J fPhShow (1 bit): A bit that specifies whether the new cell contains a phonetic string.
- K fPhShowOld (1 bit): A bit that specifies whether the old cell contains a phonetic string.
- **L fEOLFmlaUpdate (1 bit):** A bit that specifies whether the new cell contents were changed because of an adjustment to the formula.

reserved2 (5 bits): MUST be zero, and MUST be ignored.

loc (4 bytes): An RgceLoc structure that specifies the location of the cell change revision.

cbOldVal (4 bytes): An unsigned integer that specifies the size of the old cell contents. If **cbOldVal** is greater than 0, the old cell contents immediately follow the **cetxpRst** field, then it is followed by the new cell contents. MUST be a value from the following table based on the value of **vtOld**:

vtOld	cbOldVal
-------	----------

vtOld	cbOldVal
0x0	MUST be 0x00000000.
0x1	MUST be 0x00000004.
0x2	MUST be 0x00000008.
0x3	MUST be equal to the size of the old XLUnicodeRichExtendedString. The size is calculated assuming all characters are double-byte characters. That is, if XLUnicodeRichExtendedString. fHighByte is 1, the calculation is made by using the size of XLUnicodeRichExtendedString.
0x4	MUST be 0x00000002.
0x5	MUST be greater than or equal to 0x00000018.

cetxpRst (2 bytes): An unsigned integer that specifies the number of RRDRstEtxp records that follow this record.

dxfOld (variable): A <u>DXFN</u> structure that specifies the <u>differential formatting</u> for the old cell contents. This field MUST exist if **fOldFmt** is 0x1 and **fOldFmtNull** is 0x0.

dxf (variable): A DXFN structure that specifies the differential formatting for the new cell contents. This field MUST exist if **fDxf** is 0x1 and **fDxfNull** is 0x0.

rkOld (4 bytes): An RkNumber structure that specifies the old cell contents. This field MUST exist if and only if **cbOldVal** is greater than 0 and **vtOld** is 0x1.

numOld (8 bytes): An Xnum value that specifies the old cell contents. This field MUST exist if and only if **cbOldVal** is greater than 0 and **vtOld** is 0x2.

stOld (variable): An XLUnicodeRichExtendedString structure that specifies the old cell contents. This field MUST exist if and only if **cbOldVal** is greater than 0 and **vtOld** is 0x3.

besOld (2 bytes): A Bes structure that specifies the old cell contents. This field MUST exist if and only if **cbOldVal** is greater than 0 and **vtOld** is 0x4.

xpeOld (variable): A CellParsedFormula structure that specifies the old cell contents. This field MUST exist if and only if **cbOldVal** is greater than 0 and **vtOld** is 0x5.

rk (4 bytes): An RkNumber value that specifies the new cell contents. This field MUST exist if and only if ${\bf vt}$ is $0{\bf x}1$.

num (8 bytes): An Xnum value that specifies the new cell contents. This field MUST exist if and only if **vt** is 0x2.

st (variable): An XLUnicodeRichExtendedString structure that specifies the new cell contents. This field MUST exist if and only if **vt** is 0x3.

bes (2 bytes): A Bes structure that specifies the new cell contents. This field MUST exist if and only if **vt** is 0x4.

xpe (variable): A CellParsedFormula structure that specifies the new cell contents. This field MUST exist if and only if **vt** is 0x5.

2.4.224 RRDConflict

The RRDConflict record specifies the resolution of a conflict between the revisions of two uses'.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														rrd	(14	by	tes))													
															•																
															•																

rrd (14 bytes): An <u>RRD</u> structure that specifies the <u>revision record</u> information used to track changes in a <u>shared workbook</u>. The <u>rrd.revid</u> MUST be greater than 0. The <u>rrd.revid</u> identifies the <u>revision</u> that won the conflict. The <u>rrd.revt</u> MUST be equal to <u>revtConflict</u>.

2.4.225 RRDDefName

The **RRDDefName** record specifies a **defined name** revision.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
													ı	rrd	(14	byt	tes))

														ре	(va	riab	le)														
												stC	ust	om	Mer	nu (var	iab	le)												
												stl	Des	scrip	otio	n (\	/ari	able	e)												

rrd (14 bytes): An RRD structure that specifies the revision record information used to track changes in a shared workbook. The revt field of the RRD structure MUST be 0x000A or 0x0022. The fDelAtEdgeOfSort field of the RRD structure MUST be 0x0000. The revid field of the RRD structure MUST be greater than or equal to 0.

tabidLocal (2 bytes): A <u>TabId</u> structure that specifies the **sheet** containing the defined name. A value of 0xFFFF specifies that the defined name is not a **local name**.

fViewName (1 byte): A Boolean (section 2.5.14) that specifies whether the defined name belongs to a **custom view**. MUST be a value from the following table:

Value	Meaning
0x00	The defined name does not belong to a custom view.
0x01	The defined name belongs to a custom view.

reserved (1 byte): MUST be zero, and MUST be ignored.

grbit (6 bytes): An RRDDefNameFlags structure that specifies data for the new defined name.

grbitOld (6 bytes): An RRDDefNameFlags structure that specifies data for the old defined name.

builtinIndex (1 byte): An unsigned integer that specifies the identifier of a built-in name. MUST be a value from the following table:

Identifier	Built-in Name
0x00	Not a built-in name
0x01	"Consolidate_Area"
0x02	"Auto_Open"
0x03	"Auto_Close"
0x04	"Extract"
0x05	"Database"
0x09	"Recorder"
0x0A	"Data_Form"
0x0B	"Auto_Activate"
0x0C	"Auto_Deactivate"
0x0D	"Sheet_Title"

unused (3 bytes): Optional, undefined, and MUST be ignored. MUST exist if and only if builtinIndex
is not equal to 0.

stDefName (variable): An <u>XLUnicodeString</u> structure that specifies the defined name. MUST exist if and only if **builtinIndex** is equal to 0. MUST be less than or equal to 255 characters. MUST begin with a letter or underscore character.

pe (variable): A <u>NameParsedFormula</u> structure that specifies the formula (section <u>2.2.2</u>) of the new defined name. The length of the formula in bytes is specified by **grbit.cce**.

stCustomMenu (variable): An XLUnicodeString structure that specifies the new custom menu text.

stDescription (variable): An XLUnicodeString structure that specifies the new description text.

stHelpTopic (variable): An XLUnicodeString structure that specifies the new help text.

stStatusText (variable): An XLUnicodeString structure that specifies the new status bar text.

peOld (variable): A NameParsedFormula structure that specifies the formula of the old defined name. The length of the formula in bytes is specified by **grbitOld.cce**.

stCustomMenuOld (variable): An XLUnicodeString structure that specifies the old custom menu text.

stDescriptionOld (variable): An XLUnicodeString structure that specifies the old description text.

stHelpTopicOld (variable): An XLUnicodeString structure that specifies the old help text.

stStatusTextOld (variable): An XLUnicodeString structure that specifies the old status bar text.

2.4.226 RRDHead

The **RRDHead** record specifies metadata about a set of revisions that a user has made in a <u>shared</u> workbook.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														rrd	(1	4 by	tes))		•											
																T							(1)	c .							
							•	••													Ç	Juid	(1	6 by	/tes	5)					
																					,	wFil	eCo	odel	Page	e					
							cchl	Ise	r																byte						
																1					-				Dy co						
															sc	ddtr															
																 T															
						t	abio	dMa	ic																						

- rrd (14 bytes): An RRD structure that specifies the revision record information used to track changes in a shared workbook. The rrd.revt MUST be equal to 0x0020. The rrd.cbMemory MUST be equal to 0xFFFFFFFF and MUST be ignored. The rrd.revid MUST be 0 because this is a revision that cannot be reviewed.
- **guid (16 bytes):** A **GUID** as specified by [MS-DTYP] that specifies a unique identifier for this set of revisions.
- **wFileCodePage (2 bytes):** An unsigned integer that specifies the **sheet's code page**. The value MUST be one of the code page values specified in [CODEPG] or the special value 1200, which means that the sheet is **Unicode**.
- **cchUser (2 bytes):** An unsigned integer that specifies the number of characters in **stUser** that are used to specify the name of the user who made this set of revisions. Characters in **stUser** that are to the right of these used characters are ignored. The value of **cchUser** MUST be less than or equal to 54.
- **stUser (114 bytes):** An <u>XLUnicodeStringNoCch</u> structure that specifies the name of the user who made this set of revisions.
- **sddtr (8 bytes):** A <u>ShortDTR</u> structure that specifies the date and time when the user saved this set of revisions.

tabidMac (2 bytes): A signed integer that specifies the next available sheet identifier in this **workbook**. The value MUST be greater than or equal to -1. Each sheet identifier is specified by the order in which the BoundSheet8 records appear in the Globals Substream.

2.4.227 RRDInfo

The **RRDInfo** record specifies information about a <u>shared workbook</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
						,	wXI	_Vei	r													re	eser	ved	11						
Α	В	С	D	Е					res	erv	ed2										ç	juid	(16	5 by	/tes	;)					
																					gui	dRo	ot ((16	byt	es)					
																							rev	/id							
																						,	vers	sion	l						
																F	G						re	eser	vec	13					
					wR	evH	listo	oryI	nte	rval																					

wXLVer (2 bytes): An unsigned integer that specifies the major **BIFF** version that was last used to save a shared workbook.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

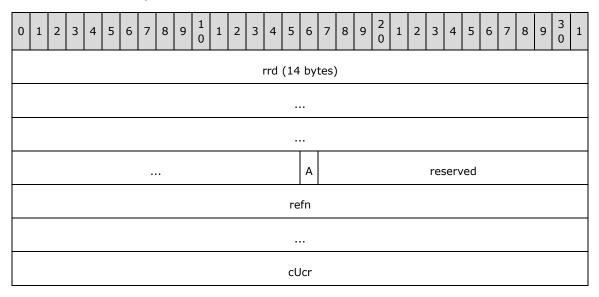

- A fssShared (1 bit): A bit that specifies whether this workbook is a shared workbook. If this value is 1, fssExclusive MUST be equal to 0.
- **B fssDiskHasRev (1 bit):** A bit that specifies whether the **revision history** on disk contains revisions. If this value is 1, **fssRevTrack** MUST be equal to 1.
- **C fssRevHist (1 bit):** A bit that specifies whether revisions are automatically deleted. If this value is 1, **fssRevTrack** MUST be equal to 1. MUST be a value from the following table:

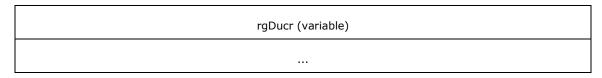

Value	Meaning
0	Revisions are not automatically deleted.
1	Revisions are automatically deleted.

- **D fssRevTrack (1 bit):** A bit that specifies whether the revisions are being tracked. If this value is 1, **fssShared** MUST be equal to 1.
- **E fssExclusive (1 bit):** A bit that specifies whether this workbook is in exclusive mode. Exclusive mode means the workbook was shared when revisions were made, but it is no longer shared. If this value is 1, **fssShared** MUST be equal to 0.
- reserved2 (11 bits): MUST be zero, and MUST be ignored.
- **guid (16 bytes):** A **GUID** as specified by [MS-DTYP] that specifies the last set of revisions. MUST be 0, or MUST match the GUID for the most recent header.
- **guidRoot (16 bytes):** A GUID as specified by [MS-DTYP] that specifies the last set of revisions that was saved to the file. MUST be 0, or MUST match the GUID for one of the **revision** headers.
- **revid (4 bytes):** A signed integer that specifies the current revision number of this shared workbook. This identifier is used to track the order of <u>revision records</u>. MUST be greater than or equal to 0.
- version (4 bytes): An unsigned integer that specifies the current version of this shared workbook.
- **F fNoRevHist (1 bit):** A bit that specifies whether this workbook preserves revision history. If this value is 1, **wRevHistoryInterval** MUST be equal to 0 and **fssShared** MUST be equal to 1. If this value is 0, **wRevHistoryInterval** MUST be greater than or equal to 1.
- **G fProtRev (1 bit):** A bit that specifies whether the revision history is **protected** for this shared workbook. If this value is 1, **fssShared** MUST be equal to 1.
- reserved3 (14 bits): MUST be zero, and MUST be ignored.
- wRevHistoryInterval (2 bytes): An unsigned integer that specifies the number of days for which the revision history is stored for this workbook. MUST be less than or equal to 0x7FFF. If **fssExclusive** is equal to 1, this field MUST be ignored.

2.4.228 RRDInsDel

The **RRDInsDel** record specifies the <u>insertion / deletion of rows / columns revision</u> changes, and specifies the beginning of a collection of records as defined by the <u>Revision Stream</u> **ABNF**. The collection of records specifies insertions and deletions in a <u>shared workbook</u>.

- **rrd (14 bytes):** An RRD structure that specifies the <u>revision record</u> information used to track changes in a shared workbook. The **rrd.revid** field MUST be greater than 0. The **rrd.tabid** field MUST NOT be 0xFFFF. The **rrd.revt** field MUST be greater than or equal to 0 and less than or equal to 3.
- A fEndOfList (1 bit): A bit that specifies that a row was inserted at the bottom of the filled cells range. This field has meaning only if the rrd.revt field of this record is <u>REVTINSRW</u>. MUST be 1 if data was inserted at the bottom of the filled cells range. MUST be 0 if data was inserted or deleted in any other place.

reserved (15 bits): MUST be zero, and MUST be ignored.

refn (8 bytes): A <u>Ref8U</u> structure that specifies the range of **cells** affected by the insertion or deletion action.

cUcr (4 bytes): An unsigned integer that specifies the number of items in rgDucr.

rgDucr (variable): An array of <u>Ducr</u> structures that specifies undo data to apply to an **expression** for which the **revision** was rejected.

2.4.229 RRDInsDelBegin

The **RRDInsDelBegin** record specifies the beginning of a collection of records as defined by the <u>Revision Stream</u> **ABNF**. The collection of records specifies a set of <u>Insertion / Deletion of Rows / Columns Revision</u> changes.

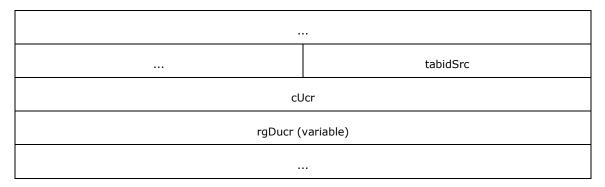

2.4.230 RRDInsDelEnd

The **RRDInsDelEnd** record specifies the end of a collection of records as defined by the <u>Revision Stream</u> **ABNF**. The collection of records specifies a set of <u>Insertion / Deletion of Rows / Columns Revision</u> changes.

2.4.231 RRDMove

The **RRDMove** record represents <u>revision record</u> information about the **range** of **cells** that have moved.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
													I	rrd	(14	by	tes))													
																							ref	Src							
																							ref	Dst							

- rrd (14 bytes): An RRD structure that specifies the revision record information used to track changes in a <u>shared workbook</u>. The **rrd.revid** MUST be greater than 0. The **rrd.revt** MUST be equal to 0x0004. The **rrd.tabid** MUST NOT be 0xFFFF because this **revision** corresponds to a specific **sheet**.
- **refSrc (8 bytes):** A <u>Ref8U</u> structure that specifies the original location of the range of cells that moved.
- refDst (8 bytes): A Ref8U structure that specifies the new location of the range of cells that moved.
- tabidSrc (2 bytes): A TabId structure that specifies the sheet on which refSrc resides.
- cUcr (4 bytes): An unsigned integer that specifies the number of elements in rgDucr.
- **rgDucr (variable):** An array of <u>Ducr</u> structures that specifies undo data that will have to be applied to an **expression** if the revision is rejected.

2.4.232 RRDMoveBegin

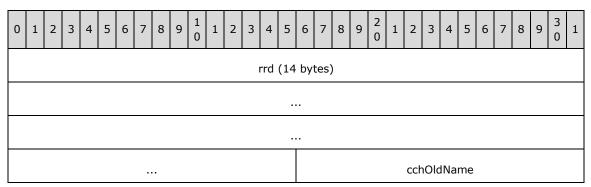

The **RRDMoveBegin** record specifies the beginning of a collection of records as defined by the Revision Stream **ABNF**. The collection of records specifies moved **cells**.

2.4.233 RRDMoveEnd

The **RRDMoveEnd** record specifies the end of a collection of records as defined by the <u>Revision</u> <u>Stream</u> **ABNF**. The collection of records specifies moved **cells**.

2.4.234 RRDRenSheet

The **RRDRenSheet** record specifies the old and new name of a **sheet** after renaming the sheet in a <u>shared workbook</u>.

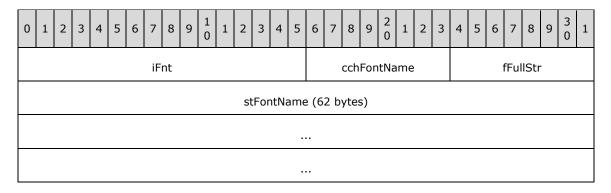

stOldName (255 bytes)	
	cchNewName
 stNewName (255 bytes)	

- **rrd (14 bytes):** An RRD structure that specifies the <u>revision record</u> information used to track changes in a shared workbook. The **rrd.revid** MUST be greater than 0. The **rrd.revt** MUST be equal to 0x0009. The **rrd.tabid** MUST NOT be 0xFFFF.
- **cchOldName (2 bytes):** An unsigned integer that specifies the number of characters in **stOldName** that are used to specify the name of the old sheet. Characters in **stOldName** that are to the right of these used characters are ignored. If **stOldName.fHighByte** is 0, the value MUST be less than or equal to 227. If **stOldName.fHighByte** is 1, the value MUST be less than or equal to 127.
- **stOldName (255 bytes):** An <u>XLUnicodeStringNoCch</u> structure that specifies the name of the old sheet.
- cchNewName (2 bytes): An unsigned integer that specifies the number of characters in stNewName that are used to specify the name of the new sheet. Characters in stNewName that are to the right of these used characters are ignored. If stNewName.fHighByte is 0, the value MUST be less than or equal to 227. If stNewName.fHighByte is 1, the value MUST be less than or equal to 127.
- **stNewName (255 bytes):** An XLUnicodeStringNoCch structure that specifies the name of the new sheet.

2.4.235 RRDRstEtxp

The **RRDRstEtxp** record specifies **font** information for a **formatting run**. Instances of this record MUST be preceded by an RRDChgCell record that specifies the **cell** containing the formatting run.

	stxp (16 bytes)
	icvFore
reserved1	reserved2

- **iFnt (2 bytes):** An unsigned integer that specifies the zero-based index of this record in the set of RRDRstEtxp records that have a common preceding RRDChgCell record. MUST be greater than or equal to zero and less than the **cetxpRst** field of the preceding RRDChgCell record.
- **cchFontName (1 byte):** An unsigned integer that specifies the count of double-byte **Unicode** characters in **stFontName**. MUST be less than or equal to 0x1F.
- **fFullStr (1 byte):** A Boolean (section 2.5.14) that specifies that **stFontName** contains double-byte Unicode characters. MUST be 0x01 if **cchFontName** is greater than 0. If **cchFontName** is 0, the value of **fFullStr** is undefined and MUST be ignored.
- **stFontName (62 bytes):** A fixed length array of Unicode characters that specifies the name of the font. Characters whose position in this array is greater than **cchFontName** are undefined and MUST be ignored.
- **stxp (16 bytes):** An <u>Stxp</u> structure that specifies the font attributes.

icvFore (2 bytes): An Icv structure that specifies the color palette value for the font.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

2.4.236 RRDTQSIF

The **RRDTQSIF** record specifies the **query table** field that has been removed in a <u>shared workbook</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
							r	t															grb	itfrt							
	ref (variable)																														
														rrd	(14	by	tes))													

 idField

rt (2 bytes): An unsigned integer that specifies the RRDTQSIF record type. The value MUST be 0x0808.

grbitfrt (2 bytes): MUST be 0x0001, and MUST be ignored.

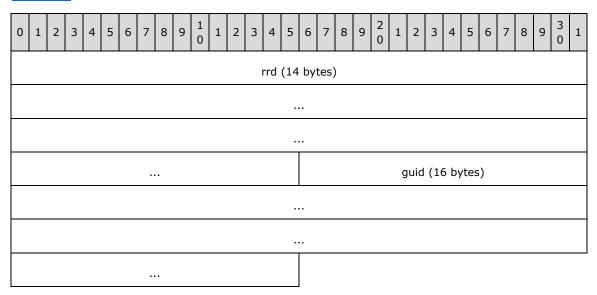

ref (variable): An <u>Ref8U</u> or <u>Ref8U2007</u> that specifies the **range** of the query table from which the field was removed. If the value of the **wXLVer** field of the <u>RRDInfo</u> record in this <u>revision log</u> as specified by the <u>Revision Stream (Revision Log)</u> **ABNF** is equal to 12, Ref8U2007 is used. Otherwise, Ref8U is used.

rrd (14 bytes): An RRD that specifies the properties of this **revision record**. The value of **rrd.revid** MUST be 0x0. The value of **rrd.revt** MUST be 0x2E. The value of **rrd.fDelAtEdgeofSort** MUST be 0x0.

idField (4 bytes): An unsigned integer that specifies the identity of this field in the query table. The value MUST be unique among **idField** fields of all RRDTQSIF records in the query table and all <u>Qsif</u> records in the query table. MUST be greater than 0x00000000 and less than 0x00000FFFF.

2.4.237 RRDUserView

The **RRDUserView** record specifies the changes caused by a **custom view revision** in a <u>shared</u> workbook.

rrd (14 bytes): An RRD that specifies the revision record information used to track changes in a shared workbook. The rrd.revid MUST be 0 because this is a revision that cannot be reviewed The rrd.revt MUST be equal to 0x002B or 0x002C. The rrd.tabid MUST be 0xFFFF because this revision does not correspond to a specific sheet.

guid (16 bytes): A GUID as specified by [MS-DTYP] that specifies the custom view in the workbook whose revision caused the changes specified in this record. MUST be globally unique. The value of this field MUST be equal to one of the guid fields of the UserSViewBegin collection in the sheet.

2.4.238 RRFormat

The **RRFormat** record specifies a formatting change that was applied to a **shared workbook**. If the change information is too large for a single RRFormat record, it is split into multiple RRFormat records. This record cannot be continued with **Continue** records.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rrd (14 bytes)																														
A														Α	В	С	reserved														
	sqref (variable)																														
													c	lxfn	(v	aria	ble)													

rrd (14 bytes): An RRD that specifies the <u>revision record</u> information used to track changes in a <u>shared workbook</u>. The RRD structure MUST conform to the restrictions specified in the following table:

Value	Restriction
rrd.revt	MUST be 0x000B.
rrd.revid	MUST be 0x0.
rrd.tabid	MUST NOT be 0xFFFF.

- A fXfDxf (1 bit): A bit that specifies that the affected cells need to have their format reset to the format specified by the current style before applying any format from dxfn, if present.
- **B fXfDxfNull (1 bit):** A bit that specifies whether **dxfn** exists.
- C fStyXfDxf (1 bit): A bit that specifies that the format of the cells need to be cleared before applying any format from dxfn, if present.

reserved (13 bits): MUST be zero, and MUST be ignored.

sqref (variable): An <u>SqRefU</u> structure that specifies the location or locations on the **sheet** affected by the formatting changes specified by this record.

dxfn (variable): A <u>DXFN</u> structure that specifies the new cell formatting. MUST exist if and only if fXfDxfNull is 0.

2.4.239 RRInsertSh

The **RRInsertSh** record specifies the changes caused by inserting a **sheet** in a **shared** workbook.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rrd (14 bytes)																														
														itabPos																	
	reserved												cch																		
	stName (256 bytes)																														

rrd (14 bytes): An RRD structure that specifies the revision record information used to track changes in a shared workbook. The rrd.revid MUST be greater than 0 because this is a reviewable revision. The rrd.revt MUST be equal to 0x0005. The rrd.tabid MUST NOT be 0xFFFF because this revision corresponds to a specific sheet.

itabPos (2 bytes): A <u>TabIndex</u> structure that specifies the position of the new sheet in the **workbook**.

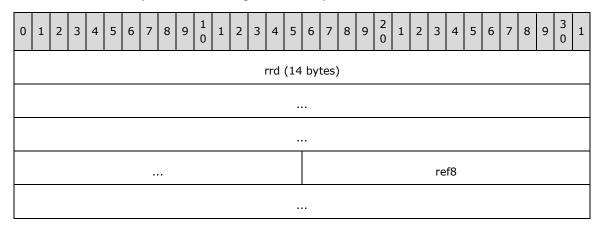

reserved (2 bytes): MUST be zero, and MUST be ignored.

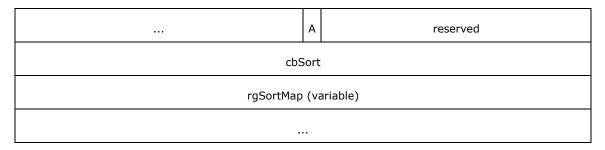

cch (2 bytes): An unsigned integer that specifies the number of characters in **stName** that are used to specify the name of the new sheet. Characters in **stName** that are to the right of these used characters are ignored. If **stName.fHighByte** is 0, the value MUST be less than or equal to 227. If **stName.fHighByte** is 1, the value MUST be less than or equal to 127.

stName (256 bytes): An XLUnicodeStringNoCch structure that specifies the name of the new sheet.

2.4.240 RRSort

The **RRSort** record specifies the changes caused by **sort** actions in a <u>shared workbook</u>.

rrd (14 bytes): An <u>RRD</u> structure that specifies the <u>revision record</u> information used to track changes in a shared workbook. The **rrd.revt** MUST be equal to 0x0007. The **rrd.tabid** MUST NOT be 0xFFFF because this **revision** corresponds to a specific **sheet**.

ref8 (8 bytes): A <u>Ref8U</u> structure that specifies the **range** of cells affected by sort actions. If the value of **fCol** is 0, the range of rows MUST be within the valid range of the number of rows on the sheet as defined in the used range specified by the <u>Dimensions</u> record. If the value of **fCol** is 1, the range of columns MUST be within the valid range of the number of columns on the sheet as defined in the used range specified by the Dimensions record.

A - fCol (1 bit): A bit that specifies whether sorting is performed on the columns.

Value	Meaning							
0	The rows have been reordered.							
1	The columns have been reordered.							

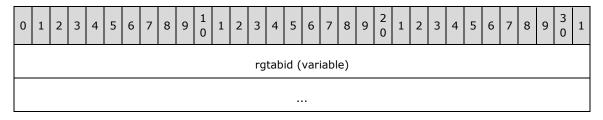

reserved (15 bits): MUST be zero, and MUST be ignored.

cbSort (4 bytes): An unsigned integer that specifies the size of rgSortMap in bytes.

rgSortMap (variable): An array of SortItem structures. The size MUST be equal to cbSort.

2.4.241 RRTabId

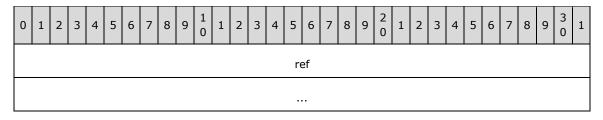

The **RRTabId** record specifies an array of unique **sheet** identifiers, each of which is associated with a sheet in the **workbook**. The order of the sheet identifiers in the array matches the order of the <u>BoundSheet8</u> records as they appear in the <u>Globals Substream</u>. If the workbook contains more than 4112 sheets, then this record is not present and each sheet identifier is specified by the order in which the BoundSheet8 records appear in the <u>Globals Substream</u>, beginning with 1.<115>

rgtabid (variable): An array of 2-byte unsigned integers. Each element of this array is a unique sheet identifier, which is associated with a sheet in the workbook. The order of the sheet identifiers in the array matches the order in which the BoundSheet8 records appear in the <u>Globals Substream</u>.

2.4.242 SBaseRef

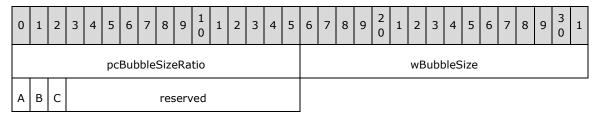

The **SBaseRef** record specifies the location of a PivotTable view referenced by a chart.

ref (8 bytes): A Ref8U structure that specifies the location of a PivotTable view referenced by a chart.

2.4.243 Scatter

The **Scatter** record specifies that the <u>chart group</u> is a scatter chart group or a bubble chart group, and specifies the chart group attributes.

pcBubbleSizeRatio (2 bytes): An unsigned integer that specifies the size of the <u>data points</u> as a percentage of their default size. A value of 100 shows all the data points in their default size, as determined by the application. MUST be greater than or equal to 0 and less than or equal to 300. MUST be ignored if the **fBubbles** field is 0.

wBubbleSize (2 bytes): An unsigned integer that specifies how the default size of the data points represents the value. MUST be ignored if the **fBubbles** field is 0. MUST be a value from the following table:

Value	Meaning							
0x0001	The area of the data point represents the value.							
0x0002 The width of the data point represents the value.								

A - fBubbles (1 bit): A bit that specifies whether this chart group is a scatter chart group or bubble chart group. MUST be a value from the following table:

Value	Meaning
0	Scatter chart group
1	Bubble chart group

- **B fShowNegBubbles (1 bit):** A bit that specifies whether data points with negative values in the chart group are shown on the <u>chart</u>. MUST be ignored if the **fBubbles** field is 0.
- **C fHasShadow (1 bit):** A bit that specifies whether one or more **data markers** in a scatter chart group or data points in a bubble chart group have shadows.

reserved (13 bits): MUST be zero, and MUST be ignored.

2.4.244 SCENARIO

The **SCENARIO** record specifies a **scenario**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	cref												fLocked fHidden																		
cchName cchComment											cchNameUser rgchName (variable))											
	rgchNameUser (variable)																														
	rgchComment (variable)																														
													rç	gSL	C (\	/ari	able	e)													
													ı	rgst	(va	aria	ble)													
													ur	nuse	ed (var	iabl	le)													
															•																

cref (2 bytes): An unsigned integer that specifies the number of **cells** in the scenario. MUST be greater than zero and less than or equal to 32.

fLocked (1 byte): A Boolean (section 2.5.14) that specifies whether the scenario can be modified if the **workbook** is **protected**. It MUST be a value from the following table:

Value	Meaning
0x00	The user can change the scenario.
0x01	When the workbook is protected, the user cannot change the scenario.

fHidden (1 byte): A Boolean that specifies whether the scenario is to be **hidden** from the user if the workbook is protected. It MUST be a value from the following table:

Value	Meaning							
0x00	The scenario is never hidden							
0x01	When the workbook is protected, the scenario is hidden from the user.							

- cchName (1 byte): An unsigned integer that specifies the character count in the field rgchName.
- cchComment (1 byte): An unsigned integer that specifies the character count in the field rgchComment.
- **cchNameUser (1 byte):** An unsigned integer that specifies the character count in the field **rgchNameUser**.
- rgchName (variable): An XLUnicodeStringNoCch structure that specifies the name of the scenario.
- **rgchNameUser (variable):** An <u>XLUnicodeString</u> structure that specifies the name of the user who created the scenario. The character count MUST be less than or equal to 52. MUST be omitted if **cchNameUser** is 0.
- **rgchComment (variable):** An XLUnicodeString structure that specifies a **comment** associated with the scenario. MUST be omitted if **cchComment** is 0.
- **rgSLC (variable):** An array of <u>SLCO8</u> structures. Each element of the array specifies one cell that is changed by the scenario. Its element count MUST be **cref**.
- **rgst (variable):** An array of XLUnicodeString structures. Each element of the array specifies the value associated to a cell by the scenario. Its element count MUST be **cref**.

unused (variable): Undefined and MUST be ignored. The size of this field in bytes MUST be 2*cref.

2.4.245 ScenarioProtect

The **ScenarioProtect** record specifies the **protection** state for **scenarios** in a **sheet**. Scenarios are defined in the Worksheet Substream ABNF.

fScenProtect (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether the scenarios in the sheet are **protected**. MUST be a value from the following table:

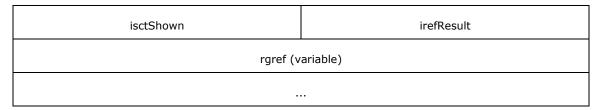

Value	Meaning							
0x0000	Scenarios are not protected.							
0x0001	Scenarios are protected.							

2.4.246 ScenMan

The **ScenMan** record specifies the state of the **Scenario Manager** for the **sheet**.

This record also specifies the beginning of a collection of <u>Scenario</u> records as defined by the <u>Worksheet Substream</u> **ABNF**. The collection of Scenario records specifies individual scenarios.

- **csct (2 bytes):** A signed integer that specifies the total number of **scenarios** in the sheet. MUST be equal to the number of Scenario records in the Worksheet substream and MUST be greater than or equal to 0.
- isctCur (2 bytes): A signed integer that specifies the zero-based index of the Scenario in this Worksheet substream that is currently selected in the Scenario Manager. If csct is greater than 0, then isctCur MUST be greater than or equal to −1 and MUST be less than the number of Scenario records in the Worksheet substream. The value -1 means that no scenario is currently selected.
- isctShown (2 bytes): A signed integer that specifies the zero-based index of the Scenario in this Worksheet substream that specifies the scenario that is currently applied in the sheet associated with this record. If csct is greater than 0, then isctShown MUST be greater than or equal to −1 and MUST be less than the number of Scenario records in the Worksheet substream. The value −1 means that no scenario is currently shown.
- **irefResult (2 bytes):** A signed integer that specifies the number of **result cells** that are referenced in the field **rgref**. MUST be greater than or equal to 0 and less than or equal to 32.
- **rgref (variable):** An array of <u>Ref8U</u> structures. Each element specifies a **range** of cells in the current sheet. These cells contain the results that are to be compared across scenarios. Its count MUST be equal to **irefResult**.

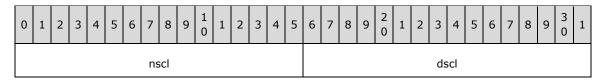

2.4.247 Scl

The **Scl** record specifies the **zoom level** of the current view in the window used to display the **sheet** as a fraction given by the following formula:

Fraction = nscl / dscl

The fraction MUST be greater than or equal to 1/10 and less than or equal to 4.

This record MUST exist if the zoom level of the current view is not equal to 1.

- **nscl (2 bytes):** A signed integer that specifies the numerator of the fraction. The value MUST be greater than or equal to 1.
- **dscl (2 bytes):** A signed integer that specifies the denominator of the fraction. The value MUST be greater than or equal to 1.

2.4.248 Selection

The **Selection** record specifies **selected cells** within a **sheet**. There can be multiple contiguous Selection records that have the same **pnn** value to specify all selected cells within a sheet <116>. If

this is the case, the values of **rwAct**, **colAct**, and **irefAct** MUST be the same across all the contiguous Selection records that have the same **pnn** value.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	pnn rwAct													colAct																	
	irefAct										cref																				
	rgref (variable)																														

pnn (1 byte): A PaneType enumeration that specifies the active pane.

rwAct (2 bytes): An RwU structure that specifies the zero-based row number of the active cell.

colAct (2 bytes): A ColU structure that specifies the zero-based column number of the active cell.

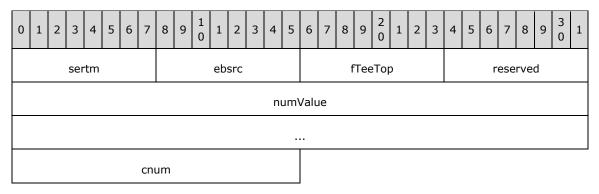

irefAct (2 bytes): A signed integer that specifies the zero-based index to the <u>RefU</u> structure in **rgref** that contains the active cell. MUST be greater than or equal to 0. If this record is one of multiple contiguous Selection records, this value is the index to the RefU structure across the aggregation of **rgref** arrays of all Selection records.

cref (2 bytes): An unsigned integer that specifies the number of RefU structures in the rgref array of this record.

rgref (variable): An array of RefU structures that specifies ranges of selected cells in the sheet. The number of RefU structures in this array MUST be less than or equal to 1369.

2.4.249 SerAuxErrBar

The **SerAuxErrBar** record specifies properties of an <u>error bar</u>.

sertm (1 byte): An unsigned integer that specifies the direction of the error bars. MUST be a value from the following table.

Value	Meaning
0x01	Error bars are horizontal in the plus direction.
0x02	Error bars are horizontal in the minus direction.
0x03	Error bars are vertical in the plus direction.
0x04	Error bars are vertical in the minus direction.

ebsrc (1 byte): An unsigned integer that specifies the error amount type of the error bars. MUST be a value from the following table:

Value	Meaning
0x01	Percentage
0x02	Fixed value
0x03	Standard deviation
0x04	Custom values (array of values or range)
0x05	Standard error

If the **cce** field of the <u>ChartParsedFormula</u> record contained in the **formula** field of the closest preceding <u>BRAI</u> record with **id** field equal to 0x0001 is 0x0000, then the error bars value source is an array of values. Each value in this array MUST be stored in a <u>Number</u> record in the <u>SERIESDATA</u> part of the Chart Sheet substream as specified in the Chart Sheet Substream <u>ABNF</u>. The <u>cell.col</u> field of each Number record MUST store the zero-based position index of the closest preceding <u>Series</u> record, as it is calculated across all Series records in the current <u>Chart Sheet</u> substream. The <u>cell.rw</u> field MUST store the zero-based index of this value in the array.

Otherwise, the value source is a range. The closest preceding BRAI record with the **id** field equal to 0×0001 specifies a link to the Race structure that describes this range.

fTeeTop (1 byte): A Boolean (section 2.5.14) that specifies whether the error bars are T-shaped.

reserved (1 byte): MUST be 0x01 and MUST be ignored.

numValue (8 bytes): An Xnum (section <u>2.5.342</u>) value that specifies the fixed value, percentage, or number of standard deviations for the error bars. If **ebsrc** is equal to 0x05 or 0x04, MUST be ignored.

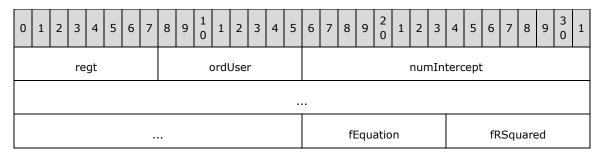

cnum (2 bytes): An unsigned integer that specifies the number of value or cell references used for custom error bars when **ebsrc** is equal to 0x04. This value MUST be ignored if **ebsrc** does not equal 0x04.

If the value source is an array of values, this value MUST equal the count of Number records whose **cell.col** field stores the zero-based index of the closest preceding Series record in the collection of Series records in the current chart sheet substream.

If the value source is a range, this value MUST equal the count of cell references of the range as specified in the **rgce** field of the ChartParsedFormula contained in the **formula** field of the closest preceding BRAI record that has an **id** field equal to 0x0001.

2.4.250 SerAuxTrend

The **SerAuxTrend** record specifies a <u>trendline</u>.

numForecast
numBackcast

regt (1 byte): An unsigned integer that specifies the type of trendline. The value MUST be one of the following values:

Value	Meaning
0x00	Polynomial
0x01	Exponential
0x02	Logarithmic
0x03	Power
0x04	Moving average

- ordUser (1 byte): An unsigned integer that specifies the polynomial order or moving average period. MUST be greater than or equal to 0x02 and less than or equal to 0x06 if **regt** is equal to 0x00; MUST be greater than or equal to 0x02 and less than or equal to the value of the **cValx** field of the <u>Series</u> record specified by the preceding <u>SerParent</u> record minus one if **regt** is equal to 0x04. MUST be ignored for trendlines of all other types.
- **numIntercept (8 bytes):** A <u>ChartNumNillable</u> structure that specifies where the trendline intersects the value <u>axis</u> or vertical axis on bubble and scatter <u>chart groups</u>. If no intercept is specified, this ChartNumNillable structure MUST specify a <u>NilChartNum</u> structure, and the value of the **type** field in the NilChartNum structure MUST be 0x0100.
- **fEquation (1 byte):** A Boolean (section 2.5.14) that specifies whether the trendline equation is displayed in the trendline label. MUST be ignored if **regt** is equal to 0x04. MUST be ignored if the chart sheet substream contains an attached label with an ObjectLink record that contains both a wLinkObj field equal to 0x0004 and a wLinkVar1 field equal to the zero-based index into a Series record in the collection of Series records in the current chart sheet substream that represents this trendline , and the attached label contains a SeriesText record.
- **fRSquared (1 byte):** A Boolean that specifies whether the R-squared value is displayed in the trendline label. MUST be ignored if **regt** is equal to 0x04. MUST be ignored if the chart sheet substream contains an attached label with an ObjectLink record that contains both a **wLinkObj** field equal to 0x0004 and a **wLinkVar1** field equal to the zero-based index into a Series record in the collection of Series records in the current chart sheet substream that represents this trendline, and the attached label contains a SeriesText record.
- **numForecast (8 bytes):** An Xnum (section $\underline{2.5.342}$) that specifies the number of periods to **forecast** forward.

numBackcast (8 bytes): An Xnum that specifies the number of periods to forecast backward.

2.4.251 SerFmt

The **SerFmt** record specifies properties of the associated <u>data points</u>, **data markers**, or lines of the <u>series</u>. The associated data points, data markers, or lines of the series are specified by the preceding <u>DataFormat</u> record. If this record is not present in the sequence of records that conforms to the <u>SS</u>

rule of the Chart Sheet Substream **ABNF**, then the properties of the associated data points, data markers, or lines of the series are specified by the default values of the fields of this record.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
А	В	С						res	serv	ed.																					

- **A fSmoothedLine (1 bit):** A bit that specifies whether the lines of the series are displayed with a smooth line effect on a scatter, radar, and line chart group. The default value of this field is 0.
- **B f3DBubbles (1 bit):** A bit that specifies whether the data points of a bubble chart group are displayed with a 3-D effect. MUST be ignored for all other chart groups. The default value of this field is 0.
- **C fArShadow (1 bit):** A bit that specifies whether the data markers are displayed with a shadow on bubble, scatter, radar, stock, and line chart groups. The default value of this field is 0.

reserved (13 bits): MUST be zero, and MUST be ignored.

2.4.252 Series

The **Series** record specifies properties of the data for a <u>series</u>, a <u>trendline</u>, or <u>error bars</u>, and specifies the beginning of a collection of records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a series, a trendline, or error bars.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
sdtX sdt*									ltY																						
	cValx								cValy																						
	sdtBSize														c/	ValE	3Siz	ze													

sdtX (2 bytes): An unsigned integer that specifies the type of data in **categories (2)**, or horizontal values on bubble and scatter <u>chart groups</u>, in the series. MUST be a value from the following table:

Value	Meaning
0x0001	The series contains categories (2), or horizontal values on bubble and scatter chart groups, with numeric information.
0x0003	The series contains categories (2), or horizontal values on bubble and scatter chart groups, with text information.

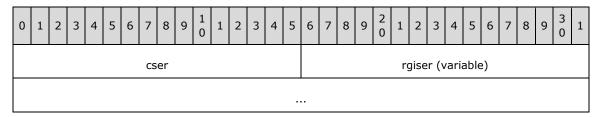

sdtY (2 bytes): An unsigned integer that specifies that the values or vertical values on bubble and scatter chart groups, in the series contain numeric information. It MUST be 0x0001 and MUST be ignored.

cValx (2 bytes): An unsigned integer that specifies the count of categories (2), or horizontal values on bubble and scatter chart groups, in the series. The value MUST be less than or equal to 32767.

- **cValy (2 bytes):** An unsigned integer that specifies the count of values, or vertical values on bubble and scatter chart groups, in the series. The value MUST be less than or equal to 32767.
- **sdtBSize (2 bytes):** An unsigned integer that specifies that the **bubble size** values in the series contain numeric information. The value MUST be 0x0001, and MUST be ignored.
- **cValBSize (2 bytes):** An unsigned integer that specifies the count of bubble size values in the series. The value MUST be less than or equal to 32767.

2.4.253 SeriesList

The **SeriesList** record specifies the <u>series</u> for the <u>chart</u>.

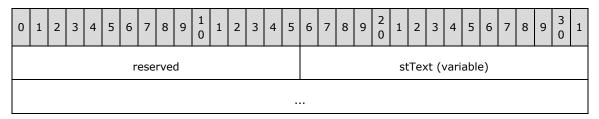

cser (2 bytes): An unsigned integer that specifies the count of series indexes in the rgiser field.

rgiser (variable): An array of 2-byte unsigned integers, each of which specifies a one-based index of a <u>Series</u> record in the collection of Series records in the current <u>chart sheet</u> substream. Each referenced Series specifies a series for the chart.

2.4.254 SeriesText

The **SeriesText** record specifies the text for a <u>series</u>, <u>trendline</u> name, trendline label, <u>axis</u> title or <u>chart</u> title.

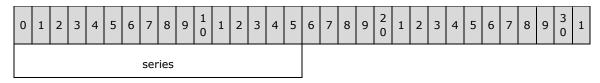

reserved (2 bytes): MUST be zero, and MUST be ignored.

stText (variable): A <u>ShortXLUnicodeString</u> that specifies the text string.

2.4.255 SerParent

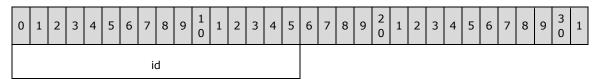

The **SerParent** record specifies the <u>series</u> to which the current <u>trendline</u> or <u>error bar</u> corresponds.

series (2 bytes): An unsigned integer that specifies the one-based index of a <u>Series</u> record in the collection of Series records in the current <u>chart sheet</u> substream. The referenced Series record specifies the series associated with the current trendline or error bar. The value MUST be greater than or equal to 0x0001 and less than or equal to 0x0FE.

2.4.256 SerToCrt

The **SerToCrt** record specifies the <u>chart group</u> for the current <u>series</u>.

id (2 bytes): An unsigned integer that specifies the zero-based index of a <u>ChartFormat</u> record in the collection of ChartFormat records in the current <u>chart sheet</u> substream. The referenced ChartFormat record specifies the chart group that contains the current series.

2.4.257 Setup

The **Setup** record specifies the page format settings used to print the current **sheet**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
						iP	аре	rSi	ze														iSc	ale							
						iP	age	Sta	ırt													il	FitV	Vidt	h						
						iF	FitH	eigł	nt							Α	В	С	D	Е	F	G	Н	I	J	ŀ	<		l	-	
							iR	es															iVF	Res							
														r	nur	mHd	r														
	nu							nuı	mFtr	-																					
							iCop	pies	6																						

iPaperSize (2 bytes): An unsigned integer that specifies the paper size. Refer to the following table for values. The value 0, or values greater than or equal to 256, specify custom printer paper sizes. Values between 118 and 255 are reserved for future use. If **fNoPls** is 1, this value is undefined and MUST be ignored.

Value	Meaning
1	US Letter 8 1/2 x 11 in
2	US Letter Small 8 1/2 x 11 in
3	US Tabloid 11 x 17 in

- **iScale (2 bytes):** An unsigned integer that specifies the scaling factor for printing as a percentage. For example, if the value is 107 then the scaling factor is 107%. If **fNoPls** is 1, this value is undefined and MUST be ignored.
- **iPageStart (2 bytes):** A signed integer that specifies the starting page number. If **fUsePage** is 0, MUST be ignored.
- **iFitWidth (2 bytes):** An unsigned integer that specifies the number of pages the sheet width is fit to. MUST be less than or equal to 32767. The value 0 means use as many pages as necessary to print the columns in the sheet.
- **iFitHeight (2 bytes):** An unsigned integer that specifies the number of pages the sheet height is fit to. MUST be less than or equal to 32767. The value 0 means use as many pages as necessary to print the rows of the sheet.
- A fLeftToRight (1 bit): A bit that specifies the order that multiple pages are sent to the printer for a single sheet.

Value	Meaning
0	Pages are printed top-to-bottom first and then left-to-right.
1	Pages are printed left-to-right first and then top-to-bottom.

B - fPortrait (1 bit): A bit that specifies whether to print using portrait mode or landscape mode. If **fNoPls** is 1, the value is undefined and MUST be ignored. If **fNoOrient** is 1, the value is undefined and MUST be ignored.

Value	Meaning
0	Pages are printed using landscape mode.
1	Pages are printed using portrait mode.

- C fNoPls (1 bit): A bit that specifies whether the iPaperSize, iScale, iRes, iVRes, iCopies, fNoOrient, and fPortrait data are undefined and ignored. If the value is 1, they are undefined and ignored.
- D fNoColor (1 bit): A bit that specifies whether the document is printed in black and white.
- E fDraft (1 bit): A bit that specifies whether the document is printed using draft quality.
- F fNotes (1 bit): A bit that specifies whether comments are printed.
- **G fNoOrient (1 bit):** A bit that specifies whether the paper orientation is set.

Value	Meaning
0	Paper orientation is specified by the value of fPortrait .
1	Pages are printed using portrait mode.

- **H fUsePage (1 bit):** A bit that specifies whether a custom starting page number is used to print. If the value is 1, the custom starting page number specified by the value of **iPageStart** is used.
- I unused1 (1 bit): Undefined and MUST be ignored.
- **J fEndNotes (1 bit):** A bit that specifies whether the comments are printed at the end of the sheet. If **fNotes** is 0, the value MUST be ignored.

Value	Meaning
0	Comments are printed as displayed on the sheet.
1	Comments are printed at the end of the sheet.

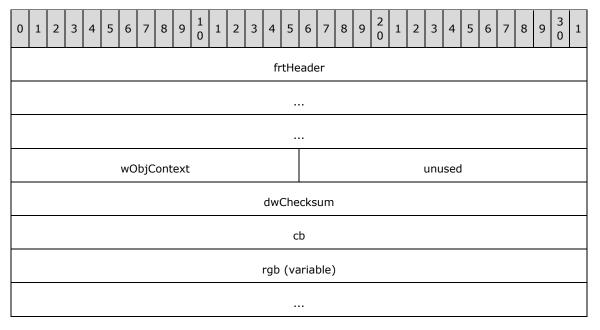

K - iErrors (2 bits): An unsigned integer that specifies how to handle errors in the **cell** data. MUST be a value from the following table:

Value	Meaning
0	Print errors as displayed on the sheet.
1	Print errors as blank.
2	Print errors as dashes ("").
3	Print errors as "#N/A".

- L reserved (4 bits): MUST be zero, and MUST be ignored.
- **iRes (2 bytes):** An unsigned integer that specifies the print resolution in dots per inch (DPI). If **fNoPls** is 1, this value is undefined and MUST be ignored.
- **iVRes (2 bytes):** An unsigned integer that specifies the vertical print resolution in DPI. If **fNoPls** is 1, this value is undefined and MUST be ignored.
- **numHdr (8 bytes):** An Xnum (section <u>2.5.342</u>) value that specifies the header margin in inches. The value MUST be greater than or equal to 0 and less than 49.
- **numFtr (8 bytes):** An Xnum value that specifies the footer margin in inches. The value MUST be greater than or equal to 0 and less than 49.
- **iCopies (2 bytes):** An unsigned integer that specifies the number of copies to print. If **fNoPls** is 1, this value is undefined and MUST be ignored.

2.4.258 ShapePropsStream

The **ShapePropsStream** record specifies the **shape** formatting properties for <u>chart</u> elements. These shape formatting properties are a superset of the properties stored in the <u>LineFormat</u>, <u>AreaFormat</u>, <u>MarkerFormat</u>, and <u>GelFrame</u> records. They are stored in the **rgb** field, which is an **XML stream** (section <u>2.1.7.22</u>), as defined in [ECMA-376] Part 4, section 5.7.2.198.<117>

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field of the field MUST be 0x08A4.

wObjContext (2 bytes): An unsigned integer that specifies the chart element that the shape formatting properties in this record apply to.

If this record is in a sequence of records that specifies an $\underline{\mathsf{AXS}}$ rule, then it MUST be a value from the following table:

Value	Meaning
0x0000	The shape properties in this record apply to the <u>axis</u> .
0x0001	The shape properties in this record apply to the major gridlines of the axis.
0x0002	The shape properties in this record apply to the minor gridlines of the axis.
0x0003	The shape properties in this record apply to the three-dimensional surfaces of the walls or floor .

If this record precedes an <u>End</u> record matched by a <u>Begin</u> record in a sequence of records that conforms to the CRT rule, then this field MUST be a value from the following table:

Value	Meaning
0x0000	The shape properties in this record apply to the drop lines of the <u>chart group</u> .
0x0001	The shape properties in this record apply to the high-low lines of the chart group.
0x0002	The shape properties in this record apply to the leader lines of the chart group.
0x0003	The shape properties in this record apply to the series lines of the chart group.

If this record is in a sequence of records that conforms to the SS rule, then this field MUST be a value from the following table:

Value	Meaning
0x0000	The shape properties in this record apply to the <u>series</u> , <u>data points</u> , <u>error bars</u> , or <u>trendlines</u> specified by the <u>DataFormat</u> record.
0x0001	The shape properties in this record apply to the data markers specified by the DataFormat record.

If this record is in a sequence of records that conforms to the FRAME rule, then it MUST be 0x0000, which means the shape properties apply to the current **chart area** (section <u>2.2.3.17</u>), **plot area**, <u>legend</u>, or <u>attached label</u>.

If this record is in a sequence of records that conforms to the DROPBAR rule as specified by the Chart Sheet Substream **ABNF**, then it MUST be 0x0000, which means the shape properties apply to **up bar** or **down bar** formatting.

unused (2 bytes): Undefined and MUST be ignored.

dwChecksum (4 bytes): An unsigned integer that specifies the checksum of the shape formatting properties related to this record. The algorithm used to calculate the checksum is defined by [MS-OSHARED] section 2.4.3.2. The checksum MUST be calculated by using every property of the property stream, as a stream of bytes as specified by the ShapePropsStreamChecksumData structure.

The information required to build the stream of bytes can be gathered from the LineFormat, AreaFormat, MarkerFormat, and GelFrame records associated with this record, as specified by LinePropertiesForShapePropsStreamChecksum, and LinePropertiesForShapePropsStreamChecksum, and LillStylePropertiesForShapePropsStreamChecksum.

When reading this record, the checksum is calculated as previously specified and compared to the **dwChecksum** value stored in this record. If the calculated checksum does not match the **dwChecksum** value, the application MUST assume that the XML stream is out of date, and the data from the LineFormat, AreaFormat, MarkerFormat, and GelFrame records MUST be used instead of the data specified by the **XML stream** (section 2.1.7.22).

cb (4 bytes): An unsigned integer that specifies the length of the character array in the rgb field.

rgb (variable): An array of ANSI characters whose length is specified by **cb** that contains the XML representation of the shape formatting properties as defined in [ECMA-376] Part 4, section 5.7.2.198.tel:18>

2.4.259 SheetExt

The **SheetExt** record specifies **sheet** properties, including **sheet tab** color and additional optional information specified by using the <u>SheetExtOptional</u> structure.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	frtHeader																														
															С	h															

icvPlain	reserved
	sheetExtOptional (20 bytes, optional)

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0862.

cb (4 bytes): An unsigned integer that specifies the size of this record in bytes.

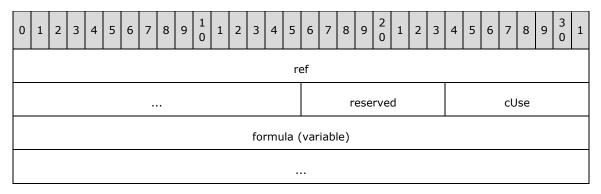

icvPlain (7 bits): An unsigned integer that specifies the tab color of this sheet. If the tab has a color assigned to it, the value of this field MUST be greater than or equal to 0x08 and less than or equal to 0x3F, as specified in the color table for the Icv structure. If the tab has no color assigned to it, the value of this field MUST be 0x7F, and MUST be ignored.

reserved (25 bits): MUST be zero, and MUST be ignored.

sheetExtOptional (20 bytes): A SheetExtOptional structure that specifies optional <119> fields. Exists if and only if the value of **cb** is 0x00000028.

2.4.260 ShrFmla

The **ShrFmla** record specifies a formula (section 2.2.2) that is shared across multiple **cells**. This record specifies a file size optimization. It is used with the <u>Formula</u> record to compress the amount of storage required for the formula. This record is preceded by a single Formula record that specifies the first cell in the **range** that uses this shared formula. Other Formula records that use this shared formula follow later in the file, not necessarily in a contiguous sequence. Formula records that use this shared formula have the Formula.**fShrFmla** bit set, and a Formula.**cell** that is within the range specified in the **ref** field of this record.

ref (6 bytes): A RefU structure that specifies the range of cells that use this shared formula. Cells in this range do not have to use the shared formula.

reserved (8 bits): MUST be zero, and MUST be ignored.

cUse (8 bits): An unsigned integer that specifies the number of cells that use this shared formula.

formula (variable): A SharedParsedFormula structure that specifies the shared formula.

2.4.261 ShtProps

The ShtProps record specifies properties of a chart as defined by the Chart Sheet Substream ABNF.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е		reserved1												n	ndB	lan	k					re	eser	vec	12		

- A fManSerAlloc (1 bit): A bit that specifies whether <u>series</u> are automatically allocated for the chart.
- B fPlotVisOnly (1 bit): A bit that specifies whether to plot visible cells only.
- C fNotSizeWith (1 bit): A bit that specifies whether to size the chart with the window.
- **D fManPlotArea (1 bit):** If **fAlwaysAutoPlotArea** is 1, then this field MUST be 1. If **fAlwaysAutoPlotArea** is 0, then this field MUST be ignored.
- E fAlwaysAutoPlotArea (1 bit): A bit that specifies whether the default plot area dimension (2) is used.

Value	Meaning
0	Use the default plot area dimension (2) regardless of the <u>Pos</u> record information.
1	Use the plot area dimension (2) of the Pos record; and fManPlotArea MUST be 1.

reserved1 (11 bits): MUST be zero, and MUST be ignored.

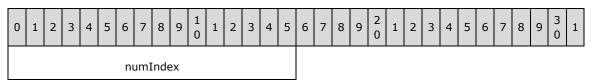

mdBlank (1 byte): An unsigned integer that specifies how the empty cells are plotted be a value from the following table:

Value	Meaning
0x00	Empty cells are not plotted.
0x01	Empty cells are plotted as zero.
0x02	Empty cells are plotted as interpolated.

reserved2 (1 byte): MUST be zero, and MUST be ignored.

2.4.262 SIIndex

The **SIIndex** record is part of a group of records which specify the data of a <u>chart</u>. This particular record indicates the type of data contained in the <u>Number</u> records following it.

numIndex (2 bytes): An unsigned integer that specifies the type of the data records contained by the Number records following it. MUST be a value from the following table:

Value	Number Records Following It Contain
0x0001	Series values or vertical values (for scatter or bubble chart groups)

Value	Number Records Following It Contain
0x0002	Category labels or horizontal values (for scatter or bubble chart groups)
0x0003	Bubble sizes

2.4.263 Sort

The **Sort** record specifies the information used to **sort** values contained in a **range** of **cells**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1			
Α	В	С	D	Е		iC	Orde	er		F		res	erve	ed1				C	chk	(ey:	1					С	chk	(ey2	2					
cchKey3 stKey1 (variable)														e)																				
	stKey2 (variable)																																	
													st	Key	') 3	vari	abl	e)																
		re	eser	ved	12																													

A - fCol (1 bit): A bit that specifies whether to sort by columns or rows. MUST be one of the values from the following table:

Value	Meaning						
0	Sort rows from top to bottom.						
1	Sort columns from logical left to right.						

B - fKey1Dsc (1 bit): A bit that specifies whether **stKey1** sorts in **descending order**. MUST be one of the values from the following table:

Value Meaning								
0	Sort in ascending order.							
1	1 Sort in descending order.							

C - fKey2Dsc (1 bit): A bit that specifies whether stKey2 sorts in descending order. MUST be one of the values from the following table:

	Value	Meaning							
0 Sort in ascending order.									
1 Sort in descending order.									

D - fKey3Dsc (1 bit): A bit that specifies whether **stKey3** sorts in descending order. MUST be one of the values from the following table:

Value	Meaning					
0	Sort in ascending order.					
1 Sort in descending order.						

E - fCaseSensitive (1 bit): A bit that specifies whether the sort is case-sensitive. MUST be one of the values from the following table:

Value Meaning								
0	The sort is not case-sensitive.							
1	1 The sort is case-sensitive.							

iOrder (5 bits): A signed integer that specifies the zero-based index of the **custom list** that specifies the **sort order**. The set of custom lists is based on the current user's environment.

For more information about how the set of custom lists is determined see [MSFT-XL2000].

F - fAltMethod (1 bit): A bit that specifies whether to use **phonetic information** when sorting. MUST be one of the values from the following table:

Value Meaning								
0	0 Do not use phonetic information when sorting.							
1 Use phonetic information when sorting.								

reserved1 (5 bits): MUST be zero, and MUST be ignored.

cchKey1 (1 byte): An unsigned integer that specifies the length of stKey1.

cchKey2 (1 byte): An unsigned integer that specifies the length of stKey2.

cchKey3 (1 byte): An unsigned integer that specifies the length of stKey3.

stKey1 (variable): An <u>XLUnicodeStringNoCch</u> structure that specifies the string for the first sort key. MUST exist if and only if **cchKey1** is greater than 0.

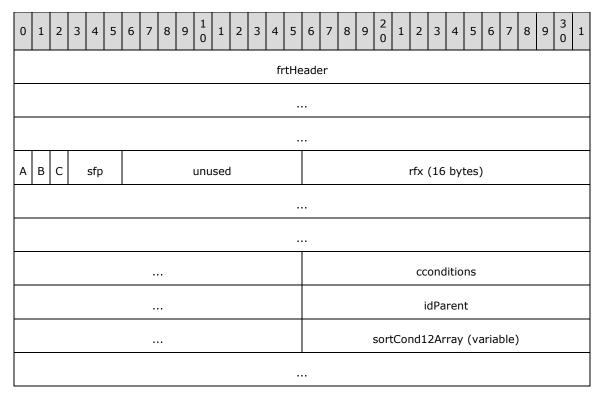

stKey2 (variable): An XLUnicodeStringNoCch structure that specifies the string for the second sort key. MUST exist if and only if **cchKey2** is greater than 0.

stKey3 (variable): An XLUnicodeStringNoCch structure that specifies the string for the third sort key. MUST exist if and only if **cchKey3** is greater than 0.

reserved2 (1 byte): MUST be zero, and MUST be ignored.

2.4.264 SortData

The **SortData** record specifies data used for sorting a **range**.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0895.

A - fCol (1 bit): A bit that specifies whether to **sort** by columns or rows. MUST be one of the values from the following table:

Value	Meaning
0x0	Sort by rows.
0x1	Sort by columns.

B - fCaseSensitive (1 bit): A bit that specifies whether to use a case-sensitive sorting method. MUST be one of the values from the following table:

Value Meaning									
0x0	The sort is not case-sensitive.								
0x1	0x1 The sort is case-sensitive.								

C - fAltMethod (1 bit): A bit that specifies whether to use a sorting method other than character order, such as stroke order or Mandarin phonetic symbols. MUST be one of the values from the following table:

Value Meaning									
0x0 The sort uses character order.									
0x1	The sort uses a method other than character order.								

sfp (3 bits): An unsigned integer that specifies the type of the object that contains the sort field. MUST be a value from the following table:

Value	Meaning
0x0	The sort field is contained in a sheet .
0x1	The sort field is contained in a table .
0x2	The sort field is contained in an AutoFilter .
0x3	The sort field is contained in a query table .

unused (10 bits): Undefined and MUST be ignored.

rfx (16 bytes): An RFX structure that specifies the range to sort.

cconditions (4 bytes): An unsigned integer that specifies the count of **sort conditions**. This record MUST be followed by one ContinueFrt12 record for each sort condition.

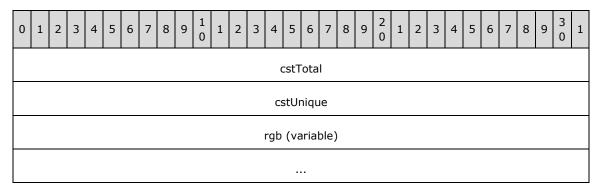

idParent (4 bytes): An unsigned integer that specifies the identifier of the object that contains the sort field, if the sfp field is 0x1 or 0x3. If the sfp field is equal to 0x1, the value of this field MUST be equal to the idList field of the associated TableFeatureType. If the sfp field is equal to 0x3, the value of this field MUST be equal to the zero-based index of the associated query table (Qsi in the Qsi records in the current substream. If the sfp field is equal to 0x0 or 0x2, this is undefined and MUST be ignored.

sortCond12Array (variable): An array of SortCond12 structures that specifies the sort conditions.

2.4.265 SST

The **SST** record specifies string constants.

Each string constant in this record has one or more references in the **workbook**, with the goal of improving performance in opening and saving the file. The <u>LabelSst</u> record specifies how to make a reference to a string in this record.

cstTotal (4 bytes): A signed integer that specifies the total number of references in the workbook to the strings in the shared string table. MUST be greater than or equal to 0.

cstUnique (4 bytes): A signed integer that specifies the number of unique strings in the shared string table. MUST be greater than or equal to 0.

rgb (variable): An array of <u>XLUnicodeRichExtendedString</u> structures. Records in this array are unique.

2.4.266 StartBlock

The **StartBlock** record specifies the beginning of a collection of records. <u>Future records</u> contained in this collection specify saved features to allow applications that do not support the feature to preserve the information. This record MUST have a matching <u>EndBlock</u> record. StartBlock and EndBlock pairs can be nested. Up to 100 levels of blocks can be nested.

Prior to writing a <u>chart-specific future record</u>, which is a <u>record</u> with a record number greater than or equal to 2048 and less than or equal to 2303, according to <u>Record Enumeration</u>, StartBlock records MUST be written according to the following rules:

- A StartBlock record MUST NOT be written if the record is preceded by a <u>StartObject</u> record but not preceded by the matching <u>EndObject</u> record. That is, StartBlock and EndBlock pairs MUST NOT belong to any collection defined by StartObject and EndObject.
- If there does not exist a StartBlock record with iObjectKind equal to 0x000D without a matching EndBlock record, then a corresponding StartBlock record with iObjectKind equal to 0x000D MUST be written.
- If the chart-specific future record exists in the sequence of records that conforms to the <u>DAT</u> rule, and there does not exist a StartBlock record with **iObjectKind** equal to 0x0006 without a matching EndBlock record, then a corresponding StartBlock record with **iObjectKind** equal to 0x0006 MUST be written. If a StartBlock record is written because of rule number 2, then this StartBlock record MUST be written immediately after that record.
- If the chart-specific future record is in a <u>series</u>, and there does not exist a StartBlock record with **iObjectKind** equal to 0x000C without a matching EndBlock record, then a corresponding StartBlock record with **iObjectKind** equal to 0x000C and **iObjectInstance1** equal to the number of series prior to this series in the current <u>Sheet</u> MUST be written. If any StartBlock records are written because of rule number 2 or 3, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the SS rule, and there does not exist a StartBlock record with iObjectKind equal to 0x000E without a matching EndBlock record, then a corresponding StartBlock record with iObjectKind equal to 0x000E, iObjectContext equal to the yi field of the DataFormat record in the current SS rule, and iObjectInstance1 equal to the xi field of the DataFormat record in the current SS rule MUST be written. If any StartBlock records are written because of rule number 2, 3, or 4, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is in a series, and is part of a collection defined by a Begin and End pair written immediately after a LegendException record, and there does not exist a StartBlock record with IObjectKind equal to 0x000A without a matching EndBlock record, then a corresponding StartBlock record with IObjectKind equal to 0x000A and IObjectInstance1 equal to the Isas field of the LegendException record in the series MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, or 5, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is in an axis group, and there does not exist a StartBlock record with iObjectKind equal to 0x0000 without a matching EndBlock record, then a corresponding StartBlock record with iObjectKind equal to 0x0000 and iObjectInstance1 equal to the iax field of the AxisParent record of the axis group MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, or 6, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is in a <u>Chart Group</u>, and there does not exist a StartBlock record with **iObjectKind** equal to 0x0005 without a matching EndBlock record, then a corresponding StartBlock record with **iObjectKind** equal to 0x0005 and **iObjectInstance1** equal to the **iax** field of the AxisParent record of the axis group MUST be written. If any StartBlock records are written

because of rule number 2, 3, 4, 5, 6, or 7, then this StartBlock record MUST be written immediately after those records.

- If the chart-specific future record is in an <u>axis</u>, and there does not exist a StartBlock record with **iObjectKind** equal to 0x0004 without a matching EndBlock record, then:
- If the chart-specific future record exists in the sequence of records that conforms to the IVAXIS rule, then a corresponding StartBlock record with **iObjectKind** equal to 0x0004 and **iObjectInstance1** equal to 0x0000 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, or 8, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the SERIESAXIS rule, then a corresponding StartBlock record with **iObjectKind** equal to 0x0004 and **iObjectInstance1** equal to 0x0002 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, or 8, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the DVAXIS rule, and **wType** of the Axis record in the sequence of records that conforms to the DVAXIS rule is equal to 0, then a corresponding StartBlock record with **iObjectKind** equal to 0x0004 and **iObjectInstance1** equal to 0x0001 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, or 8, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the DVAXIS rule, and **wType** of the Axis record in the sequence of records that conforms to the DVAXIS rule is equal to 1, then a corresponding StartBlock record with **iObjectKind** equal to 0x0004 and **iObjectInstance1** equal to 0x0003 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, or 8, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the DROPBAR rule, and there does not exist a StartBlock record with **iObjectKind** equal to 0x000F without a matching EndBlock record, then a corresponding StartBlock record with **iObjectKind** equal to 0x000F and **iObjectInstance1** equal to one less than the number of <u>DropBar</u> records written prior to the chart-specific future record in the current Chart Group MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, or 9, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is in a <u>legend</u> and there does not exist a StartBlock record with **iObjectKind** equal to 0x0009 without a matching EndBlock record, then:
- If the chart-specific future record is in a chart group, then a corresponding StartBlock record with **iObjectKind** equal to 0x0009 and **iObjectContext** equal to 0x0001 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, or 10, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is not in a chart group, then a corresponding StartBlock record with **iObjectKind** equal to 0x0009 and **iObjectContext** equal to 0x0000 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, or 10, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record is in an <u>attached label</u>, and there does not exist a StartBlock record with **iObjectKind** equal to 0x0002 without a matching EndBlock record, then:
- If the chart-specific future record exists in the sequence of records that conforms to the DFTTEXT rule of a chart group, and the **id** field of the <u>DefaultText</u> record in the sequence of records that conforms to the DFTTEXT rule is greater than or equal to 0x0002, then a corresponding StartBlock record with **iObjectKind** equal to 0x0002, **iObjectContext** equal to 0x0002, and

iObjectInstance1 equal to 0xFFFF MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, or 11, then this StartBlock record MUST be written immediately after those records. Else,

- If the chart-specific future record exists in the sequence of records that conforms to the DFTTEXT rule of a chart group, then a corresponding StartBlock record with **iObjectKind** equal to 0x0002, **iObjectContext** equal to 0x0002, and **iObjectInstance1** equal to the **id** field of the DefaultText record in the sequence of records that conforms to the DFTTEXT rule MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, or 11, then this StartBlock record MUST be written immediately after those records. Else,
- If the wLinkVar1 of the ObjectLink record of the attached label is equal to 0x0003, then a corresponding StartBlock record with iObjectKind equal to 0x0002, iObjectContext equal to 0x0004 and iObjectInstance1 equal to 0x0000 MUST be written. If any StartBlock records are written because of rules number 2, 3, 4, 5, 6, 7, 8, 9, 10 or 11, then this StartBlock record MUST be written immediately after those records. Else,
- If the **wLinkVar1** of the ObjectLink record of the attached label is equal to 0x0002, then a corresponding StartBlock record with **iObjectKind** equal to 0x0002, **iObjectContext** equal to 0x0004 and **iObjectInstance1** equal to 0x0001 MUST be written. If any StartBlock records are written because of rules number 2, 3, 4, 5, 6, 7, 8, 9, 10 or 11, then this StartBlock record MUST be written immediately after those records. Else,
- If the **wLinkVar1** of the ObjectLink record of the attached label is equal to 0x0007, then a corresponding StartBlock record with **iObjectKind** equal to 0x0002, **iObjectContext** equal to 0x0004, and **iObjectInstance1** equal to 0x0002 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, or 11, then this StartBlock record MUST be written immediately after those records. Else,
- If the chart-specific future record is in the first attached label of a chart sheet, then a corresponding StartBlock record with iObjectKind equal to 0x0002 and iObjectContext equal to 0x0000 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, or 11, then this StartBlock record MUST be written immediately after those records. Else,
- If the chart-specific future record is not in the first attached label of a chart sheet, then a corresponding StartBlock record with **iObjectKind** equal to 0x0002 and **iObjectContext** equal to 0x0005, **iObjectInstance1** equal to **wLinkVar1** of the ObjectLink record of the attached label and **iObjectInstance2** equal to **wLinkVar2** of the ObjectLink record of the attached label MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, or 11, then this StartBlock record MUST be written immediately after those records.
- If the chart-specific future record exists in the sequence of records that conforms to the FRAME rule, and there does not exist a StartBlock record with iObjectKind equal to 0x0007 without a matching EndBlock record, then:
- If the chart-specific future record is in an attached label or legend, then a corresponding StartBlock record with **iObjectKind** equal to 0x0007, **iObjectContext** equal to 0x0000, and **iObjectInstance1** equal to 0x0000 MUST be written. If any StartBlock records are written because of rules number 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12, then this StartBlock record MUST be written immediately after those records. Else,
- If the chart-specific future record exists in the sequence of records that conforms to the AXES rule, then a corresponding StartBlock record with **iObjectKind** equal to 0x0007, **iObjectContext** equal to 0x0001, and **iObjectInstance1** equal to 0x0000 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12, then this StartBlock record MUST be written immediately after those records. Else,
- If the chart-specific future record is in a Sheet, then a corresponding StartBlock record with **iObjectKind** equal to 0x0007, **iObjectContext** equal to 0x0002, and **iObjectInstance1** equal to

0x0000 MUST be written. If any StartBlock records are written because of rule number 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12, then this StartBlock record MUST be written immediately after those records.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	0	1
	frtHeaderOld																														
	iObjectKind iObjectContext																														
	iObjectInstance1																	iC)bje	ectIı	nsta	ance	2								

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0852.

iObjectKind (2 bytes): An unsigned integer that specifies the type of object that is encompassed by the block. MUST be a value from the following table:

Value	Object Type
0x0000	Axis group
0x0002	Attached label record
0x0004	Axis
0x0005	Chart group
0x0006	<u>Dat</u> record
0x0007	Frame
0x0009	Legend
0x000A	LegendException record
0x000C	Series
0x000D	Sheet
0x000E	DataFormat record
0x000F	DropBar record

iObjectContext (2 bytes): An unsigned integer that specifies the context of the object. This value further specifies the object specified in **iObjectKind**. MUST be a value from the following table:

iObjectKind	iObjectCont ext	iObjectInst ance1	iObjectInst ance2	Description of Future Record Type Contents
0x0000 (Axis group)	0x0000	0x0000	0x0000	Primary axis group of the current chart.
0x0000 (Axis group)	0x0000	0x0001	0x0000	Secondary axis group of the current chart.
0x0002 (AttachedLabel)	0x0000	0x0000	0x0000	Chart title of the current chart.
0x0002 (AttachedLabel)	0x0002	0x0000	0×0000	Default <u>data labels</u> in the chart that are not displayed as a percentage of the sum of all <u>data</u> <u>points</u> , and that do not contain values.

iObjectKind	iObjectCont ext	iObjectInst ance1	iObjectInst ance2	Description of Future Record Type Contents
0x0002 (AttachedLabel)	0x0002	0x0001	0x0000	Default data labels that contain values or percentage values.
0x0002 (AttachedLabel)	0x0002	0xFFFF	0x0000	Default for all text in the chart.
0x0002 (AttachedLabel)	0x0004	0x0000	0x0000	A : The title formatting <u>Text</u> record of the Category axis or horizontal value axis on a scatter or bubble chart group.
0x0002 (AttachedLabel)	0x0004	0x0001	0x0000	B : The title formatting Text record of value axis or vertical value axis on a scatter or bubble chart group. A chart MUST NOT have both A and B .
0x0002 (AttachedLabel)	0x0004	0x0002	0x0000	C : The title formatting Text record of the series axis. A chart MUST NOT have both B and C .
0x0002 (AttachedLabel)	0x0005	Data Point Index	Series Index	Data labels for data points in visible series, identified by the zero-based index of the <u>Series</u> record of the current chart and the zero-based index of the <u>AttachedLabel</u> record of the current series.
0x0002 (AttachedLabel)	0x0005	0xFFFF	Series Index	Default data labels for a given series, identified by the zero-based index of the Series record of the current chart.
0x0004 (Axis)	0x0000	0×0000	0x0000	Category axis or fill effect of the walls of the current chart.
0x0004 (Axis)	0x0000	0x0001	0x0000	Value axis or fill effect of the walls of the current chart.
0x0004 (Axis)	0x0000	0x0002	0x0000	Series axis.
0x0004 (Axis)	0x0000	0x0003	0x0000	Horizontal value axis for scatter chart group.
0x0005 (Chart group)	0x0000	0x0000	0x0000	Chart group of the primary axis group.
0x0005 (Chart group)	0×0000	0x0001	0x0000	Chart group of the secondary axis group.
0x0006 (Dat)	0×0000	0x0000	0x0000	Data table definition.
0x0007 (Frame)	0x0000	0x0000	0x0000	Frame of the current CHARTFORMATS, LD, AXES, and ATTACHEDLABEL in the collection.
0x0007 (Frame)	0x0001	0x0000	0x0000	Frame of the plot area .
0x0007 (Frame)	0x0002	0x0000	0x0000	Frame of the chart area (section 2.2.3.17)
0x0009 (Legend)	0x0000	0x0000	0x0000	Legend of the data table.
0x0009 (Legend)	0x0001	0x0000	0x0000	Legend of the chart.
0x000A (LegendException)	0x0000	0xFFFF	0×0000	Default legend formatting exception information for entries in the current legend.
0x000A (LegendException)	0×0000	Series Index	0x0000	Legend formatting exception information for a series index entry in the current legend, identified by the zero-based index of the Series record of the current chart.
0x000C (Series)	0x0000	Series Index	0x0000	Series of the current chart, identified by the zero-based index of the Series record of the current chart.
0x000D (<u>Chart</u>)	0x0000	0x0000	0x0000	Current chart.

iObjectKind	iObjectCont ext	iObjectInst ance1	iObjectInst ance2	Description of Future Record Type Contents
0x000E (DataFormat)	Series Index	0xFFFF	0x0000	Default formatting for all data points of a given series identified by the zero-based index of the Series record of the current chart.
0x000E (DataFormat)	Series Index	DataFormat Index	0x0000	Formatting of a given data point identified by the zero-based index of the Series record of the current chart and the zero-based index of the DataFormat record of the current chart.
0x000F (DropBar)	0x0000	0x0000	0x0000	Up bar of the current chart.
0x000F (DropBar)	0x0000	0x0001	0x0000	Down bar of the current chart.

iObjectInstance1 (2 bytes): An unsigned integer that specifies additional information about the context of the object, together with **iObjectContext**, **iObjectInstance2**, and **iObjectKind**. This field MUST equal one of the values specified in the previous **table** under the **iObjectContext** field.

iObjectInstance2 (2 bytes): An unsigned integer that specifies more information about the object context, together with **iObjectContext**, **iObjectInstance1**, and **iObjectKind**. This field MUST equal one of the values specified in the previous table under the **iObjectContext** field.

2.4.267 StartObject

The **StartObject** record specifies the beginning of a collection of <u>Future Record Type</u> records as defined by the <u>Chart Sheet Substream</u> **ABNF**. The collection of records specifies a feature saved as a Future Record Type such that an application that does not support the feature can preserve it. This record MUST have a matching <u>EndObject</u> record. StartObject and EndObject pairs can be nested. Up to 100 levels of blocks can be nested.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														frtŀ	lea	der	Old														
						iO	bje	ctKi	nd												į	Obj	ect	Con	tex	t					
	iObjectInstance1 iObjectInstance2																														

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0854.

iObjectKind (2 bytes): An unsigned integer that specifies the kind of object that is encompassed by the block. MUST be a value from the following table:

Value	Object Type Encompassed By the Block	Description of Future Record Type Contents
0x0010	A sequence of records that conforms to the ATTACHEDLABEL rule is encompassed by the block.	Display units labels of the current <u>axis</u> .
0x0011	A sequence of records that conforms to *(Font [Fbi]) is encompassed by the block, as specified by the FONTLIST rule.	Font cache for a given application version. The block contains fonts for only those records introduced in the specified application version.

Value	Object Type Encompassed By the Block	Description of Future Record Type Contents
0x0012	A <u>DefaultText</u> record followed by a sequence of records that conforms to the ATTACHEDLABEL rule is encompassed by the block when in a sequence of records that conforms to the DFTTEXT rule.	An extended <u>data label</u> .
	A sequence of records that conforms to the ATTACHEDLABEL rule is encompassed by the block when in a sequence of records that conforms to the CHARTFOMATS rule.	

iObjectContext (2 bytes): An unsigned integer that specifies the object context. MUST be 0x0000.

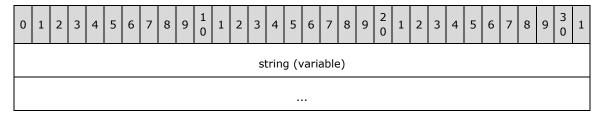

iObjectInstance1 (2 bytes): An unsigned integer that specifies additional information about the context of the object, together with **iObjectContext**, **iObjectInstance2**, and **iObjectKind**. This field MUST equal 0x0000 if **iObjectKind** is equal to 0x0010 or 0x0012. MUST be a value from the following table if **iObjectKind** is equal to 0x0011:

iObjectInstance1	Application Version
0x0008	Specifies the application version.<120>
0x0009	Specifies the application version. <a><121>
0x000A	Specifies the application version. <a><122>
0x000B	Specifies the application version. <a><123>
0x000C	Specifies the application version.<124>
0x000E	Specifies the application version. <a><125>
0x000F	Specifies the application version. <a><126>

iObjectInstance2 (2 bytes): An unsigned integer that specifies more information about the object context, together with **iObjectContext**, **iObjectInstance1** and **iObjectKind**. This field MUST equal 0x0000.

2.4.268 String

The **String** record specifies the string value of a formula (section 2.2.2).

string (variable): An <u>XLUnicodeString</u> structure that specifies the string value of a formula (section 2.2.2). The value of **string.cch** MUST be less than or equal to 32767.

2.4.269 Style

The **Style** record specifies a <u>cell style</u>.

0	1	2	З	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
					ix	fe							Α		В					Ł	ouilt	InΩ	Data	ı (o	ptic	nal)				
													ι	ıser	· (v	aria	ble))													

- **ixfe (12 bits):** An unsigned integer that specifies the zero-based index of the <u>cell style XF</u> in the collection of <u>XF</u> records in the <u>Globals Substream</u>. See <u>XFIndex</u> for more information about the organization of XF records in the file.
- A unused (3 bits): Undefined and MUST be ignored.
- **B fBuiltIn (1 bit):** A bit that specifies whether the cell style is built-in.
- **builtInData (2 bytes):** An optional <u>BuiltInStyle</u> structure that specifies the built-in cell style properties. MUST exist if and only if **fBuiltIn** is 1. The value of **builtInData.istyBuiltIn** MUST be less than or equal to 0x09.
- user (variable): An optional <u>XLUnicodeString</u> structure that specifies the name of the user-defined cell style. MUST exist if and only if **fBuiltIn** is 0. The number of characters in this string SHOULD be greater than or equal to 1 and MUST be less than or equal to 255.

2.4.270 StyleExt

The **StyleExt** record specifies additional information for a <u>cell style</u>.

0	1	2	3	4 5 6 7 8 9 1 1 2 3 4 5 6 7 8 9 2 1 2 3 4 5 6 7 8 9 2 1 2 3 4 5 6 7 8 9 3 1												1											
														fr	tHe	ade	er										
																•											
																•											
Α	В	С		res	serv	/ed				iC	Cate	gor	у							bu	iiltIi	nDa	ita				
													stľ	Van	ne (vari	iabl	le)									
													xfl	Prop	os (vari	iabl	e)									

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0892.

- **A fBuiltIn (1 bit):** A bit that specifies if this is a built-in cell style. If the value is 1, this is a built-in cell style. This value MUST match the **fBuiltIn** field of the preceding Style record.
- **B fHidden (1 bit):** A bit that specifies whether the cell style is not displayed in the user interface.

C - fCustom (1 bit): A bit that specifies whether the built-in cell style was modified by the user and thus has a custom definition. If this field is equal to 1, then **fBuiltIn** MUST equal 1.

reserved (5 bits): MUST be zero and MUST be ignored.

iCategory (1 byte): An unsigned integer that specifies which **style category (2)** that this style belongs to. MUST be one of the values from the following table:

Value	Meaning
0x00	Custom style
0x01	Good, bad, neutral style
0x02	Data model style
0x03	Title and heading style
0x04	Themed cell style
0x05	Number format style

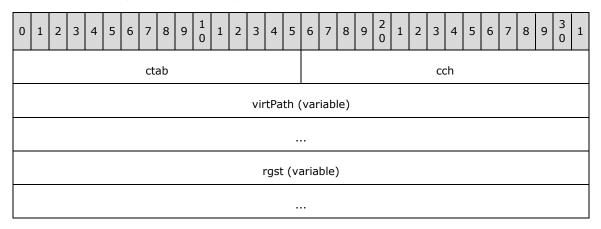

builtInData (2 bytes): A <u>BuiltInStyle</u> structure that specifies the built-in cell style properties. If **fBuiltIn** is 0, this field MUST be 0xFFFF and MUST be ignored. If **fBuiltIn** is 1, this field MUST match the **builtInData** field of the preceding Style record.

stName (variable): An <u>LPWideString</u> structure that specifies the name of the style to extend. MUST be less than or equal to 255 characters in length. If **fBuiltIn** is 0, the name specified by this field MUST match the name specified by the **user** field of the preceding Style record.

xfProps (variable): An XFProps structure that specifies the formatting properties.

2.4.271 SupBook

The **SupBook** record specifies a <u>supporting link</u> and specifies the beginning of a collection of records as defined by the <u>Globals Substream</u> **ABNF**. The collection of records specifies the contents of an <u>external workbook</u>, <u>DDE data source</u>, or <u>OLE data source</u>.

ctab (2 bytes): An undefined field, a reserved field, or an unsigned integer that specifies the number of sheets in a referenced external workbook. The type and meaning of this field is dependent on the type of supporting link specified by the cch and virtPath fields, and is defined in the following table:

Type of supporting link specified by cch and virtPath	Meaning
Self-referencing	Undefined and MUST be ignored.
Same-sheet referencing DDE data source referencing OLE data source referencing	Reserved. MUST be 0x0000.
Add-in referencing	Reserved. MUST be 0x0001.
External workbook referencing	An unsigned integer that specifies the count of sheets in the referenced external workbook.
Unused	An unsigned integer that specifies the count of sheets in the external workbook formerly referenced by this supporting link, if this supporting link was an external workbook referencing type, when used. Otherwise, this value MUST be 0x0000.

cch (2 bytes): An unsigned integer that specifies a type of supporting link or specifies the length of the string in **virtPath**. MUST be a value from the following table:

Value	Meaning
0x0401	This record specifies a self-referencing supporting link.
0x3A01	This record specifies an add-in referencing type of supporting link. The names of all add-in functions implemented by XLL , or COM automation add-ins that are referenced by formulas in this workbook , MUST be specified in the ExternName records that follow this record.
0x0001 to 0x00ff (inclusive)	The type of supporting link specified by this record is specified by virtPath . This value is the count of characters in virtPath .

virtPath (variable): An XLUnicodeStringNoCch structure that specifies the type of supporting link and, if applicable, the target of that supporting link. This field MUST exist if and only if the value of cch is between 0x0001 and 0x00ff (inclusive). The length of the string in this field MUST be equal to cch. The contents of this field MUST be a value from the following table:

Value	Meaning
A single character of Unicode value 0x20 (SPACE)	This record specifies an unused supporting link. This supporting link MUST NOT be used by any external reference consumers.
A single character of Unicode value 0x00 (NULL)	This record specifies a same-sheet referencing type of supporting link.
A string that conforms to the OLE-link rule, as specified in <u>VirtualPath</u>	This record specifies a DDE data source referencing or an OLE data source referencing type of supporting link. The value of this field specifies the target of the supporting link.
A string that conforms to the virt-path rule, but does not conform to the ole-link rule, as specified in VirtualPath	This record specifies an external workbook referencing type of supporting link. The value of this field specifies the path and file name of the external workbook.

rgst (variable): An array of XLUnicodeString structures that specify sheet names in the external workbook. This field MUST exist if and only if the supporting link type specified by cch and virtPath is external workbook referencing or unused. If this field exists, the number of elements in this array MUST be equal to ctab. The contents and meaning of this array are defined in the following table:

Type of supporting link	rgst value
External workbook referencing	An array of XLUnicodeString structures that specify the sheet names in the external workbook. Each element in this array MUST conform to the restrictions set on the stName field of the BoundSheet8 record.
Unused	An array of XLUnicodeString structures that provide placeholders for any XTI references to sheets in this unused supporting link. Each element in this array MUST be a string that contains a single character of Unicode value 0x20 (SPACE).

2.4.272 Surf

The **Surf** record specifies that the chart group is a surface chart group and specifies the chart group attributes.

A - fFillSurface (1 bit): A bit that specifies whether the surface chart group is wireframe or has a **fill**. MUST be a value from the following table:

Value	lue Meaning							
0	O Surface chart group is wireframe.							
1	Surface chart group has a fill.							

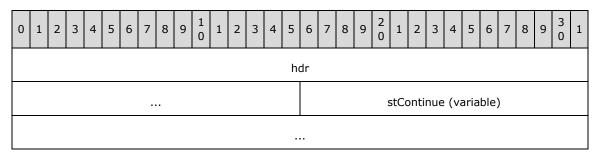

B - f3DPhongShade (1 bit): A bit that specifies whether **3-D Phong shading** is displayed.

reserved (14 bits): MUST be zero, and MUST be ignored.

2.4.273 SXAddl Records

2.4.273.1 Continue_SxaddlSxString

The **Continue_SxaddlSxString** record specifies a continuation of the <u>SXAddl_SXString</u> in the preceding <u>SXAddl_record</u>. If the string specified by the SXAddl_SXString is longer than 255 characters, the first 255 characters of the string exist in the SXAddl_SXString in the preceding SXAddl record. Subsequent 255 character segments exist in one or more Continue_SxaddlSxString records that exist after the SXAddl_record.

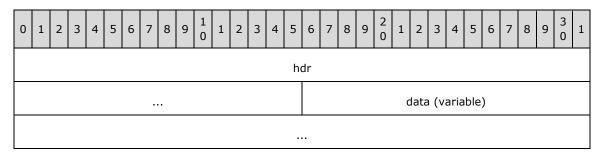

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of the hdr.sxc field MUST equal the value of the hdr.sxc field of the preceding SXAddI record and the hdr.sxd field MUST equal the value of the hdr.sxd field of the preceding SXAddI record.

stContinue (variable): An SXAddl SXString structure that specifies the next segment of the string.

2.4.273.2 SXAddl

The **SXAddI** record specifies additional information for a <u>PivotTable view</u>, <u>PivotCache</u>, or **query table**. The current <u>class</u> and full type of this record are specified by the **hdr** field which determines the contents of the **data** field. See <u>Usage of SXAddI records</u> for more information.

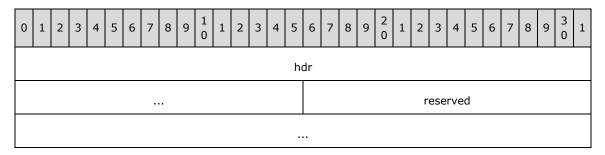

hdr (6 bytes): An SXAddlHdr structure that specifies header information for an SXAddl record.

data (variable): A variable-size field that contains data specific to the full record type of the SXAddl record.

2.4.273.3 SXAddl_SXCAutoSort_SXDEnd

The **SXAddI_SXCAutoSort_SXDEnd** record specifies the end of an <u>SXCAutoSort class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x12 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.4 SXAddl_SXCAutoSort_SXDId

The **SXAddl_SXCAutoSort_SXDId** record specifies information for <u>pivot field sorting</u> for an SXCAutoSort class.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
								Α	A reserved1																						
															re	eser	ved	12													

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x12 and the value of hdr.sxd MUST equal 0x00.

A - fAscendSort (1 bit): A bit that specifies whether the **sort order** is ascending or descending. The value MUST be one of the values from the following table:

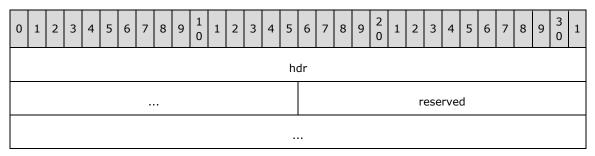

Value	Description						
0 Sort order is descending.							
1	Sort order is ascending.						

reserved1 (31 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.5 SXAddl_SXCCache_SXDEnd

The **SXAddI_SXCCache_SXDEnd** record specifies the end of an <u>SxcCache class</u>.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.6 SXAddl_SXCCache_SXDId

The **SXAddl_SXCCache_SXDId** record specifies how an <u>SxcCache class</u> is associated with other records for a <u>PivotCache</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
																						i	dCa	ache	9						
																						r	ese	rve	d						

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0x00.

idCache (4 bytes): An unsigned integer that specifies the PivotCache stream associated with this SxcCache class. MUST be equal to the idStm field of the <u>SXStreamID</u> record of the PivotCache stream associated with this SxcCache class.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.7 SXAddl_SXCCache_SXDInfo12

The **SXAddl_SXCCache_SXDInfo12** record specifies information for a <u>PivotCache</u> for an <u>SxcCache</u> class.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
																Α	В	С						res	erv	ed1					
																						re	eser	vec	12						

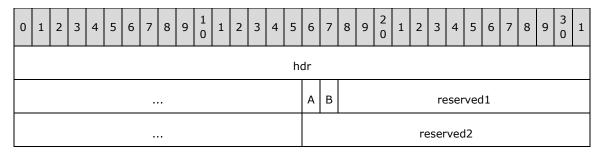

- hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0x41.
- A fSheetData (1 bit): MUST be zero, and MUST be ignored.
- **B fSrvSupportAttribDrill (1 bit):** A bit that specifies whether the **data source** of the PivotCache supports attribute drilldown. MUST be ignored if the data source is not **OLAP**.
- **C fSrvSupportSubQuery (1 bit):** A bit that specifies whether the data source of the PivotCache supports the MDX SUBSELECT statement. MUST be ignored if the data source is not OLAP.

reserved1 (29 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.8 SXAddl_SXCCache_SXDInvRefreshReal

The **SXAddl_SXCCache_SXDInvRefreshReal** record specifies properties related to <u>PivotCache</u> **refresh** for an <u>SxcCache class</u>.

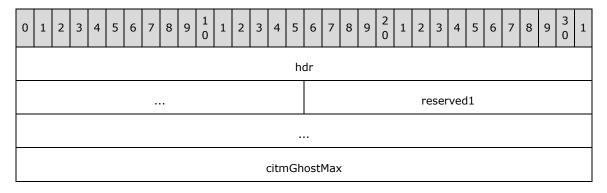

- hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0x34.
- A fEnableRefresh (1 bit): A bit that specifies whether refresh is enabled for the PivotCache.
- **B fInvalid (1 bit):** A bit that specifies whether the <u>cache records</u> are not valid. If the value is 1, the cache records MUST be ignored. See cache record for more information.

reserved1 (30 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.9 SXAddl_SXCCache_SXDVer10Info

The **SXAddl_SXCCache_SXDVer10Info** record specifies information for a <u>PivotCache</u> for an <u>SxcCache class</u>.

bVerCacheLastRefresh	bVerCacheRefreshableMin	numDateCopy
		reserved2

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0x02.

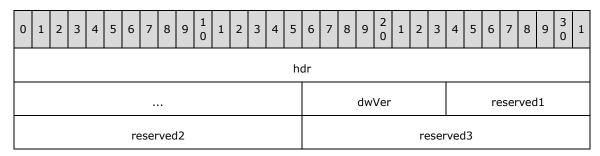

reserved1 (6 bytes): MUST be zero, and MUST be ignored.

- citmGhostMax (4 bytes): A signed integer that specifies the number of unused <u>cache items</u> to allow before discarding unused cache items. MUST<128> be greater than or equal to -1 and less than or equal to 1048576. If this value is -1, the number of unused cache items retained by the application is optimized to balance memory usage on the system and future usage of cache items.
- **bVerCacheLastRefresh (1 byte):** A <u>DataFunctionalityLevel</u> type that specifies the <u>data functionality level</u> that the PivotCache was last refreshed with. MUST be 0xFF or one of the values of the DataFunctionalityLevel type. If this value is equal to 0xFF, the data functionality level is not set.
- **bVerCacheRefreshableMin (1 byte):** A DataFunctionalityLevel type that specifies the lowest data functionality level the application is allowed to **refresh** the PivotCache with. MUST be 0xFF or one of the values of the DataFunctionalityLevel type. If this value is equal to 0xFF, the data functionality level is not set.
- **numDateCopy (8 bytes):** A <u>DateAsNum</u> structure that specifies the date and time when the PivotCache was last refreshed.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.10 SXAddl_SXCCache_SXDVerSXMacro

The **SXAddl_SXCCache_SXDVerSXMacro** record specifies the <u>data functionality level</u> of the application that created the <u>PivotCache</u> for an <u>SxcCache class</u>.

- hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x03 and the value of hdr.sxd MUST equal 0x18.
- **dwVer (1 byte):** A <u>DataFunctionalityLevel</u> type that specifies the data functionality level that the PivotCache was created with.

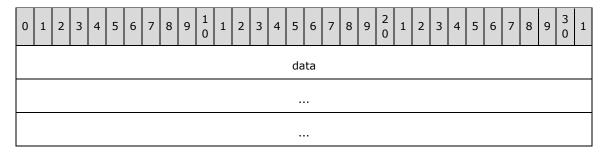

reserved1 (1 byte): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.11 SXAddl_SXCCache_SXDVerUpdInv

The **SXAddl_SXCCache_SXDVerUpdInv** record specifies the record-handling behavior for following records of the SXCCache class.

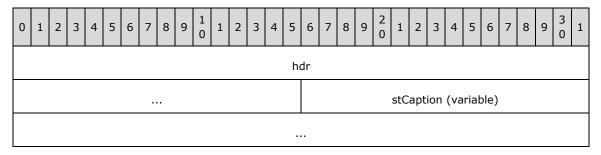

data (12 bytes): An <u>SXAddl_SXDVerUpdInv</u> structure. The value of data.hdr.sxc MUST equal 0x03 and the value of data.hdr.sxd MUST equal 0x01. The value of data.dwVersionInvalidates MUST equal 0x0002 or 0x00FF.

If the value of **data.dwVersionInvalidates** is not 0x00FF and is greater than or equal to the value of the **bVerCacheLastRefresh** field of the <u>SXAddl_SXCCache_SXDVer10Info</u> record of this SXCCache class, the following records of this SXCCache class (including nested classes or until another SXAddl_SXCCache_SXDVerUpdInv record is encountered) MUST be ignored.

2.4.273.12 SXAddl_SXCCacheField_SXDCaption

The **SXAddl_SXCCacheField_SXDCaption** record specifies the caption of a <u>cache field</u> for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u> and the <u>PivotCache functionality level</u> is greater than 2.

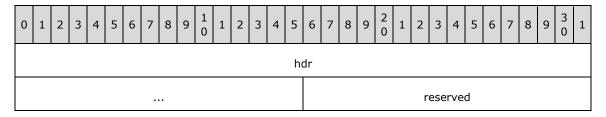

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x2F.

stCaption (variable): A <u>SXAddl_SXString</u> structure that specifies the caption of the cache field. The number of characters in the string MUST be less than or equal to 255.

2.4.273.13 SXAddl_SXCCacheField_SXDEnd

The SXAddl_SXCCacheField_SXDEnd record specifies the end of an SxcCacheField class.

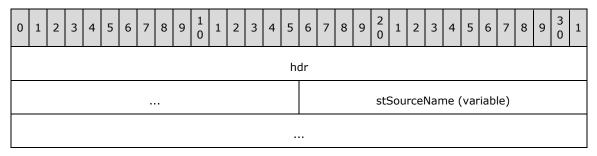

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.14 SXAddl_SXCCacheField_SXDId

The **SXAddl_SXCCacheField_SXDId** record specifies how an <u>SxcCacheField class</u> is associated with other records for a <u>cache field</u>.

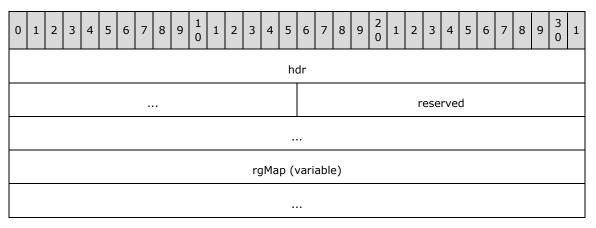

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x00.

stSourceName (variable): An <u>SXAddl SXString</u> structure that specifies the name of the cache field to which this SxcCacheField class applies. The number of characters in the string MUST be less than or equal to 255. The corresponding <u>SXFDB</u> record is the SXFDB record with its **stFieldName** field equal to the value of this field. If there exists no such SXFDB record, then this SxcCacheField class MUST be ignored.

2.4.273.15 SXAddl_SXCCacheField_SXDIfdbMempropMap

The **SXAddl_SXCCacheField_SXDIfdbMempropMap** record specifies the indexes of the <u>member properties</u> for the <u>cache field</u> for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u> and the <u>PivotCache functionality level</u> is greater than 2.

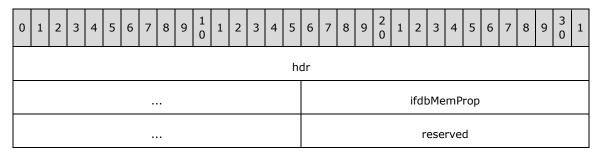

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x30.

reserved (6 bytes): MUST be zero, and MUST be ignored.

rgMap (variable): An array of 2-byte unsigned integers. The array MUST NOT be empty. Each element in the array specifies a cache field index, as specified by Cache Fields. The referenced cache field is associated with a member property as specified in member properties. The isxtl field of the SXVDTEx record of the pivot field associated with the referenced cache field MUST be equal to 0x00007FFF or equal to isxtl of the SXVDTEx record of the pivot field associated with this cache field. The ihdb field of the SXAddl SXCCacheField SXDProperty record associated with the referenced cache field MUST be equal to the isxth field of SXVDTEx record of the pivot field associated with this cache field. The size of the array MUST be equal to the ifdbMemProp field in the SXAddl SXCCacheField SXDIfdbMpMapCount record in this SXAddl collection. The value of each element in the array MUST be less than the number of cache fields in this PivotCache as specified by the cfdbdb field of the SXDB record for this PivotCache.

2.4.273.16 SXAddl_SXCCacheField_SXDIfdbMpMapCount

The **SXAddi_SXCCacheField_SXDIfdbMpMapCount** record specifies the number of <u>member properties</u> for the <u>cache field</u>, for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u> and the <u>PivotCache functionality level</u> is greater than 2.

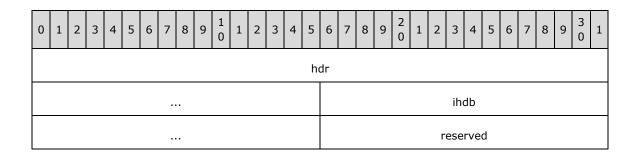

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x31.

ifdbMemProp (4 bytes): An unsigned integer that specifies the number of elements in the array specified by the **rgMap** field of the <u>SXAddl_SXCCacheField_SXDIfdbMempropMap</u> record that follows this record. MUST be greater than 0 and less than the number of cache fields in this <u>PivotCache</u>.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.17 SXAddl_SXCCacheField_SXDProperty

The **SXAddl_SXCCacheField_SXDProperty** record specifies the hierarchy information of the <u>cache field</u> for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u>, the <u>PivotCache functionality level</u> is greater than 2, and this cache field is associated with a <u>member property</u>.

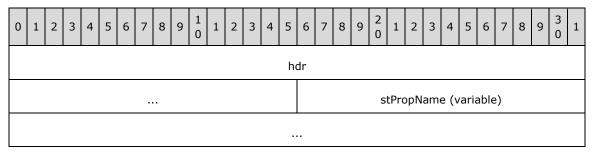

- hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x05.
- **ihdb (4 bytes):** An unsigned integer that specifies a <u>pivot hierarchy</u> index. The pivot hierarchy index specifies which pivot hierarchy this cache field is part of.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.18 SXAddl_SXCCacheField_SXDPropName

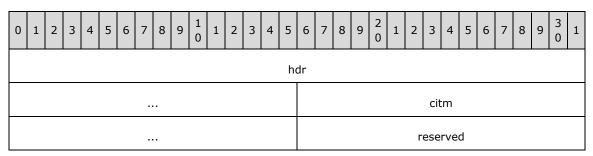

The **SXAddl_SXCCacheField_SXDPropName** record specifies the name of a <u>member property</u> of the associated <u>cache field</u> for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u>, the <u>PivotCache functionality level</u> is greater than 2, and this cache field is associated with a member property.

- hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x40.
- **stPropName (variable):** An <u>SXAddl_SXString</u> structure that specifies the name of the member property associated with this cache field. The length of the string MUST be greater than 0 and less than 32768.

2.4.273.19 SXAddl_SXCCacheField_SXDSxrmitmCount

The **SXAddl_SXCCacheField_SXDSxrmitmCount** record specifies the number of <u>cache item</u> records in this <u>cache field</u> for an <u>SxcCacheField class</u>. This record exists only if this is an <u>OLAP PivotCache</u> and the <u>PivotCache functionality level</u> is greater than 2.

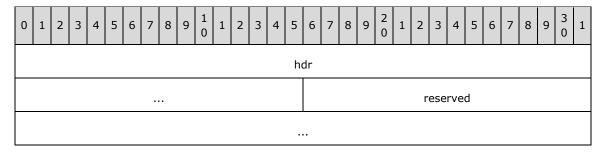

- hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x04 and the value of hdr.sxd MUST equal 0x2D.
- **citm (4 bytes):** An unsigned integer that specifies the number of cache item records. The value MUST be greater than or equal to 0 and less than or equal to 1048576. The number of SXADDLCACHEITEM collections that follows this record MUST match this value.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.20 SXAddl_SXCCacheItem_SXDEnd

The **SXAddl_SXCCacheItem_SXDEnd** record specifies the end of a collection of <u>SxcCacheItem</u> <u>classes</u> for the <u>SxcCacheField class</u>.

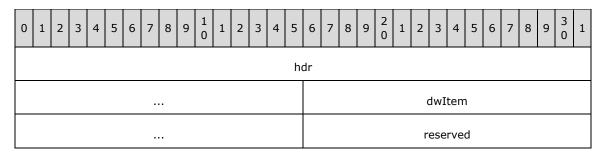

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x09 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.21 SXAddl_SXCCacheItem_SXDId

The **SXAddl_SXCCacheItem_SXDId** record specifies how an <u>SxcCacheItem class</u> is associated with other records for a <u>cache item</u>. The records of this class exist if and only if this is an <u>OLAP PivotCache</u>, the <u>PivotCache functionality level</u> is greater than or equal to 3, the **fAllAtoms** field of the <u>SXFDB</u> record of this <u>cache field</u> is equal to 1, and the **catm** field of that SXFDB record is greater than 0.

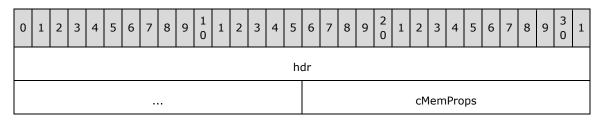

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x09 and the value of hdr.sxd MUST equal 0x00.

dwItem (4 bytes): An unsigned integer that specifies the cache item index that this SxcCacheItem class applies to.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.22 SXAddl_SXCCacheItem_SXDItmMpMapCount

The **SXAddi_SXCCacheItem_SXDItmMpMapCount** record specifies the number of <u>member property</u> mappings for this <u>cache item</u>, for an <u>SxcCacheItem class</u>.

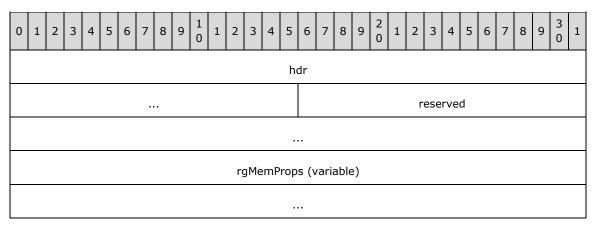

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x09 and the value of hdr.sxd MUST equal 0x33.

cMemProps (4 bytes): An unsigned integer that specifies the number of member property mappings for this cache item.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.23 SXAddl_SXCCacheItem_SXDItmMpropMap

The **SXAddl_SXCCacheItem_SXDItmMpropMap** record specifies the mapping of the <u>member properties</u> for this <u>cache item</u>, for an <u>SxcCacheItem class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x09 and the value of hdr.sxd MUST equal 0x32.

reserved (6 bytes): MUST be zero, and MUST be ignored.

rgMemProps (variable): An array of 4-byte signed integers. Each element of this array specifies a cache item index, as specified by Cache Items, in the <u>cache field</u> associated with that element. For a given element, the associated cache field is the cache field specified by the element with the same index in the **rgMap** array of the preceding <u>SXAddl SXCCacheField SXDIfdbMempropMap</u> record. Each referenced cache item specifies a member property value.

A value of -1 specifies no cache item. Each element in this array MUST be greater than or equal to -1.

2.4.273.24 SXAddl SXCCacheItem SXDSxrmitmDisp

The **SXAddl_SXCCacheItem_SXDSxrmitmDisp** record specifies the display name of this <u>cache item</u> for an <u>SxcCacheItem class</u>.

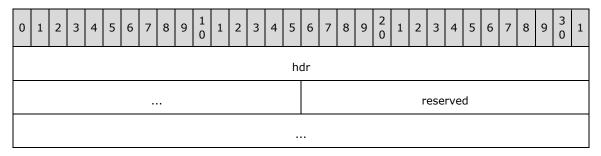

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
																					stD	ispl	ay	(va	riab	ole)					

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x09 and the value of hdr.sxd MUST equal 0x2E.

stDisplay (variable): An <u>SXAddl_SXString</u> structure that specifies the display name of this cache item.

2.4.273.25 SXAddl_SXCField_SXDEnd

The **SXAddl_SXCField_SXDEnd** record specifies the end of an **SxcField class**.

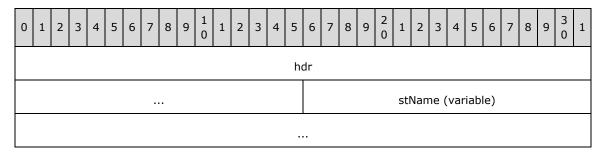

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x01 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.26 SXAddl_SXCField_SXDId

The **SXAddl_SXCField_SXDId** record specifies how an <u>SxcField class</u> is associated with other records for a <u>pivot field</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x01 and the value of hdr.sxd MUST equal 0x00.

stName (variable): An <u>SXAddl_SXString</u> structure that specifies the pivot field to which this SxcField class applies. The corresponding <u>SXFDB</u> record, of the associated <u>cache field</u> of this pivot field, is the SXFDB record with its **stFieldName** field equal to the value of this field. If there exists no such SXFDB record, then this SxcField class MUST be ignored.

2.4.273.27 SXAddl_SXCField_SXDVer10Info

The **SXAddl_SXCField_SXDVer10Info** record specifies additional properties of the <u>PivotTable fields</u> for an <u>SxcField class</u>.

0		1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
																ho	dr															
																	Α							res	erve	ed1						
																							re	eser	vec	12						

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x01 and the value of hdr.sxd MUST equal 0x02.

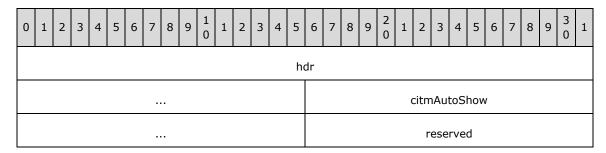

A - fHideDD (1 bit): A bit that specifies whether the per pivot field drop-down user interface is hidden for the pivot field.

reserved1 (31 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.28 SXAddl_SXCField12_SXDAutoshow

The **SXAddl_SXCField12_SXDAutoshow** record specifies the number of items for <u>simple filters</u> in the <u>pivot field</u> for an <u>SXCField12 class</u>.

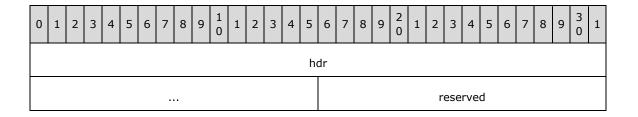

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0x37.

citmAutoShow (4 bytes): An unsigned integer that specifies the number of items for simple filters. The value MUST be greater than or equal to 1 and less than or equal to 0x7FFFFFFF.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.29 SXAddl_SXCField12_SXDEnd

The **SXAddl_SXCField12_SXDEnd** record specifies the end of an <u>SXCField12 class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.30 SXAddl_SXCField12_SXDId

The **SXAddl_SXCField12_SXDId** record specifies how this <u>SXCField12 class</u> is associated with other records for a <u>pivot field</u>.

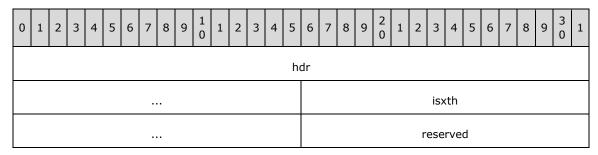

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0x00.

stName (variable): An <u>SXAddl SXString</u> structure that specifies the name of the pivot field to which this SXCField12 class applies. The corresponding <u>SXFDB</u> record, of the associated <u>cache field</u> of this pivot field, is the SXFDB record with its **stFieldName** field equal to the value of this field. If there exists no such SXFDB record, then this SXCField12 class MUST be ignored.

2.4.273.31 SXAddl_SXCField12_SXDISXTH

The **SXAddl_SXCField12_SXDISXTH** record specifies a particular <u>Pivot Hierarchy</u> to which this <u>pivot field</u> is associated for an <u>SXCField12 class</u>.

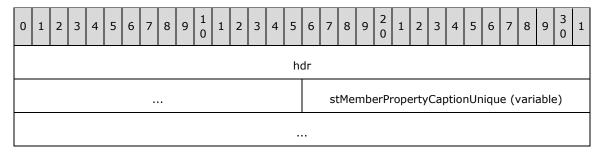

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0x1C.

isxth (4 bytes): An unsigned integer that specifies a pivot hierarchy index that specifies the pivot hierarchy to which this pivot field is associated. See <u>Association of Pivot Hierarchies and Pivot Fields and Cache Fields for more information.</u>

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.32 SXAddl_SXCField12_SXDMemberCaption

The **SXAddl_SXCField12_SXDMemberCaption** record specifies the name of the <u>member property</u> used as a caption for the <u>pivot field</u>, for an <u>SXCField12 class</u>.

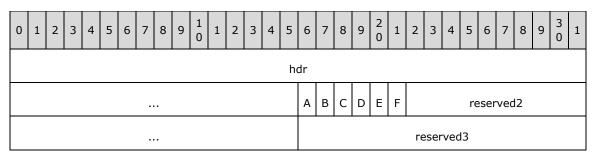

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0x11.

stMemberPropertyCaptionUnique (variable): An <u>SXAddl_SXString</u> structure that specifies the unique name of the member property used as a caption for the pivot field. MUST be ignored if the value of **fUseMemPropCaption** in <u>SXAddl_SXCField12_SXDVer12Info</u> is not equal to 1.

2.4.273.33 SXAddl_SXCField12_SXDVer12Info

The **SXAddl_SXCField12_SXDVer12Info** record specifies additional properties of a <u>pivot field</u> for an <u>SXCField12 class</u>.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x17 and the value of hdr.sxd MUST equal 0x19.

- A reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **B fHiddenLvI (1 bit):** A bit that specifies whether the **OLAP** pivot field is a **hidden** level. The value is ignored if it is not an <u>OLAP PivotTable view</u>.
- **C fUseMemPropCaption (1 bit):** A bit that specifies whether the <u>member property</u> is used as a caption for the pivot field. If it is set and there is a <u>SXAddl_SXCField12_SXDMemberCaption</u> record in this SXCField12 class, then the value from the member property specified by SXAddl_SXCField12_SXDMemberCaption is used as captions for the <u>pivot items</u> of this pivot field.
- **D fCompact (1 bit):** A bit that specifies where the next pivot field is displayed in the PivotTable layout.

Value	Meaning
0x0	The pivot field is displayed in the next column on the sheet .
0x1	The pivot field is displayed in the same column on the sheet.

- **E fNotAutoSortDft (1 bit):** A bit that specifies whether, during the next sort operation that is done on this pivot field, the pivot items are sorted or whether the sort condition is remembered and reapplied on subsequent recalculation of the PivotTable view. A value of 1 specifies that pivot items are to be sorted.
- **F fFilterInclusive (1 bit):** A bit that specifies whether any <u>manual filter</u> applied to this pivot field specifies pivot items that are included or excluded. If this pivot field is associated with a <u>pivot hierarchy</u>, this value MUST equal the **fFilterInclusive** field on the <u>SXTH</u> record that specifies the pivot hierarchy that this pivot field is associated with. MUST be a value from the following table:

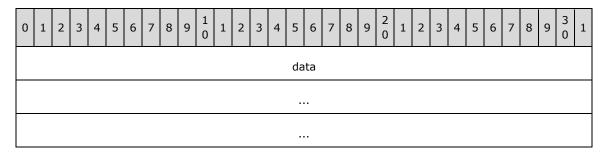

Value	Meaning
0x0	Any manual filter applied to this pivot field specifies pivot items that are excluded.
0x1	Any manual filter applied to this pivot field specifies pivot items that are included.

reserved2 (26 bits): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.34 SXAddl_SXCField12_SXDVerUpdInv

The **SXAddl_SXCField12_SXDVerUpdInv** record specifies the record handling behavior for following records of the SXCField12 class.

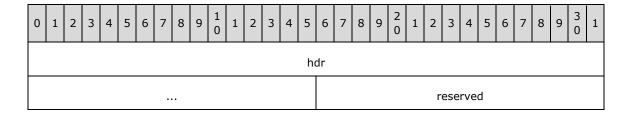

data (12 bytes): An <u>SXAddl_SXDVerUpdInv</u> structure. The value of data.hdr.sxc MUST equal 0x17 and the value of data.hdr.sxd MUST equal 0x01. The value of data.dwVersionInvalidates MUST equal 0x0002 or 0x00FF.

If the value of **data.dwVersionInvalidates** is not equal to 0x00FF and is greater than or equal to the value of the **VerSxLastUpdated** field of the <u>QsiSXTag</u> record of this <u>PivotTable view</u>, the following records of this SXCField12 class, including nested classes or until another SXAddl_SXCField12_SXDVerUpdInv record is encountered, MUST be ignored.

2.4.273.35 SXAddl_SXCGroup_SXDEnd

The **SXAddl_SXCGroup_SXDEnd** record specifies the end of an <u>SxcGroup class</u>.

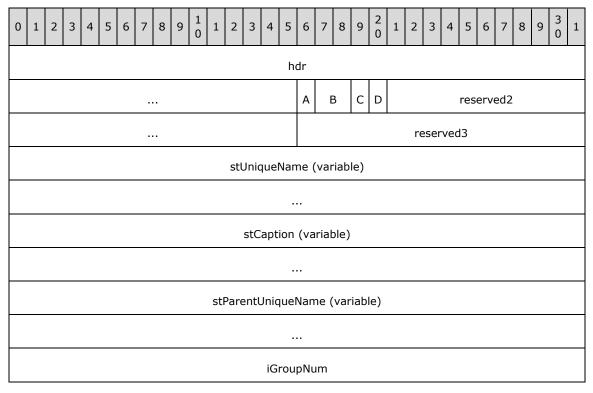

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x08 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.36 SXAddl_SXCGroup_SXDGrpInfo

The **SXAddl_SXCGroup_SXDGrpInfo** record specifies information about an <u>OLAP grouping</u> for an <u>SxcGroup class</u>.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x08 and the value of hdr.sxd MUST equal 0x07.

A - unused1 (1 bit): Undefined and MUST be ignored.

B - reserved1 (2 bits): MUST be zero, and MUST be ignored.

C - unused2 (1 bit): Undefined and MUST be ignored.

D - fHasNoParent (1 bit): A bit that specifies whether the **stParentUniqueName** field does not exist.

reserved2 (27 bits): MUST be zero, and MUST be ignored.

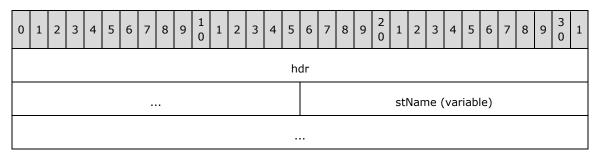

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

stUniqueName (variable): An <u>XLUnicodeString</u> structure that specifies the fully qualified unique name of the **OLAP** group. The length of this field MUST be less than or equal to 255 characters.

- **stCaption (variable):** An XLUnicodeString structure that specifies the caption (display name) of the OLAP group. The length of this field MUST be less than or equal to 255 characters.
- **stParentUniqueName (variable):** An optional XLUnicodeString structure that specifies an **MDX unique name** of the **OLAP member**, which is the parent of the **members (2)** of this group in the OLAP **cube**. This field exists if and only if the value of **fHasNoParent** is zero. The length of this field MUST be less than or equal to 255 characters.
- **iGroupNum (4 bytes):** A signed integer that specifies a unique identifier for this OLAP group within the OLAP grouping level containing it. MUST be greater than zero.

2.4.273.37 SXAddl_SXCGroup_SXDId

The **SXAddl_SXCGroup_SXDId** record specifies information about an <u>OLAP grouping</u> for an SxcGroup class.

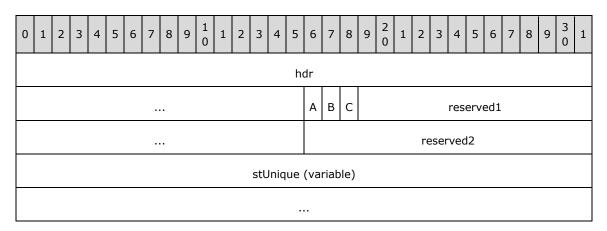

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x08 and the value of hdr.sxd MUST equal 0x00.

stName (variable): An <u>SXAddl_SXString</u> structure that specifies the name of the **OLAP** group. MUST contain less than or equal to 255 characters.

2.4.273.38 SXAddl_SXCGroup_SXDMember

The **SXAddl_SXCGroup_SXDMember** record specifies an **OLAP member** or the name of a group in the subsequent **OLAP level** that is part of this <u>OLAP grouping</u> for an <u>SxcGroup class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x08 and the value of hdr.sxd MUST equal 0x08.

A - unused1 (1 bit): Undefined and MUST be ignored.

B - fGroup (1 bit): A bit that specifies whether this record specifies the name of a group in the subsequent OLAP level.

Value	Meaning
0	This record specifies an OLAP member.
1	This record specifies the name of a group in the subsequent OLAP level.

C - unused2 (1 bit): Undefined and MUST be ignored.

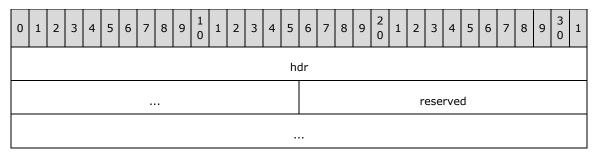

reserved1 (29 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

stUnique (variable): An <u>XLUnicodeString</u> that specifies the **MDX unique name** of an OLAP member or the name of a group in the subsequent OLAP level. If the value of **fGroup** is 0, this is an MDX unique name of an OLAP member. If the value of **fGroup** is 1, this is a group name and it MUST match the **stName** field in one of the <u>SXAddl_SXCGroup_SXDId</u> records for the subsequent OLAP level. The length of this field MUST be less than or equal to 255 characters.

2.4.273.39 SXAddl_SXCGrpLevel_SXDEnd

The **SXAddl_SXCGrpLevel_SXDEnd** record specifies the end of an <u>SxcGrpLevel class</u>.

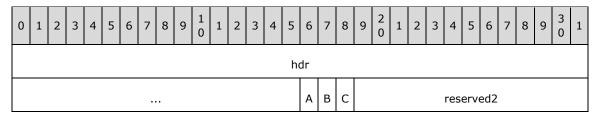

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x07 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.40 SXAddl_SXCGrpLevel_SXDGrpLevelInfo

The **SXAddi_SXCGrpLevel_SXDGrpLevelInfo** record specifies information about an <u>OLAP group</u> for an <u>SxcGrpLevel class</u>.

	reserved3
stLevelNan	ne (variable)

hdr (6 bytes): An SXAddlHdr structure. The value of hdr.sxc MUST equal 0x08 and the value of hdr.sxd MUST equal 0x06.

A - fGroupLevel (1 bit): A bit that specifies whether this is a user-defined group level. MUST be a value from the following table:

ĺ	Value	Meaning
	0	The record specifies a group level that corresponds to the source cube level.
ĺ	1	The record specifies a user-defined group level.

B - reserved1 (1 bit): MUST be zero, and MUST be ignored.

C - fCustomRollup (1 bit): A bit that specifies whether the OLAP group level has custom rollup.

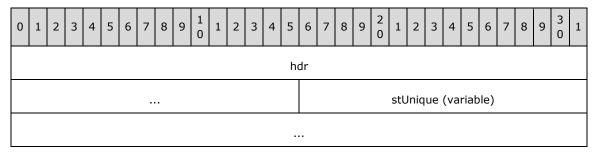

reserved2 (29 bits): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

stLevelName (variable): An <u>XLUnicodeString</u> that specifies the display name of the OLAP group level. The length of this field MUST be less than or equal to 255 characters.

2.4.273.41 SXAddl_SXCGrpLevel_SXDId

The **SXAddl_SXCGrpLevel_SXDId** record specifies information about an <u>OLAP group</u>, for an <u>SxcGrpLevel class</u>.

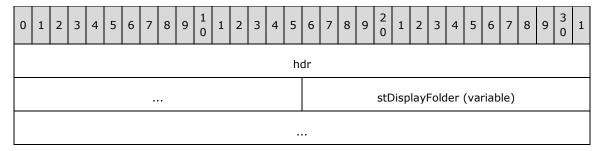

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x07 and the value of hdr.sxd MUST equal 0x00.

stUnique (variable): An SXAddl SXString that specifies the unique name of the OLAP group level.

2.4.273.42 SXAddl_SXCHierarchy_SXDDisplayFolder

The **SXAddl_SXCHierarchy_SXDDisplayFolder** record specifies the name for the **display folder** for a <u>pivot hierarchy</u> for an <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x25.

stDisplayFolder (variable): An <u>SXAddl_SXString</u> that specifies the name of the pivot hierarchy display folder.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 65535 characters.

2.4.273.43 SXAddl_SXCHierarchy_SXDEnd

The SXAddl_SXCHierarchy_SXDEnd record specifies the end of an SxcHierarchy class.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.44 SXAddl_SXCHierarchy_SXDFilterMember

The **SXAddl_SXCHierarchy_SXDFilterMember** record specifies **OLAP members** used in <u>OLAP page filtering</u> for a <u>pivot hierarchy</u> on the <u>page axis</u> for an <u>SxcHierarchy class</u>. MUST NOT exist if the <u>PivotCache functionality level</u> of the <u>associated PivotCache</u> is greater than or equal to 3.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
																Α	В						re	eser	vec	12					
																						re	eser	vec	13						
							cIte	ems	5											rg:	StPa	age	Iter	ns ((vai	riab	le)				

- hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x09.
- A reserved1 (1 bit): MUST be 1 and MUST be ignored.
- **B fMultFiltHavePlex (1 bit):** A bit that specifies whether multiple OLAP members in this pivot hierarchy are selected in the OLAP page filtering. If the value of this field is 0, **cItems** and **rgStPageItems** MUST be ignored.

reserved2 (30 bits): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

- **cItems (2 bytes):** An unsigned integer that specifies the number of elements in **rgStPageItems**. MUST be greater than 0 if **fMultFiltHavePlex** is 1.
- **rgStPageItems (variable):** An array of <u>XLUnicodeString</u>. Each element specifies the **MDX unique name** of an OLAP member selected in the OLAP page filtering. The number of elements in the array is specified by **cItems**. The length of each element MUST be greater than zero characters and less than or equal to 255 characters.

2.4.273.45 SXAddl_SXCHierarchy_SXDFilterMember12

The **SXAddl_SXCHierarchy_SXDFilterMember12** record specifies an <u>OLAP manual filter</u> for a <u>pivot hierarchy</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the <u>associated PivotCache</u> is less than 3.

- hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x3F.
- **isxtl (4 bytes):** An unsigned integer that specifies the zero-based ordinal of the **OLAP level** in the pivot hierarchy that the OLAP manual filter applies to. MUST be greater than or equal to 0.

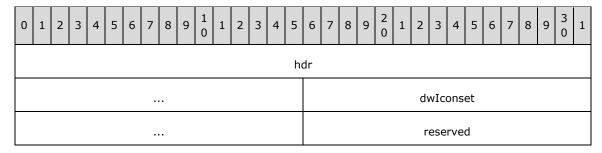

reserved (2 bytes): MUST be zero, and MUST be ignored.

cItems (2 bytes): An unsigned integer that specifies the number of items in rgStMembers.

rgStMembers (variable): An array of <u>XLUnicodeString</u>. Each element specifies the **MDX unique name** of an **OLAP member** selected in the OLAP manual filter. The number of elements in the array is specified by **cItems**. The length of each element MUST be greater than zero characters and less than or equal to 255 characters.

2.4.273.46 SXAddl_SXCHierarchy_SXDIconSet

The **SXAddl_SXCHierarchy_SXDIconSet** record specifies the **icon set** for a <u>pivot hierarchy</u>, for an <u>SxcHierarchy class</u>.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x20.

dwIconset (4 bytes): An unsigned integer that specifies the icon set.

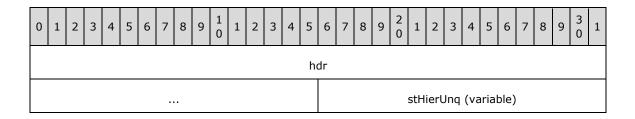

MUST be a value from the following table:

Value	Meaning
0x0000	Default
0x0001	3-arrow ascending
0x0002	3-arrow descending
0x0003	5-arrow ascending
0x0004	5-arrow descending
0x0005	5-arrow gray ascending
0x0006	Traffic lights
0x0007	Traffic lights 2
0x0008	Quarters ascending
0x0009	Quarters descending
0x000A	Signs
0x000B	Symbols

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.47 SXAddl_SXCHierarchy_SXDId

The **SXAddl_SXCHierarchy_SXDId** record specifies how an <u>SxcHierarchy class</u> is associated with other records for a <u>pivot hierarchy</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x00.

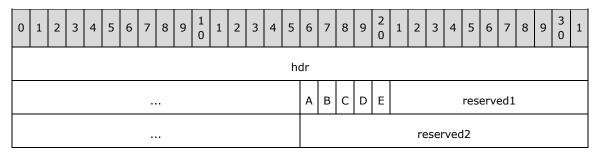

stHierUnq (variable): An <u>SXAddl SXString</u> that specifies the **MDX unique name** of the corresponding pivot hierarchy to which this SxcHierarchy class applies. The corresponding <u>SXTH</u>, of the pivot hierarchy in the <u>PivotTable view</u>, is the SXTH record with its **stUnique** field equal to the value of this field.

If there exists no such SXTH record, then this SxcHierarchy class MUST be ignored.

The length of this field MUST be greater than zero characters and less than or equal to 255 characters.

2.4.273.48 SXAddl_SXCHierarchy_SXDInfo12

The **SXAddl_SXCHierarchy_SXDInfo12** record specifies additional properties for a <u>pivot hierarchy</u>, for an <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

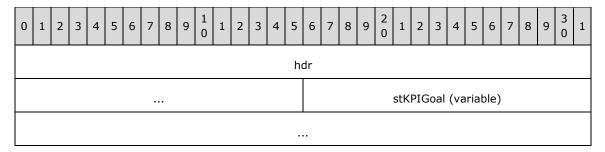

- hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x41.
- **A fUnbalancedRealKnown (1 bit):** A bit that specifies whether **fUnbalancedReal** is valid. MUST be 0 if the pivot hierarchy is grouped.
- **B fUnbalancedReal (1 bit):** A bit that specifies whether the pivot hierarchy is balanced or unbalanced. If the value is 1 and **fUnbalancedRealKnown** is 1, the pivot hierarchy is unbalanced. If the value is 0 and **fUnbalancedRealKnown** is 1, the pivot hierarchy is balanced. If **fUnbalancedRealKnown** is 0 the value is undefined.
- **C fUnbalancedGroupKnown (1 bit):** A bit that specifies whether **fUnbalancedGroup** is valid. MUST be 0 if the pivot hierarchy is not grouped.
- **D fUnbalancedGroup (1 bit):** A bit that specifies whether the <u>OLAP group</u> pivot hierarchy is balanced or unbalanced. If the value is 1 and **fUnbalancedGroupKnown** is 1, the pivot hierarchy is unbalanced. If the value is 0 and **fUnbalancedGroupKnown** is 1, the pivot hierarchy is balanced. If **fUnbalancedGroupKnown** is 0 the value is undefined.
- **E fHidden (1 bit):** A bit that specifies whether the **OLAP hierarchy** corresponding to this pivot hierarchy is **hidden**.

reserved1 (27 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.49 SXAddl_SXCHierarchy_SXDKPIGoal

The **SXAddl_SXCHierarchy_SXDKPIGoal** record specifies the **MDX unique name** of the **OLAP KPI** goal **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

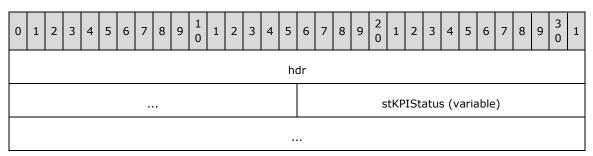

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x28.

stKPIGoal (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI goal measure.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 32767 characters.

2.4.273.50 SXAddl_SXCHierarchy_SXDKPIStatus

The **SXAddl_SXCHierarchy_SXDKPIStatus** record specifies the **MDX unique name** of the **OLAP KPI** status **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

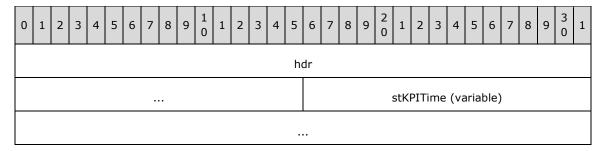

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x29.

stKPIStatus (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI status measure.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 32767 characters.

2.4.273.51 SXAddl_SXCHierarchy_SXDKPITime

The **SXAddl_SXCHierarchy_SXDKPITime** record specifies the **MDX unique name** of the **OLAP KPI** time **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

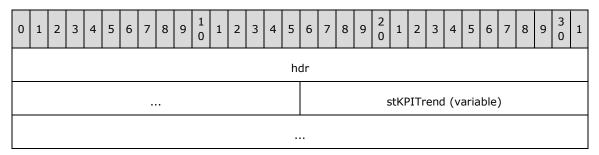

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x2C.

stKPITime (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI time **Multidimensional Expressions (MDX)**.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 32767 characters.

2.4.273.52 SXAddl_SXCHierarchy_SXDKPITrend

The **SXAddl_SXCHierarchy_SXDKPITrend** record specifies the **MDX unique name** of the **OLAP KPI** trend **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

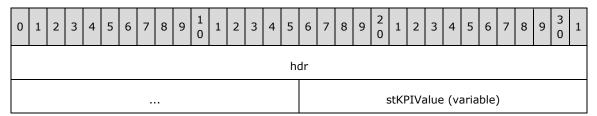

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x2A.

stKPITrend (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI trend measure.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 32767 characters.

2.4.273.53 SXAddl_SXCHierarchy_SXDKPIValue

The **SXAddl_SXCHierarchy_SXDKPIValue** record specifies the **MDX unique name** of the **OLAP KPI** value **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

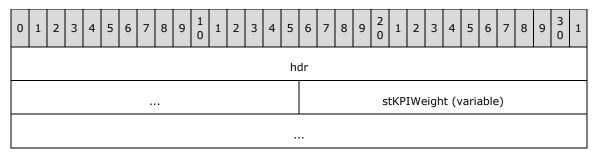

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x27.

stKPIValue (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI value measure.

The length of this field MUST be greater than zero characters and less than or equal to 32767 characters.

2.4.273.54 SXAddl_SXCHierarchy_SXDKPIWeight

The **SXAddl_SXCHierarchy_SXDKPIWeight** record specifies the **MDX unique name** of the **OLAP KPI** weight **measure** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

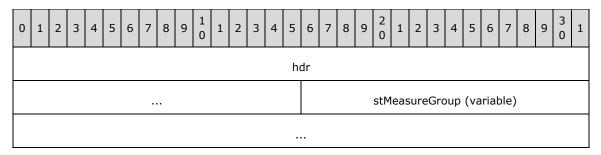

hdr (6 bytes): An SXAddlHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x2B.

stKPIWeight (variable): An <u>SXAddl_SXString</u> structure that specifies the MDX unique name of the KPI weight **Multidimensional Expressions (MDX)**.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 32767 characters.

2.4.273.55 SXAddl_SXCHierarchy_SXDMeasureGrp

The **SXAddl_SXCHierarchy_SXDMeasureGrp** record specifies the name of the **OLAP measure group** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache</u> functionality level of the associated <u>PivotCache</u> is less than 3.

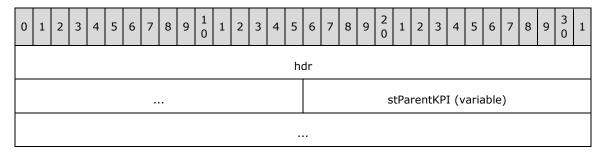

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x24.

stMeasureGroup (variable): An <u>SXAddl_SXString</u> structure that specifies the name of the OLAP measure group.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 65535 characters.

2.4.273.56 SXAddl_SXCHierarchy_SXDParentKPI

The **SXAddl_SXCHierarchy_SXDParentKPI** record specifies the name of the **OLAP** parent **KPI** for a <u>pivot hierarchy</u>, for a <u>SxcHierarchy class</u>. This record MUST NOT exist if the <u>PivotCache functionality level</u> of the associated <u>PivotCache</u> is less than 3.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x26.

stParentKPI (variable): An SXAddl SXString structure that specifies the name of the parent KPI.

The length of this field MUST be greater than or equal to zero characters and less than or equal to 65535 characters.

2.4.273.57 SXAddl_SXCHierarchy_SXDProperty

The **SXAddl_SXCHierarchy_SXDProperty** record specifies a <u>member property</u> of a <u>pivot hierarchy</u> for a <u>SxcHierarchy class</u>. The member property is displayed if the <u>OLAP PivotTable view</u> is recalculated and the pivot hierarchy is either on the <u>row axis</u> as specified by the **sxaxis.sxaxisRw** field of <u>SXTH</u> or on the <u>column axis</u> as specified by the **sxaxis.sxaxisCol** field of SXTH.

0 1 2 3 4 5 6 7 8 9 1 1 2 3 4 5	6 7 8 9 2 1 2 3 4 5 6 7 8 9 3 1												
h	dr												
	A B C reserved1												
	reserved2												
cchProperty	stProperty (variable)												
cchLevelUnq	ichPropName												
cchPropName	isxtl												

- hdr (6 bytes): An SXAddlHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x05.
- **A fDisplayInReport (1 bit):** A bit that specifies whether this member property is displayed in the row axis or in the column axis, if this member property is associated with a <u>pivot field</u>.
- **B fDisplayInTip (1 bit):** A bit that specifies whether this member property is displayed in a **ToolTip**.
- C fDisplayInCaption (1 bit): A bit that specifies whether this member property is used as a caption for <u>pivot items</u> in the pivot field that is in this pivot hierarchy and is specified by the SXVDTex record with an isxtl field equal to the value of the isxtl field of this record. MUST be 0 if the PivotCache functionality level of the associated PivotCache is less than 3.

reserved1 (29 bits): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

cchProperty (2 bytes): An unsigned integer that specifies the length in characters of stProperty.

The value MUST be greater than or equal to five characters and less than or equal to 255 characters.

stProperty (variable): An <u>XLUnicodeStringNoCch</u> that specifies the **MDX unique name** of this member property. If a <u>cache field</u> has a matching value in the **stFieldName** field of <u>SXFDB</u>, then the cache field is a member property cache field and is associated with this pivot hierarchy.

The length is specified in **cchProperty**.

cchLevelUnq (2 bytes): An unsigned integer that specifies the length in characters of the OLAP level MDX unique name of the cache pivot hierarchy in stProperty. The OLAP level MDX unique name comes before the member property name in stProperty. For example, if the value for stProperty equals "[Store].[Store Name].[Store Manager]", then cchLevelUnq equals 20. This refers to "[Store].[Store Name]".

If the PivotCache functionality level of the <u>associated PivotCache</u> is 3, then this value is undefined and MUST be ignored.

ichPropName (2 bytes): An unsigned integer that specifies the zero-based index of the character where the property name portion begins in **stProperty**. For example, if the value for **stProperty** equals "[Store].[Store Name].[Store Manager]", **ichPropName** equals 22. This refers to the starting character of "Store Manager".

If the PivotCache functionality level of the associated PivotCache is 3, then this value is undefined and MUST be ignored.

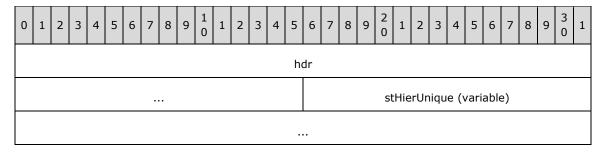

cchPropName (2 bytes): An unsigned integer that specifies the length in characters of the name portion of **stProperty**. For example, if the value for **stProperty** equals "[Store].[Store Name].[Store Manager]", **cchPropName** equals 13. This refers to the length of "Store Manager".

If the PivotCache functionality level of the associated PivotCache is 3, then this value is undefined and MUST be ignored.

isxtl (2 bytes): A signed integer that specifies the zero-based index of the OLAP level in the pivot hierarchy that this property applies to. The value MUST be greater than or equal to -1.

2.4.273.58 SXAddl_SXCHierarchy_SXDSXSetParentUnique

The **SXAddl_SXCHierarchy_SXDSXSetParentUnique** record specifies the **MDX unique name** of the parent <u>pivot hierarchy</u> for an <u>SxcHierarchy class</u>. This record exists only if this pivot hierarchy is a named set.

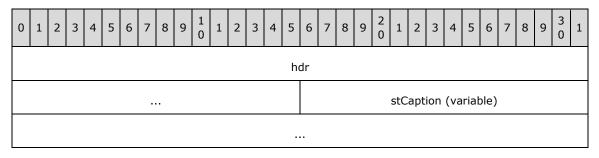

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x1D.

stHierUnique (variable): An <u>SXAddl SXString</u> structure that specifies the MDX unique name of the parent pivot hierarchy. The length of this field MUST be greater than zero characters and less than or equal to 32767 characters.

2.4.273.59 SXAddl_SXCHierarchy_SXDUserCaption

The **SXAddl_SXCHierarchy_SXDUserCaption** record specifies the user-defined caption for a <u>pivot</u> <u>hierarchy</u>, for a <u>SxcHierarchy</u> class.

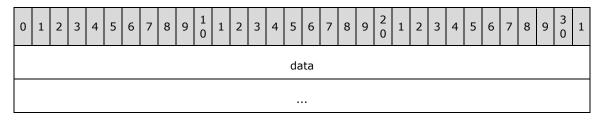

hdr (6 bytes): An SXAddlHdr structure. The value of hdr.sxc MUST equal 0x02 and the value of hdr.sxd MUST equal 0x1F.

stCaption (variable): An <u>SXAddl_SXString</u> structure that specifies the user-defined caption of this pivot hierarchy. The length of this field MUST be greater than zero characters and less than or equal to 255 characters.

2.4.273.60 SXAddl_SXCHierarchy_SXDVerUpdInv

The **SXAddl_SXCHierarchy_SXDVerUpdInv** record specifies the record-handling behavior for records of the <u>SXCHierarchy class</u>.

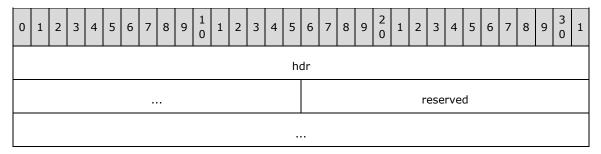

data (12 bytes): An <u>SXAddl_SXDVerUpdInv</u>. The value of data.hdr.sxc MUST equal 0x02 and the value of data.hdr.sxd MUST equal 0x01.

If the value of **data.dwVersionInvalidates** is not 0x00FF and is greater than or equal to the value of the **VerSxLastUpdated** field of the <u>QsiSXTag</u> record of this <u>PivotTable view</u>, then all the records and nested records of this SXCHierarchy class MUST be ignored until another SXAddl_SXCHierarchy_SXDVerUpdInv record is encountered.

2.4.273.61 SXAddl_SXCQsi_SXDEnd

The **SXAddl_SXCQsi_SXDEnd** record specifies the end of a <u>SxcQsi class</u>.

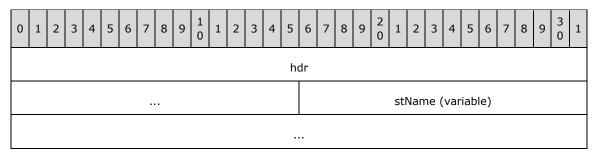

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x05 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.62 SXAddl_SXCQsi_SXDId

The **SXAddl_SXCQsi_SXDId** record specifies how a <u>SxcQsi class</u> is associated with other records for a **query table**.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x05 and the value of hdr.sxd MUST equal 0x00.

stName (variable): A <u>SXAddl SXString</u> structure that specifies the name of the query table. If the **stName** field equals the **rgchName** field of a <u>Qsi</u> record in this <u>worksheet</u> substream, then this SxcQsi class applies to the query table that the Qsi record is associated with. Otherwise, this SxcQsi class MUST be ignored.

2.4.273.63 SXAddl_SXCQuery_SXDEnd

The **SXAddl_SXCQuery_SXDEnd** record specifies the end of a <u>SxcQuery_class</u>.

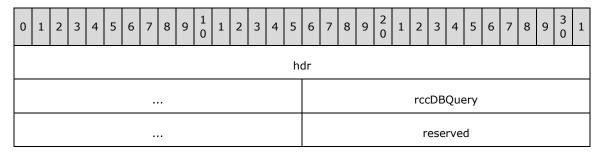

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	hdr																														
	reserved																														

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x07 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.64 SXAddl_SXCQuery_SXDReconnCond

The **SXAddl_SXCQuery_SXDReconnCond** record specifies the **reconnect condition** for an <u>external connection</u>, for a <u>SxcQuery class</u>.

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x06 and the value of hdr.sxd MUST equal 0x07.

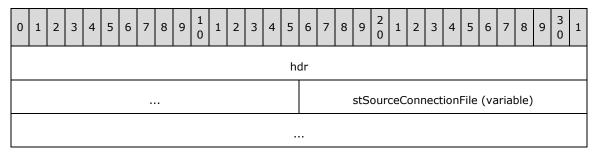

rccDBQuery (4 bytes): An unsigned integer that specifies the reconnect condition for the database **query**. MUST be a value from the following table:

Value	Reconnect condition
0x0000000	Retrieve external connection information as required. When external data is refreshed from the external connection, use the existing external connection information; if the external data refresh from the external connection fails, then retrieve updated external connection information, if available, from the <u>external connection file</u> .
0x0000001	Retrieve external connection information. When external data is refreshed from the external connection, retrieve updated external connection information from the external connection file, if available, and use that instead of the existing external connection information. In this case, the external data refresh fails if the external connection file is unavailable.
0x0000000	Never retrieve external connection information. Never get updated external connection information from the external connection file even if it is available and even if the existing external connection information is not valid.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.65 SXAddl_SXCQuery_SXDSrcConnFile

The **SXAddl_SXCQuery_SXDSrcConnFile** record specifies the <u>external connection file</u> for an <u>external connection</u>, for a <u>SxcQuery class</u>.

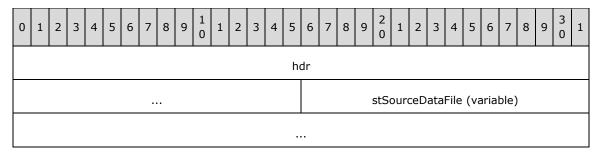

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x06 and the value of hdr.sxd MUST equal 0x06.

stSourceConnectionFile (variable): An <u>SXAddl SXString</u> that specifies the external connection file for the database **query**. The total count of characters of the string MUST be less than or equal to 65535.

2.4.273.66 SXAddl_SXCQuery_SXDSrcDataFile

The **SXAddl_SXCQuery_SXDSrcDataFile** record specifies the **source data** file for an <u>external</u> <u>connection</u>, for a <u>SxcQuery class</u>.

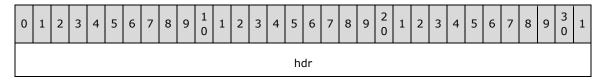

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x06 and the value of hdr.sxd MUST equal 0x05.

stSourceDataFile (variable): An <u>SXAddl SXString</u> structure that specifies the source data file for the database **query**. The total count of characters of the string MUST be less than or equal to 65535.

2.4.273.67 SXAddl_SXCQuery_SXDXMLSource

The **SXAddl_SXCQuery_SXDXMLSource** record specifies the **Uniform Resource Locator (URL)**, used to display an edit dialog for an <u>external connection</u>, for a <u>SxcQuery class</u>.

 stURL (variable)

hdr (6 bytes): An <u>SXAddIHdr</u> structure The value of hdr.sxc MUST equal 0x06 and the value of hdr.sxd MUST equal 0x04.

stURL (variable): An <u>XLUnicodeStringSegmentedSXAddl</u> that specifies the URL used to display an edit dialog.

2.4.273.68 SXAddl_SXCSXCondFmt_SXDEnd

The **SXAddl_SXCXCondFmt_SXDEnd** record specifies the end of a <u>SXCSXCondFmt class</u>.

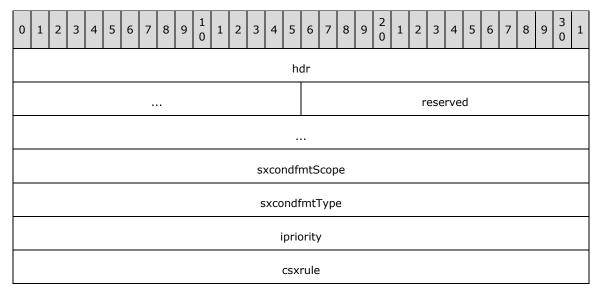

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1B and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.69 SXAddl_SXCSXCondFmt_SXDSXCondFmt

The **SXAddl_SXCXCondFmt_SXDSXCondFmt** record specifies information for a <u>PivotTable</u> **conditional formatting** rule, for a <u>SXCSXCondFmt class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1B and the value of hdr.sxd MUST equal 0x35.

reserved (6 bytes): MUST be zero, and MUST be ignored.

sxcondfmtScope (4 bytes): An unsigned integer that specifies the scope of the <u>PivotTable view</u> conditional formatting. MUST be a value from the following table:

Name	Value	Description
SXCONDFMTSELECTIONSCOPE	0x00000000	This conditional formatting is applied to the cells , as specified by the <u>SXCSXrule classes</u> contained in this SXCSXCondFmt class.
SXCONDFMTDATASCOPE	0x0000001	This conditional formatting is applied to all cells that display values for the <u>data item</u> , as specified by the SXCSXrule class contained in this SXCSXCondFmt class.
SXCONDFMTFIELDSCOPE	0x00000002	This conditional formatting is applied to all cells that display values for the <u>pivot field</u> intersections, as specified by the SXCSXrule class contained in this SXCSXCondFmt class.

The value MUST be SXCONDFMTFIELDSCOPE if the value of **sxcondfmtType** is SXCONDFMTTOP10R or SXCONDFMTTOP10C.

If the value is SXCONDFMTDATASCOPE or SXCONDFMTFIELDSCOPE, there MUST be only one SXCSXrule class contained in this SXCSXCondFmt class.

sxcondfmtType (4 bytes): An unsigned integer that specifies the type of this PivotTable view conditional formatting. MUST be one of the values from following table:

Name	Value	Description
SXCONDFMTTOP10NIL	0x00000000	Top N or Bottom N conditional formatting is not evaluated.
SXCONDFMTTOP10A	0x0000001	Top N or Bottom N conditional formatting is evaluated across the entire scope range .
SXCONDFMTTOP10R	0x00000002	Top N or Bottom N conditional formatting is evaluated for each row.
SXCONDFMTTOP10C	0x00000003	Top N or Bottom N conditional formatting is evaluated for each column.

The value MUST be equal to SXCONDFMTTOP10NIL or SXCONDFMTTOP10A if the value of **sxcondfmtScope** is SXCONDFMTSELECTIONSCOPE or SXCONDFMTDATASCOPE.

ipriority (4 bytes): An unsigned integer that specifies the priority of the PivotTable view conditional formatting. It is used to locate the conditional formatting rule by matching the **ipriority** field of either CF12 or the **rgbContent** field which is a CFExNonCF12 structure in CFEx. MUST be greater than or equal to 1.

csxrule (4 bytes): An unsigned integer that specifies the number of SXCSXrule classes contained in this SXCSXCondFmt class. The SXCSXrule classes specify the area that the conditional formatting is applied to.

2.4.273.70 SXAddl_SXCSXCondFmts_SXDEnd

The **SXAddi_SXCXCondFmts_SXDEnd** record specifies the end of a <u>SXCSXCondFmts class</u>.

 reserved

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x1A and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.71 SXAddl_SXCSXCondFmts_SXDId

The **SXAddl_SXCXCondFmts_SXDId** record specifies information for <u>PivotTable conditional formatting</u> rules, for a <u>SXCSXCondFmts class</u>.

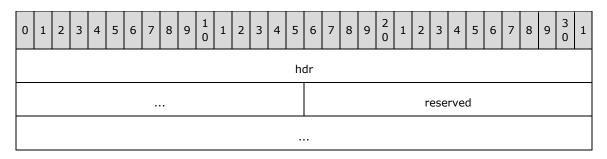

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1A and the value of hdr.sxd MUST equal 0x00.

cSxcondfmt (4 bytes): A signed integer that specifies the number of <u>SXCSXCondFmt class</u> instances that follow this record. MUST be greater than 0.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.72 SXAddl_SXCSXDH_SXDEnd

The **SXAddl_SXCSXDH_SXDEnd** record specifies the end of an <u>SXCSXDH class</u>.

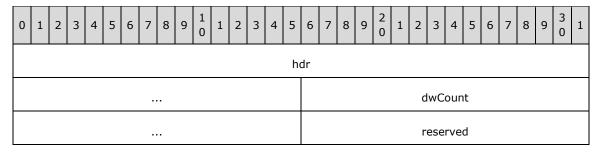

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x10 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.73 SXAddl_SXCSXDH_SXDId

The **SXAddl_SXCSXDH_SXDId** record specifies information for an **OLAP dimension (1)** for a <u>SXCSXDH class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x10 and the value of hdr.sxd MUST equal 0x00.

dwCount (4 bytes): An unsigned integer that specifies the number of <u>SXAddl</u> records of type <u>SXADDL SXCSXDH SXDSXDH</u> that follow this record. The count MUST be greater than zero and less than 0xFFFFFFFF.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.74 SXAddl_SXCSXDH_SXDSxdh

The **SXAddl_SXCSXDH_SXDSxdh** record specifies a mapping between an **OLAP dimension (1)** and a <u>pivot hierarchy</u> for a <u>SXCSXDH class</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

				C	chl	Dim	ens	ion	Сар	tior	1					stDimensionName (variable)															
	stDimensionUnique (variable)																														
	stDimensionCaption (variable)																														

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x10 and the value of hdr.sxd MUST equal 0x1A.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

isxth (4 bytes): A signed integer that specifies a reference to a pivot hierarchy. MUST be a value from the following table:

Value	Meaning
-2	This value specifies the <u>data field</u> .
0+	A pivot hierarchy index, as specified in Pivot Hierarchies, that specifies a pivot hierarchy in the <u>associated PivotTable view</u> of the <u>OLAP PivotCache</u> .

The value MUST be -2 or greater than or equal to zero and less than the number of pivot hierarchy in the associated PivotTable view of the OLAP PivotCache.

cchDimensionName (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch in the **stDimensionName** field. MUST be greater than zero and less than or equal to 0x00FF.

cchDimensionUnique (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch in the **stDimensionUnique** field. MUST be greater than zero and less than or equal to 0x00FF.

cchDimensionCaption (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch in the **stDimensionCaption** field. MUST be greater than zero and less than or equal to 0x00FF.

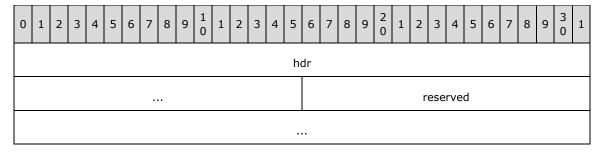

stDimensionName (variable): An XLUnicodeStringNoCch that specifies the name of the OLAP dimension (1). The length is specified in **cchDimensionName**.

stDimensionUnique (variable): An XLUnicodeStringNoCch that specifies the fully qualified unique name of the **cube** dimension (1). The length is specified in **cchDimensionUnique**.

stDimensionCaption (variable): An XLUnicodeStringNoCch that specifies the caption of the OLAP dimension (1). The length is specified in **cchDimensionCaption**.

2.4.273.75 SXAddl_SXCSXfilt_SXDEnd

The **SXAddl_SXCSXfilt_SXDEnd** record specifies the end of an <u>SXCSXfilt class</u>.

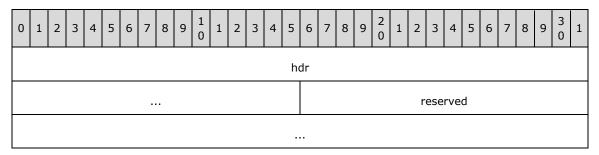

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x0D and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.76 SXAddl_SXCSXfilt_SXDId

The **SXAddl_SXCSXfilt_SXDId** record specifies information for a <u>PivotTable rule</u> filter, for an <u>SXCSXfilt class</u>.

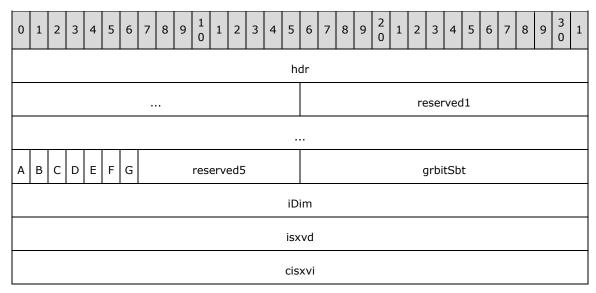

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x0D and the value of hdr.sxd MUST equal 0x00.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.77 SXAddl_SXCSXfilt_SXDSXfilt

The **SXAddl_SXCSXfilt_SXDSXfilt** record specifies information for a <u>PivotTable rule</u> filter, for an <u>SXCSXfilt class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x0D and the value of hdr.sxd MUST equal 0x14.

reserved1 (6 bytes): MUST be zero, and MUST be ignored.

A - sxaxisRw (1 bit): A bit that specifies whether the row axis is being referred to.

MUST be zero if the value of **sxaxisCol** is 1 or the value of **sxaxisPage** is 1 or the value of **sxaxisPata** is 1.

B - sxaxisCol (1 bit): A bit that specifies whether the column axis is being referred to.

MUST be zero if the value of **sxaxisRw** is 1 or the value of **sxaxisPage** is 1 or the value of **sxaxisData** is 1.

- C reserved2 (1 bit): MUST be zero, and MUST be ignored.
- D sxaxisData (1 bit): A bit that specifies whether the value axis is being referred to.

MUST be zero if the value of **sxaxisRw** is 1 or the value of **sxaxisCol** is 1 or the value of **sxaxisPage** is 1.

- **E fSelected (1 bit):** A bit that specifies whether the header of the <u>Pivot Field</u> is included in the <u>PivotTable rule filters.</u>
- F reserved3 (1 bit): MUST be zero, and MUST be ignored.
- **G reserved4 (1 bit):** MUST be zero, and MUST be ignored.

reserved5 (9 bits): MUST be zero, and MUST be ignored.

grbitSbt (2 bytes): A signed integer that specifies the subtotals for this PivotTable rule filter. MUST be a value from the following table:

Value	Meaning
0	No subtotals are displayed.
1	Data value subtotals are displayed.

iDim (4 bytes): A signed integer that specifies the position of the Pivot Field within the axis specified by **sxaxisRw**, **sxaxisCol**, **sxaxisPage**, or **sxaxisData**. MUST be greater than or equal to -1 and less than or equal to 0x0000001F.

isxvd (4 bytes): A signed integer that specifies the Pivot Field that this PivotTable rule filter refers to. MUST be a value from the following table:

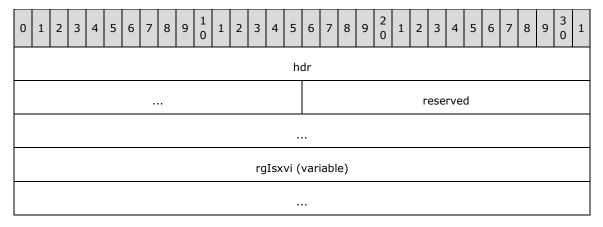

Value	Meaning
-2	This PivotTable rule filter refers to the data field.
-1	This PivotTable rule filter does not refer to a pivot field
0 to 255	This value specifies a pivot field index, as specified in Pivot Fields. The pivot field index specifies which pivot field this PivotTable rule filter refers to.

If the value is greater than or equal to zero, MUST be less than the number of pivot fields in the PivotTable view.

cisxvi (4 bytes): An unsigned integer that specifies the count of <u>pivot item</u> indexes in the <u>SXAddl_SXCSXfilt_SXDSXItm</u> record that follows this record. MUST be greater than or equal to zero. If **isxvd** is -1, MUST be 0.

2.4.273.78 SXAddl_SXCSXfilt_SXDSXItm

The **SXAddl_SXCSXfilt_SXDSXItm** record specifies an array of <u>pivot item</u> records of a <u>PivotTable</u> rule filter for an SXCSXfilt class.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x0D and the value of hdr.sxd MUST equal 0x15.

reserved (6 bytes): MUST be zero, and MUST be ignored.

rgIsxvi (variable): An array of 2-byte unsigned integers. Each element specifies the pivot item or data item index in the pivot field or data field specified by the isxvd field of the preceding SXAddl SXCSXfilt SXDSXfilt record. See PivotTable rule for more information about the references that are used.

The number of items in the array MUST equal the **cisxvi** field of the preceding SXAddl SXCSXfilt SXDSXfilt record.

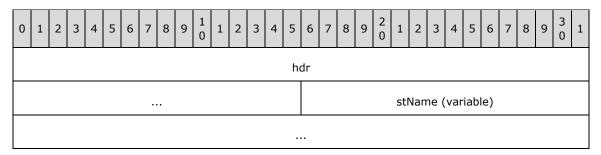

The value of each element in **rgIsxvi** MUST be in sorted order such that **rgIsxvi**[item] is less than **rgIsxvi**[item+1] where item is between 0 and the number of elements in **rgIsxvi** – 2.

If the value of the **isxvd** field of the preceding SXAddl_SXCSXfilt_SXDSXfilt record is greater than or equal to zero, each item in this array MUST be 0x7FFF (isxviNULL) or greater than or equal to zero plus the number of pivot items in the pivot field specified by the **isxvd** field of the preceding SXAddl_SXCSXfilt_SXDSXfilt record.

If the value of the **isxvd** field of the preceding SXAddl_SXCSXfilt_SXDSXfilt record is less than zero, each item in this array MUST be greater than or equal to zero and less than the number of data items in the <u>PivotTable view</u>.

2.4.273.79 SXAddl_SXCSXFilter12_SXDCaption

The **SXAddl_SXCSXFilter12_SXDCaption** record specifies the name of the <u>advanced filter</u> for an SXCSXFilter12 class.

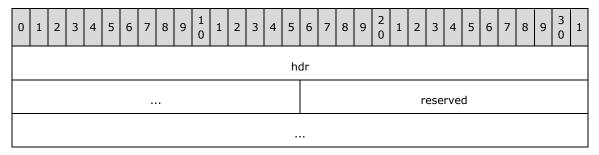

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x2F.

stName (variable): An <u>SXAddl_SXString</u> structure that specifies the name of the <u>PivotTable view</u> **filter**.

2.4.273.80 SXAddl_SXCSXFilter12_SXDEnd

The **SXAddl_SXCSXFilter12_SXDEnd** record specifies the end of an <u>SXCSXFilter12 class</u>.

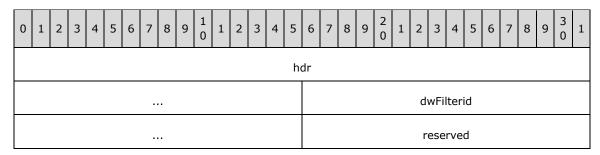

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.81 SXAddl_SXCSXFilter12_SXDId

The **SXAddl_SXCSXFilter12_SXDId** record specifies information for an <u>advanced filter</u>, for an <u>SXCSXFilter12 class</u>.

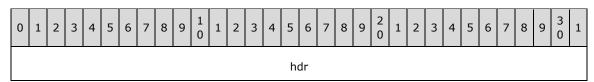

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x00.

dwFilterid (4 bytes): An unsigned integer that specifies the unique identifier of this filter.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.82 SXAddl_SXCSXFilter12_SXDSXFilter

The **SXAddl_SXCSXFilter12_SXDSXFilter** record specifies the **filter** information of an <u>advanced</u> <u>filter</u> for an <u>SXCSXFilter12 class</u>.

	reserved1					
	reserved2					
isxvd						
isxvdMProp						
S	kft.					
unused						
isxdiMeasure						
isxthMeasure						

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x38.

reserved1 (4 bytes): MUST be zero and MUST be ignored.

reserved2 (2 bytes): MUST be zero and MUST be ignored.

isxvd (4 bytes): An unsigned integer that specifies a <u>pivot field</u> index as specified in pivot fields. The pivot field index specifies which pivot field this filter applies to. The value MUST be less than the **cDim** field of the <u>SxView</u> record of this <u>PivotTable view</u>.

isxvdMProp (4 bytes): A signed integer that specifies the <u>member property</u> pivot field on which this advanced filter is based. MUST be a value from the following table:

Value	Meaning
-1	This advanced filter is not defined on a member property .
Greater than or equal to zero	This value specifies a pivot field index as specified in pivot fields. The pivot field index specifies which pivot field this advanced filter is based on.

This value MUST be -1 and MUST be ignored if the value of the **sxft** field is less than 0x00000004 or greater than 0x00000011. The value MUST be greater than or equal to -1 and less than the value of the **cDim** field of the SxView record of this PivotTable view.

sxft (4 bytes): A <u>SxFT</u> structure that specifies the advanced filter type. If the value is equal to SXFTCOUNT, SXFTPERCENT, or SXFTSUM, the **cft** field in <u>SXAddl SXCSXFilter12 SXDXIsFilter</u> MUST be equal to CFTTOP10.

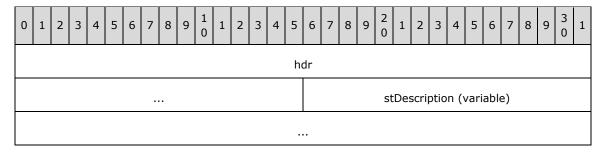

unused (4 bytes): Undefined and MUST be ignored.

isxdiMeasure (4 bytes): A signed integer that specifies a <u>data item</u> index of the data item on which this advanced filter is based. If this is an <u>OLAP PivotTable view</u> then isxdiMeasure MUST be -1, if this is a <u>value filter</u> then isxdiMeasure MUST be greater than or equal to zero and less than the number of <u>SXDI</u> records in this PivotTable view. Otherwise isxdiMeasure MUST be 0.

isxthMeasure (4 bytes): A signed integer that specifies a <u>pivot hierarchy</u> index of the <u>measure</u> pivot hierarchy on which this advanced filter applies. If this is a non-OLAP PivotTable view then isxthMeasure MUST be -1. If this is a value filter then **isxthMeasure** MUST be greater than or equal to zero and less than the number of <u>SXTH</u> records in this PivotTable view. Otherwise isxthMeasure MUST be 0.

2.4.273.83 SXAddl_SXCSXFilter12_SXDSXFilterDesc

The **SXAddl_SXCSXFilter12_SXDSXFilterDesc** record specifies the description of an <u>advanced filter</u> for an <u>SXCSXFilter12 class</u>.

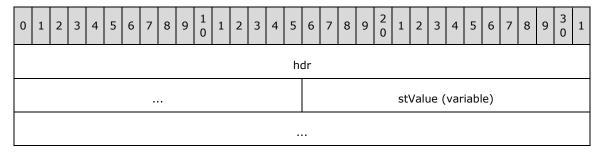

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x39.

stDescription (variable): A <u>SXAddl_SXString</u> structure that specifies the description of the <u>PivotTable view</u> **filter**.

2.4.273.84 SXAddl_SXCSXFilter12_SXDSXFilterValue1

The **SXAddl_SXCSXFilter12_SXDSXFilterValue1** record specifies the first value used by the <u>label filter</u> for an <u>SXCSXFilter12 class</u>. This record MUST NOT exist if the value of the **sxft** field of the preceding <u>SXAddl_SXCSXFilter12_SXDSXFilter</u> record is less than 0x00000004 or greater than 0x000000011.

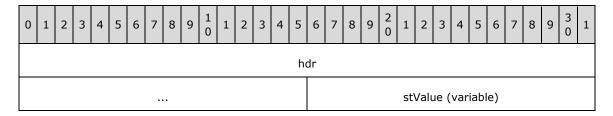

hdr (6 bytes): An SXAdd|Hdr structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x3A.

stValue (variable): A SXAddl SXString structure that specifies the first value used by the label filter.

2.4.273.85 SXAddl_SXCSXFilter12_SXDSXFilterValue2

The **SXAddl_SXCSXFilter12_SXDSXFilterValue2** record specifies the second value used by the <u>label filter</u> for an <u>SXCSXFilter12 class</u>. This record MUST NOT exist if the value of the <u>sxft</u> field of the preceding <u>SXAddl_SXCSXFilter12_SXDSXFilter</u> record is less than 0x00000004 or greater than 0x000000011.

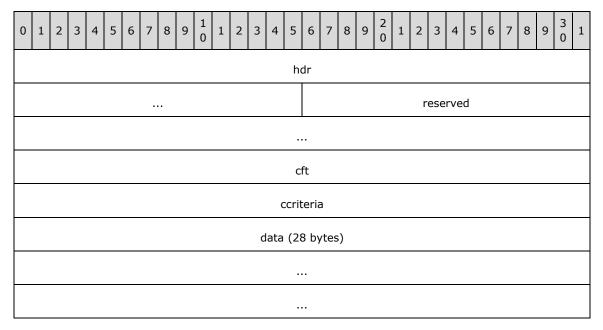

...

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x3B.

stValue (variable): A <u>SXAddl_SXString</u> structure that specifies the second value used by the label filter.

2.4.273.86 SXAddl_SXCSXFilter12_SXDXIsFilter

The **SXAddl_SXCSXFilter12_SXDXIsFilter** record specifies information for an <u>advanced filter</u>, for an <u>SXCSXFilter12 class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x3C.

reserved (6 bytes): MUST be zero, and MUST be ignored.

cft (4 bytes): A **CFT** enumeration that specifies the **custom filter** type. If the **sxft** field in SXAddl SXCSXFilter12 SXDSXFilter is equal to SXFTCOUNT, SXFTPERCENT, or SXFTSUM, this value MUST be CFTTOP10.

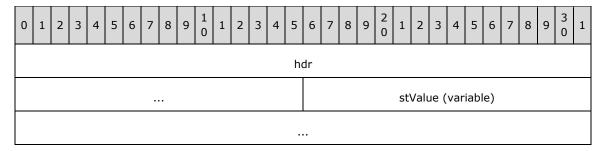

ccriteria (4 bytes): A signed integer that specifies the number of criteria. MUST be greater than or equal to zero and less than or equal to 2.

data (28 bytes): A 28-byte structure that contains the filter data.

If **cft** equals CFTTOP10 this is an <u>XIsFilter Top10</u> structure, otherwise this is an <u>XIsFilter Criteria</u> structure.

2.4.273.87 SXAddl_SXCSXFilter12_SXDXIsFilterValue1

The **SXAddl_SXCSXFilter12_SXDXIsFilterValue1** record specifies the first value of an <u>advanced filter</u> for an <u>SXCSXFilter12 class</u>.

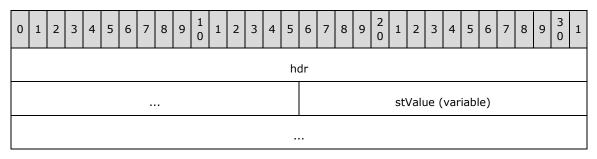

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x3D.

stValue (variable): A <u>SXAddl_SXString</u> structure that specifies the first value string of the <u>SXAddl_SXCSXFilter12_SXDXIsFilter</u> **filter**.

2.4.273.88 SXAddl_SXCSXFilter12_SXDXlsFilterValue2

The **SXAddl_SXCSXFilter12_SXDXIsFilterValue2** record specifies the second value of an <u>advanced filter</u> for an <u>SXCSXFilter12 class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1D and the value of hdr.sxd MUST equal 0x3E.

stValue (variable): A <u>SXAddl_SXString</u> structure that specifies the second value of the <u>SXAddl_SXCSXFilter12_SXDXIsFilter</u> **filter**.

2.4.273.89 SXAddl_SXCSXFilters12_SXDEnd

The **SXAddl_SXCSXFilters12_SXDEnd** record specifies the end of an <u>SXCSXFilters12 class</u>.

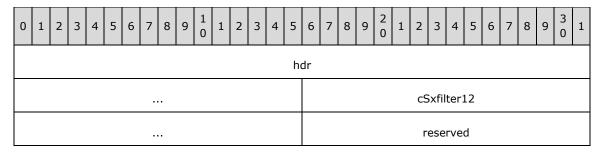

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1C and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.90 SXAddl_SXCSXFilters12_SXDId

The **SXAddI_SXCSXFilters12_SXDId** record specifies information for <u>advanced filters</u>, for an <u>SXCSXFilters12 class</u>.

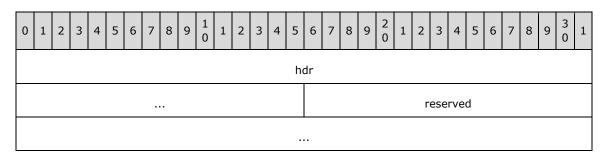

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x1C and the value of hdr.sxd MUST equal 0x00.

cSxfilter12 (4 bytes): An unsigned integer that specifies the count of PivotTable advanced filters in the **sheet**.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.91 SXAddl_SXCSXMg_SXDEnd

The **SXAddl_SXCSXMg_SXDEnd** record specifies the end of an <u>SXCSXMg class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x14 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.92 SXAddl_SXCSXMg_SXDId

The **SXAddl_SXCSXMg_SXDId** record specifies information for an **OLAP measure group**, for an <u>SXCSXMg class</u>.

 stName (variable)

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x14 and the value of hdr.sxd MUST equal 0x00.

stName (variable): An <u>SXAddl_SXString</u> structure that specifies the name of the OLAP measure group.

2.4.273.93 SXAddl_SXCSXMg_SXDUserCaption

The **SXAddl_SXCSXMg_SXDUserCaption** record specifies the display name for the **OLAP measure group** specified in this <u>SXAddl</u> record collection.

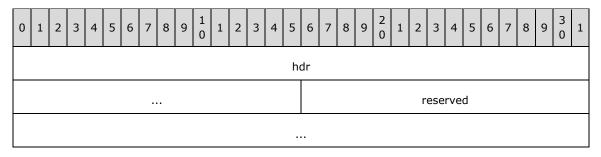

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x14 and the value of hdr.sxd MUST equal 0x1F.

stUserCaption (variable): An <u>SXAddl_SXString</u> structure that specifies the display name of the OLAP measure group.

2.4.273.94 SXAddl_SXCSXMgs_SXDEnd

The SXAddl_SXCSXMgs_SXDEnd record specifies the end of an SxcSXMgs class.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x13 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.95 SXAddl_SXCSXMgs_SXDId

The **SXAddl_SXCSXMgs_SXDId** record specifies information for an **OLAP measure group** collection, for an <u>SxcSXMgs class</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															ho	dr															
										cmgs																					
															r	ese	rve	d													
															cma	aps															

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x13 and the value of hdr.sxd MUST equal 0x00.

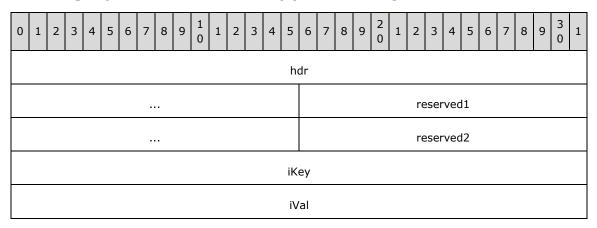

cmgs (4 bytes): An unsigned integer that specifies the number of OLAP measure groups in the OLAP measure group collection. MUST be equal to the number of SXCSXMg classes that are nested inside this SxcSXMgs class.

reserved (2 bytes): MUST be zero, and MUST be ignored.

cmaps (4 bytes): An unsigned integer that specifies the number of mappings between OLAP measure groups and **OLAP dimensions (1)** in the OLAP measure group collection. Each mapping is defined by an SXAddl_SXCSXMgs_SXDMGrpSXDHMap record. This value MUST be equal to the number of SXAddl_SXCSXMgs_SXDMGrpSXDHMap records that follow this record.

2.4.273.96 SXAddl_SXCSXMgs_SXDMGrpSXDHMap

The **SXAddl_SXCSXMgs_SXDMGrpSXDHMap** record specifies a mapping between an **OLAP** measure group and an **OLAP** dimension (1) for an <u>SxcSXMgs class</u>.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x13 and the value of hdr.sxd MUST equal 0x23.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

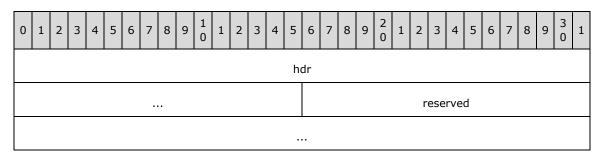

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

iKey (4 bytes): An unsigned integer that specifies a zero-based index of an SXCSXMg class in the collection of SXCSXMg classes. The SXCSXMg SXDId record of the referenced SXCSXMg class specifies an OLAP measure group in the **measure group** collection. MUST be less than the value of the **cmgs** field of the SXAddl SXCSXMgs SXDId record of this SxcSXMgs class.

iVal (4 bytes): An unsigned integer that specifies a zero-based index of the SXAddl SXCSXDH SXDSxdh record in the collection of SXAddl_SXCSXDH_SXDSxdh records in the SXCSXDH class of the containing SxcCache class of this record. The referenced record specifies an OLAP dimension (1). MUST be less than the value of the dwCount field of the SXAddl SXCSXDH SXDId record of the SXCSXDH class.

2.4.273.97 SXAddl_SXCSXrule_SXDEnd

The **SXAddl_SXCSXrule_SXDEnd** record specifies the end of an <u>SXCSXrule class</u>.

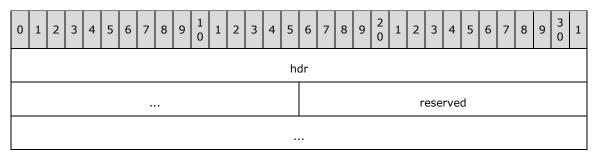

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x0C and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.98 SXAddl_SXCSXrule_SXDId

The **SXAddl_SXCSXrule_SXDId** record specifies information for a <u>PivotTable rule</u>, for the <u>SXCSXrule</u> <u>class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x0C and the value of hdr.sxd MUST equal 0x00.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.99 SXAddl_SXCSXrule_SXDSXrule

The **SXAddl_SXCSXrule_SXDSXrule** record specifies information for a <u>PivotTable rule</u>, for an SXCSXrule class.

													reserved1						
	A sxrtype						В	С	D	Е	F	G	Н	I	J	erved4			
К	L	М	N	0	Р			re	eser	vec	16					irwFirst	irwLast		
		i	coll	irs	t				i	icol	Las	t			csxfilt				
													iD	im					
												isxvd							

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x0C and the value of hdr.sxd MUST equal 0x13.

reserved1 (6 bytes): MUST be zero, and MUST be ignored.

A - reserved2 (4 bits): MUST be zero, and MUST be ignored.

sxrtype (4 bits): An unsigned integer that specifies the area of the <u>PivotTable</u> specified by this PivotTable rule. MUST be a value from the following table:

Value	Meaning
0x0	This rule applies to no area.
0x1	This rule applies to selected cells in the <u>row area</u> , <u>column area</u> , or <u>data area</u> of the PivotTable report.
0x2	This rule applies to the data area of the PivotTable report.
0x3	This rule applies to the entire PivotTable report.
0x4	This rule applies to the blank cells at the logical top-left of the PivotTable report.
0x5	This rule applies to a button shown next to a <u>pivot field</u> in the PivotTable report.
0x6	This rule applies to the blank cells at the logical top-right of the PivotTable report.

If the value of **isxvd** is not -1, MUST be 0x1 or 0x2 or 0x5.

B - fPart (1 bit): A bit that specifies whether only a portion of the <u>PivotTable area</u> is included in this rule. MUST be a value from the following table:

Value	Meaning
0x0	The entire PivotTable area is included in the rule. The irwFirst , irwLast , icolFirst , and icolLast fields are undefined and MUST be ignored.
0x1	A portion of the PivotTable area is included in the rule. The irwFirst , irwLast , icolFirst , and icolLast fields hold the relative offset into the PivotTable area included in this rule.

- **C fDataOnly (1 bit):** A bit that specifies whether only the cells in the data area are included in this PivotTable rule. If **fLabelOnly** is 1 then **fDataOnly** MUST be 0. If **sxrtype** is 0x2, the value of this field value MUST be 1.
- **D fLabelOnly (1 bit):** A bit that specifies whether only cells in the <u>page area</u>, row area, or column area are included in this PivotTable rule. If **fDataOnly** is 1 then **fLabelOnly** MUST be 0. If **sxrtype** is 0x5 or 0x6, this value MUST be 1.
- **E fGrandRw (1 bit):** A bit that specifies whether cells in the **grand total** row are included in this PivotTable rule.
- **F fGrandCol (1 bit):** A bit that specifies whether cells in the grand total column are included in this PivotTable rule.
- **G fGrandRwSav (1 bit):** A bit that specifies whether cells in the grand total row are included in this PivotTable rule. MUST be equal to **fGrandRw**.
- **H reserved3 (1 bit):** MUST be zero, and MUST be ignored.
- I fGrandColSav (1 bit): A bit that specifies whether cells in the grand total column are included in this PivotTable rule. MUST be equal to fGrandCol.
- J fFuzzy (1 bit): A bit that specifies whether the <u>pivot items</u> of the pivot field specified by this rule are treated as subtotals for the purposes of formatting when the pivot field is displayed in outline mode.

reserved4 (15 bits): MUST be zero, and MUST be ignored.

- K unused1 (1 bit): Undefined, MUST be ignored.
- **L fLineMode (1 bit):** A bit that specifies whether the area of the PivotTable report specified by this PivotTable rule is displayed in outline mode.
- M unused2 (1 bit): Undefined, MUST be ignored.
- N unused3 (1 bit): Undefined, MUST be ignored.
- O reserved5 (1 bit): MUST be zero, and MUST be ignored.
- **P fDrillOnly (1 bit):** A bit that specifies the **sort order** of the PivotTable rule filters specified by **csxfilt**. MUST be a value from the following table:

Value	Meaning
0x0	PivotTable rule filters are sorted by Pivot Field index as specified in Pivot Fields.
0x1	PivotTable rule filters are sorted by position.

reserved6 (10 bits): MUST be zero, and MUST be ignored.

- **irwFirst (1 byte):** A <u>DRwByteU</u> structure that specifies the difference between the index of the first row of the range of cells included in this rule and the index of the first row of the PivotTable.
- **irwLast (1 byte):** A DRwByteU structure that specifies the difference between the index of the last row of the range of cells included in this rule and the index of the first row of the PivotTable. If **fPart** is 1, MUST be greater than or equal to **irwFirst**.

- **icolFirst (1 byte):** A <u>DColByteU</u> structure that specifies the difference between the index of the first column of the range of cells included in this rule and the index of the first column of the PivotTable.
- **icolLast (1 byte):** A DColByteU structure that specifies the difference between the index of the last column of the range of cells included in this rule and the index of the first column of the PivotTable. If **fPart** is 1, MUST be greater than or equal to **icolFirst**.
- **csxfilt (4 bytes):** An unsigned integer that specifies the number of <u>SXAddl SXCSXfilt SXDId</u> records following this record. MUST be greater than or equal to 0. If **sxrtype** is not 0x1 or 0x2, this value MUST be 0.
- iDim (4 bytes): An signed integer that specifies the position of the pivot field within the PivotTable axis for this PivotTable rule. If isxvd is 0xFFFFFFFF or 0xFFFFFFFF this field MUST be ignored. If isxvd is between 0x00000000 and 0x000000FF, then the value of iDim depends on the value of certain fields in the sxaxis structure in isxvd. The following table shows the values that iDim MUST have given certain values of the specified fields of isxvd.sxaxis.

Value	Meaning
isxvd.sxaxis.sxaxisRw is 1	The value of iDim MUST be greater than 0 and less than the number of pivot fields on the <u>row axis</u> .
isxvd.sxaxis.sxaxisCol is 1	The value of iDim MUST be greater than 0 and less than the number of pivot fields on the <u>column axis</u> .
isxvd.sxaxis.sxaxisPage is 1	The value of iDim MUST be greater than 0 and less than the number of pivot fields on the <u>page axis</u> .
isxvd.sxaxis.sxaxisData is	The value of iDim MUST be greater than 0 and less than the number of pivot fields on the <u>data axis</u>

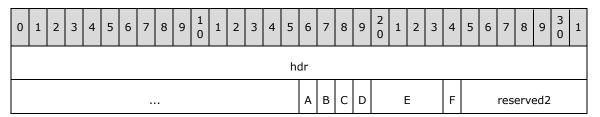

isxvd (4 bytes): A signed integer that specifies the pivot field this rule refers to. MUST be a value from the following table:

Value	Meaning
0xFFFFFFE	This rule refers to the <u>data field</u> .
0xFFFFFFF	This rule does not refer to a pivot field.
0x0000000 to 0x000000FF	This value specifies a pivot field index as specified in Pivot Fields. The pivot field index specifies which pivot field this rule refers to.

MUST be greater than or equal to 0xFFFFFFFE and less than or equal to 0x000000FF. If the value is greater than or equal to 0x00000000, MUST be less than the value of the **cDim** field of the preceding <u>SxView</u>.

2.4.273.100 SXAddl_SXCView_SXDCalcMember

The **SXAddl_SXCView_SXDCalcMember** record specifies <u>OLAP calculated members</u> properties for a <u>PivotTable view</u>, for an <u>SxcView class</u>.

	reserved3								
stName (variable)									
::									
stMDXFormula (variable)									
stMemberName (variable)									
stSourceHiera	rchy (variable)								
stParentUnq	iue (variable)								
wSolv	eOrder								

- hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x03.
- A fParentUnique (1 bit): A bit that specifies whether stParentUnique exists. If the value is 1, stParentUnique exists. If fSet is 1, this field MUST be zero.
- **B fMemberName (1 bit):** A bit that specifies whether **stMemberName** exists. If the value is 1, **stMemberName** exists. If **fSet** is 1, this field MUST be zero; otherwise, this field MUST be 1.
- **C fSourceHier (1 bit):** A bit that specifies whether **stSourceHierarchy** exists. If the value is 1, **stSourceHierarchy** exists. If **fSet** is 1, this field MUST be zero; otherwise, this field MUST be 1.
- **D fLongFormula (1 bit):** A bit that specifies whether the length of the user-specified **MDX expression** that defines the calculation is greater than 255 characters.

MUST be a value from the following table:

Value	Meaning
0	Length of the user-specified MDX expression is less than or equal to 255 characters and stMDXFormula contains the MDX.
1	Length of the user-specified MDX expression is greater than 255 characters and the user-specified MDX expression is written to a subsequent SXAddl SXCView SXDCalcMemString record.

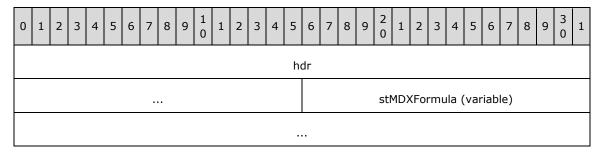

- **E reserved1 (4 bits):** MUST be zero, and MUST be ignored.
- F fSet (1 bit): A bit that specifies whether this calculation is for an OLAP named set.

reserved2 (23 bits): MUST be zero, and MUST be ignored.

- reserved3 (2 bytes): MUST be zero, and MUST be ignored.
- **stName (variable):** An <u>XLUnicodeString</u> structure that specifies the **MDX unique name** of this OLAP calculated member. The length of this field MUST be greater than 0 characters and less than or equal to 255 characters.
- **stMDXFormula (variable):** An XLUnicodeString structure that specifies the user-specified MDX expression for this OLAP calculated member. If **fLongFormula** is 1, this field does not exist. If **fLongFormula** is 0, the length of this field MUST be greater than 0 characters and less than or equal to 255 characters.
- **stMemberName (variable):** An XLUnicodeString structure that specifies the name of this OLAP calculated member. If **fMemberName** is 0, this field does not exist. If **fMemberName** is 1, the length of this field MUST be less than or equal to 255 characters.
- **stSourceHierarchy (variable):** An XLUnicodeString structure that specifies the MDX unique name of the **OLAP hierarchy** that this OLAP calculated member is associated with. If **fSourceHier** is zero this field does not exist. If **fSourceHier** is 1 then the length of this field MUST be less than or equal to 255 characters.
- **stParentUnqiue (variable):** An XLUnicodeString structure that specifies the MDX unique name of the parent **member (2)** that this OLAP calculated member is associated with. If **fParentUnique** is zero this field does not exist. If **fParentUnique** is 1 then the length of this field MUST be less than or equal to 255 characters.
- **wSolveOrder (4 bytes):** An unsigned integer that specifies the calculation order when there are multiple OLAP calculated members. The calculation order goes from lowest **wSolveOrder** value to highest. If the value is zero the calculation order is determined by the **OLAP data provider**.

2.4.273.101 SXAddl_SXCView_SXDCalcMemString

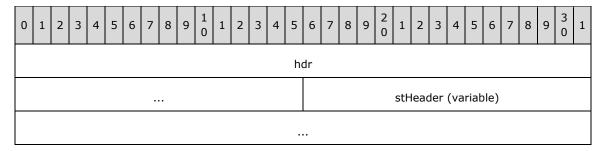

The **SXAddl_SXCView_SXDCalcMemString** record specifies a user-specified **MDX expression** for an <u>OLAP calculated member</u>, for an <u>SxcView class</u>. The other properties of the OLAP calculated member are specified in the preceding <u>SXAddl_SXCView_SXDCalcMember</u> record.

- hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x0A.
- **stMDXFormula (variable):** An <u>SXAddl SXString</u> structure that specifies the user-specified MDX expression. The length of this field MUST be greater than zero. If the <u>PivotCache functionality level</u> of the <u>associated PivotCache</u> of this <u>PivotTable view</u> is less than 3, the length of this field MUST be less than 2048 characters; otherwise, the length MUST be less than 32767 characters.

2.4.273.102 SXAddl_SXCView_SXDCompactColHdr

The **SXAddl_SXCView_SXDCompactColHdr** record specifies the <u>column area</u> caption string used in the compact PivotTable layout for a PivotTable view, for an SxcView class.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x22.

stHeader (variable): An <u>SXAddl_SXString</u> structure that specifies the caption displayed in the column area of the compact PivotTable layout. The length MUST be less than or equal to 255 characters.

2.4.273.103 SXAddl_SXCView_SXDCompactRwHdr

The **SXAddl_SXCView_SXDCompactRwHdr** record specifies the <u>row area</u> caption string used in the compact <u>PivotTable layout</u> for a <u>PivotTable view</u>, for an <u>SxcView class</u>.

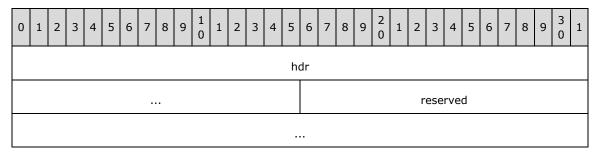

hdr (6 bytes): An SXAddIHdr structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x21.

stHeader (variable): An <u>SXAddl SXString</u> structure that specifies the caption displayed in the row area of the compact PivotTable layout. The length MUST be less than or equal to 255 characters.

2.4.273.104 SXAddl SXCView SXDEnd

The **SXAddl_SXCView_SXDEnd** record specifies the end of an SxcView class.

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.4.273.105 SXAddl_SXCView_SXDId

The **SXAddl_SXCView_SXDId** record specifies how an <u>SxcView class</u> is associated with other records for a <u>PivotTable view</u>.

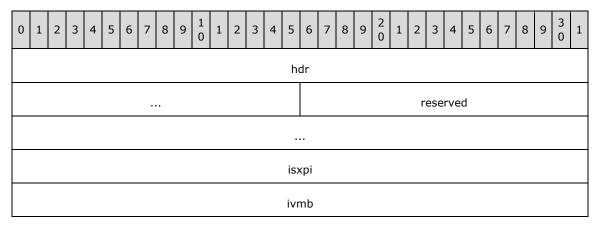

hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x00.

stName (variable): An <u>SXAddl SXString</u> structure that specifies the PivotTable view that this SxcView class applies to. The corresponding <u>SxView</u> record of this PivotTable view is the SxView record, in this <u>Worksheet substream</u>, with its **stTable** field equal to the value of this field. If there exists no such SxView record then this SxcView class MUST be ignored.

2.4.273.106 SXAddl_SXCView_SXDSXPIIvmb

The **SXAddl_SXCView_SXDSXPIIvmb** record specifies a mapping between <u>value metadata</u> and a field on the <u>page axis</u> for a <u>PivotTable view</u>, for an <u>SxcView class</u>.

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x36.

reserved (6 bytes): MUST be zero, and MUST be ignored.

isxpi (4 bytes): An unsigned integer that specifies the index of the entry on the page axis. MUST be greater than or equal to zero and less than the value of the **cDimPg** field of the <u>SxView</u> record of the PivotTable view.

ivmb (4 bytes): An unsigned integer that specifies the zero-based index of the <u>MDB</u> record in the sequence of records that conforms to the <u>MDBLOCK</u> rule. The referenced MDB specifies the value metadata. MUST be greater than or equal to zero and less than the count of MDB records.

2.4.273.107 SXAddl_SXCView_SXDTableStyleClient

The **SXAddl_SXCView_SXDTableStyleClient** record specifies <u>table style</u> properties for a <u>PivotTable</u> view, for an SxcView class.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															h	dr															
	reserved1																														
															•																
Α	A B C D E F G reserved2 stName (variable)																														

hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x1E.

reserved1 (6 bytes): MUST be zero, and MUST be ignored.

- A unused (1 bit): Undefined and MUST be ignored.
- **B fLastColumn (1 bit):** A bit that specifies whether any <u>table style elements</u> (as specified by <u>TableStyleElement</u>) with a **tseType** field equal to 0x00000004 are applied to the PivotTable view.
- C fRowStrips (1 bit): A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000005 or 0x00000006 are applied to the PivotTable view.
- **D fColumnStrips (1 bit):** A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000007 or 0x00000008 are applied to the PivotTable view.
- **E fRowHeaders (1 bit):** A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000003, 0x00000017, 0x00000018, or 0x00000019 are applied to the PivotTable view.
- **F fColumnHeaders (1 bit):** A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000001, 0x00000014, 0x00000015, or 0x00000016 are applied to the PivotTable view.
- **G fDefaultStyle (1 bit):** A bit that specifies whether to apply the default <u>TableStyle</u> to the PivotTable view.

reserved2 (9 bits): MUST be zero, and MUST be ignored.

stName (variable): An <u>LPWideString</u> structure that specifies the name of the TableStyle applied to the PivotTable view. The length MUST be greater than zero and less than or equal to 255 characters.

2.4.273.108 SXAddl SXCView SXDVer10Info

The **SXAddl_SXCView_SXDVer10Info** record specifies information about a <u>PivotTable view</u> for an SxcView class.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															h	dr															
								bVerSxMacro A B C D E F G H										Н													
Ι	I J unused														re	eser	vec	12													

- hdr (6 bytes): An <u>SXAddlHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x02.
- bVerSxMacro (1 byte): A <u>DataFunctionalityLevel</u> structure that specifies the <u>data functionality level</u> that this <u>PivotTable</u> was created with. SHOULD<129> be less than 3 if the <u>PivotCache functionality level</u> of the <u>associated PivotCache</u> is less than 3. MUST be greater than or equal to 3 if the PivotCache functionality level of the associated PivotCache is greater than or equal to 3.
- **A fDisplayImmediateItems (1 bit):** A bit that specifies whether <u>pivot items</u> are displayed in the PivotTable view even when there is no <u>pivot field</u> on the <u>data axis</u>. If **bVerSxMacro** is greater than or equal to 3 then this value MUST be 1.
- **B fEnableDataEd (1 bit):** A bit that specifies whether the user is allowed to change values in the data axis of the PivotTable view.
- C fDisableFList (1 bit): A bit that specifies whether the PivotTable field list is disabled.
- **D fReenterOnLoadOnce (1 bit):** A bit that specifies whether the PivotTable view is recalculated the next time the **workbook** is opened.
- **E fNotViewCalculatedMembers (1 bit):** A bit that specifies whether **OLAP calculated members** are **hidden** in the PivotTable view.

MUST be a value from the following table:

Value	Meaning
0	OLAP calculated members are not hidden.
1	OLAP calculated members are hidden.

MUST be ignored if the PivotTable view is a non-OLAP PivotTable view.

F - fNotVisualTotals (1 bit): A bit that specifies whether **grand totals** and subtotals in an OLAP PivotTable view include the values of hidden **OLAP members**.

MUST be a value from the following table:

Value	Meaning
0	Hidden OLAP members are not included in grand totals and subtotals.
1	Hidden OLAP members are included in grand totals and subtotals.

MUST be ignored if the PivotTable view is a non-OLAP PivotTable view.

G - fPageMultipleItemLabel (1 bit): A bit that specifies what text is displayed in a **cell** in the page area when a non-**OLAP data source** has one or more hidden pivot items.

MUST be a value from the following table:

Value	Meaning
-------	---------

Value	Meaning
0	Show text indicating that all items are displayed.
1	If the data source has one or more hidden pivot items, show text indicating that not all items are displayed, otherwise show text indicating that all items are displayed.

MUST be ignored if the PivotTable view is an OLAP PivotTable view.

H - fTensorFillCv (1 bit): A bit that specifies whether the **fill color** retrieved from the OLAP data source is used in the PivotTable view.

MUST be a value from the following table:

Value	Meaning
0	The fill color from the OLAP data source is not used.
1	If the data source is OLAP and the fill color is available from the OLAP data source, then the fill color is used.

MUST be ignored if the PivotTable view is a non-OLAP PivotTable view.

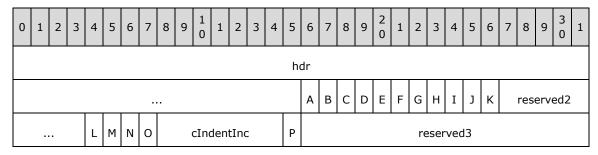

- I fHideDDData (1 bit): A bit that specifies whether the control for selecting the pivot items to be displayed in the PivotTable view is hidden.
- J reserved1 (3 bits): MUST be zero, and MUST be ignored.

unused (12 bits): Undefined, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.109 SXAddl_SXCView_SXDVer12Info

The **SXAddl_SXCView_SXDVer12Info** record specifies information for a <u>PivotTable view</u>, for an <u>SxcView class</u>.

- hdr (6 bytes): An <u>SXAddIHdr</u> structure. The value of hdr.sxc MUST equal 0x00 and the value of hdr.sxd MUST equal 0x19.
- **A fDefaultCompact (1 bit):** A bit that specifies whether new <u>pivot fields</u> added to the PivotTable view are in **compact axis** mode by default.
- **B fDefaultOutline (1 bit):** A bit that specifies whether new pivot fields added to the PivotTable view are displayed in outline format by default.
- **C fOutlineData (1 bit):** A bit that specifies whether the <u>data field</u> is displayed in outline format. See <u>Subtotalling</u> for more information.
- **D fCompactData (1 bit):** A bit that specifies whether the data field is displayed in compact axis mode. See PivotTable Layout for more information.

- E fNewDropZones (1 bit): A bit that specifies whether the application allows dragging within the PivotTable field list.
- **F fPublished (1 bit):** A bit that specifies whether this PivotTable is marked as having already been **published** to a server-based application. This bit is ignored if the **fPublishedBookItems** field of the **BookExt Conditional12** structure is zero.
- **G fTurnOffImmersive (1 bit):** A bit that specifies whether a user interface for manipulating PivotTable options is displayed.

MUST be a value from the following table:

Value	Meaning
0	A user interface for manipulating PivotTable options is displayed.
1	A user interface for manipulating PivotTable options is not displayed.

H - fSingleFilterPerField (1 bit): A bit that specifies whether this PivotTable can have multiple **filters** per field.

MUST be a value from the following table:

Value	Meaning
0	The PivotTable can have many filters per field.
1	The PivotTable can have a maximum of one filter per field.

I - fNonDefaultSortInFlist (1 bit): A bit that specifies whether PivotTable fields are sorted in the PivotTable field list.

MUST be a value from the following table:

Value	Meaning
0	PivotTable fields are not sorted in the PivotTable field list.
1	PivotTable fields are sorted in the PivotTable field list.

- **J reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **K fDontUseCustomLists (1 bit):** A bit that specifies whether to use **custom lists** when sorting the PivotTable.

MUST be a value from the following table:

Value	Meaning								
0	Custom lists are used when sorting the PivotTable.								
1	Custom lists are not used when sorting the PivotTable.								

reserved2 (9 bits): MUST be zero, and MUST be ignored.

L - fHideDrillIndicators (1 bit): A bit that specifies whether the expand/collapse buttons are hidden in the PivotTable view.

- **M fPrintDrillIndicators (1 bit):** A bit that specifies whether the expand/collapse buttons are printed.
- N fMemPropsInTips (1 bit): A bit that specifies whether OLAP member properties are displayed in ToolTips.
- **O fNoPivotTips (1 bit):** A bit that specifies whether ToolTips are displayed on cells in the PivotTable view.

MUST be a value from the following table:

Value	Meaning								
0	ToolTips are displayed on cells in the PivotTable view.								
1	ToolTips are not displayed on cells in the PivotTable view.								

- **cIndentInc (7 bits):** An unsigned integer that specifies the number of characters to indent row labels by when compact axis mode is used. See PivotTable Layout for more information.
- **P fNoHeaders (1 bit):** A bit that specifies whether field captions are displayed in the PivotTable layout.

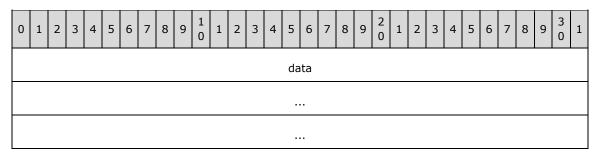

MUST be a value from the following table:

Value	Meaning								
0	Field captions are displayed in the PivotTable layout.								
1	Field captions are not displayed in the PivotTable layout.								

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

2.4.273.110 SXAddl SXCView SXDVerUpdInv

The **SXAddl_SXCView_SXDVerUpdInv** record specifies the record-handling behavior for following records of the <u>SXCView class</u>.

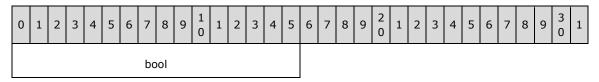

data (12 bytes): An SXAddl SXDVerUpdInv structure. The value of data.hdr.sxc MUST equal 0x00 and the value of data.hdr.sxd MUST equal 0x01. The value of data.dwVersionInvalidates MUST equal 0x0002 or 0x00FF.

If the value of **data.dwVersionInvalidates** is not 0x00FF and is greater than or equal to the value of the **VerSxLastUpdated** field of the <u>QsiSXTag</u> record of this <u>PivotTable view</u>, the following records of this SXCView class, including nested classes or until another SXAddl_SXCView_SXDVerUpdInv record is encountered, MUST be ignored.

2.4.274 SxBool

The **SxBool** record specifies a Boolean <u>cache item</u> or value.

bool (2 bytes): A Boolean (section 2.5.14) that specifies the record value.

2.4.275 SXDB

The **SXDB** record specifies <u>PivotCache</u> properties.

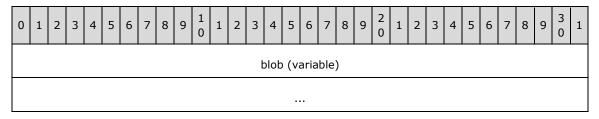

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
crdbdb																															
	idstm A B C D E F unused1																														
	unused2 cfdbdb																														
						(cfdl	Tot														С	rdb	Use	d						
							vsT	уре	!													(cch	Who)						
													ı	rgb	(v	arial	ble))													
			•••																												

- crdbdb (4 bytes): A signed integer that specifies the number of <u>cache records</u> for this PivotCache. MUST be greater than or equal to 0. MUST be 0 for <u>OLAP PivotCaches</u>. MUST be ignored if **fSaveData** is 0.
- idstm (2 bytes): An unsigned integer that specifies the stream that contains the data for this PivotCache. MUST be equal to the value of the idstm field of the <u>SXStreamID</u> record that specifies the PivotCache stream that contains this record.
- A fSaveData (1 bit): A bit that specifies whether cache records exist. MUST be 0 for OLAP PivotCaches.
- **B fInvalid (1 bit):** A bit that specifies whether the cache records are in the not-valid state. MUST be equal to 1 if the PivotCache functionality level is greater than or equal to 3. MUST be equal to 1 for OLAP PivotCaches. See cache records for more information.
- C fRefreshOnLoad (1 bit): A bit that specifies whether the PivotCache is refreshed on load.
- **D fOptimizeCache (1 bit):** A bit that specifies whether optimization is applied to the PivotCache to reduce memory usage. MUST be 0 and MUST be ignored for a non-**ODBC** PivotCache.
- **E fBackgroundQuery (1 bit):** A bit that specifies whether the **query** used to **refresh** the PivotCache is executed asynchronously. MUST be ignored if **vsType** not equals 0x0002.

- **F fEnableRefresh (1 bit):** A bit that specifies whether refresh of the PivotCache is enabled. MUST be equal to 0 if the PivotCache functionality level is greater than or equal to 3. MUST be equal to 0 for OLAP PivotCaches.
- unused1 (10 bits): Undefined and MUST be ignored.
- unused2 (2 bytes): Undefined and MUST be ignored.
- **cfdbdb (2 bytes):** A signed integer that specifies the number of <u>cache fields</u> that corresponds to the <u>source data</u>. MUST be greater than or equal to 0.
- **cfdbTot (2 bytes):** A signed integer that specifies the number of cache fields in the PivotCache. MUST be greater than or equal to 0.
- crdbUsed (2 bytes): An unsigned integer that specifies the number of records used to calculate the PivotTable report. Records excluded by PivotTable view filtering are not included in this value.
 MUST be 0 for OLAP PivotCaches.
- **vsType (2 bytes):** An unsigned integer that specifies the type of source data. MUST be equal to the value of the **sxvs** field of the <u>SXVS</u> record that follows the SXStreamID record that specifies the PivotCache stream that contains this record.
- **cchWho (2 bytes):** An unsigned integer that specifies the number of characters in **rgb**. MUST be equal to 0xFFFF, or MUST be greater than or equal to 1 and less than or equal to 0x00FF.
- rgb (variable): An optional XLUnicodeStringNoCch structure that specifies the name of the user who last refreshed the PivotCache. MUST exist if and only if the value of cchWho is not equal to 0xFFFF. If this field exists, the length MUST equal cchWho. The length of this value MUST be less than 256 characters. The name is an application-specific setting that is not necessarily related to the User Names Stream ABNF.

2.4.276 SXDBB

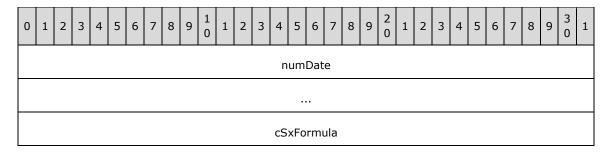

The **SXDBB** record specifies the values of all the <u>cache fields</u> that have a **fAllAtoms** field of the <u>SXFDB</u> record equal to 1 and that correspond to <u>source data</u> entities, as specified by cache fields, for a single <u>cache record</u>.

blob (variable): An array of 1-byte and 2-byte unsigned integers that specifies indexes to <u>cache</u> <u>items</u> of cache fields that correspond to source data entities, as specified by cache fields, that have an **fAllAtoms** field of the SXFDB record equal to 1. The order of the indexes specified in the array corresponds to the order of the cache fields as they appear in the <u>PivotCache</u>. Each unsigned integer specifies a zero-based index of a record in the sequence of records that conforms to the <u>SRCSXOPER</u> rule of the associated cache field. The referenced record from the SRCSXOPER rule specifies a cache item that specifies a value for the associated cache field. If the **fShortIitms** field of an SXFDB record of the cache field equals 1, the index value for this cache field is stored in this field in two bytes; otherwise, the index value is stored in this field in a single byte.

2.4.277 SXDBEx

The **SXDBEx** record specifies additional <u>PivotCache</u> properties.

numDate (8 bytes): A <u>DateAsNum</u> structure that specifies the date and time on which the PivotCache was created or last refreshed.

cSxFormula (4 bytes): An unsigned integer that specifies the count of <u>SXFormula</u> records for this cache.

2.4.278 SXDI

The **SXDI** record specifies a <u>data item</u> for a <u>PivotTable view</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
	isxvdData														iiftab																
	df														isxvd																
							is	κvi								ifmt															
	cchName												stName (variable)																		

isxvdData (2 bytes): A signed integer that specifies a pivot field index as specified in Pivot Fields.

If the PivotTable view is a non-<u>OLAP PivotTable view</u>, the values in the <u>source data</u> associated with the associated <u>cache field</u> of the referenced pivot field are aggregated as specified in this record.

If the PivotTable view is an OLAP PivotTable view, the associated <u>pivot hierarchy</u> of the referenced pivot field specifies the **OLAP measure** for this data item and the **iiftab** field is ignored. See <u>Association of Pivot Hierarchies and Pivot Fields and Cache Fields</u> to determine the associated pivot hierarchy.

MUST be greater than or equal to zero and less than the value of the **cDim** field of the preceding SxView record.

The value of the **sxaxis.sxaxisData** field of the <u>Sxvd</u> record of the referenced pivot field MUST be 1.

iiftab (2 bytes): A signed integer that specifies the aggregation function.

MUST be a value from the following table:

Value	Meaning
0x0000	Sum of values
0x0001	Count of values

Value	Meaning
0x0002	Average of values
0x0003	Max of values
0x0004	Min of values
0x0005	Product of values
0x0006	Count of numbers
0x0007	Statistical standard deviation (sample)
0x0008	Statistical standard deviation (population)
0x0009	Statistical variance (sample)
0x000A	Statistical variance (population)

df (2 bytes): A signed integer that specifies the calculation used to display the value of this data item.

MUST be a value from the following table:

Value	Meaning
0x0000	The data item value is displayed.
0x0001	Display as the difference between this data item value and the value of the <u>pivot item</u> specified by isxvi .
0x0002	Display as a percentage of the value of the pivot item specified by isxvi .
0x0003	Display as a percentage difference from the value of the pivot item specified by isxvi .
0x0004	Display as the running total for successive pivot items in the pivot field specified by isxvd .
0x0005	Display as a percentage of the total for the row containing this data item.
0x0006	Display as a percentage of the total for the column containing this data item.
0x0007	Display as a percentage of the grand total of the data item.
0x0008	Calculate the value to display using the following formula: ((this data item value) * (grand total of grand totals)) / ((row grand total) * (column grand total))

isxvd (2 bytes): A signed integer that specifies a pivot field index as specified in Pivot Fields. The referenced pivot field is used in calculations as specified by the **df** field.

If **df** is 0x0001, 0x0002, 0x0003, or 0x0004 then the value of **isxvd** MUST be greater than or equal to zero and less than the value of the **cDim** field in the preceding SxView record. Otherwise, the value of **isxvd** is undefined and MUST be ignored.

isxvi (2 bytes): A signed integer that specifies the pivot item used by df.

If df is 0x0001, 0x0002, or 0x0003 then the value of this field MUST be a value from the following table:

Value	Meaning
0 to 0x7EFE	A pivot item index, as specified by Pivot Items, that specifies a pivot item in the pivot field specified by isxvd . MUST be less than the cItm field of the Sxvd record of the pivot field specified by isxvd .
0x7FFB	The previous pivot item in the pivot field specified by isxvd .
0x7FFC	The next pivot item in the pivot field specified by isxvd.

Otherwise, the value is undefined and MUST be ignored.

ifmt (2 bytes): An IFmt structure that specifies the number format for this item.

cchName (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stName** field. If the value is 0xFFFF then **stName** does not exist. Otherwise, the value MUST be greater than zero and less than or equal to 0x00FF.

MUST NOT be 0xFFFF when the <u>PivotCache functionality level</u> is less than 3, or for non-OLAP PivotTable view .

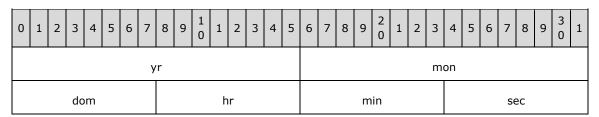

stName (variable): An XLUnicodeStringNoCch structure that specifies the name of this data item. A value that is not NULL specifies that this string is used to override the name in the corresponding cache field.

MUST NOT exist if **cchName** is 0xFFFF. Otherwise, MUST exist and the length MUST equal **cchName**.

If this string is not NULL and the PivotTable view is a non-OLAP PivotTable view, this field MUST be unique within all SXDI records in this PivotTable view.

2.4.279 SXDtr

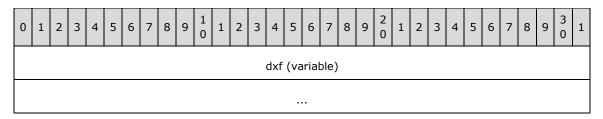

The **SXDtr** record specifies a <u>cache item</u> or a value in the <u>PivotCache</u> that is an instance in time, expressed as a date and time of day.

- **yr (2 bytes):** An unsigned integer that specifies the year component of the date. MUST be greater than or equal to 1900 and MUST be less than or equal to 9999. If **dom** is 0, **yr** MUST be 1900.
- mon (2 bytes): An unsigned integer that specifies the month component of the date. MUST be greater than or equal to 1, and MUST be less than or equal to 12. If dom is equal to 0, mon MUST be equal to 1.
- **dom (1 byte):** An unsigned integer that specifies the day of month component of the date. MUST be greater than or equal to 0 and MUST be less than or equal to 31.
- **hr (1 byte):** An unsigned integer that specifies the hour component of the time of day. MUST be less than or equal to 23.
- **min (1 byte):** An unsigned integer that specifies the minute component of the time of day. MUST be less than or equal to 59.
- **sec (1 byte):** An unsigned integer that specifies the second component of the time of day. MUST be less than or equal to 59.

2.4.280 SxDXF

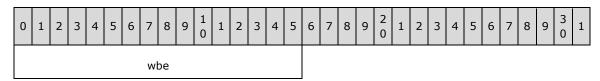

The **SxDXF** record specifies differential formatting applied to a PivotTable area.

dxf (variable): A <u>DXFN12NoCB</u> structure that specifies the differential formatting.

2.4.281 SxErr

The **SxErr** record specifies an error <u>cache item</u> or value.

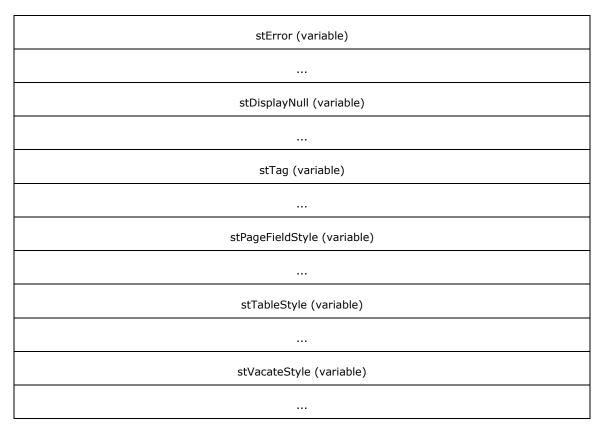

wbe (2 bytes): An unsigned integer that specifies the error record value. MUST be a value from the following table<130>:

Value	Meaning
0x00	#NULL!
0x07	#DIV/0!
0x0F	#VALUE!
0x17	#REF!
0x1D	#NAME?
0x24	#NUM!
0x2A	#N/A

2.4.282 SXEx

The **SXEx** record specifies additional properties of a <u>PivotTable view</u> and specifies the beginning of a collection of records as defined by the <u>Worksheet substream</u> **ABNF**. The collection of records specifies **selection** and formatting properties for the PivotTable view.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
csxformat														cchErrorString																	
cchNullString												cch	Tag																		
						C	sxs	elec	ct							crwPage															
						c	coll	Pag	e							Α	A cWrapPage B C reserved2														
D	D E F G H I J K reserved3 cchPageFieldStyle																														
cchTableStyle													cchVacateStyle																		

- **csxformat (2 bytes):** An unsigned integer that specifies the number of <u>SxFormat</u> records that follow this record. MUST be less than or equal to 0xFFFF.
- **cchErrorString (2 bytes):** An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stError** field. If the value is 0xFFFF, then **stError** does not exist. MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.
- **cchNullString (2 bytes):** An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stDisplayNull** field. If the value is 0xFFFF, then **stDisplayNull** does not exist. MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.
- **cchTag (2 bytes):** An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stTag** field. If the value is 0xFFFF, then **stTag** does not exist. MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.
- **csxselect (2 bytes):** An unsigned integer that specifies the number of <u>SxSelect</u> records that follow this record. MUST be less than or equal to 0xFFFF.
- **crwPage (2 bytes):** A <u>DRw</u> structure that specifies the number of rows in the page area (see <u>Location and Body</u>) of the PivotTable view.
- **ccolPage (2 bytes):** A <u>DCol</u> structure that specifies the number of columns in the page area (see Location and Body) of the PivotTable view.
- A fAcrossPageLay (1 bit): A bit that specifies how <u>pivot fields</u> are laid out in the page area (see Location and Body) when there are multiple pivot fields on the <u>page axis</u>. MUST be a value from the following table:

Value	Meaning
0x0	Pivot fields are displayed in the page area from the top to the bottom first, as fields are added, before moving to another column.
0x1	Pivot fields are displayed in the page area from left to right first, as fields are added, before moving to another row.

cWrapPage (8 bits): An unsigned integer that specifies the number of pivot fields in the page area (see Location and Body) to display before moving to another row or column, as specified by **fAcrossPageLay**.

MUST be less than or equal to 0xFF. A value of 0 means that no wrap is allowed.

- **B unused (1 bit):** Undefined and MUST be ignored.
- C reserved1 (1 bit): MUST be zero and MUST be ignored.

reserved2 (5 bits): MUST be zero and MUST be ignored.

- **D fEnableWizard (1 bit):** A bit that specifies whether a wizard user interface is displayed to work with the PivotTable view.
- **E fEnableDrilldown (1 bit):** A bit that specifies whether details can be shown for **cells** in the data area, as specified by <u>PivotTable Layout</u>.
- **F fEnableFieldDialog (1 bit):** A bit that specifies whether a user interface for setting properties of a pivot field can be displayed.
- **G fPreserveFormatting (1 bit):** A bit that specifies whether formatting is preserved when the PivotTable view is recalculated.

If the value is 1, **csxformat** MUST be 0 and there MUST be no SxFormat records following this record.

- H fMergeLabels (1 bit): A bit that specifies whether empty cells adjacent to the cells displaying pivot item captions of pivot fields on the row axis and column axis of the PivotTable view are merged into a single cell with center-aligned text.
- **I fDisplayErrorString (1 bit):** A bit that specifies whether the PivotTable view displays the custom error string **stError** in cells that contain errors.
- **J fDisplayNullString (1 bit):** A bit that specifies whether the PivotTable view displays the custom string **stDisplayNull** in cells that contain NULL values.
- K fSubtotalHiddenPageItems (1 bit): A bit that specifies whether hidden pivot items, as specified by <u>SXVI</u> records with the fHidden field equal to 1, of a pivot field on the page axis with the isxvi field of the corresponding <u>SXPI Item</u> structure equal to 0x7FFD are filtered out when calculating the PivotTable view.

MUST be 0 for non-OLAP data sources if the PivotCache functionality level is 3.

reserved3 (8 bits): MUST be zero and MUST be ignored.

cchPageFieldStyle (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stPageFieldStyle** field. If the value is 0xFFFF, then **stPageFieldStyle** does not exist.

MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.

cchTableStyle (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the **stTableStyle** field. If the value is 0xFFFF, then **stTableStyle** does not exist.

MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.

cchVacateStyle (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch structure in the stVacateStyle field. If the value is 0xFFFF, then stVacateStyle does not exist.

MUST be 0xFFFF or MUST be greater than zero and less than or equal to 0x00FF.

stError (variable): An XLUnicodeStringNoCch structure that specifies a custom string displayed in cells that contain errors when the value of **fDisplayErrorString** is 1. The length is specified in **cchErrorString**.

This field is optional and MUST NOT exist if **cchErrorString** is 0xFFFF.

stDisplayNull (variable): An XLUnicodeStringNoCch structure that specifies a custom string displayed in cells that contain NULL values when **fDisplayNullString** is 1. The length is specified in **cchNullString**.

This field is optional and MUST NOT exist if **cchNullString** is 0xFFFF.

stTag (variable): An XLUnicodeStringNoCch structure that specifies a custom string saved with the PivotTable view. The length is specified in **cchTag**.

This field is optional and MUST NOT exist if **cchTag** is 0xFFFF.

stPageFieldStyle (variable): An XLUnicodeStringNoCch structure that specifies the **style** used in the page area (see Location and Body) of the PivotTable view. The style is specified by the StyleExt record with its **stName** field equal to this field's value. If **cchPageFieldStyle** is 0xFFFF or less than 1, no style is applied. The length is specified in **cchPageFieldStyle**.

This field is optional and MUST NOT exist if **cchPageFieldStyle** is 0xFFFF.

stTableStyle (variable): An XLUnicodeStringNoCch structure that specifies the style used in the body of the PivotTable view. The style is specified by the StyleExt record with its **stName** field equal to this field's value. If **cchTableStyle** is 0xFFFF or less than 1, no style is applied. The length is specified in **cchTableStyle**.

This field is optional and MUST NOT exist if **cchTableStyle** is 0xFFFF.

stVacateStyle (variable): An XLUnicodeStringNoCch structure that specifies the style applied to cells that become empty when the PivotTable view is recalculated. The style is specified by the StyleExt record with its **stName** field equal to this field's value. If **cchVacateStyle** is 0xFFFF or less than 1, no style is applied. The length is specified in **cchVacateStyle**.

This field is optional and MUST NOT exist if **cchVacateStyle** is 0xFFFF.

2.4.283 SXFDB

The **SXFDB** record specifies properties for a <u>cache field</u> within a <u>PivotCache</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е	F	G	Н	Ι	J	K	L	М	N	0	Р	ifdbParent															

ifdbBase	citmUnq
csxoper	cisxoper
catm	stFieldName (variable)
,	

- **A fAllAtoms (1 bit):** A bit that specifies whether this cache field has a collection of <u>cache items</u>. If **fSomeUnhashed** is equal to 1, this value MUST be equal to 0.
- **B fSomeUnhashed (1 bit):** Undefined, and MUST be ignored. If the **fAllAtoms** field is equal to 1, MUST be equal to 0.
- C fUsed (1 bit): Undefined, and MUST be ignored.
- **D fHasParent (1 bit):** A bit that specifies whether **ifdbParent** specifies a reference to a parent grouping cache field. For more information, see <u>Grouping</u>. If the **fCalculatedField** field is equal to 1, then this field MUST be equal to 0.
- E fRangeGroup (1 bit): A bit that specifies whether this cache field is grouped by using numeric grouping or date grouping, as specified by Grouping. If this field is equal to 1, then this record MUST be followed by a sequence of SXString records, as specified by the GRPSXOPER rule. The quantity of SXString records is specified by Csxoper. If this field is equal to 1, then this record MUST be followed by a sequence of records that conforms to the SXRANGE rule that specifies the grouping properties for the ranges of values.
- **F fNumField (1 bit):** A bit that specifies whether the cache items in this cache field contain at least one numeric cache item, as specified by SXNum. If **fDateInField** is equal to 1, this field MUST be equal to 0.
- **G unused1 (1 bit):** Undefined and MUST be ignored.
- **H fTextEtcField (1 bit):** A bit that specifies whether the cache items contain text data. If **fNumField** is 1, this field MUST be ignored.
- I fnumMinMaxValid (1 bit): A bit that specifies whether a valid minimum or maximum value can be computed for the cache field. MUST be equal to 1 if fDateInField or fNumField is equal to 1.
- **J fShortIitms (1 bit):** A bit that specifies whether there are more than 255 cache items in this cache field. If **catm** is greater than 255, this value MUST be equal to 1; otherwise it MUST be 0.
- K fNonDates (1 bit): A bit that specifies whether the cache items in this cache field contain values that are not time or date values. If this cache field is a grouping cache field, as specified by Grouping, then this field MUST be ignored. Otherwise, if fDateInField is equal to 1, then this field MUST be 0.
- **L fDateInField (1 bit):** A bit that specifies whether the cache items in this cache field contain at least one time or date cache item, as specified by SXDtr. If **fNonDates** is equal to 1, then this field MUST be equal to 0.
- M unused2 (1 bit): Undefined and MUST be ignored.
- **N fServerBased (1 bit):** A bit that specifies whether this cache field is a server-based page field when the corresponding <u>pivot field</u> is on the <u>page axis</u> of the <u>PivotTable view</u>, as specified in source data.

This value applies only to an **ODBC** PivotCache. MUST NOT be equal to 1 if **fCantGetUniqueItems** is equal to 1. If **fCantGetUniqueItems** is equal to 1, then the <u>ODBC connection</u> cannot provide a list of unique items for the cache field.

MUST be 0 for a cache field in a non-ODBC PivotCache.

O - fCantGetUniqueItems (1 bit): A bit that specifies whether a list of unique values for the cache field was not available while refreshing the source data. This field applies only to a PivotCache that uses ODBC source data and is intended to be used in conjunction with optimization features. For example, the application can optimize memory usage when populating PivotCache records if it has a list of unique values for a cache field before all the records are retrieved from the ODBC connection. Or, the application can determine the appropriate setting of fServerBased based on this value.

MUST be 0 for fields in a non-ODBC PivotCache.

- **P fCalculatedField (1 bit):** A bit that specifies whether this field is a <u>calculated field</u>. The formula (section <u>2.2.2</u>) of the calculated field is stored in a directly following <u>SXFormula</u> record. If **fHasParent** is equal to 1, this field MUST be equal to 0.
- **ifdbParent (2 bytes):** An unsigned integer that specifies the cache field index, as specified by Cache Fields, of the grouping cache field for this cache field. MUST be greater than or equal to 0x0000 and less than the **cfdbTot** field of the <u>SXDB</u> record of this PivotCache. If **fHasParent** is equal to 0, then this field MUST be ignored. If **fHasParent** is equal to 1, and **fRangeGroup** is equal to 1, and the **iByType** field of the <u>SXRng</u> record of this cache field is greater than 0, then the **iByType** field of the SXRng record of the cache field specified by **ifdbParent** MUST be 1 and the **iByType** field of the SXRng record of the cache field specified by **ifdbParent** MUST be greater than the **iByType** field of the SXRng record of this cache field.
- **ifdbBase (2 bytes):** An unsigned integer that specifies the cache field index, as specified by Cache Fields, of the base cache field, as specified by Grouping, for the cache field specified by this record. MUST be greater than or equal to 0x0000 and less than the value of the **cfdbdb** field of the SXDB record of this PivotCache. If the cache field specified by this record is not a grouping cache field, then this field MUST be ignored.
- citmUnq (2 bytes): Undefined and MUST be ignored.
- **csxoper (2 bytes):** An unsigned integer that specifies the number of cache items in this cache field when this cache field is a grouping cache field, as specified by Grouping. There MUST be an equivalent number of sequences of records that conform to the GRPSXOPER rule following this record that specify the cache items. If the **fRangeGroup** field and the **fCalculatedField** field are equal to 0 and this cache field corresponds to a source data entity, this field MUST be equal to 0. If the **fRangeGroup** field is equal to 1, this value MUST be greater than or equal to 1.
- **cisxoper (2 bytes):** An unsigned integer that specifies the number of cache items in the base cache field that are grouped by this cache field. There MUST be an equivalent number of SxIsxoper records following this record that specify which cache item in this cache field groups each of the cache items in the base cache field. For more information, see Grouping.
- **catm (2 bytes):** An unsigned integer that specifies the number of cache items in the collection sequences of records that conform to the SRCSXOPER rule in this cache field. If **fAllAtoms** is 0, then this field MUST be equal to 0x0000. If this cache field corresponds to source data entities then there MUST be an equal number of SRCSXOPER rules in this cache field.
- **stFieldName (variable):** An <u>XLUnicodeString</u> structure that specifies the name of the cache field. MUST be less than or equal to 255 characters long.

2.4.284 SXFDBType

The **SXFDBType** record specifies the type of data contained in this <u>cache field</u>.

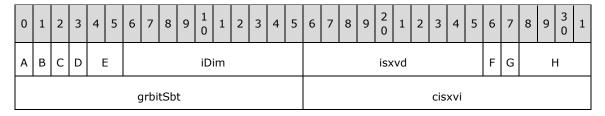

wTypeSql (2 bytes): An <u>ODBCType</u> structure that specifies the **ODBC** data type as returned by the ODBC provider of the data in this cache field.

2.4.285 SxFilt

The **SxFilt** record specifies information for a <u>PivotTable rule</u> filter.

See <u>SxRule</u> for more information about <u>PivotTable views</u> that this record applies to.

- A sxaxisRw (1 bit): A bit that specifies whether this filter refers to the <u>row axis</u>. MUST be zero if sxaxisCol is 1, if sxaxisPage is 1, or if sxaxisData is 1.
- **B sxaxisCol (1 bit):** A bit that specifies whether this filter refers to the <u>column axis</u>. MUST be zero if **sxaxisRw** is 1, if **sxaxisPage** is 1, or if **sxaxisData** is 1.
- **C sxaxisPage (1 bit):** A bit that specifies whether this filter refers to the <u>page axis</u>. MUST be zero if **sxaxisRw** is 1, if **sxaxisCol** is 1, or if **sxaxisData** is 1.
- **D sxaxisData (1 bit):** A bit that specifies whether this filter refers to the <u>value axis</u>. MUST be zero if **sxaxisRw** is 1, if **sxaxisCol** is 1, or if **sxaxisPage** is 1.
- **E reserved1 (2 bits):** MUST be zero, and MUST be ignored.
- **iDim (10 bits):** A signed integer that specifies the zero-based position of the <u>PivotTable field</u> within the <u>PivotTable axis</u> specified by **sxAxis**. MUST be greater than or equal to 0 and less than or equal to 31.
- **isxvd (10 bits):** A signed integer that specifies the <u>data field</u>, pivot field, or <u>cache field</u> that this filter refers to. MUST be greater than or equal to 0 and less than or equal to 255 or equal to -2. MUST be a value from the following table:

Value	Value of the fCacheBased field of the preceding SxRule record	Meaning
-2	MUST be 0	Specifies that this rule refers to the data field.
A value greater than or equal to zero	0	Specifies a pivot field index as specified by pivot fields. The pivot field index specifies which pivot field is referenced by this filter.

Value	Value of the fCacheBased field of the preceding SxRule record	Meaning
A value greater than or equal to zero	1	Specifies a cache field index as specified by cache fields. The cache field index specifies which cache field is referenced by this filter.

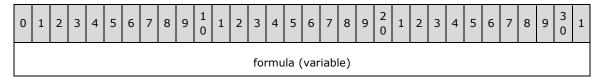

- **F fSelected (1 bit):** A bit that specifies whether the header of the PivotTable field this filter refers to is included in the PivotTable rule that this record belongs to.
- **G reserved2 (1 bit):** MUST be zero, and MUST be ignored.
- **H reserved3 (4 bits):** MUST be zero, and MUST be ignored.
- **grbitSbt (2 bytes):** A signed integer that specifies the set of subtotals used in this filter. MUST be one of the following bits, or a combination of the following bits. DEFAULT MUST be combined only with DATA, BLANK, or both.

Bits	Meaning
0x0001	DATA
0x0002	DEFAULT
0x0004	SUM
0x0008	COUNTA
0x0010	AVERAGE
0x0020	MAX
0x0040	MIN
0x0080	PRODUCT
0x0100	COUNT
0x0200	STDEV
0x0400	STDEVP
0x0800	VAR
0x1000	VARP
0x4000	BLANK

cisxvi (2 bytes): An unsigned integer that specifies the number of indexes in the <u>SxItm</u> record that follows this record.

2.4.286 SxFmla

The **SxFmla** record specifies a <u>PivotParsedFormula</u> and specifies the beginning of a collection of records as defined by the <u>pivot cache</u> storage **ABNF**. The collection of records specifies the <u>PivotTable calculated field</u> or <u>calculated item</u> formula (section <u>2.2.2</u>).

...

formula (variable): A PivotParsedFormula structure that specifies the formula.

2.4.287 **SxFormat**

The **SxFormat** record specifies the beginning of a collection of records as defined by the <u>Worksheet substream</u> **ABNF**. The collection of records specifies the <u>differential formatting</u> and specifies a <u>PivotRule</u> that specifies the area of the <u>PivotTable view</u> to apply the formatting to.

rlType (4 bits): A Boolean (section 2.5.14) that specifies whether formatting was applied to the PivotTable view. MUST be a value from the following table:

Value	Description
0x0000	The formatting was cleared.
0x0001	The formatting was applied.

reserved (12 bits): MUST be zero, and MUST be ignored

cbData (2 bytes): An unsigned integer that specifies the number of bytes in the <u>SxDXF</u> record that follows this record. MUST be zero if **rIType** is zero. If this field is zero then zero SxDXF records MUST follow this record.

2.4.288 SXFormula

The **SXFormula** record specifies the <u>cache field</u> that a <u>calculated item</u> formula (section <u>2.2.2</u>) applies to. The calculated item formula is stored in the last <u>SxFmla</u> record preceding this record.

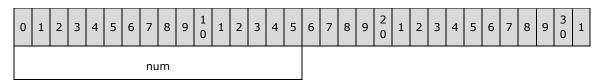

reserved (2 bytes): MUST be zero, and MUST be ignored.

ifdb (2 bytes): A signed integer that specifies the cache field index as specified in Cache Fields. The cache field index specifies which cache field the calculated item formula applies to. MUST be greater than or equal to -1. If the value is -1, the calculated item formula applies to all cache fields. If the cache field is a source field, the value MUST be equal to the value of **isxvd** in the last <u>SxRule</u> record preceding this record.

2.4.289 SXInt

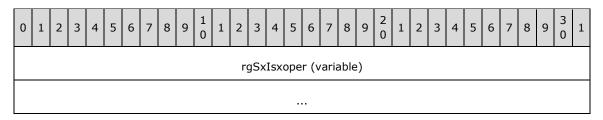

The **SXInt** record specifies a number in the PivotCache.

num (2 bytes): A signed integer that specifies a number in the PivotCache.

2.4.290 SxIsxoper

The **SxIsxoper** record specifies the mapping between <u>cache items</u> in a <u>cache field</u> and cache items in a grouping cache field for discrete grouping, as specified by <u>Grouping</u>. The grouping cache field is specified by the <u>SXFDB</u> record preceding this record. The value of the **fRangeGroup** field of the SXFDB record MUST be 0 and the value of the **csxoper** field of the SXFDB record MUST be greater than 0. This record immediately follows the collection of records that specifies cache item values for the SXFDB record as defined in the <u>PivotCache Storage</u> part **ABNF**.

rgSxIsxoper (variable): An array of 2-byte unsigned integers. Each element of the array corresponds to a cache item in the cache field being grouped by the grouping cache field. The value of each element specifies the index of the cache item, as specified by Cache Items, in the grouping cache field that the cache item in the cache field is grouped under.

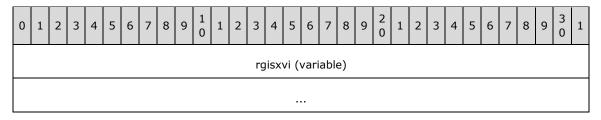

The count of elements in the array MUST be equal to the value of the **cisxoper** field of the SXFDB record preceding this record and is identical to the number of cache items in the cache field being grouped. The value of each element MUST be less than the total number of cache items in the grouping cache field.

2.4.291 SxItm

The **SxItm** record specifies references to <u>pivot items</u>, <u>data items</u>, or <u>cache items</u> as part of a <u>PivotTable rule</u> filter.

If this record exists, the cisxvi field of the preceding SxFilt MUST be greater than 0.

See SxRule for more information about PivotTable views that this record applies to.

rgisxvi (variable): An array of 2-byte unsigned integers that specifies pivot items, data item, or cache items associated with **ranges** of **cells** included in the PivotTable rule. The array MUST be sorted in ascending order. The size of the array MUST be equal to the value of the **cisxvi** field of the preceding SxFilt record. Each unsigned 2-byte integer in the array MUST be less than or equal to 32500, or equal to 32767. The value 32767 specifies that there is no associated pivot item,

data item, or cache item with the index. For more information, see PivotTable Rules. The meaning of this field is specified in the following table:

Value of the isxvd field of the preceding SxFilt record	Value of the fCacheBased field of the preceding SxRule record	Meaning of the index
-2	Not used	A data item index that specifies a data item associated with ranges of cells included in the PivotTable rules. MUST be less than the value of the cDimData field of the associated <u>SxView</u> record.
>= 0	0	A pivot item index that specifies a pivot item in the <u>pivot field</u> specified by the isxvd field of the SxFilt record. The referenced pivot item is associated with ranges of cells included in the PivotTable rule. MUST be less than the cItems field of the <u>Sxvd</u> record.
	1	A cache item index, as specified by cache items, within the <u>cache field</u> specified by the isxvd field of the SxFilt record in the current <u>PivotCache</u> . The referenced cache item is associated with ranges of cells included in the PivotTable rule. MUST be less than the total number of cache items within the cache field associated with the pivot field specified by the isxvd field of the SxFilt record.

2.4.292 SxIvd

The **SxIvd** record specifies an array of <u>SxIvdRw</u> or <u>SxIvdCol</u>.

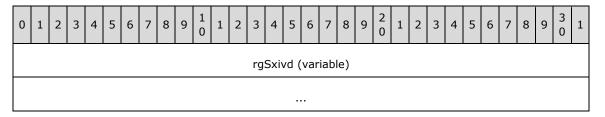

An array of SxIvdRw specifies all items for the <u>row axis</u> of the <u>PivotTable view</u>. An array of SxIvdCol specifies all items on <u>column axis</u> of the PivotTable view.

Two or fewer records of this type appear in the file depending on the values of the **cDimRw** and **cDimCol** fields of the SxView record of the PivotTable view.

If the **cDimRw** and **cDimCol** fields of the SxView record are both greater than zero, then two records of this type appear in the file for the PivotTable view. The first record is an array of SxIvdRw and the second record is an array of SxIvdCol.

If the value of the **cDimRw** field of the SxView record is greater than zero and the value of the **cDimCol** field of the SxView record is equal to zero, then only one record of this type appears in the file for the PivotTable view and it is an array of SxIvdRw.

If the value of the **cDimCol** field of the SxView record is greater than zero and the value of the **cDimRw** field of the SxView record is equal to zero, then only one record of this type appears in the file for the PivotTable view and it is an array of SxIvdCol.

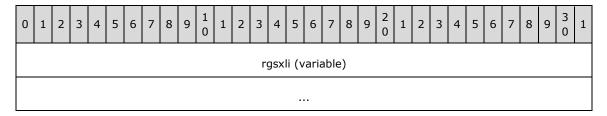

rgSxivd (variable): An array of SxIvdRw or SxIvdCol items.

If this is an array of SxIvdRw, the count of elements in the array MUST equal the value of the **cDimRw** field of the SxView record.

If this is an array of SxIvdCol, the count of elements in the array MUST equal the value of the **cDimCol** field of the SxView record.

2.4.293 SXLI

The **SXLI** record specifies <u>pivot lines</u> for the <u>row area</u> or <u>column area</u> of a <u>PivotTable view</u>.

rgsxli (variable): An array of SXLIItem.

Zero or two records of this type appear in the file for each PivotTable view depending on the values of the **cRw** and **cCol** fields of the associated <u>SxView</u> record.

If the value of either of the **cRw** or **cCol** fields of the associated SxView is greater than zero, then two records of this type MUST exist in the file for the associated SxView. The first record contains row area pivot lines and the second record contains column area pivot lines.

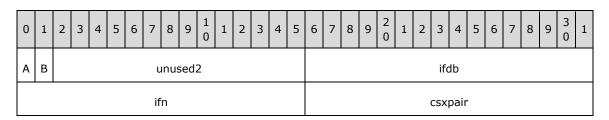

The count of SXLIItem structures in **rgsxli**, which are row area pivot lines, MUST equal the **cRw** field of SxView.

The count of SXLIItem structures in **rgsxli**, which are column area pivot lines, MUST equal the **cCol** field of SxView.

The associated SxView record is the SxView record of the PivotTable view.

2.4.294 SxName

The **SxName** record specifies information used for a <u>calculated field</u> or <u>calculated item</u> and that specifies the beginning of a collection of records as specified by the <u>pivot cache</u> storage **ABNF**. When used for a calculated field, this record specifies the index of a <u>cache field</u> used in a calculated field formula (section <u>2.2.2</u>). When used for a calculated item, this record is followed by a collection of <u>SxPair</u> records that specify a <u>pivot item</u> used in a calculated item formula (section 2.2.2).

- A unused1 (1 bit): Undefined and MUST be ignored.
- **B fErrName (1 bit):** A bit that specifies whether this record is not valid. MUST be set to 1 if **ifdb** field is set to -1.

unused2 (14 bits): Undefined and MUST be ignored.

ifdb (2 bytes): A signed integer that specifies a cache field index. The cache field index specifies a cache field used in a calculated field formula. MUST be greater than or equal to -1. MUST be set to

-1 if **csxpair** is greater than 0. MUST be set to -1 when the calculated field formula cannot be computed because the cache field used in the formula is removed.

ifn (2 bytes): A signed integer that MUST be set to -1.

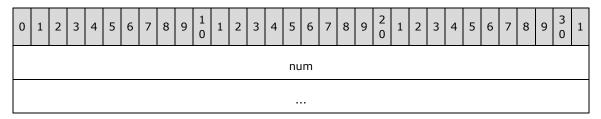

csxpair (2 bytes): An unsigned integer that specifies the count of contiguous SXPair records that follow this record. MUST be less than or equal to 1. MUST be equal to 0 if and only if this record is in a calculated field.

2.4.295 SxNil

The **SxNil** record specifies an empty <u>cache item</u> or value.

2.4.296 SXNum

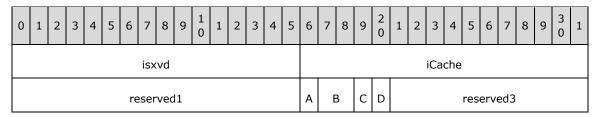

The **SXNum** record specifies a numeric <u>cache item</u> or value.

num (8 bytes): An Xnum (section 2.5.342) structure that specifies the numeric record value.

2.4.297 SXPair

The **SXPair** record specifies a reference to a <u>pivot item</u> used to compute the value of a <u>calculated item</u> in a PivotTable.

isxvd (2 bytes): An unsigned integer that specifies a <u>cache field</u> index. This index specifies a cache field that contains the <u>cache</u> item associated with the pivot item specified by **iCache**.

iCache (2 bytes): A signed integer that specifies a pivot item of the <u>PivotTable view</u> associated with this record as specified by <u>Associated PivotCache</u>. This pivot item is used in a calculated item formula (section <u>2.2.2</u>). If more than one PivotTable view is associated with this record, **iCache** specifies a pivot item for each such PivotTable view.

If the value of **fPhysical** is 0, **iCache** is a cache item index and specifies the pivot item associated with that cache item.

Otherwise, if the value of **fRelative** is 0 or if no pivot item in the visible item collection has a pivot item index smaller than the pivot item index of the current pivot item, **iCache** is a visible item index. Otherwise, the pivot item specified by **iCache** is the pivot item whose visible item index equals the value of **iCache** + 1 + the largest visible item index whose associated pivot item has a pivot item index smaller than the pivot item index of the current pivot item. If this value is less than 0 or greater than or equal to the number of elements in the visible item collection, no pivot item is specified.

The current pivot item is the pivot item in the current <u>pivot field</u> that corresponds to the calculated item that contains this record.

The current pivot field is the pivot field of the PivotTable view associated with the cache field specified by **isxvd**.

The visible item collection is the ordered collection of all pivot items specified by the sequence of records that conforms to the <u>PIVOTVD</u> rule associated with the current pivot field that satisfy the following criteria:

- The value of the **fHidden** field of the <u>SXVI</u> record associated with the pivot item is 0.
- The value of the **fMissing** field of the SXVI record associated with the pivot item is 0 or the value of the **fShowAllItems** field of the SXVI record associated with the current pivot field is 1.
- The value of the itmType field of the SXVI record associated with the pivot item is 0.

A visible item index is specified to be the zero-based index of a pivot item in the visible item collection.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

- **A fFormula (1 bit):** A bit that specifies whether the item is a calculated item. If **fPhysical** is 1, it MUST have the same value as the **fFormula** field of the SXVI record corresponding to the pivot item specified by **iCache**.
- **B reserved2 (2 bits):** MUST be zero, and MUST be ignored.
- C fPhysical (1 bit): A bit that specifies whether iCache specifies a cache item index.

Value	Meaning
0	iCache specifies a cache item index.
1	iCache does not specify a cache item index.

D - fRelative (1 bit): A bit that specifies whether the item is referred to by relative position rather than absolute position. If **fPhysical** is 0, **fRelative** MUST be 0 and MUST be ignored. If **fPhysical** is 1, **fRelative** MUST be a value from the following table:

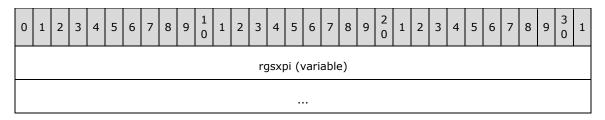

Value	Meaning
0	Absolute position.
1	Position relative to the calculated item referring this item.

reserved3 (11 bits): MUST be zero, and MUST be ignored.

2.4.298 SXPI

The **SXPI** record specifies the <u>pivot fields</u> and information about filtering on the <u>page axis</u> of a <u>PivotTable view</u>.

MUST exist if and only if the value of the ${\bf cDimPg}$ field of the ${\bf \underline{SxView}}$ record of the PivotTable view is greater than zero.

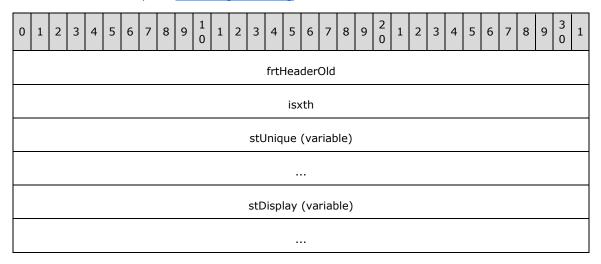

rgsxpi (variable): An array of <u>SXPI Item</u>s that specifies the pivot fields and information about filtering on the page axis of a PivotTable view. The number of array elements MUST equal the value of the **cDimPg** field of the SxView record of the PivotTable view.

2.4.299 SXPIEx

The **SXPIEx** record specifies **OLAP** extensions to the <u>page axis</u> of a <u>PivotTable view</u>. The number of SXPIEx records MUST equal the number of array elements in the **rgsxpi** field of the <u>SXPI</u> record. Each SXPIEx record corresponds to the <u>SXPI Item</u> at the same position in the **rgsxpi** field of the SXPI record.

For more information, see **OLAP Page Filtering**.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x080E.

isxth (4 bytes): An unsigned integer that specifies a <u>pivot hierarchy</u> index, as specified in Pivot Hierarchies, of the pivot hierarchy associated with this entry on the page axis. The **sxaxis.sxaxisPage** field of the <u>SXTH</u> record of the pivot hierarchy MUST be 1.

stUnique (variable): A <u>XLUnicodeString</u> structure that specifies the unique name of the **OLAP member** that is used for filtering. The length of the string MUST be less than or equal to 255.

stDisplay (variable): A XLUnicodeString structure that specifies the caption of this OLAP member. The length of the string MUST be less than or equal to 255.

2.4.300 SXRng

The **SXRng** record specifies properties for numeric grouping or date grouping of <u>cache items</u> in a grouping <u>cache field</u>, as specified by <u>Grouping</u>. The values of the **fRangeGroup** and **fCalculatedField** fields of the <u>SXFDB</u> record of this cache field MUST be 1 and 0, respectively.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	C unused																													

A - fAutoStart (1 bit): A bit that specifies whether the <u>source data</u> is used to set the starting range value.

Value	Meaning
0	The starting range value is not recalculated from the source data on the next refresh.
1	The starting range value is recalculated from the source data on the next refresh.

B - fAutoEnd (1 bit): A bit that specifies whether the source data is used to set the ending range value.

Value	Meaning
0	The ending range value is not recalculated from the source data on the next refresh.
1	The ending range value is recalculated from the source data on the next refresh.

C - iByType (3 bits): An unsigned integer that specifies the grouping criteria.

If the value of the **fNumField** field of the SXFDB record of this cache field is 1, **iByType** specifies numeric grouping, as specified by Grouping. In this case, **iByType** MUST be 0 and this record MUST be followed by three <u>SXNum</u> records specifying the starting number, the ending number, and the interval size, respectively. Additionally, the ending number MUST be greater than or equal to the starting number.

If the value of the **fNumField** field of the SXFDB record of this cache field is 0, **iByType** specifies date grouping, as specified by Grouping. In this case, **iByType** MUST be greater than 0. Additionally, this record MUST be followed by two <u>SXDtr</u> records followed by one <u>SXInt</u> record specifying the starting date/time, the ending date/time, and the interval size, respectively. The ending date/time MUST be greater than or equal to the starting date/time. If this cache field corresponds to source data entities, the collection of sequences of records that conform to the <u>SRCSXOPER</u> rule in this cache field MUST contain only SXDtr and <u>SxNil</u> records.

iByType MUST be a value from the following table:

Value	Meaning	Restriction on the value of the catm field of the SXFDB record of this cache field, dictated by the value of iByType.
0	Group by numeric value.	No restriction.
1	Group by seconds.	MUST be 62.

Value	Meaning	Restriction on the value of the catm field of the SXFDB record of this cache field, dictated by the value of iByType.
2	Group by minutes.	MUST be 62.
3	Group by hours.	MUST be 26.
4	Group by days.	MUST be 368.
5	Group by months.	MUST be 14.
6	Group by quarters.	MUST be 6.
7	Group by years.	No restriction.

unused (11 bits): Undefined and MUST be ignored.

2.4.301 SxRule

The **SxRule** record specifies areas or parts of a one or more <u>PivotTable views</u>, as specified in <u>PivotTable rules</u>, and that specifies the beginning of a collection of <u>SxFilt</u> records as specified by the <u>Common Productions</u> **ABNF**. Each SxFilt record specifies an individual area or part of the PivotTable view.

If this record occurs as part of the specification of a PivotTable view, references (in this record and in the collection) to <u>pivot fields</u>, the <u>data field</u>, and <u>pivot items</u> are instances of those entities in the context of the PivotTable view.

If this record occurs as part of the specification of a <u>PivotCache</u>, references (in this record and the collection) to PivotTable view, pivot fields, the data field, and pivot items are instances of those entities in the context of all the <u>associated PivotTable views</u> of the PivotCache.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
iDim isxvd											Α	В	С	D	9	sxrT	уре	9	Е	F	G	Н	Ι	J	K	L					
	reserved												csxFilt																		
irwFirst (optional) irwLast (optional)										icc	lFir	st (opt	ion	al)			ico	olLa	st (opt	ion	al)								

iDim (8 bits): An unsigned integer that specifies the zero-based position of the pivot field specified by **isxvd** within the <u>PivotTable axis</u>. MUST be greater than or equal to 0 and less than or equal to 255.

isxvd (8 bits): An unsigned integer that specifies the data field, pivot field, or <u>cache field</u> that this rule refers to. MUST be equal to 0xFF if this record is followed by any SxFilt records. MUST be a value from the following table:

Value	Value of fCacheBased	Meaning
0 to 0xFD	0	Specifies a pivot field index, as specified by pivot fields, to the pivot field that this rule refers to.
0 to 0xFD	1	Specifies a cache field index, as specified by cache fields, to the

Value	Value of fCacheBased	Meaning								
		cache field that this rule refers to.								
0xFE	MUST be 0	Specifies that this rule refers to the data field.								
0xFF	0	Specifies that the rule is followed by zero or more SxFilt records, which specify the pivot fields that this rule refers to.								
0xFF	1	Specifies that the rule is followed by zero or more SxFilt records, which specify the cache fields that this rule refers to.								

A - sxaxisRw (1 bit): A bit that specifies whether the <u>row axis</u> is referenced by this record.

MUST be zero if **sxaxisCol** is 1, **sxaxisPage** is 1, or **sxaxisData** is 1.

B - sxaxisCol (1 bit): A bit that specifies whether the column axis is referenced by this record.

MUST be zero if **sxaxisRw** is 1, **sxaxisPage** is 1, or **sxaxisData** is 1.

C - sxaxisPage (1 bit): A bit that specifies whether the page axis is referenced by this record.

MUST be zero if **sxaxisRw** is 1, **sxaxisCol** is 1, or **sxaxisData** is 1.

D - sxaxisData (1 bit): A bit that specifies whether the value axis is referenced by this record.

MUST be zero if **sxaxisRw** is 1, **sxaxisCol** is 1, or **sxaxisPage** is 1.

sxrType (4 bits): An unsigned integer that specifies the PivotTable view area that this rule refers to. MUST be a value from the following table:

Value	Meaning
0x0	Does not refer to any area.
0x1	Refers to one or more pivot fields specified by SxFilt records that follow this record.
0x2	Refers to cells displaying values of <u>data items</u> specified by SxFilt records that follow this record.
0x3	Refers to the entire PivotTable view.
0x4	Refers to the cells at the top-left of the PivotTable view, or at the top-right for a right-to-left sheet . For more information about this area, see <u>Location and Body</u> .
0x5	Refers to a cell displaying a pivot field caption. The pivot field is specified by isxvd .
0x6	Refers to the cells at the top-right of the PivotTable view, or at the top-left for a right-to-left sheet. For more information about this area, see Location and Body.

This rule is followed by SxFilt records if and only if that value of **sxrType** is equal to 0x1 or 0x2.

- **E fPart (1 bit):** A bit that specifies whether only a portion of the PivotTable view area is included in this rule. If the value equals 1, **irwFirst**, **irwLast**, **icolFirst**, and **icolLast** hold the relative location in the PivotTable view area included in this rule.
- **F fDataOnly (1 bit):** A bit that specifies whether only the data cells of the PivotTable view are included in this rule. MUST be 0 if **fLabelOnly** is equal to 1.
- **G fLabelOnly (1 bit):** A bit that specifies whether only the labels of the PivotTable view are included in this rule. MUST be 1 if **sxrType** is equal to 0x5 or 0x6. MUST be 0 if **fDataOnly** is equal to 1.

- H fGrandRw (1 bit): A bit that specifies whether the grand total row is included in this rule.
- I fGrandCol (1 bit): A bit that specifies whether the grand total column is included in this rule.
- **J fGrandRwSav (1 bit):** A bit that specifies whether the grand total row was included in this PivotTable rule when the PivotTable rule was created.
- K fCacheBased (1 bit): A bit that specifies whether isxvd specifies a cache field in the PivotCache, or a pivot field or the data field in a PivotTable view.

Value	Meaning									
0	isxvd specifies a pivot field or the data field in a PivotTable view.									
1	isxvd specifies a cache field in the PivotCache.									

- L fGrandColSav (1 bit): A bit that specifies whether the grand total column was included in this PivotTable rule when the PivotTable rule was created.
- reserved (2 bytes): MUST be zero, and MUST be ignored.
- **csxFilt (2 bytes):** An unsigned integer that specifies the number of SxFilt records following this record. MUST be zero if **sxrType** is neither 0x1 nor 0x2.
- **irwFirst (1 byte):** An optional unsigned integer that specifies the offset of the first row, from the first cell in the PivotTable view area to the first cell in the partial area included in this rule. MUST be less than or equal to 255. This field MUST NOT exist if **fPart** is equal to 0.
- irwLast (1 byte): An optional unsigned integer that specifies the offset of the last row, from the first cell in the PivotTable view area to the last cell in the partial area included in this rule. MUST be greater than or equal to irwFirst and less than or equal to 255. This field MUST NOT exist if fPart is equal to 0.
- **icolFirst (1 byte):** An optional unsigned integer that specifies the offset of the first column, from the first cell in the PivotTable view area to the first cell in the partial area included in this rule. MUST be less than or equal to 255. This field MUST NOT exist if **fPart** is equal to 0.
- icolLast (1 byte): An optional unsigned integer that specifies the offset of the last column, from the first cell in the PivotTable view area to the last cell in the partial area included in this rule. MUST be greater than or equal to icolFirst and less than or equal to 255. This field MUST NOT exist if fPart is equal to 0.

2.4.302 SxSelect

The **SxSelect** record specifies information about **selected cells** in the <u>PivotTable</u> report for a <u>PivotTable view</u>. The selection is stored in the <u>PivotTable rule</u> following this record.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
						re	eser	vec	11										рі	nn						re	eser	vec	12		
						S	xax	isAd	ct													i	Din	nAc	t						
iLiStart																iLi	٩ct														

			iLiľ	Min			iLiMax				
			rwC	Click	(colClick				
		rw	Clic	kPr	ev		colClickPrev				
cClick	Α	В	С	D	Е	unused					

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

pnn (1 byte): A <u>PaneType</u> structure that specifies the **active pane**.

reserved2 (1 byte): MUST be zero, and MUST be ignored.

sxaxisAct (2 bytes): An <u>SXAxis</u> structure that specifies the <u>PivtotTable Axis</u> of the PivotTable **selection**.

The value of the **sxaxisData** field of SXAxis MUST be zero.

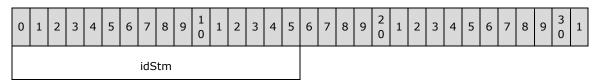

- **iDimAct (2 bytes):** An unsigned integer that specifies the zero-based field position of the field that is selected within the PivtotTable Axis.
- **iLiStart (2 bytes):** An unsigned integer that specifies the zero-based position of the <u>PivotTable line</u> where the selection operation started. MUST be greater than or equal to the **iLiMin** field and less than or equal to the **iLiMax** field.
- **iLiAct (2 bytes):** An unsigned integer that specifies the zero-based position of the PivotTable line that was most recently included in the selection. MUST be greater than or equal to zero and less than or equal to the **iLiMax** field.
- **iLiMin (2 bytes):** An unsigned integer that specifies the zero-based position of the minimum PivotTable line that could be included in the selection. MUST be greater than or equal to zero and less than or equal to the **iLiMax** field.
- **iLiMax (2 bytes):** An unsigned integer that specifies the zero-based position of the maximum PivotTable line that could be included in the selection. MUST be greater than or equal to zero. MUST be greater than or equal to the **iLiMin** field.
- **rwClick (2 bytes):** An RwU structure that specifies the row of the cell where the user last clicked for the PivotTable selection.
- **colClick (2 bytes):** A <u>ColU</u> structure that specifies the column of the cell where the user last clicked for the PivotTable selection.
- **rwClickPrev (2 bytes):** An RwU structure that specifies the row of the cell previously clicked by the user on the PivotTable selection.
- **colClickPrev (2 bytes):** A ColU structure that specifies the column of the cell previously clicked on the PivotTable selection.
- **cClick (5 bits):** An unsigned integer that specifies the number of clicks made by the user to refine the current PivotTable selection.
- A fLabelOnly (1 bit): A bit that specifies that only cells in the <u>row area</u>, <u>column area</u>, or <u>page area</u> are selected.
- **B fDataOnly (1 bit):** A bit that specifies that only cells in the <u>data area</u> are selected.

- C fToggleDataHeader (1 bit): A bit that specifies whether the PivotTable selection toggle is enabled. The selection toggle enables a method for the user to select values, labels, or both values and labels.
- **D fSelectionClick (1 bit):** A bit that specifies whether any selections on the PivotTable were refined by the user.
- **E fExtendable (1 bit):** A bit that specifies whether an additional PivotTable line can be added to the current selection.

unused (6 bits): Undefined and MUST be ignored.

2.4.303 SXStreamID

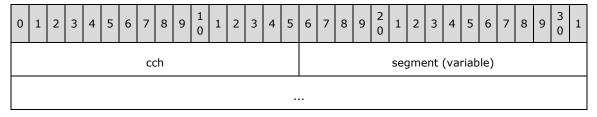

The **SXStreamID** record specifies a stream in the <u>PivotCache storage</u>.

idStm (2 bytes): An unsigned integer that specifies a stream in the PivotCache storage. The stream specified is the one that has its name equal to the hexadecimal representation of this field. The four-digit hexadecimal string representation of this field, where each hexadecimal letter digit is a capital letter, MUST be equal to the name of a stream in the PivotCache storage.

2.4.304 **SXString**

The **SXString** record specifies a segment of a string that contains information about a <u>PivotCache</u> or an <u>external connection</u>. When this record occurs in a sequence of records that conforms to the <u>SRCSXOPER</u> rule or the <u>GRPSXOPER</u> rule, then it specifies a <u>cache item</u> with a string value.

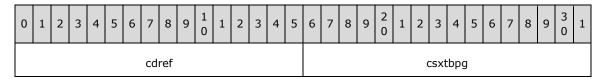

cch (2 bytes): An unsigned integer that specifies the length, in characters, of the <u>XLUnicodeStringNoCch</u> structure in the **segment** field. If **cch** is 0xFFFF, **segment** MUST NOT exist.

segment (variable): An XLUnicodeStringNoCch structure that specifies a segment of the string. This exists only if the value of the **cch** field is different than 0xFFFF.

2.4.305 SXTbl

The **SXTbl** record stores information about <u>multiple consolidation ranges</u>.

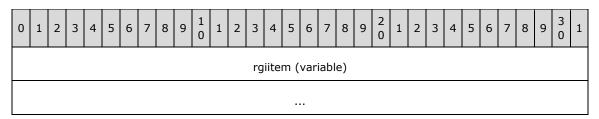

- cdref (2 bytes): An unsigned integer that specifies the number of multiple consolidation ranges used as <u>source data</u> for the <u>PivotCache</u>. MUST be equal to the number of <u>DConRef</u>, <u>DConBin</u>, or <u>DConName</u> records that follow this record.
- **csxtbpg (2 bytes):** An unsigned integer that specifies the number of SxTbpg records that follow this record. MUST be equal to **cdref**.
- **cPages (15 bits):** An unsigned integer that specifies the number of optional <u>cache fields</u> in the PivotCache, as specified by Multiple Consolidation Ranges. MUST be less than or equal to 0x0004.
- **A fAutoPage (1 bit):** A bit that specifies whether there is one automatically created cache field with <u>cache items</u> qualifying each source data **range** of the multiple consolidation ranges PivotCache. MUST be a value from the following table:

Value	Meaning
0	The cache fields that qualify the source data ranges are not automatically created.
1	There is one automatically created cache field with cache items qualifying each source data range of the multiple consolidation ranges PivotCache. Each cache item qualifies one source data range.

2.4.306 SxTbpg

The **SxTbpg** record specifies properties of <u>source data</u> **ranges** for a <u>multiple consolidation ranges</u> <u>PivotCache</u>. There MUST be one SxTbpg record for each source data range. The order of the SxTbpg records corresponds to the order of the <u>DREF</u> records that precede this record.

rgiitem (variable): An array of signed 2-byte integers that associates <u>cache items</u> with the range associated with this record. Each element in this array is associated with a <u>cache field</u>, as specified in the multiple consolidation ranges overview.

The number of elements in this array MUST be equal to the value of the **cPages** field of the preceding $\underline{\mathsf{SXTbl}}$ record and MUST be equal to the number of $\underline{\mathsf{SXTBRGIITM}}$ records that follow this record. The n^{th} element in this array is associated with the n^{th} SXTBRGIITM record that follows this record.

Each element in this array MUST be less than the value of the **cItems** field of the associated SXTBRGIITM. Each element in this array MUST be a value from the following table:

Value	Meaning								
-1	Specifies that a blank cache item is used.								
Greater than or equal to zero	Specifies the zero-based index of an <u>SXString</u> record in the collection of SXString records directly following the associated SXTBRGIITM record.								

2.4.307 SXTBRGIITM

The **SXTBRGIITM** record specifies the beginning of a collection of <u>SXString</u> records as specified by the <u>Globals Substream</u> **ABNF**. The collection of SXString records specifies the values corresponding to the <u>cache items</u> for an optional <u>cache field</u> in a <u>multiple consolidation ranges PivotCache</u>.

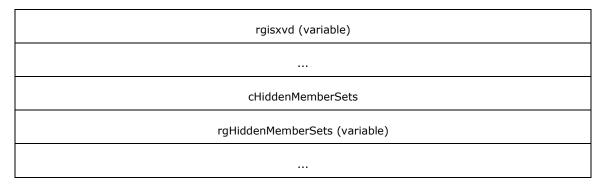

cItems (2 bytes): An unsigned integer that specifies the number of SXString records that follow this record. MUST be less than or equal to 65534.

2.4.308 SXTH

The **SXTH** record specifies properties of a <u>pivot hierarchy</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

	stDimension (variable)																														
															cis	‹vd															

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x080D.

- **A fMeasure (1 bit):** A bit that specifies whether this pivot hierarchy is an **OLAP measure**, which means it can be placed only on the <u>data axis</u>.
- **B unused1 (1 bit):** Undefined and MUST be ignored.
- **C fOutlineMode (1 bit):** A bit that specifies whether the <u>pivot fields</u> representing the levels of this pivot hierarchy have the **fOutline** field of the <u>SXVDEx</u> record set to 1 when the pivot fields are first created. See <u>Subtotalling</u> for more information.
- **D fEnableMultiplePageItems (1 bit):** A bit that specifies whether multiple **OLAP members** can be selected when the pivot hierarchy is on the <u>page axis</u> of the <u>PivotTable view</u>.
- **E fSubtotalAtTop (1 bit):** A bit that specifies whether the pivot fields representing the levels of this pivot hierarchy have the **fSubtotalAtTop** field of the SXVDEx record set to 1 when the pivot fields are first created. See Subtotalling for more information.
- **F fSet (1 bit):** A bit that specifies whether this pivot hierarchy is an **OLAP named set**. MUST be 0 if **fMeasure** is 1.
- **G fDontShowFList (1 bit):** A bit that specifies whether this pivot hierarchy is hidden in the list of pivot fields that can be added to or removed from the PivotTable view.
- **H fAttributeHierarchy (1 bit):** A bit that specifies whether this pivot hierarchy is an **attribute hierarchy**.
- I fTimeHierarchy (1 bit): A bit that specifies whether this pivot hierarchy is a time hierarchy.
- **J fFilterInclusive (1 bit):** A bit that specifies whether <u>manual filters</u> applied to this pivot hierarchy are inclusive or exclusive. MUST be a value from the following table:

Value	Meaning
0	OLAP members specified in the manual filter are excluded from the PivotTable view along with their descendants.
1	OLAP members specified in the manual filter are included from the PivotTable view along with their ascendants and descendants.

For more information, see **OLAP Manual Filters**.

- K unused2 (1 bit): Undefined and MUST be ignored.
- L fKeyAttributeHierarchy (1 bit): A bit that specifies whether this pivot hierarchy is the key attribute hierarchy in the OLAP dimension (1).

- M fKPI (1 bit): A bit that specifies whether this pivot hierarchy is a key performance indicator (KPI) hierarchy.
- unused3 (19 bits): Undefined and MUST be ignored.
- **sxaxis (2 bytes):** An <u>SXAxis</u> structure that specifies the axis or axes this pivot hierarchy is present on. For more information, see <u>PivotTable Axes</u>.
- If sxaxis.sxaxisData is 1, then sxaxis.sxaxisRw, sxaxis.sxaxisCol, and sxaxis.sxaxisPage MUST be zero.
- If sxaxis.sxaxisRw is 1, then sxaxis.sxaxisCol and sxaxis.sxaxisPage MUST be zero.
- If sxaxis.sxaxisCol is 1, sxaxis.sxaxisPage MUST be zero.

reserved (2 bytes): MUST be zero, and MUST be ignored.

- **isxvd (4 bytes):** A signed integer that specifies a pivot field index as specified by Pivot Fields. The pivot field index specifies the associated pivot field for this pivot hierarchy.
- If the value of **sxaxis.sxaxisPage** is 1 or the value of **sxaxis.sxaxisData** is 1, then the value of this field MUST be greater than or equal to 0 and MUST be less than the value of the **cDim** field of the <u>SxView</u> record of the PivotTable view, and the value of **cisxvd** MUST be 0. Also, the **sxaxis** field of the <u>Sxvd</u> record of the referenced pivot field MUST be equal to the **sxaxis** field of this record.
- If both **sxaxis.sxaxisPage** and **sxaxis.sxaxisData** are equal to 0, the value of this field MUST be ignored.
- **csxvdXl (4 bytes):** A signed integer that specifies the number of pivot fields in the PivotTable view on PivotTable axes for this pivot hierarchy. MUST be greater than or equal to 0.

If sxaxis.sxaxisPage is 1 or sxaxis.sxaxisData is 1, then the value of this field MUST be 1.

If sxaxis.sxaxisPage is 0, sxaxis.sxaxisData is 0, sxaxis.sxaxisRw is 0 and sxaxis.sxaxisCol is 0, the value of this field MUST be 0.

If **sxaxis.sxaxisRw** is 1 or **sxaxis.sxaxisCol** is 1, the restrictions on the value of this field vary depending on the value of the **stAll** string, as specified in the following table:

stAll	Value of csxvdXI									
Empty	MUST be equal to the value of cisxvd									
Not empty	MUST be equal to cisxvd – 1									

- **N fDragToRow (1 bit):** A bit that specifies whether this pivot hierarchy can be placed on the <u>row</u> axis of the PivotTable view. MUST be 0 if **fMeasure** is 1.
- **O fDragToColumn (1 bit):** A bit that specifies whether this pivot hierarchy can be placed on the column axis of the PivotTable view. MUST be 0 if **fMeasure** is 1.
- **P fDragToPage (1 bit):** A bit that specifies whether this pivot hierarchy can be placed on the page axis of the PivotTable view. MUST be 0 if **fMeasure** is 1.
- **Q fDragToData (1 bit):** A bit that specifies whether this pivot hierarchy can be placed on the data axis of the PivotTable view.
- **R fDragToHide (1 bit):** A bit that specifies whether this pivot hierarchy can be removed from the PivotTable view.

unused4 (11 bits): Undefined and MUST be ignored.

- **stUnique (variable):** An <u>XLUnicodeString</u> structure that specifies the **MDX unique name** of this pivot hierarchy. The length of the string MUST be greater than zero and less than or equal to 255.
- **stDisplay (variable):** An XLUnicodeString structure that specifies the display name of this pivot hierarchy. The length of the string MUST be greater than zero and less than or equal to 255.
- **stDefault (variable):** An XLUnicodeString structure that specifies the MDX unique name of the default **member (2)** of this pivot hierarchy. The length of the string MUST be less than or equal to 255.
- **stAll (variable):** An XLUnicodeString structure that specifies the unique name of the **ALL** member (2) of this pivot hierarchy. The length of the string MUST be less than or equal to 255. A length of zero specifies that there is no ALL member (2) of this pivot hierarchy.
- **stDimension (variable):** An XLUnicodeString structure that specifies the unique name of the OLAP dimension (1) to which this pivot hierarchy belongs, unless the length of the string is zero. The length of the string MUST be less than or equal to 255. If **fMeasure** is 1, the length of the string MUST be zero.
- **cisxvd (4 bytes):** An unsigned integer that specifies the number of elements in **rgisxvd**. MUST be zero If **sxaxis.sxaxisRw** is 0 and **sxaxis.sxaxisCol** is 0.
- **rgisxvd (variable):** An array of 4-byte signed integers that specify the pivot fields associated with this pivot hierarchy. Each array element MUST be a value from the following table:

Value	Meaning
-1	No pivot field is referenced.
Greater than or equal to zero	A pivot field index, as specified by pivot fields, that specifies a pivot field that is associated with this pivot hierarchy. The referenced pivot field MUST have an sxaxis field equal to the value of the sxaxis field of this record.

This field is arranged such that the n^{th} element in the array is a reference to the Sxvd record that has a related $\underbrace{\mathsf{SXVDTEx}}$ record that has a value of n for its **isxtl** field. If there is no such SXVDTEx for the n^{th} element, the value of the n^{th} element MUST be equal to -1.

- cHiddenMemberSets (4 bytes): An unsigned integer that specifies the deepest one-based level in the pivot hierarchy that has OLAP members hidden from the PivotTable view. If the value of cisxvd is greater than 0, then the value of this field also specifies the number of elements in rgHiddenMemberSets. If the value of fFilterInclusive is 1, then the value of this field MUST be 0.
- **rgHiddenMemberSets (variable):** An array of HiddenMemberSet structures that specifies which of the OLAP members in the pivot hierarchy are hidden from the PivotTable view through manual filtering at each level of the pivot hierarchy. The index of each member (2) in the array corresponds to a level in the pivot hierarchy, beginning with index 0. MUST exist if and only if **cHiddenMemberSets** is greater than 0 and **cisxvd** is greater than 0.

2.4.309 Sxvd

The **Sxvd** record specifies <u>pivot field</u> properties and that specifies the beginning of a collection of records as defined in the <u>Worksheet substream</u> **ABNF**. This collection of records specifies details for a pivot field.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
sxaxis						cSub																									
Α	В	С	D	Е	F	G	Н	Ι	J	К	L		N	1		cItm															
	cchName stName (variable)																														

- **sxaxis (2 bytes):** An <u>SXAxis</u> structure that specifies the <u>PivotTable axis</u> that this pivot field is on. If the **sxaxis.sxaxisData** field equals 1, there MUST be a corresponding <u>SXDI</u> record with an **isxvd** field that specifies this Sxvd record.
- **cSub (2 bytes):** An unsigned integer that specifies the number of subtotal functions used for this pivot field. MUST equal the count of subtotal fields of this record whose value is 1. The subtotal fields of this record are **fDefault**, **fSum**, **fCounta**, **fAverage**, **fMax**, **fMin**, **fProduct**, **fCount**, **fStdev**, **fStdevp**, **fVariance**, and **fVariancep**. For more information, see <u>Subtotalling</u>.
- A fDefault (1 bit): A bit that specifies whether the default subtotal function is applied. The default subtotal is separately determined for each <u>data item</u>. If the fDefault field equals 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one <u>SXVI</u> record with the itmType field of the SXVI record equal to 1. MUST be a value from the following table:

Value	Meaning
0	The default subtotal function is not applied.
1	The default subtotal function is applied.

B - fSum (1 bit): A bit that specifies whether the sum subtotal function is displayed. If the **fDefault** field equals 1, this value MUST be zero. If the **fSum** field equals 1 and the **sxaxis.sxaxisRw** field equals 1 or if the **sxaxis.sxaxisCol** field equals 1 or if the **sxaxis.sxaxisPage** field equals 1, there MUST be one SXVI record with the **itmType** field of the SXVI record equal to 2. MUST be a value from the following table:

Value	Meaning
0	The sum subtotal function is not displayed.
1	The sum subtotal function is displayed.

C - fCounta (1 bit): A bit that specifies whether the count subtotal function is displayed. If the fDefault field equals 1, this value MUST be zero. If the fCounta field equals 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 3. MUST be a value from the following table:

Value	Meaning
0	The count subtotal function is not displayed.
1	The count subtotal function is displayed.

D - fAverage (1 bit): A bit that specifies whether the average subtotal function is displayed. If the **fDefault** field equals 1, this value MUST be zero. If the **fAverage** field equals 1 and the **sxaxis.sxaxisRw** field equals 1 or if the **sxaxis.sxaxisCol** field equals 1 or if the **sxaxis.sxaxisPage** field equals 1, there MUST be one SXVI record with the **itmType** field of the SXVI record equal to 4. MUST be a value from the following table:

Value	Meaning
0	The average subtotal function is not displayed.
1	The average subtotal function is displayed.

E - fMax (1 bit): A bit that specifies whether the max subtotal function is displayed. If the **fDefault** field equals 1, this value MUST be zero. If the **fMax** field equals 1 and the **sxaxis.sxaxisRw** field equals 1 or if the **sxaxis.sxaxisCol** field equals 1 or if the **sxaxis.sxaxisPage** field equals 1, there MUST be one SXVI record with the **itmType** field of the SXVI record equal to 5. MUST be a value from the following table:

Value	Meaning
0	The max subtotal function is not displayed.
1	The max subtotal function is displayed.

F - fMin (1 bit): A bit that specifies whether the min subtotal function is displayed. If the **fDefault** field equals 1, this value MUST be zero. If the **fMin** field equals 1 and the **sxaxis.sxaxisRw** field equals 1 or if the **sxaxis.sxaxisCol** field equals 1 or if the **sxaxis.sxaxisPage** field equals 1, there MUST be one SXVI record with the **itmType** field of the SXVI record equal to 6. MUST be a value from the following table:

Value	Meaning
0	The min subtotal function is not displayed.
1	The min subtotal function is displayed.

G - fProduct (1 bit): A bit that specifies whether the product subtotal function is displayed. If the **fDefault** field is 1, this value MUST be zero. If the **fProduct** field is 1 and the **sxaxis.sxaxisRw** field equals 1 or if the **sxaxis.sxaxisCol** field equals 1 or if the **sxaxis.sxaxisPage** field equals 1, there MUST be one SXVI record with the **itmType** field of the SXVI record equal to 7. MUST be a value from the following table:

Value	Meaning
0	The product subtotal function is not displayed.
1	The product subtotal function is displayed.

H - fCount (1 bit): A bit that specifies whether the count numbers subtotal function is displayed. If the fDefault field is 1, this value MUST be zero. If the fCount field equals 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 8. MUST be a value from the following table:

Value	Meaning
0	The count numbers subtotal function is not displayed.
1	The count numbers subtotal function is displayed.

I - fStdev (1 bit): A bit that specifies whether the standard deviation subtotal function is displayed. If the fDefault field is 1, this value MUST be zero. If the fStdev field equals 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 9. MUST be a value from the following table:

Value	Meaning
0	The standard deviation subtotal function is not displayed.
1	The standard deviation subtotal function is displayed.

J - fStdevp (1 bit): A bit that specifies whether the standard deviation population subtotal function is displayed. If the fDefault field equals 1, this value MUST be zero. If the fStdevp field equals 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 10. MUST be a value from the following table:

Value	Meaning
0	The standard deviation population subtotal function is not displayed.
1	The standard deviation population subtotal function is displayed.

K - fVariance (1 bit): A bit that specifies whether the variance subtotal function is displayed. If the fDefault field is 1, this value MUST be zero. If the fVariance field is 1 and the sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 11. MUST be a value from the following table:

Value	Meaning
0	The variance subtotal function is not displayed.
1	The variance subtotal function is displayed.

L - fVariancep (1 bit): A bit that specifies whether the variance population subtotal function is displayed. If the fDefault field is 1, the value MUST be zero. If the fVariancep field equals 1 and sxaxis.sxaxisRw field equals 1 or if the sxaxis.sxaxisCol field equals 1 or if the sxaxis.sxaxisPage field equals 1, there MUST be one SXVI record with the itmType field of the SXVI record equal to 12. MUST be a value from the following table:

Value	Meaning
0	The variance population subtotal function is not displayed.
1	The variance population subtotal function is displayed.

M - reserved (4 bits): MUST be zero, and MUST be ignored.

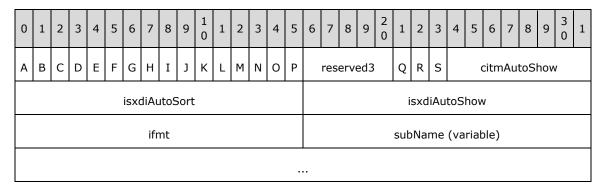

cItm (2 bytes): A signed integer that specifies the number of <u>pivot items</u> for this pivot field. This value MUST match the number of SXVI records following this record and MUST be less than or equal to the following formula:

32500 + the cSub field

- **cchName (2 bytes):** An unsigned integer that specifies the length, in characters, of the **stName** field. If the value is 0xFFFF then **stName** is NULL. The value MUST be 0xFFFF or greater than zero and less than or equal to 255.
- **stName (variable):** An XLUnicodeStringNoCch structure that specifies the caption of this pivot field. A non-NULL value specifies that this string is used to override the **stFieldName** field in SXFDB record from the associated Cache field, as specified in pivot fields. The length is specified in CchName. This field exists only if the value of CchName is not 0xFFFF. If this PivotTable view and this string is non-NULL, then StName MUST be unique within all Sxvd records in this PivotTable view.

2.4.310 SXVDEx

The **SXVDEx** record specifies extended pivot field properties.

A - fShowAllItems (1 bit): A bit that specifies whether to show all <u>pivot items</u> for this pivot field, including pivot items that do not currently exist in the <u>source data</u>. The value MUST be 0 for an <u>OLAP PivotTable view</u>. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that all pivot items are not displayed.
0x1	Specifies that all pivot items are displayed.

B - fDragToRow (1 bit): A bit that specifies whether this pivot field can be placed on the <u>row axis</u>. This value MUST be ignored for an OLAP PivotTable view. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the user is prevented from placing this pivot field on the row axis.
0x1	Specifies that the user is not prevented from placing this pivot field on the row axis.

C - fDragToColumn (1 bit): A bit that specifies whether this pivot field can be placed on the <u>column</u> <u>axis</u>. This value MUST be ignored for an OLAP PivotTable view. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the user is prevented from placing this pivot field on the column axis.
0x1	Specifies that the user is not prevented from placing this pivot field on the column axis.

D - fDragToPage (1 bit): A bit that specifies whether this pivot field can be placed on the <u>page axis</u>. This value MUST be ignored for an OLAP PivotTable view. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the user is prevented from placing this pivot field on the page axis.
0x1	Specifies that the user is not prevented from placing this pivot field on the page axis.

E - fDragToHide (1 bit): A bit that specifies whether this pivot field can be removed from the <u>PivotTable view</u>. This value MUST be ignored for an OLAP PivotTable view. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the user is prevented from removing this pivot field from the PivotTable view.
0x1	Specifies that the user is not prevented from removing this pivot field from the PivotTable view.

F - fNotDragToData (1 bit): A bit that specifies whether this pivot field can be placed on the <u>data axis</u>. This value MUST be ignored for an OLAP PivotTable view. MUST be a value from the following table:

Value	Meaning
0x0	Specifies that the user is not prevented from placing this pivot field on the data axis.
0x1	Specifies that the user is prevented from placing this pivot field on the data axis.

- **G reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **H fServerBased (1 bit):** A bit that specifies whether this pivot field is server-based when on the page axis. For more information, see Source Data. A value of 1 specifies that this pivot field is a server-based pivot field.

MUST be 1 if and only if the value of the **fServerBased** field of the $\underline{\text{SXFDB}}$ record of the associated $\underline{\text{cache field}}$ of this pivot field is 1.

- I reserved2 (1 bit): MUST be zero, and MUST be ignored.
- **J fAutoSort (1 bit):** A bit that specifies whether AutoSort will be applied to this pivot field. For more information, see Pivot Field Sorting.
- **K fAscendSort (1 bit):** A bit that specifies whether any AutoSort applied to this pivot field will **sort** in ascending order. MUST be a value from the following table:

Value	Meaning
0x0	Sort in descending order.
0x1	Sort in ascending order.

- **L fAutoShow (1 bit):** A bit that specifies whether an **AutoShow filter** is applied to this pivot field. For more information, see <u>Simple Filters</u>.
- **M fTopAutoShow (1 bit):** A bit that specifies whether any AutoShow filter applied to this pivot field shows the top-ranked or bottom-ranked values. For more information, see Simple Filters. MUST be a value from the following table:

Value	Meaning
0x0	Any AutoShow filter applied to this pivot field shows the bottom-ranked values.
0x1	Any AutoShow filter applied to this pivot field shows the topranked values.

- **N fCalculatedField (1 bit):** A bit that specifies whether this pivot field is a <u>calculated field</u>. A value of 1 specifies that this pivot field is a calculated field.
 - MUST be 1 if and only if the value of the **fCalculatedField** field of the SXFDB record of the cache field associated with this pivot field is 1.
- **O fPageBreaksBetweenItems (1 bit):** A bit that specifies whether a **page break** is inserted after each pivot item when the PivotTable is printed.
- **P fHideNewItems (1 bit):** A bit that specifies whether new pivot items that appear after a **refresh** are **hidden** by default. This value MUST be equal to 0 for a non-OLAP PivotTable view.

Value	Meaning
0x0	New pivot items are shown by default.
0x1	New pivot items are hidden by default.

reserved3 (5 bits): MUST be zero, and MUST be ignored.

- **Q fOutline (1 bit):** A bit that specifies whether this pivot field is in **outline** form. For more information, see PivotTable layout.
- R fInsertBlankRow (1 bit): A bit that specifies whether to insert a blank row after each pivot item.
- **S fSubtotalAtTop (1 bit):** A bit that specifies whether subtotals are displayed at the top of the group when the **fOutline** field is equal to 1. For more information, see PivotTable layout.
- **citmAutoShow (8 bits):** An unsigned integer that specifies the number of pivot items to show when the **fAutoShow** field is equal to 1. The value MUST be greater than or equal to 1 and less than or equal to 255.
- **isxdiAutoSort (2 bytes):** A signed integer that specifies the <u>data item</u> that AutoSort uses when the **fAutoSort** field is equal to 1. If the value of the **fAutoSort** field is one, the value MUST be greater than or equal to zero and less than the count of <u>SXDI</u> records. MUST be a value from the following table:

Value	Meaning
-1	Specifies that the values of the pivot items themselves are used.
Greater than or equal to zero	Specifies a data item index, as specified in Data Items, of the data item that is used.

isxdiAutoShow (2 bytes): A signed integer that specifies the data item that AutoShow ranks by when the **fAutoShow** field is equal to 1. For more information, see Simple Filters. If the value of the **fAutoShow** field is 1, this value MUST be greater than or equal to zero and less than the count of SXDI records. MUST be a value from the following table:

Value	Meaning
-1	AutoShow is not enabled for this pivot field.
Greater than or equal to zero	Specifies a data item index, as specified in Data Items, of the data item that is used.

ifmt (2 bytes): An IFmt structure that specifies the number format of this pivot field.

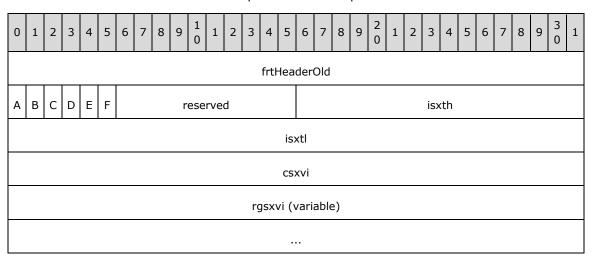

subName (variable): An optional <u>SXVDEx_Opt</u> structure that specifies the name of the aggregate **function** used to calculate this pivot field's subtotals. SHOULD<a>131> be present.

2.4.311 SXVDTEx

The **SXVDTEx** record specifies **OLAP** extensions to a <u>pivot field</u>. This record MUST NOT exist if this <u>PivotTable view</u> is a non-<u>OLAP PivotTable view</u>.

The pivot field associated with this record is the pivot field with an index that equals the index of this SXVDTEx record in the collection of SXVDTEx records of this PivotTable view.

The count of SXVDTEx records MUST equal the count of pivot fields in the OLAP PivotTable view.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x080F.

- **A fTensorSort (1 bit):** A bit that specifies whether the **sort order** is determined by the OLAP **source data**. See <u>Pivot Field Sorting</u> for more information.
- **B fDrilledLevel (1 bit):** A bit that specifies whether all <u>pivot items</u> in this pivot field are expanded. See <u>Collapsing</u> for more information.
- **C fItemsDrilledByDefault (1 bit):** A bit that specifies whether this **attribute hierarchy** is expanded by default. See Collapsing for more information.
- **D fMemPropDisplayInReport (1 bit):** A bit that specifies whether this <u>member property</u> pivot field is displayed in the <u>PivotTable</u> report. See <u>row axis</u> or <u>column axis</u> for more information. MUST

be 0 if the <u>PivotCache functionality level</u> of the <u>associated PivotCache</u> is less than 3. MUST be ignored if this pivot field is not a member property pivot field.

- **E fMemPropDisplayInTip (1 bit):** A bit that specifies whether this member property pivot field is displayed in a **ToolTip**. MUST be 0 if the PivotCache functionality level of the associated PivotCache is less than 3. MUST be ignored if this pivot field is not a member property pivot field.
- **F fMemPropDisplayInCaption (1 bit):** A bit that specifies whether to display member property captions from this pivot field, for a pivot field of the associated OLAP levels and associated <u>pivot hierarchy</u> as this pivot field, instead of the pivot item captions. The pivot field for which to display captions has an <u>SXAddl SXCField12 SXDMemberCaption</u> record. MUST be 0 if the PivotCache functionality level of the associated PivotCache is less than 3. MUST be ignored if this pivot field is not a member property pivot field.

reserved (10 bits): MUST be zero, and MUST be ignored.

isxth (2 bytes): A signed integer that specifies the pivot hierarchy that this pivot field is associated with. See <u>Association of Pivot Hierarchies and Pivot Fields and Cache Fields</u> for more information. MUST be a value from the following table:

Value	Meaning
-1	This pivot field is not part of a pivot hierarchy.
Greater than or equal to zero	This specifies a pivot hierarchy index, as specified in Pivot Hierarchies, that specifies a pivot hierarchy.

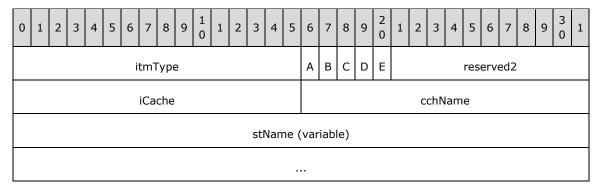

MUST be greater than or equal to -1 and less than the ${\color{red} {\bf csxth}}$ field of the ${\color{red} {\bf SXViewEx}}$ record of the PivotTable view.

- isxtl (4 bytes): A signed integer that specifies the zero-based index of the OLAP level associated with the pivot hierarchy. If isxth specifies a pivot hierarchy that is not an OLAP Hierarchy, this value MUST be ignored.
- **csxvi (4 bytes):** A signed integer that specifies the number of items in the array specified by **rgsxvi**. MUST equal the count of pivot items in this pivot field.
- **rgsxvi (variable):** An array of <u>SXVIFlags</u> that specifies additional properties for the pivot items in this pivot field. Each SXVIFlags in the **rgsxvi** array specifies additional properties of the pivot item with a pivot item index equal to the index of the SXVIFlags element in the **rgsxvi** array.

The number of elements in this array MUST equal **csxvi**.

2.4.312 SXVI

The **SXVI** record specifies information about a <u>pivot item</u>.

itmType (2 bytes): A signed integer that specifies the pivot item type. The value MUST be one of the following values:

Value	Name	Meaning
0x0000	itmtypeData	A data value
0x0001	itmtypeDEFAULT	Default subtotal for the <u>pivot field</u>
0x0002	itmtypeSUM	Sum of values in the pivot field
0x0003	itmtypeCOUNTA	Count of values in the pivot field
0x0004	itmtypeAVERAGE	Average of values in the pivot field
0x0005	itmtypeMAX	Max of values in the pivot field
0x0006	itmtypeMIN	Min of values in the pivot field
0x0007	itmtypePRODUCT	Product of values in the pivot field
0x0008	itmtypeCOUNT	Count of numbers in the pivot field
0x0009	itmtypeSTDEV	Statistical standard deviation (estimate) of the pivot field
0x000A	itmtypeSTDEVP	Statistical standard deviation (entire population) of the pivot field
0x000B	itmtypeVAR	Statistical variance (estimate) of the pivot field
0x000C	itmtypeVARP	Statistical variance (entire population) of the pivot field

A - fHidden (1 bit): A bit that specifies whether this pivot item is **hidden**. For more information, see <u>Manual Filtering</u>.

MUST be zero if **itmType** is not itmtypeData. MUST be zero for <u>OLAP PivotTable view</u>.

B - fHideDetail (1 bit): A bit that specifies whether the pivot item detail is collapsed.

MUST be zero for OLAP PivotTable view.

- C reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **D fFormula (1 bit):** A bit that specifies whether this pivot item is a calculated item.

This field MUST be zero if any of the following apply:

- **itmType** is not zero.
- This item is in an OLAP PivotTable view.
- The **sxaxisPage** field of **sxaxis** in the <u>Sxvd</u> record of the pivot field equals 1 (the associated Sxvd is the last Sxvd record before this record in the stream).
- The fCalculatedField field in the <u>SXVDEx</u> record of the pivot field equals 1.
- There is not an associated <u>SXFDB</u> record in the <u>associated PivotCache</u>.
- The fRangeGroup field of the SXFDB record, of the associated <u>cache field</u> of the pivot field, equals 1.
- The fCalculatedField field of the SXFDB record, of the associated cache field of the pivot field, equals 1.
- **E fMissing (1 bit):** A bit that specifies if this pivot item does not exist in the **data source**.

MUST be zero if **itmType** is not zero. MUST be zero for OLAP PivotTable view.

reserved2 (11 bits): MUST be zero, and MUST be ignored.

iCache (2 bytes): A signed integer that specifies a reference to a <u>cache item</u>. MUST be a value from the following table:

Value	Meaning
-1	No cache item is referenced.
0+	A cache item index in the cache field associated with the pivot field, as specified by Cache Items.

If **itmType** is not zero, a reference to a cache item is not specified and this value MUST be -1. Otherwise, this value MUST be greater than or equal to 0.

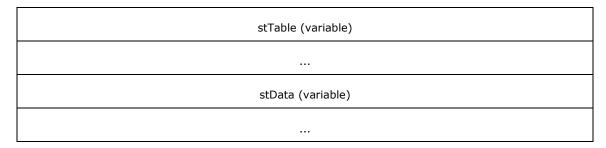

cchName (2 bytes): An unsigned integer that specifies the length of the **stName** string. If the value is 0xFFFF then **stName** is NULL. Otherwise, the value MUST be less than or equal to 254.

stName (variable): An XLUnicodeStringNoCch structure that specifies the name of this pivot item. If not NULL, this is used as the caption of the pivot item instead of the value in the cache item specified by **iCache**. The length of this field is specified in **cchName**. This field exists only if **cchName** is not 0xFFFF. If this is in a non-OLAP PivotTable view and this string is not NULL, it MUST be unique within all SXVI records in associated with the pivot field.

2.4.313 SxView

The **SxView** record specifies <u>PivotTable view</u> information and that specifies the beginning of a collection of records as defined by the <u>Worksheet substream</u> **ABNF**. The collection specifies the remainder of the PivotTable view.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1

A B C D E F G H I J unused2												itblAutoFmt																			
cchTableName																	cch	Dat	aNa	ame	!										

- **ref (8 bytes):** A <u>Ref8U</u> structure that specifies the <u>PivotTable</u> report body. For more information, see <u>Location and Body</u>.
- **rwFirstHead (2 bytes):** An RwU structure that specifies the first row of the row area. MUST be 1 if none of the axes are assigned in this PivotTable view. Otherwise, the value MUST be greater than or equal to **ref.rwFirst**.
- **rwFirstData (2 bytes):** An RwU structure that specifies the first row of the <u>data area</u>. MUST be 1 if none of the axes are assigned in this PivotTable view. Otherwise, it MUST be equal to the value as specified by the following formula:

rwFirstData = rwFirstHead + cDimCol

- colFirstData (2 bytes): A <u>ColU</u> structure that specifies the first column of the data area. It MUST be 1 if none of the axes are assigned in this PivotTable view. Otherwise, the value MUST be greater than or equal to ref.colFirst, and if the value of cDimCol or cDimData is not zero, it MUST be less than or equal to ref.colLast.
- **iCache (2 bytes):** A signed integer that specifies the zero-based index of an <u>SXStreamID</u> record in the <u>Globals Substream</u>. See <u>Associated PivotCache</u> for more information. MUST be greater than or equal to zero and less than the number of SXStreamID records in the <u>Globals Substream</u>.
- reserved (2 bytes): MUST be zero, and MUST be ignored.
- sxaxis4Data (2 bytes): An SXAxis structure that specifies the default axis for the data field. Either the sxaxis4Data.sxaxisRw field MUST be 1 or the sxaxis4Data.sxaxisCol field MUST be 1. The sxaxis4Data.sxaxisPage field MUST be 0 and the sxaxis4Data.sxaxisData field MUST be 0.
- **ipos4Data (2 bytes):** A signed integer that specifies the row or column position for the data field in the PivotTable view. The **sxaxis4Data** field specifies whether this is a row or column position. MUST be greater than or equal to -1 and less than or equal to 0x7FFF. A value of -1 specifies the default position.
- **cDim (2 bytes):** A signed integer that specifies the number of <u>pivot fields</u> in the PivotTable view. MUST equal the number of <u>Sxvd</u> records following this record. MUST equal the number of fields in the associated <u>PivotCache</u> specified by **iCache**.
- **cDimRw (2 bytes):** An unsigned integer that specifies the number of fields on the row axis of the PivotTable view. MUST be less than or equal to 0x7FFF. MUST equal the number of array elements in the <u>SxIvd</u> record in this PivotTable view that contain row items.
- **cDimCol (2 bytes):** An unsigned integer that specifies the number of fields on the column axis of the PivotTable view. MUST be less than or equal to 0x7FFF. MUST equal the number of array elements in the SxIvd record in this PivotTable view that contain column items.
- **cDimPg (2 bytes):** An unsigned integer that specifies the number of page fields in the PivotTable view. MUST be less than or equal to 0x7FFF. MUST equal the number of array elements in the SXPI record in this PivotTable view.

- **cDimData (2 bytes):** A signed integer that specifies the number of data fields in the PivotTable view. MUST be greater than or equal to zero and less than or equal to 0x7FFF. MUST equal the number of SXDI records in this PivotTable view.
- **cRw (2 bytes):** An unsigned integer that specifies the number of <u>pivot lines</u> in the row area of the PivotTable view. MUST be less than or equal to 0x7FFF. MUST equal the number of array elements in the first <u>SXLI</u> record in this PivotTable view.
- **cCol (2 bytes):** An unsigned integer that specifies the number of pivot lines in the <u>column area</u> of the PivotTable view. MUST equal the number of array elements in the second SXLI record in this PivotTable view.
- **A fRwGrand (1 bit):** A bit that specifies whether the PivotTable contains grand totals for rows. MUST be 0 if none of the axes have been assigned in this PivotTable view.
- **B fColGrand (1 bit):** A bit that specifies whether the PivotTable contains grand totals for columns. MUST be 1 if none of the axes are assigned in this PivotTable view.
- C unused1 (1 bit): Undefined and MUST be ignored.
- **D fAutoFormat (1 bit):** A bit that specifies whether the PivotTable has **AutoFormat** applied.
- E fAtrNum (1 bit): A bit that specifies whether the PivotTable has number AutoFormat applied.
- F fAtrFnt (1 bit): A bit that specifies whether the PivotTable has font AutoFormat applied.
- G fAtrAlc (1 bit): A bit that specifies whether the PivotTable has alignment AutoFormat applied.
- H fAtrBdr (1 bit): A bit that specifies whether the PivotTable has border AutoFormat applied.
- I fAtrPat (1 bit): A bit that specifies whether the PivotTable has pattern AutoFormat applied.
- J fAtrProc (1 bit): A bit that specifies whether the PivotTable has width/height AutoFormat applied.
- unused2 (6 bits): Undefined and MUST be ignored.
- **itblAutoFmt (2 bytes):** An <u>AutoFmt8</u> structure that specifies the PivotTable AutoFormat. If the value of **itblAutoFmt** in the associated <u>SXViewEx9</u> record is not 1, this field is overridden by the value of **itblAutoFmt** in the associated SXViewEx9.
- **cchTableName (2 bytes):** An unsigned integer that specifies the length, in characters, of **stTable**. MUST be greater than or equal to zero and less than or equal to 0x00FF.
- **cchDataName (2 bytes):** An unsigned integer that specifies the length, in characters of **stData**. MUST be greater than zero and less than or equal to 0x00FE.
- **stTable (variable):** An <u>XLUnicodeStringNoCch</u> structure that specifies the name of the PivotTable. The length of this field is specified by **cchTableName**.
- **stData (variable):** An XLUnicodeStringNoCch structure that specifies the name of the data field. The length of this field is specified by **cchDataName**.

2.4.314 **SXViewEx**

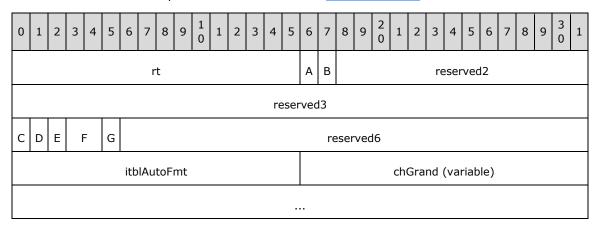

The **SXViewEx** record specifies the beginning of a collection of records as specified in the <u>Worksheet substream</u> **ABNF**. The collection of records specifies details about an <u>OLAP PivotTable view</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														frtŀ	lea	der	Old														
	csxth																														
	csxpi																														
	csxvdtex																														
														c	bFu	ıtur	e														
	rgbFuture (variable)																														

- frtHeaderOld (4 bytes): An <u>FrtHeaderOld</u> structure. The value of the frtHeaderOld.rt field MUST be 0x80C.
- **csxth (4 bytes):** A signed integer that specifies the number of <u>SXTH</u> records following this record. MUST be greater than or equal to 1.
- **csxpi (4 bytes):** A signed integer that specifies the number of <u>SXPIEx</u> records following the SXTH records. MUST be greater than or equal to zero.
- **csxvdtex (4 bytes):** A signed integer that specifies the number of <u>SXVDTEx</u> records following the SXPIEx records. MUST be greater than or equal to zero.
- **cbFuture (4 bytes):** An unsigned integer that specifies the count of bytes in **rgbFuture**. MUST be greater than or equal to zero and less than or equal to 1024. MUST be equal to the byte count of **rgbFuture**.
- rgbFuture (variable): Information from future versions. The byte count MUST equal cbFuture.

2.4.315 **SXViewEx9**

The **SXViewEx9** record specifies extensions to the <u>PivotTable view</u>.

rt (2 bytes): An unsigned integer that specifies the record type identifier. The value MUST be 0x0810.

- A reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **B fFrtAlert (1 bit):** A bit that specifies whether features of this <u>PivotTable</u> are not supported in earlier versions of the **BIFF**.

An application can alert the user of possible problems when saving as an earlier version of the BIFF.

reserved2 (14 bits): MUST be zero, and MUST be ignored.

reserved3 (4 bytes): MUST be zero, and MUST be ignored.

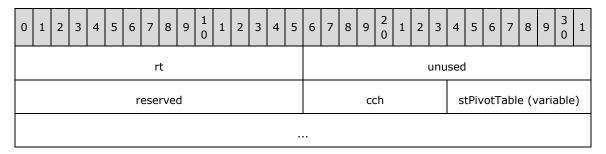

- C reserved4 (1 bit): MUST be zero, and MUST be ignored.
- **D fPrintTitles (1 bit):** A bit that specifies whether the print titles for the **worksheet** are set based on the PivotTable report. The row print titles are set to the pivot item captions on the column axis and the column print titles are set to the pivot item captions on the row axis.
- **E fLineMode (1 bit):** A bit that specifies whether any <u>pivot field</u> is in outline mode. See Subtotalling for more information.
- F reserved5 (2 bits): MUST be zero, and MUST be ignored.
- **G fRepeatItemsOnEachPrintedPage (1 bit):** A bit that specifies whether <u>pivot item</u> captions on the <u>row axis</u> are repeated on each printed page for pivot fields in tabular form.

reserved6 (26 bits): MUST be zero, and MUST be ignored.

- **itblAutoFmt (2 bytes):** An <u>AutoFmt8</u> structure that specifies the PivotTable **AutoFormat**. If the value of this field is not 1, this field overrides the **itblAutoFmt** field in the previous <u>SxView</u> record.
- **chGrand (variable):** An <u>XLUnicodeString</u> structure that specifies a user-entered caption to display for grand totals when the PivotTable is recalculated. The length MUST be less than or equal to 255 characters.

2.4.316 SXViewLink

The **SXViewLink** record specifies the name of the source <u>PivotTable view</u> associated with a <u>Pivot</u> Chart.

rt (2 bytes): An unsigned integer. MUST be 0x0858.

unused (2 bytes): Undefined, and MUST be ignored.

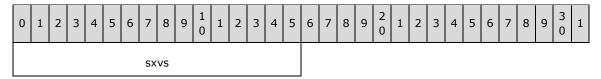

reserved (2 bytes): MUST be zero and MUST be ignored.

cch (1 byte): An unsigned integer that specifies the count of characters of the stPivotTable field.

stPivotTable (variable): An <u>XLUnicodeStringNoCch</u> non-null-terminated, case-sensitive **Unicode** string that specifies the name of the PivotTable view associated with the Pivot Chart. The size of this field in bytes MUST be **cch**.

2.4.317 SXVS

The **SXVS** record specifies the type of <u>source data</u> used for a <u>PivotCache</u>. This record is followed by a sequence of records that specify additional information about the source data.

sxvs (2 bytes): An unsigned integer that specifies the type of source data used for the PivotCache. The types of records that follow this record are dictated by the value of this field. MUST be a value from the following table:

Name	Value	Meaning
SHEET	0×0001	Specifies that the source data is a range . This record MUST be followed by a <u>DConRef</u> record that specifies a simple range, or a <u>DConName</u> record that specifies a named range , or a <u>DConBin</u> record that specifies a built-in named range.
EXTERNAL	0x0002	Specifies that external source data is used. This record MUST be followed by a sequence of records beginning with a DbQuery record that specifies connection and query information that is used to retrieve external data .
CONSOLIDATION	0x0004	Specifies that multiple consolidation ranges are used as the source data. This record MUST be followed by a sequence of records beginning with an SXTbl record that specifies information about the multiple consolidation ranges.
SCENARIO	0x0010	The source data is populated from a temporary internal structure. In this case there is no additional source data information because the raw data does not exist as a permanent structure and the logic to produce it is application-dependent.

2.4.318 Sync

When multiple windows are used to view a **sheet** with synchronous scrolling enabled, the **Sync** record specifies the coordinates of the top-left visible **cell** of all windows.

rw (2 bytes): A <u>RwU</u> structure that specifies the row for the top-left visible cell of all windows.

col (2 bytes): A ColU structure that specifies the column for the top-left visible cell of all windows.

2.4.319 Table

The **Table** record specifies a **data table (1)**. This record is preceded by a single <u>Formula</u> record that defines the first **cell** in the data table (1). Other Formula records that represent the rest of cells in the data table (1) follow later in the file, not necessarily in a contiguous sequence. Formula records that define the cells in the data table (1) MUST have the cell field that is within the **range** specified in the

ref field of this record and MUST have their formula begin with PtgTbl. Also, each cell specified in the **ref** field MUST have a Formula that is part of this table.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															re	ef															
															A B C D E F reserved2																
rwInpRw														colInpRw																	
rwInpCol																			C	olIn	рСо	ol									

- **ref (6 bytes):** A <u>Ref</u> structure that specifies the range of the data table (1). The value of **ref.rwFirst.rw** MUST be greater than or equal to 1. The value of **ref.colFirst.col** MUST be greater than or equal to 1.
- A fAlwaysCalc (1 bit): A bit that specifies whether this data table (1) is recalculated as part of the next recalculation.
- **B reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **C fRw (1 bit):** A bit that specifies whether the **input cell** of a **one-variable data table** is a row input cell or a column input cell. If the value is 1, the input cell for a one-variable data table is a row input cell.

If the value of the fTbl2 field is 1, the value of fRw is undefined and MUST be ignored.

- **D fTbl2 (1 bit):** A bit that specifies whether the data table (1) is a **two-variable data table** or a one-variable data table. If the value is 1, the data table (1) is a two-variable data table.
- **E fDeleted1 (1 bit):** A bit that specifies whether the cell referenced in the input cell specified by the **rwInpRw** and **colInpRw** fields is deleted.
- **F fDeleted2 (1 bit):** A bit that specifies whether the cell referenced in the input cell specified by the **rwInpCol** and **colInpCol** fields is deleted.

reserved2 (10 bits): MUST be zero, and MUST be ignored.

rwInpRw (2 bytes): A RwU structure that specifies either the row of a row input cell or the row of a column input cell. If the value of the fTbl2 field is 0 and the value of the fRw field is 0, the value of rwInpRw specifies the row of a column input cell; for any other combination of the fTbl2 and fRw fields, rwInpRw specifies the row of a row input cell. If the value of fDeleted field is 1, the value of rwInpRw MUST be 65535.

If **fTbl2** is 1, the following statement (1) holds.

If **fTbl2** is 0, exactly one of these statements holds:

- rwInpRw and colInpRw MUST specify a cell outside the bounds specified by ref.rwFirst 1, ref.rwLast, ref.colFirst - 1, and ref.colLast.
- rwInpRw and colInpRw MUST be equal to ref.rwFirst -1 and ref.colFirst 1, respectively.
- colInpRw (2 bytes): A <u>Col NegativeOne</u> structure that specifies either the column of a row input cell or the column of a column input cell. If the value of the fTbl2 field is 0 and the value of fRw field is 0, the value of colInpRw specifies the column of the column input cell; for any other combination of the fTbl2 and fRw fields, colInpRw specifies the column of a row input cell. If the

value of the **fDeleted** field is 1, the value of **colInpRw** MUST be -1. If the value of the **fDeleted** field is 0, the value of **colInpRw** MUST be greater than or equal to 0.

rwInpCol (2 bytes): A RwU structure that specifies the row of the column input cell. The restrictions on the value of rwInpCol are dictated by the value of the fTbl2 field and the value of the fDeleted2 field, as specified in the following table:

fTbl2	fDeleted2	rwInpCol
1	1	The value MUST be 65535.
1	0	If the colInpCol is a value between ref.colFirst – 1 and ref.colLast inclusive, rwInpCol MUST NOT be a value between ref.rwFirst – 1 and ref.rwLast inclusive.
0	1 or 0	Undefined and MUST be ignored.

colInpCol (2 bytes): A Col_NegativeOne structure that specifies the column of the column input cell. The restrictions on the value of **colInpCol** are dictated by the value of the **fTbl2** field and the value of the **fDeleted2** field, as specified in the following table:

fTbl2	fDeleted2	colInpCol
1	1	The value MUST be -1.
1	0	The value MUST be greater than or equal to 0. If the rwInpCol is a value between ref.rwFirst - 1 and ref.rwLast inclusive, colInpCol MUST NOT be a value between ref.colFirst - 1 and ref.colLast, inclusive.
0	1 or 0	Undefined and MUST be ignored.

2.4.320 TableStyle

The **TableStyle** record specifies a user-defined <u>table style</u> and the beginning of a collection of <u>TableStyleElement</u> records as specified by the <u>Globals Substream</u> **ABNF**. The collection of TableStyleElement records specifies the properties of the table style.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	ade	er														
Α	В	С						res	erve	ed2													ct	se							
																						C	chN	lam	е						
	rgchName (variable)																														

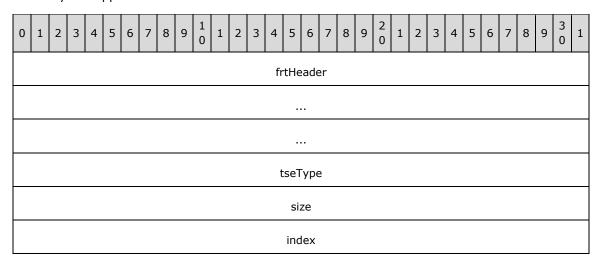

...

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x088F.

- A reserved1 (1 bit): MUST be zero, and MUST be ignored.
- B fIsPivot (1 bit): A bit that specifies whether the style can be applied to PivotTable views.
- C fIsTable (1 bit): A bit that specifies whether the style can be applied to tables.
- reserved2 (13 bits): MUST be zero, and MUST be ignored.
- **ctse (4 bytes):** An unsigned integer that specifies the count of TableStyleElement records to follow this record. MUST be less than or equal to 28.
- **cchName (2 bytes):** An unsigned integer that specifies the count of characters in the **rgchName** field. This value MUST be less than or equal to 255 and greater than or equal to 1.
- **rgchName (variable):** An array of **Unicode** characters whose length is specified by **cchName** that specifies the style name.

2.4.321 TableStyleElement

The **TableStyleElement** record specifies formatting for one element of a <u>table style</u>. Each table style element specifies the formatting to apply to a particular area of a <u>table</u> or <u>PivotTable view</u> when the table style is applied.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x0890.

tseType (4 bytes): An unsigned integer that specifies the area of the table or PivotTable viewto which the formatting is applied. MUST be a value from the following table:

Value	Meaning	
0x00000000	Whole table. If this table style is applied to a PivotTable view, this formatting type also applies to page field captions and page item captions.	
0x0000001	Header row . If this table style is applied to a PivotTable view, this formatting type applies to the collection of rows above the data region . See <i>S</i> in the PivotTable Style Diagram.	
0x00000002	Total row . If this table style is applied to a PivotTable view, this formatting type applies to the grand total row. See <i>N</i> in the PivotTable Style Diagram.	

Value	Meaning			
0x00000003	First column. If this table style is applied to a PivotTable view, this formatting type applies to the row label area, which can span multiple columns. See <i>R</i> in the PivotTable Style Diagram.			
0x00000004	Last column. If this table style is applied to a PivotTable view, this formatting type applies to the grand total column. See <i>A</i> in the PivotTable Style Diagram.			
0x00000005	Row stripe band 1			
0x00000006	Row stripe band 2			
0x00000007	Column stripe band 1			
0x00000008	Column stripe band 2			
0x00000009	First cell of Header row. If this table style is applied to a PivotTable view, this formatting type applies to cells contained in area intersected by the header row and first column.			
0x0000000A	Last cell of header row. MUST be ignored if this table style is applied to a PivotTable view.			
0x0000000B	First cell of Total row. MUST be ignored if this table style is applied to a PivotTable view.			
0x000000C	Last cell of Total row. MUST be ignored if this table style is applied to a PivotTable view.			
0x000000D	Outermost subtotal columns in a PivotTable view, specified by the columns displaying subtotals for the first <u>Sxvd</u> record in the <u>PIVOTVD</u> collection where the sxaxis field of the Sxvd record specifies the <u>column axis</u> . See <i>B</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x0000000E	Alternating even subtotal columns in a PivotTable view, specified by the columns displaying subtotals for Sxvd records for which the zero-based index in the PIVOTVD collection is an odd number, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the column axis. See <i>C</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x000000F	Alternating odd subtotal columns in a PivotTable view, specified by the columns displaying subtotals for Sxvd records for which the zero-based index in the PIVOTVD collection is an even number greater than zero, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the column axis. See <i>D</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x0000010	Outermost subtotal rows in a PivotTable view, specified by the rows displaying subtotals for the first Sxvd record in the PIVOTVD collection where the sxaxis field of the Sxvd record specifies the <u>row axis</u> . See <i>M</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x00000011	Alternating even subtotal rows in a PivotTable view, specified by the rows displaying subtotals for Sxvd records for which the zero-based index in the PIVOTVD collection is an odd number, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the row axis. See <i>K</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x00000012	Alternating odd subtotal rows in a PivotTable view, specified by the rows displaying subtotals for Sxvd records for which the zero-based index in the PIVOTVD collection is an even number greater than zero, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the row axis. See <i>J</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x00000013	Empty rows after each subtotal row. See $\it L$ in the PivotTable Style Diagram. Used only for PivotTables.			
0x0000014	Outermost column subheadings in a PivotTable view, specified by the columns displaying <u>pivot field</u> captions for the first Sxvd record in the PIVOTVD collection where the sxaxis field of the Sxvd record specifies the column axis. See <i>O</i> in the PivotTable Style Diagram. Used only for PivotTables.			
0x00000015	Alternating even column subheadings in a PivotTable view, specified by the column columns displaying pivot field captions for Sxvd records for which the zero-based index in the PIVOTVD collection is an odd number, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the column axis. See <i>P</i> in the			

Value	Meaning				
	PivotTable Style Diagram. Used only for PivotTables.				
0x0000016	Alternating odd column subheadings in a PivotTable view, specified by the columns displaying pivot field captions for Sxvd records for which the zero-based index in the PIVOTVD collection is an even number greater than zero, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the column axis. See <i>Q</i> in the PivotTable Style Diagram. Used only for PivotTables.				
0x0000017	Outermost row subheadings in a PivotTable view, specified by the rows displaying pivot field captions for the first Sxvd record in the PIVOTVD collection where the sxaxis field of the Sxvd record specifies the row axis. See <i>G</i> in the PivotTable Style Diagram. Used only for PivotTables.				
0x0000018	Alternating even row subheadings in a PivotTable view, specified by the rows displaying pivot field captions for Sxvd records for which the zero-based index in the PIVOTVD collection is an odd number, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the row axis. See <i>H</i> in the PivotTable Style Diagram. Used only for PivotTables.				
0x00000019	Alternating odd row subheadings in a PivotTable view, specified by the rows displaying pivot field captions for Sxvd records for which the zero-based index in the PIVOTVD collection is an even number greater than zero, omitting Sxvd records where the sxaxis field of the Sxvd record does not specify the row axis. See <i>I</i> in the PivotTable Style Diagram. Used only for PivotTables.				
0x000001A	Page field captions in a PivotTable view, specified by the cells displaying pivot field captions for the Sxvd records in the PIVOTVD collection where the sxaxis field of the Sxvd record specifies the <u>page axis</u> . See <i>F</i> in the PivotTable Style Diagram. Used only for PivotTables.				
0x000001B	Page item captions in a PivotTable view, specified by the cells displaying <u>pivot item</u> captions for the Sxvd records in the PIVOTVD collection where the sxaxis field of the Sxvd record specifies the page axis. See <i>E</i> in the PivotTable Style Diagram. Used only for PivotTables.				

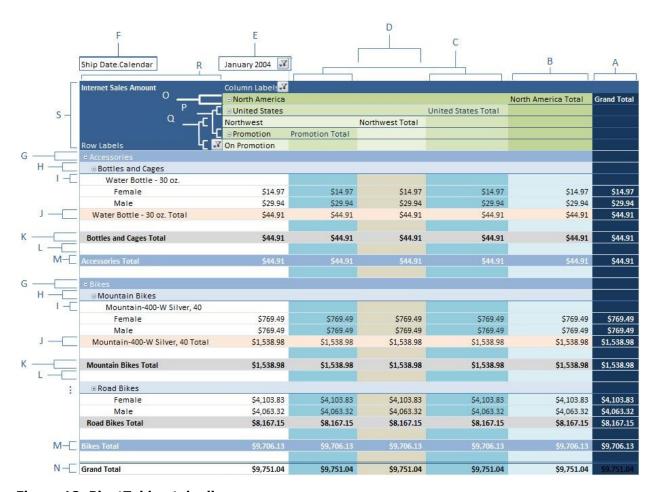

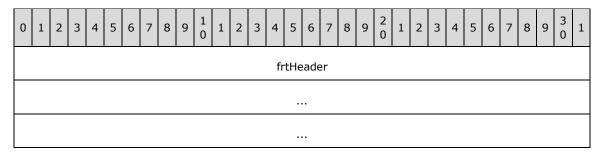

Figure 18: PivotTable-style diagram

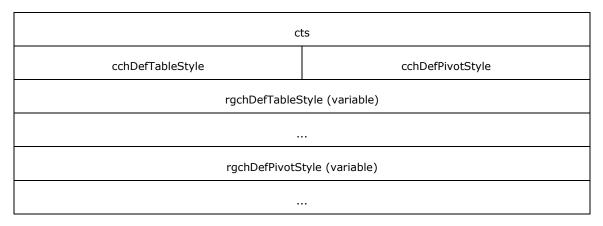

size (4 bytes): An unsigned integer that specifies the number of rows or columns to include in a single stripe band. MUST be ignored when the value of **tseType** does not equal 0x00000005, 0x00000006, 0x000000007, or 0x000000008. MUST be greater than or equal to 1 and less than or equal to 9.

index (4 bytes): A <u>DXFId</u> structure that specifies the <u>DXF</u> record that contains the <u>differential</u> <u>formatting</u> properties for this element.

2.4.322 TableStyles

The **TableStyles** record specifies the default **table** and <u>PivotTable table styles</u> and specifies the beginning of a collection of <u>TableStyle</u> records as defined by the <u>Globals Substream</u> **ABNF**. The collection of TableStyle records specifies user-defined table styles.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x088E.

- **cts (4 bytes):** An unsigned integer that specifies the total number of table styles in this document. This is the sum of the standard built-in table styles and all of the custom table styles. This value MUST be greater than or equal to 144 (the number of built-in table styles).
- **cchDefTableStyle (2 bytes):** An unsigned integer that specifies the count of characters in the **rgchDefTableStyle** field. This value MUST be less than or equal to 255.
- **cchDefPivotStyle (2 bytes):** An unsigned integer that specifies the count of characters in the **rgchDefPivotStyle** field. This value MUST be less than or equal to 255.
- **rgchDefTableStyle (variable):** An array of **Unicode** characters whose length is specified by **cchDefTableStyle** that specifies the name of the default table style.
- **rgchDefPivotStyle (variable):** An array of Unicode characters whose length is specified by **cchDefPivotStyle** that specifies the name of the default PivotTable **style**.

2.4.323 Template

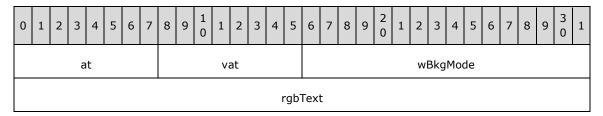

The **Template** record is an empty record that specifies whether the **workbook** is a **template**. If this record is present, the workbook is a template.

2.4.324 Text

The **Text** record specifies the properties of an <u>attached label</u> and specifies the beginning of a collection of records as defined by the <u>chart sheet</u> substream **ABNF**. This collection of records specifies an attached label.

The **fShowKey**, **fShowValue**, **fShowLabelAndPerc**, **fShowPercent**, **fShowBubbleSizes**, and **fShowLabel** fields MUST equal 0 and MUST be ignored if the current attached label does not contain an <u>ObjectLink</u> record that satisfies the following conditions:

- The **wLinkObj** field of the ObjectLink record equals 0x0004.
- The wLinkVar1 field of the ObjectLink record references a <u>series</u>.

													2	X
у						У								
	dx						x							
	dy						ly							
Α	A B C D E F G H I J K L					K	L	М	N	icvText				
dlp unused3							()	trot					

at (1 byte): An unsigned integer that specifies the **horizontal alignment** of the text. MUST be a value from the following table:

Value	Alignment
0x01	Left-alignment if iReadingOrder specifies left-to-right reading order ; otherwise, right-alignment
0x02	Center-alignment
0x03	Right-alignment if iReadingOrder specifies left-to-right reading order; otherwise, left-alignment
0x04	Justify-alignment
0x07	Distributed alignment

vat (1 byte): An unsigned integer that specifies the vertical alignment of the text. MUST be a value from the following table:

Value	Alignment
0x01	Top-alignment
0x02	Center-alignment
0x03	Bottom-alignment
0x04	Justify-alignment
0x07	Distributed alignment

wBkgMode (2 bytes): An unsigned integer that specifies the display mode of the background of the text. MUST be a value from the following table:

Value	Background Mode		
0x0001	Transparent background		
0x0002	Opaque background		

rgbText (4 bytes): A LongRGB structure that specifies the color of the text.

- **x (4 bytes):** A signed integer that specifies the horizontal position of the text, relative to the upper-left of the **chart area** (section 2.2.3.17) in <u>SPRC</u>. This value MUST be ignored when this record is preceded by a <u>DefaultText</u> record or when it is followed by a <u>Pos</u> record; otherwise MUST be greater than or equal to 0 and less than or equal to 32767. SHOULD<132> be less than or equal to 4000.
- y (4 bytes): A signed integer that specifies the vertical position of the text, relative to the upper-left of the chart area (section 2.2.3.17) in SPRC. This value MUST be ignored when this record is preceded by a DefaultText record or when it is followed by a Pos record; otherwise MUST be greater than or equal to 0 and less than or equal to 32767. SHOULD<133> be less than or equal to 4000.
- **dx (4 bytes):** A signed integer that specifies the horizontal size of the text, relative to the chart area (section 2.2.3.17) in SPRC. This value MUST be ignored when this record is followed by a Pos record; otherwise MUST be greater than or equal to 0 and less than or equal to 32767. SHOULD<134> be less than or equal to 4000.
- **dy (4 bytes):** A signed integer that specifies the vertical size of the text, relative to the chart area (section 2.2.3.17) in SPRC. This value MUST be ignored when this record is followed by a Pos record; otherwise MUST be greater than or equal to 0 and less than or equal to 32767. SHOULD<135> be less than or equal to 4000.
- **A fAutoColor (1 bit):** A bit that specifies whether the foreground text color is determined automatically.
- **B fShowKey (1 bit):** A bit that specifies whether the text is attached to a **legend key**.
- **C fShowValue (1 bit):** A bit that specifies whether the value, or the vertical value on bubble or scatter <u>chart groups</u>, is displayed in the <u>data label</u>.

If the current attached label contains a DataLabExtContents record and the **fPercent** field of the DataLabExtContents record equals 0, this field MUST equal the **fValue** field of the DataLabExtContents record.

If the current attached label does not contain a DataLabExtContents record and **fShowLabelAndPerc** equals 1, this field MUST equal 0.

This field MUST equal 0 if the current attached label does not contain a DataLabExtContents record and one or more of the following conditions are satisfied:

- The **fShowLabelAndPerc** field equals 1.
- The fShowPercent field equals 1.
- **D unused1 (1 bit):** Undefined and MUST be ignored.
- **E fAutoText (1 bit):** A bit that specifies whether the text value of this text field is automatically generated and unchanged.
- **F fGenerated (1 bit):** A bit that specifies whether the properties of this text field are automatically generated and unchanged.
- G fDeleted (1 bit): A bit that specifies whether this data label was deleted by the user.
- H fAutoMode (1 bit): A bit that specifies whether the background color is determined automatically.
- I unused2 (3 bits): Undefined and MUST be ignored.

J - fShowLabelAndPerc (1 bit): A bit that specifies whether the **category (2)** name and the value, represented as a percentage of the sum of the values of the series the data label is associated with, are displayed in the data label.

MUST equal 0 if the chart group type of the corresponding chart group, series, or <u>data point</u>, is not a bar of pie, doughnut, pie, or pie of pie chart group.

This field MUST equal 1 if the current attached label contains a DataLabExtContents record and both of the following conditions are satisfied:

- The fCatName and fPercent fields of the DataLabExtContents record equal 1.
- The fSerName, fValue, and fBubSizes fields of the DataLabExtContents record equal 0.

This field MUST equal 0 if the current attached label contains a DataLabExtContents record and one or more of the following conditions is satisfied:

- The fCatName or fPercent fields of the DataLabExtContents record equal 0.
- The fSerName, fValue, or fBubSizes fields of the DataLabExtContents record equal 1.

MUST be ignored if **fAutoText** equals 0.

K - fShowPercent (1 bit): A bit that specifies whether the value, represented as a percentage of the sum of the values of the series the data label is associated with, is displayed in the data label.

MUST equal 0 if the chart group type of the corresponding chart group, series, or data point is not a bar of pie, doughnut, pie, or pie of pie chart group.

If the current attached label contains a DataLabExtContents record, this field MUST equal the value of the **fPercent** field of the DataLabExtContents record.

If the current attached label does not contain a DataLabExtContents record and **fShowLabelAndPerc** equals 1, this field MUST equal 1.

MUST be ignored if **fAutoText** equals 0.

L - fShowBubbleSizes (1 bit): A bit that specifies whether the bubble size is displayed in the data label.

MUST equal 0 if the chart group type of the corresponding chart group, series, or data point is not a bubble chart group.

If the current attached label contains a DataLabExtContents record and the **fPercent**, **fValue**, and **fCatName** fields of the DataLabExtContents record equal 0, this field MUST equal the **fBubSizes** field of the DataLabExtContents record.

If the current attached label contains a DataLabExtContents record and the **fPercent, fValue,** or **fCatName** fields of the DataLabExtContents record equal 1, this field MUST equal 0.

If the current attached label does not contain a DataLabExtContents record and **fShowPercent**, **fShowValue**, or **fShowLabel** equal 1, this field MUST equal 0.

MUST be ignored if **fAutoText** equals 0.

M - fShowLabel (1 bit): A bit that specifies whether the category (2), or the horizontal value on bubble or scatter chart groups, is displayed in the data label on a non-area chart group, or the series name is displayed in the data label on an area chart group.

This field MUST equal the **fCatNameLabel** field of the DataLabExtContents record if the current attached label contains a DataLabExtContents record, the chart group is non-area, and both of the following conditions are satisfied:

- The **fValue** field of the DataLabExtContents record equals 0.
- The fShowLabelAndPerc field equals 1 or the fPercent field equals 0.

This field MUST equal the **fCatNameLabel** field of the DataLabExtContents record if the current attached label contains a DataLabExtContents record, the chart group is area or filled radar, and the following condition is satisfied:

The fValue field of the DataLabExtContents record equals 0.

If the current attached label contains a DataLabExtContents record and the **fValue** field of the DataLabExtContents record equals 1, this field MUST equal 0.

This field MUST equal 0 if the current attached label does not contain a DataLabExtContents record and one of the following conditions is satisfied:

- The **fShowValue** field equals 1.
- The **fShowLabelAndPerc** field equals 0 and the **fShowPercent** field equals 1.

MUST be ignored if **fAutoText** equals 0.

N - reserved (1 bit): MUST be zero, and MUST be ignored.

icvText (2 bytes): An <u>Icv</u> structure that specifies the color of the text.

dlp (4 bits): An unsigned integer that specifies the data label positioning of the text, relative to the **graph object** item the text is attached to. For all data label text fields, MUST be a value from the following table:

Data label position	Value	Value for chart group type
Auto	0x0	Pie chart group
Right	0x0	Line, Bubble, or Scatter chart group
Outside	0x0	Bar or Column chart group with fStacked equal to 0
Center	0x0	Bar or Column chart group with fStacked equal to 1
Outside End	0x1	Bar, Column, or Pie chart group
Inside End	0x2	Bar, Column, or Pie chart group
Center	0x3	Bar, Column, Line, Bubble, Scatter, or Pie chart group
Inside Base	0x4	Bar or Column chart group
Above	0x5	Line, Bubble, or Scatter chart group
Below	0x6	Line, Bubble, or Scatter chart group
Left	0x7	Line, Bubble, or Scatter

Data label position	Value	Value for chart group type
		chart group
Right	0x8	Line, Bubble, or Scatter chart group
Auto	0x9	Pie chart group
Moved by user	0xA	All

For all non-data label text fields, it MUST be 0x0.

unused3 (10 bits): Undefined and MUST be ignored.

O - iReadingOrder (2 bits): An unsigned integer that specifies the reading order of the text. MUST be a value from the following table:

Value	Reading order
0x0	The reading order is equal to the iReadingOrder value of the Text record immediately following the closest preceding <u>Chart</u> , <u>DataFormat</u> , <u>Legend</u> , <u>Series</u> , or <u>YMult</u> record where iReadingOrder is not equal to 0x0. If no such preceding record exists, the DefaultText settings of the <u>chart</u> are used. If the DefaultText settings also specify 0x0, the reading order is determined by the application.
0x1	Left-to-right
0x2	Right-to-left

trot (2 bytes): An unsigned integer that specifies the text rotation. MUST be a value from the following table:

Value	Angle description		
0 to 90	Text rotated 0 to 90 degrees counter-clockwise		
91 to 180	Text rotated 1 to 90 degrees clockwise (angle is trot – 90)		
255	Text top-to-bottom with letters upright		

2.4.325 TextPropsStream

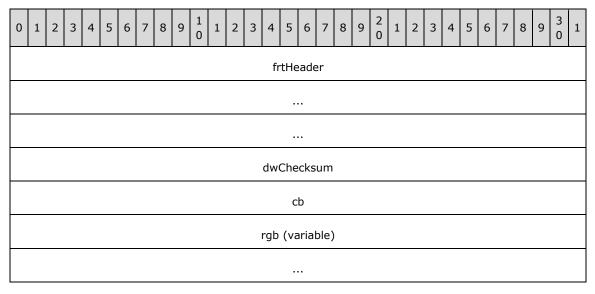

The **TextPropsStream** record specifies additional text properties for the text in the entire <u>chart</u>, text in the current <u>legend</u>, text in the current <u>legend entry</u>, text in the <u>attached label</u>, or the <u>axis</u> labels of the current axis. These text properties are a superset of the properties stored in the associated <u>Text</u> and <u>Font</u> records based on the following table, as specified by <u>Chart Sheet substream</u> **ABNF**. In each case, the associated Font record is specified by the associated <u>FontX</u> record.<136>

Rule containing the TextPropsStream record	Meaning
CHARTFORMATS	Specifies additional Rich Text Format properties for the text of the entire chart. The associated Text and FontX records are contained in the attached label that is contained in the first sequence of records that conforms to the DFTTEXT rule in the chart and that is not contained in the chart group .
LD	Specifies additional Rich Text Format properties for text in the current

Rule containing the TextPropsStream record	Meaning
	legend. The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule that is contained in the collection of records conforming to the LD rule.
SERIESFORMAT	Specifies additional Rich Text Format properties for the current legend entry. The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule that immediately precedes this record contained in the sequence of records that conforms to the SERIESFORMAT rule.
ATTACHEDLABEL	Specifies additional Rich Text Format properties for the text in the attached label. The associated Text and FontX records are contained in the sequence of records that conforms to the ATTACHEDLABEL rule.
AXS	Specifies additional Rich Text Format properties for the axis labels of the current axis. The associated Text and FontX records are contained in the sequence of records that conforms to the AXS rule.

These text properties are stored in the **XML stream** (section <u>2.1.7.22</u>), as specified in <u>[ECMA-376]</u> Part 4, section 5.7.2.217.

An application can choose to ignore this record without loss of functionality, except for the additional text properties. If an application chooses to implement this record, the application MUST implement the validation **checksum** specified by the **dwChecksum** field.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x08A5.

dwChecksum (4 bytes): An unsigned integer that specifies the checksum of the text properties attributes related to this record. The algorithm used to calculate the checksum is specified by [MS-OSHARED] section 2.4.3.2. The checksum MUST be calculated from every property of the property stream, taken as an array of bytes as specified by the TextPropsStreamChecksumData structure.

The information required to build the memory stream can be gathered from the Text and Font records associated with this record, as previously specified.

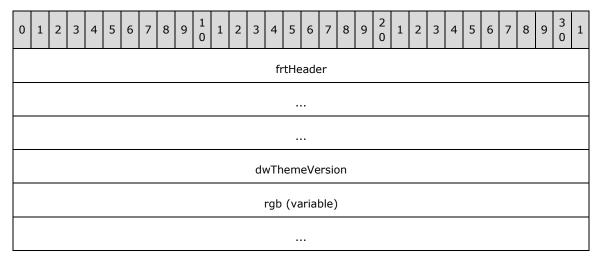

When reading this record, the checksum is calculated as previously specified and compared to the **dwChecksum** value stored in this record. If the calculated checksum does not match the

dwChecksum data, the application MUST assume that the **XML stream** (section 2.1.7.22) is out of date, and the data from the associated Text and Font records MUST be used instead of the data specified by the **XML stream** (section 2.1.7.22).

- **cb (4 bytes):** An unsigned integer that specifies the size of the **rgb** field. This field MUST contain the exact length in bytes of the **rgb** field.
- **rgb (variable):** An array of ANSI characters that contains the **XML** representation of the text formatting properties, as defined in [ECMA-376] Part 4, section 5.7.2.217. The length of this field is specified by the **cb** field.

2.4.326 Theme

The **Theme** record specifies the **theme** in use in the document.

frtHeader (12 bytes): An FrtHeader structure. The value of the frtHeader.rt field MUST be 2198.

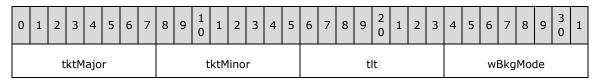

dwThemeVersion (4 bytes): An unsigned integer that specifies the theme type. SHOULD be a value from the following table<137>:

Value	Meaning
0	Custom theme
124226	Default theme

rgb (variable): An optional byte stream that specifies the theme contents (as defined in [ECMA-376] Part 1, Section 14.2.7). MUST exist if **dwThemeVersion** equals 0.

2.4.327 Tick

The **Tick** record specifies the attributes of the <u>axis</u> labels, **major tick marks**, and **minor tick marks** associated with an axis.

	rgb					
	reserved1					
	reserved2					
	reserved3					
	reserved4					
Α	В	rot	С	unused	D	icv
	trot					

tktMajor (1 byte): An unsigned integer that specifies the location of major tick marks. MUST be a value from the following table:

Value	Tick mark location
0x0000	None. No major tick marks are drawn on the axis.
0x0001	Inside. Major tick marks are drawn toward the plot area .
0x0002	Outside. Major tick marks are drawn away from the plot area.
0x0003	Crossing. Major tick marks are drawn evenly on both sides of the axis.

tktMinor (1 byte): An unsigned integer that specifies the location of minor tick marks. MUST be a value from the following table:

Value	Tick mark location
0x0000	None. No minor tick marks are present on the axis.
0x0001	Inside. Minor tick marks are drawn toward the plot area.
0x0002	Outside. Minor tick marks are drawn away from the plot area.
0x0003	Crossing. Minor tick marks are drawn evenly on both sides of the axis.

tlt (1 byte): An unsigned integer that specifies the location of axis labels. MUST be a value from the following table:

Value	Tick mark label location
0x0000	None. No axis labels are present on the axis.
0x0001	Low. Axis labels are drawn to the left of the plot area for a vertical axis or below the plot area for a horizontal axis for all chart group types except radar. Axis labels for radar chart group types will be drawn as if the value was 0x0003.
0x0002	High. Axis labels are drawn to the right of the plot area for a vertical axis or above the plot area for a horizontal axis for all chart group types except radar. Axis labels for radar chart group types will be drawn as if the value was 0x0003.

Value	Tick mark label location
0x0003	Next to Axis. Axis labels are drawn next to the axis.

wBkgMode (1 byte): An unsigned integer that specifies the display mode of the background of the text of the axis labels. MUST be ignored if the value of **fAutoCo** is 1. MUST be a value from the following table:

Value	Background Mode
0x0001	Transparent background
0x0002	Opaque background. The background color will match the rgbBack field in the associated <u>AreaFormat</u> record as specified by the <u>AXS</u> rule in the Chart Sheet Substream ABNF .

rgb (4 bytes): A <u>LongRGB</u> structure that specifies the color of the text for the axis labels. MUST be ignored if **fAutoCo** is 1.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

reserved3 (4 bytes): MUST be zero, and MUST be ignored.

reserved4 (4 bytes): MUST be zero, and MUST be ignored.

A - fAutoCo (1 bit): A bit that specifies if the foreground text color of the axis labels is determined automatically.

Value	Meaning
0	The text uses the color specified by rgb .
1	The text uses an automatically selected foreground color, based on the computer's display settings.

.

B - fAutoMode (1 bit): A bit that specifies if the background color of the axis label is determined automatically.

Value	Meaning
0	The background color is specified by wBkgMode .
1	The background color is set according to the <u>DefaultText</u> settings of the <u>chart</u> .

.

rot (3 bits): An unsigned integer that specifies text rotation of the axis labels. MUST be a value from the following table:

Value	Text Rotation
0x0	Text is drawn with the rotation specified by the value of trot .

Value	Text Rotation
0x1	Text is drawn stacked, top-to-bottom, with the letters upright.
0x2	Text is drawn rotated at 90 degrees counterclockwise.
0x3	Text is drawn rotated at 90 degrees clockwise.

C - fAutoRot (1 bit): A bit that specifies whether the text rotation of the axis label is determined automatically.

Value	Meaning
0	The axis labels do not rotate automatically, and follow the rotation specified by rot and trot .
1	The axis labels rotate as the location of the axis changes and the value of the rot and trot fields MUST be ignored.

.

unused (8 bits): Undefined, and MUST be ignored.

D - iReadingOrder (2 bits): An unsigned integer that specifies the **reading order** of the axis labels. MUST be a value from the following table:

Value	Meaning
0x0	The reading order is equal to the iReadingOrder value of the <u>Text</u> record immediately following the closest preceding <u>Chart</u> , <u>DataFormat</u> , <u>Legend</u> , <u>Series</u> or <u>YMult</u> record where iReadingOrder is not equal to 0x0. If no such preceding record exists, the DefaultText settings of the chart is used. If the DefaultText settings also specify 0x0, the reading order is determined by the Application.
0x1	Left-to-right
0x2	Right-to-left

icv (2 bytes): An Icv that specifies the color of the text. The color MUST be the same as rgb.

trot (2 bytes): An unsigned integer that specifies the axis label's text rotation. MUST be a value from the following table:

Value	Meaning
0 to 90	Text rotated 0 to 90 degrees counterclockwise
91 to 180	Text rotated 1 to 90 degrees clockwise (angle is trot – 90)
255	Text top-to-bottom with letters upright

2.4.328 TopMargin

The **TopMargin** record specifies the top margin of the current **sheet**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
															nu	ım															

num (8 bytes): An Xnum (section <u>2.5.342</u>) structure that specifies the top margin of the current sheet in inches. The value MUST be greater than or equal to 0 and less than or equal to 49.

2.4.329 TxO

The **TxO** record specifies the text in a text box or a **form** control. This record can be followed by a collection of <u>Continue</u> records that specifies additional feature data to complete this record, as follows:

- If the value of the **cchText** field is not zero, this record does not fully specify the text. The rest of the data that MUST be specified is the text string and the **formatting runs** information. That data is specified in two sets of following Continue records:
 - Text String Specification: The first set of Continue records specifies the text string.
 Each of these Continue records contains an <u>XLUnicodeStringNoCch</u> structure that specifies part of the string. The total number of characters in all XLUnicodeStringNoCch MUST be cchText.
 - Formatting Run **Specification**: The second set of Continue records specifies formatting runs. These Continue records contain a <u>TxORuns</u> structure. If the size of the TxORuns structure is longer than 8,224 bytes, it is split across multiple Continue records.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1								
Α		В			С)	Е		F G H rot											rot										rot							
	reserved4 (optional) reserved5 (optional)																																						
	controlInfo (optional)																																						
						(cch ⁻	Гех	t													,	cbR	uns	;														
	ifntEmpty fmla (variable)																																						

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - hAlignment (3 bits): An unsigned integer that specifies the **horizontal alignment**. The value MUST be one of the values in the following table:

Value	Meaning
1	Specifies left alignment.

Value	Meaning
2<138>	Specifies centered alignment.
3	Specifies right alignment.
4	Specifies justify alignment.
7	Specifies justify distributed alignment.

C - vAlignment (3 bits): An unsigned integer that specifies the **vertical alignment**. The value MUST be one of the values in the following table:

Value	Meaning
1	Specifies top alignment.
2	Specifies middle alignment.
3	Specifies bottom alignment.
4	Specifies justify alignment<139>.
7	Specifies justify distributed alignment.

D - reserved2 (2 bits): MUST be zero, and MUST be ignored.

E - fLockText (1 bit): A bit that specifies whether the text is **locked**.

F - reserved3 (4 bits): MUST be zero, and MUST be ignored.

G - fJustLast (1 bit): A bit that specifies whether the justify alignment or justify distributed alignment is used on the last line of the text in specific versions of the application <140>.

H - fSecretEdit (1 bit): A bit that specifies whether this is a text box used for typing passwords and hiding the actual characters being typed by the user.

rot (2 bytes): An unsigned integer that specifies the orientation of the text within the object boundary. The value MUST be one of the values in the following table:

Value	Meaning
0	Specifies no rotation.
1	Specifies stacked or vertical orientation.
2	Specifies 90-degree counter-clockwise rotation.
3	Specifies 90-degree clockwise rotation.

reserved4 (2 bytes): MUST be zero and MUST be ignored. This field MUST exist if and only if the value of **cmo.ot** in the preceding <u>Obj</u> record is not 0, 5, 7, 11, 12 or 14.

reserved5 (4 bytes): MUST be zero and MUST be ignored. This field MUST exist if and only if the value of **cmo.ot** in the preceding Obj record is not 0, 5, 7, 11, 12 or 14.

- **controlInfo (6 bytes):** An optional <u>ControlInfo</u> structure that specifies the properties for some form controls. The field MUST exist if and only if the value of **cmo.ot** in the preceding Obj record is 0, 5, 7, 11, 12, or 14.
- **cchText (2 bytes):** An unsigned integer that specifies the number of characters in the text string contained in the Continue records immediately following this record.
- **cbRuns (2 bytes):** An unsigned integer that specifies the number of bytes of formatting run information in the TxORuns structure contained in the Continue records following this record. If **cchText** is 0, this value MUST be 0. Otherwise, the value MUST be greater than or equal to 16 and MUST be a multiple of 8.

ifntEmpty (2 bytes): A FontIndex structure that specifies the font when the value of cchText is 0.

fmla (variable): An ObjFmla structure that specifies the parsed expression of the formula (section 2.2.2) for the text.

2.4.330 TxtQry

The **TxtQry** record specifies information for a **text query** and that specifies the beginning of a collection of <u>ExtString</u> records, as defined by the <u>Worksheet substream</u> **ABNF**. The collection of ExtString records specifies the **connection string** for a **query** that retrieves **external data**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	5 6	7	8	9	2	1	1 2 3 4 5 6 7 8 9 3									1
							r	t														r	ese	rve	d						
Α	В	C	()	D				iC	Cpid	lNe	W				Е	=						ι	ınus	sed	1						
														ro	ws	Start	At														
F	G	Н	Ι	J	K	C L chCustom unused2																									
															i	itwf															
		ch	ıDe	cim	al					ch	Tho	usS	Еер								rg	txt\	wf (var	iabl	e)					
													rg	chF	ile	e (var	iab	le)													

rt (2 bytes): An unsigned integer that specifies the record type. MUST be 0x0805.

reserved (2 bytes): MUST be zero, and MUST be ignored.

- A ffile (1 bit): A bit that specifies that the query was generated from an import text file action. MUST be 1.
- **B fDelimited (1 bit):** A bit that specifies whether the data is delimited. MUST be a value from the following table:

Value	Meaning
0x0	The data fields are of fixed size.
0x1	The data is delimited.

C - iCpid (2 bits): An unsigned integer that specifies the code page used for the origin of the file. This value is unused when the value of the fUseNewiCpid field is equal to 1 and the value of the iCpidNew field is greater than 2. MUST be a value from the following table:

Value	Meaning
0x0	Macintosh
0x1	Windows (ANSI)
0x2	MS-DOS (PC-8)

D - fPromptForFile (1 bit): A bit that specifies whether a file name is prompted for on **refresh**. MUST be a value from the following table:

Value	Meaning							
0x0	Saved file location is used during refresh							
0x1	Prompt for file name on refresh							

- **iCpidNew (10 bits):** An unsigned integer that specifies application-specific code page information that can be used to optimize **text importation** and can be ignored.
- **E fUseNewiCpid (1 bit):** A bit that specifies whether the **iCpidNew** value is used for specifying the code page instead of the **iCpid** value.
- unused1 (16 bits): Undefined and MUST be ignored.
- **rowStartAt (4 bytes):** A signed integer that specifies the row in the source file where the query begins.
- F fTab (1 bit): A bit that specifies whether the tab character is treated as a column delimiter.
- G fSpace (1 bit): A bit that specifies whether the space character is treated as a column delimiter.
- H fComma (1 bit): A bit that specifies whether the comma character is treated as a field delimiter.
- I fSemiColon (1 bit): A bit that specifies whether the semi-colon character is treated as a column delimiter.
- **J fCustom (1 bit):** A bit that specifies whether the custom character defined in the **chCustom** field is treated as a column delimiter.
- **K fConsecutive (1 bit):** A bit that specifies whether consecutive delimiters are treated as one delimiter.
- L iTextDelm (2 bits): An unsigned integer that specifies a text delimiter. MUST be a value from the following table:

Value	Meaning
0x0	Quotation mark
0x1	Apostrophe

Value	Meaning
0x2	No text delimiter

chCustom (16 bits): An unsigned integer that specifies the custom delimiter **Unicode** character. This value is used if the **fCustom** value equals 1.

unused2 (8 bits): Undefined and MUST be ignored.

itwf (4 bytes): A signed integer that specifies the number of fields in each row of data. MUST be greater than 0 and less than or equal to 256.

chDecimal (1 byte): An unsigned integer that specifies the decimal separator. MUST be a character from the **ANSI character set**.

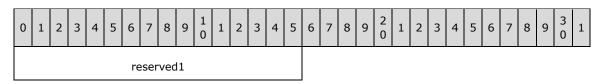

chThousSep (1 byte): An unsigned integer that specifies the thousands separator. MUST be a character from the ANSI character set.

rgtxtwf (variable): An array of <u>TxtWf</u> that specifies the text to column fields. The size of the array is determined by the **itwf** value. The array MUST NOT be empty.

rgchFile (variable): An <u>XLUnicodeString</u> structure that specifies the name of the text file that is the source of the query.

2.4.331 Uncalced

The **Uncalced** record specifies that formulas (section 2.2.2) were pending recalculation when the file was saved.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

2.4.332 Units

The **Units** record MUST be zero, and MUST be ignored.

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.333 UserBView

The **UserBView** record specifies the general **custom view** settings that apply to a whole **workbook**. There are accompanying <u>UserSViewBegin</u> records that specify individual custom view settings of each **sheet**. The set of this record and the accompanying UserSViewBegin records share the same **GUID**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

																dy															
						W	Tab	Rat	io							Α	В	(C	D	E	F	G	H	1	I	J	К	L	М	N
	unused2 O P unused3											ı																			
	wMergeInterval st (variable)																														

unused1 (4 bytes): Undefined and MUST be ignored.

tabId (2 bytes): A <u>TabId</u> structure that specifies the **active sheet** in this custom view. If the value of the **fInvalidTabId** field is 1, the value of **tabId** is undefined and MUST be ignored.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

guid (16 bytes): A GUID as specified by [MS-DTYP] that specifies the identity of the custom view.

- x (4 bytes): A signed integer that specifies the horizontal position of the workbook window, in pixels.
- y (4 bytes): A signed integer that specifies the vertical position of the workbook window, in pixels.
- **dx (4 bytes):** A signed integer that specifies the width of the workbook window, in pixels. MUST be greater than or equal to 0.
- **dy (4 bytes):** A signed integer that specifies the height of the workbook window, in pixels. MUST be greater than or equal to 0.
- wTabRatio (2 bytes): An unsigned integer that specifies the ratio of the window area used to display sheet tabs and the window area used to display the horizontal scroll bar. The value of wTabRatio MUST be greater than or equal to zero and less than or equal to 1000. A value of 0 specifies that only the horizontal scroll bar is displayed. A value of 1000 specifies that only sheet tabs are displayed.

- A fDspFmlaBar (1 bit): A bit that specifies whether a formula bar is displayed.
- **B fDspStatus (1 bit):** A bit that specifies whether a status bar is displayed.
- C mdNoteDisp (2 bits): An unsigned integer that specifies whether to show cell comment and visual cue on each cell that has a comment. MUST be a value from the following table:

Value	Meaning
0x0	Comment and visual cue are off for each cell with a comment.
0x1	A visual cue that indicates the cell has a comment.
0x2	Comment and visual cue are on for each cell with a comment.

- D fDspHScroll (1 bit): A bit that specifies whether a horizontal scroll bar is displayed.
- **E fDspVScroll (1 bit):** A bit that specifies whether a vertical scroll bar is displayed.
- F fBotAdornment (1 bit): A bit that specifies whether sheet tabs are displayed.
- **G fZoom (1 bit):** A bit that specifies whether the workbook window is maximized. The value of **fIconic** and the value of **fZoom** MUST NOT both be 1.
- H fHideObj (2 bits): A <u>HideObjEnum</u> structure that specifies how **ActiveX objects**, **OLE objects**, and **drawing objects** appear in the workbook Window.
- I fPrintIncl (1 bit): A bit that specifies whether the custom view includes the print settings of the workbook. MUST be a value from the following table:

Value	Meaning
0x0	The custom view does not include print settings of the workbook.
0x1	The custom view includes print settings of the workbook.
	UserSViewBegin records that have a guid field value equal to the guid of this record specify which print settings are included in the custom view.
	Additionally, print titles and print areas are specified by <u>Lbl</u> records that have Name containing the guid of this record, using the following form, where <guid> matches the value of guid with the characters left brace "{", right brace "}", and dash "-" in guid replaced by an underscore "_" character:</guid>
	Print titles: Z<guid>.wvu.PrintTitles</guid>
	Print area: Z<guid>.wvu.PrintArea</guid>

J - fRowColIncl (1 bit): A bit that specifies whether the custom view includes the **hidden rows**, **hidden columns**, and **filters** for the workbook. MUST be a value from the following table:

Value	Meaning
0x0	The custom view does not include Hidden rows, hidden columns, or filter settings.
0x1	The custom view includes Hidden rows, hidden columns, or filter settings of the workbook.
	UserSViewBegin records that have a guid field value equal to the guid of this record specify whether Hidden rows, hidden columns, or filter settings are included

Value	Meaning
	in the custom view.
	Additionally, hidden rows and hidden columns are specified by Lbl records that have Name containing the guid of this record, using the following form, where <guid> matches the value of guid with the characters left brace "{", right brace "}", and dash "-" in guid replaced by an underscore "_" character:</guid>
	Hidden rows: Z <guid>.wvu.Rows</guid>
	Hidden columns: Z <guid>.wvu.Cols</guid>
	Filter settings are also specified by Lbl records that have Name containing the value of guid for this record, using the following form, where <guid> matches the value of guid with the characters left brace "{", right brace "}", and dash "-" in guid replaced by an underscore "_" character:</guid>
	Range being filtered: Z <guid>.wvu.FilterData</guid>
	Range containing filter criteria: Z <guid>.wvu.FilterCriteria</guid>

- K fInvalidTabId (1 bit): A bit that specifies whether the tabId field is ignored.
- L fTimedUpdate (1 bit): A bit that specifies whether updates associated with linked or external data are coordinated. If the value of the fPersonalView field is 0, the value of fTimedUpdate MUST be 0.
- M fAllMemChanges (1 bit): A bit that specifies whether the changes being saved have priority in a merge conflict. If the value of the fTimedUpdate field is 0, the value of fAllMemChanges is undefined and MUST be ignored.
- N fOnlySync (1 bit): A bit that specifies whether the automatic update merges the current changes into a shared-workbook or whether the automatic update merges and also saves the changes. If the value of the fPersonalView field is 0, the value of fOnlySync MUST be 0.

unused2 (2 bytes): Undefined and MUST be ignored.

- **O fPersonalView (1 bit):** A bit that specifies whether the custom view is the personal view of a shared workbook. MUST be 0 if this is not a shared workbook.
- **P fIconic (1 bit):** A bit that specifies whether the workbook window is minimized. The value of **fIconic** and the value of **fZoom** MUST NOT both be 1.

unused3 (14 bits): Undefined and MUST be ignored.

wMergeInterval (2 bytes): An unsigned integer that specifies the time interval, in minutes, between automatic merges of a shared workbook. The restrictions on the value of wMergeInterval are dictated by the value of the fPersonalView field and the value of the fTimedUpdate field, as specified in the following table:

fPersonalView	fTimedUpdate	wMergeInterval
1	1	MUST be greater than or equal to 5 and less than or equal to 1440.
1	0	Undefined and MUST be ignored.
0	0	MUST be 65535.

st (variable): An XLUnicodeString structure that specifies the name of the custom view.

2.4.334 UserSViewBegin

The **UserSViewBegin** record specifies **custom view** settings for the current **sheet** and specifies the beginning of a collection of records as defined by the <u>Chart Sheet substream</u> **ABNF**, <u>Dialog Sheet substream</u> ABNF, <u>Macro Sheet substream</u> ABNF, and <u>Worksheet substream</u> ABNF. The collection of records specifies custom view settings for the current sheet. There is an associated <u>UserBView</u> record, specified by the **guid** field, that specifies custom view settings that apply to the whole **workbook**. If the current sheet is a **chart sheet**, the <u>UserSViewBegin</u> Chart version of this record MUST be used.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

	colRPane rwBPane																					r	wBF	Pan	e						

guid (16 bytes): A **GUID**, as specified by [MS-DTYP], that specifies the association with a UserBView. MUST equal the value of the **guid** field of the UserBView.

iTabid (2 bytes): A TabId structure that specifies the sheet of this custom view.

reserved1 (2 bytes): MUST be zero, and MUST be ignored.

- wScale (4 bytes): An unsigned integer that specifies the zoom level of the window used to display the sheet. MUST be greater than or equal to 10 and less than or equal to 400.
- **icvHdr (2 bytes):** An <u>Icv</u> structure that specifies the color of the **gridlines** displayed in the view. MUST be less than or equal to 64.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

pnnSel (1 byte): A **PaneType** structure that specifies the **active pane**.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

reserved4 (1 byte): MUST be zero, and MUST be ignored.

- A fShowBrks (1 bit): A bit that specifies whether page breaks are displayed.
- **B fDspFmlaSv (1 bit):** A bit that specifies whether the window used to display the sheet displays formulas or values. MUST be 0 for **dialog sheets**. MUST be a value from the following table:

Value	Meaning
0x0	The window used to display the sheet displays values.
0x1	The window used to display the sheet displays formulas.

- C fDspGridSv (1 bit): A bit that specifies whether the window used to display the sheet displays gridlines.
- **D fDspRwColSv (1 bit):** A bit that specifies whether the window used to display the sheet displays row and column headings. MUST be 0 for dialog sheets.
- **E fDspGutsSv (1 bit):** A bit that specifies whether outline symbols are displayed. MUST be 0 for dialog sheets. MUST be 1 for **macro sheets**.
- **F fDspZerosSv (1 bit):** A bit that specifies whether the window used to display the sheet displays zero values or suppresses display of zero values. MUST be 0 for dialog sheets. MUST be a value from the following table:

Value	Meaning
0	The window used to display the sheet displays zero values.
1	The window used to display the sheet suppresses display of zero values.

- **G fHorizontal (1 bit):** A bit that specifies whether the sheet is centered between the horizontal margins when printed.
- **H fVertical (1 bit):** A bit that specifies whether the sheet is centered between the vertical margins when printed.
- I fPrintRwCol (1 bit): A bit that specifies whether to print the row and column headings. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fPrintIncl field value of 0.
- J fPrintGrid (1 bit): A bit that specifies whether to print the gridlines. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equals to the guid of this record has the fPrintIncl field value of 0.

- K fFitToPage (1 bit): A bit that specifies whether the fit to page option is enabled. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fPrintIncl field value of 0.
- L fPrintArea (1 bit): A bit that specifies whether there is at least one print area on the sheet. If the value of fOnePrintArea is 1, the value of fPrintArea MUST be 1. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fPrintIncl field value of 0.

Additionally, if **fPrintArea** is 1, there MUST exist an <u>Lbl</u> record for the print area as specified in the description for the **fPrintIncl** field in UserBView.

M - fOnePrintArea (1 bit): A bit that specifies whether there is only one print area on the sheet. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with **guid** field value equal to the **guid** of this record has the **fPrintIncl** field value of 0.

Additionally, if **fOnePrintArea** is 1, there MUST exist an LbI record for the print area as specified in the description for the **fPrintIncl** field in UserBView.

N - fFilterMode (1 bit): A bit that specifies whether there are hidden cells because of filtering.

MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fRowColIncl field value of 0.

Additionally, if **fFilterMode** is 1, there MUST exist an Lbl record for the **range** being filtered as specified in the description for the **fRowColIncl** field in UserBView. There can exist an Lbl record for the range containing **filter** criteria as specified in the description for the fRowColIncl field in UserBView.

O - fEzFilter (1 bit): A bit that specifies whether the AutoFilter icon is shown on the sheet. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fRowColIncl field value of 0.

Additionally, if **fEzFilter** is 1, there MUST exist an Lbl record for the range being filtered as specified in the description for the **fRowColIncl** field in UserBView. There can exist an Lbl record for the range containing filter criteria as specified in the description for the fRowColIncl field in UserBView.

- **P fFrozen (1 bit):** A bit that specifies whether the **panes** in the window used to display the sheet are **frozen**. If the value of **fFrozenNoSplit** is 1, the value of **fFrozen** MUST be 1.
- **Q fFrozenNoSplit (1 bit):** A bit that specifies whether the panes in the window used to display the sheet are **frozen panes** but are not **split panes**.
- **R fSplitV (1 bit):** A bit that specifies whether the window used to display the sheet is split vertically.
- **S fSplitH (1 bit):** A bit that specifies whether the window used to display the sheet is split horizontally.
- **T fHiddenRw (2 bits):** An unsigned integer that specifies the state of **hidden** rows, excluding the filtered rows. MUST be a value from the following table:

Value	Meaning
0x0	Indicates a hidden row is present.
0x1	Indicates a hidden row is not present.

MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with **guid** field value equal to the **guid** of this record has the **fRowColIncl** field value of 0.

Additionally, if **fHiddenRw** is 1, there MUST exist an Lbl record for the hidden rows as specified in the description for the **fRowColIncl** field in UserBView.

U - fHiddenCol (1 bit): A bit that specifies whether there is at least one **hidden column** in the sheet. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with **guid** field value equal to the **guid** of this record has the **fRowColIncl** field value of 0.

Additionally, if **fHiddenRw** is 1, there MUST exist an LbI record for the hidden columns as specified in the description for the **fRowColIncl** field in UserBView.

- V unused1 (3 bits): Undefined and MUST be ignored.
- W fFilterUnique (1 bit): A bit that specifies whether the sheet has the advanced filter enabled and is displaying only unique rows. MUST be 0 for dialog sheets. MUST be 0 if the UserBView record with guid field value equal to the guid of this record has the fRowColIncl field value of 0.

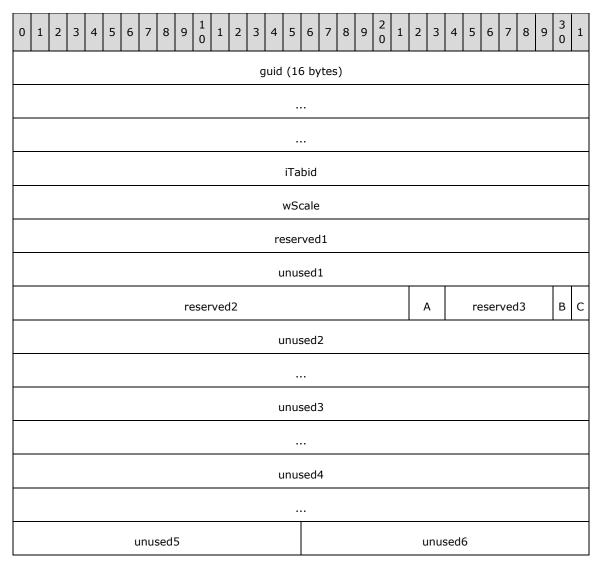

Additionally, if **fFilterUnique** is 1, there MUST exist an Lbl record for the range being filtered as specified in the description for the **fRowColIncl** field in UserBView. There can exist an Lbl record for the range containing filter criteria as specified in the description for the fRowColIncl field in UserBView.

- X fSheetLayoutView (1 bit): A bit that specifies whether the sheet is in the Page Break Preview view. Only one of this value or the value of fPageLayoutView can be 1. If both values are 0, the custom view is in the Normal view. MUST be 0 for dialog sheets and macro sheets.
- Y fPageLayoutView (1 bit): A bit that specifies whether the sheet is in the Page Layout view.

 MUST be 0 for dialog sheets and macro sheets.
- **Z unused2 (1 bit):** Undefined and MUST be ignored.
- a fRuler (1 bit): A bit that specifies whether the ruler is displayed.
- **b reserved5 (2 bits):** MUST be zero, and MUST be ignored.
- **ref8TopLeft (8 bytes):** A <u>Ref8U</u> structure that specifies the **visible** area of the **logical top-left** pane.
- **operNumX (8 bytes):** A **floating-point number** that specifies the left-to-right position of the start of the split pane expressed as a column number. The value MUST be greater than or equal to 0. The sum of this value and the value of **ref8TopLeft.colFirst** MUST be less than or equal to 256.
- **operNumY (8 bytes):** A floating-point number that specifies the top-to-bottom position of the start of the split pane expressed as a row number. The value MUST be greater than or equal to 0. The sum of this value and the value of **ref8TopLeft.rowFirst** MUST be less than or equal to 65536.
- colRPane (2 bytes): An unsigned integer that specifies the first visible column of the logical right pane. MUST be 65535 or less than or equal to 255. If the value of the fSplitV field is 1, the value of colRPane MUST be 65535. If the value of the fSplitV field is 0, the value of colRPane MUST be less than or equal to 255.
- **rwBPane (2 bytes):** An unsigned integer that specifies the first visible row of the bottom pane. If the value of the **fSplitH** field is 1, the value of **rwRPane** MUST be 65535.

2.4.335 UserSViewBegin_Chart

The **UserSViewBegin_Chart** record specifies **custom view** settings for the current **chart sheet** and that specifies the beginning of a collection of records as defined by the <u>Chart Sheet substream</u> **ABNF**. The collection of records specifies custom view settings for the current chart sheet. There is an associated <u>UserBView</u> record, specified by the **guid** field, that specifies custom view settings that apply to the whole **workbook**.

guid (16 bytes): A **GUID**, as specified by [MS-DTYP], that specifies the association with a UserBView. MUST equal the value of the **guid** field of the UserBView record.

iTabid (4 bytes): A TabId structure that specifies the sheet of this custom view.

wScale (4 bytes): An unsigned integer that specifies the **zoom level** of the window used to display the sheet. MUST be greater than or equal to 10 and less than or equal to 400.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

unused1 (4 bytes): Undefined and MUST be ignored.

reserved2 (22 bits): MUST be zero, and MUST be ignored.

A - hsState (2 bits): An unsigned integer that specifies the hidden state of the chart sheet. MUST be a value from the following table:

Value	Meaning
0x0	The chart sheet is visible .
0x1	The chart sheet is hidden.

ĺ	Value	Meaning
	0x2	Very Hidden; the sheet is hidden and cannot be displayed using the user interface.

reserved3 (6 bits): MUST be zero, and MUST be ignored.

B - fZoomToFit (1 bit): A bit that specifies whether the zoom level is set to "Zoom to Fit Selection". SHOULD<141> be 1 if the current zoom level specified by the **wScale** field fits the current selection.

C - reserved4 (1 bit): MUST be zero, and MUST be ignored.

unused2 (8 bytes): Undefined and MUST be ignored.

unused3 (8 bytes): Undefined and MUST be ignored.

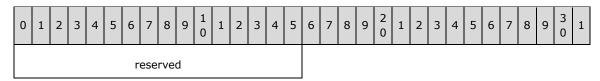

unused4 (8 bytes): Undefined and MUST be ignored.

unused5 (2 bytes): Undefined and MUST be ignored.

unused6 (2 bytes): Undefined and MUST be ignored.

2.4.336 UserSViewEnd

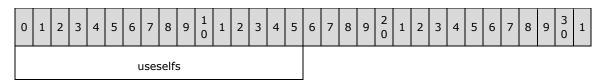

The **UserSViewEnd** record specifies the end of a collection of records, as defined by the <u>common productions</u> substream **ABNF** and the <u>Dialog Sheet substream</u> ABNF. The collection of records specifies a collection of **custom view** records.

reserved (2 bytes): MUST be 1, and MUST be ignored.

2.4.337 **UsesELFs**

The **UsesELFs** record specifies whether the file supports **natural language formulas**.

useselfs (2 bytes): A Boolean (section 2.5.14) that specifies whether the file supports natural language formulas. The value SHOULD<142> be 0x0000.

2.4.338 UsrChk

The **UsrChk** record specifies the version information for the last user who opened the <u>shared</u> workbook.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	version													r	ese	rve	d														

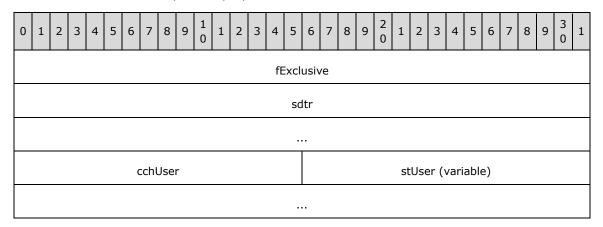

version (2 bytes): An unsigned integer that specifies the **BIFF** version that was used by the last user to open the shared workbook. The value MUST be a value from the following table:

Value	Meaning
0x0200	BIFF2
0x0300	BIFF3
0x0400	BIFF4
0x0500	BIFF5
0x0600	BIFF8

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.4.339 UsrExcl

The **UsrExcl** record specifies whether a user has acquired an exclusive lock on the <u>shared workbook</u> and that specifies the beginning of a collection of records as defined by the <u>revision</u> stream **ABNF**. The collection of records specifies properties for a shared workbook.

fExclusive (4 bytes): A Boolean (section 2.5.14) that specifies whether the user has an exclusive lock on the **workbook**. The value MUST be a value from the following table:

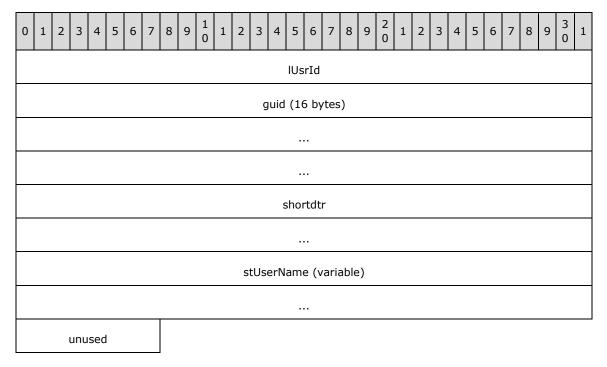

Value	Meaning
0x00000000	The user does not have an exclusive lock on the workbook.
0x0000001	The user has an exclusive lock on the workbook.

sdtr (8 bytes): A ShortDTR structure that specifies the date and time when **fExclusive** was set to 0×00000001 .

- **cchUser (2 bytes):** An unsigned integer that specifies the number of characters in **stUser** that are used to specify the name of the user who has **locked** the workbook. Characters in **stUser** that are to the right of these used characters are ignored. MUST be less than or equal to 0x0036.
- **stUser (variable):** An <u>XLUnicodeStringNoCch</u> structure that specifies the name of the user who has locked the workbook. The count of characters MUST be 147.

2.4.340 UsrInfo

The **UsrInfo** record specifies information about a user who currently has the **shared workbook** open.

- IUsrId (4 bytes): A signed integer that specifies a unique user identifier for this user.
- **guid (16 bytes):** A **GUID**, as specified by [MS-DTYP], that specifies the last set of revisions synced to by this user.
- **shortdtr (8 bytes):** A <u>ShortDTR</u> structure that specifies the date and time this user opened the shared workbook.
- **stUserName (variable):** A <u>XLUnicodeString</u> structure that specifies the name of this user. The number of characters in this string MUST be greater than or equal to 1 and less than or equal to 54.
- unused (1 byte): Undefined and MUST be ignored.

2.4.341 ValueRange

The ValueRange record specifies the properties of a value axis.

numMax									
numl	Major								
numl	Minor								
numCross									
A B C D E F G H unused									

- numMin (8 bytes): An Xnum (section 2.5.342) structure that specifies the minimum value of the value axis. MUST be less than the value of numMax. If the value of fAutoMin is 1, this field MUST be ignored.
- **numMax (8 bytes):** An Xnum structure that specifies the maximum value of the value axis. MUST be greater than the value of **numMin**. If the value of **fAutoMax** is 1, this field MUST be ignored.
- numMajor (8 bytes): An Xnum structure that specifies the interval at which major tick marks and major gridlines are displayed. MUST be greater than or equal to the value of numMinor. If the value of fAutoMajor is 1, this field MUST be ignored.
- numMinor (8 bytes): An Xnum structure that specifies the interval at which minor tick marks and minor gridlines are displayed. MUST be greater than or equal to zero. If the value of fAutoMinor is 1, this field MUST be ignored.
- **numCross (8 bytes):** An Xnum structure that specifies at which value the other axes in the <u>axis</u> group cross this value axis. If the value of **fAutoCross** is 1, this field MUST be ignored.
- **A fAutoMin (1 bit):** A bit that specifies whether **numMin** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by numMin is used as the minimum value of the value axis.
1	numMin is calculated such that the <u>data point</u> with the minimum value can be displayed in the plot area .

B - fAutoMax (1 bit): A bit that specifies whether **numMax** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by numMax is used as the maximum value of the value axis.

Value	Meaning
1	numMax is calculated such that the data point with the maximum value can be displayed in
	the plot area.

C - fAutoMajor (1 bit): A bit that specifies whether **numMajor** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by numMajor is used as the interval at which major tick marks and major gridlines are displayed.
1	numMajor is calculated automatically.

D - fAutoMinor (1 bit): A bit that specifies whether **numMinor** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by numMinor is used as the interval at which minor tick marks and minor gridlines are displayed.
1	numMinor is calculated automatically.

E - fAutoCross (1 bit): A bit that specifies whether **numCross** is calculated automatically. MUST be a value from the following table:

Value	Meaning
0	The value specified by numCross is used as the point at which the other axes in the axis group cross this value axis.
1	numCross is calculated so that the crossing point is displayed in the plot area.

F - fLog (1 bit): A bit that specifies whether the value axis has a logarithmic scale. MUST be a value from the following table:

Value	Meaning
0	The scale of the value axis is linear.
1	The scale of the value axis is logarithmic. The default base of the logarithmic scale is 10, unless a CrtMlFrt record follows this record, specifying the base in a XmlTkLogBaseFrt structure.

G - fReversed (1 bit): A bit that specifies whether the values on the value axis are displayed in reverse order. MUST be a value from the following table:

Value	Meaning
0	Values are displayed from smallest-to-largest, from left-to-right, or from bottom-to-top, respectively, depending on the orientation of the axis.
1	The values are displayed in reverse order, meaning largest-to-smallest, from left-to-right, or from bottom-to-top, respectively.

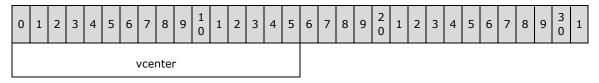

H - fMaxCross (1 bit): A bit that specifies whether the other axes in the axis group cross this value axis at the maximum value. MUST be a value from the following table:

Value	Meaning
0	The other axes in the axis group cross this value axis at the value specified by numCross .
1	The other axes in the axis group cross the value axis at the maximum value. If fMaxCross is 1, then both fAutoCross and numCross MUST be ignored.

unused (8 bits): Undefined and MUST be ignored.

2.4.342 VCenter

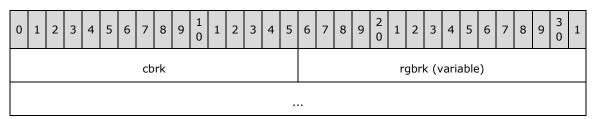

The **VCenter** record specifies whether the **sheet** is centered vertically when printed.

vcenter (2 bytes): A Boolean (section <u>2.5.14</u>) that specifies whether the sheet is centered between <u>TopMargin</u> and <u>BottomMargin</u> when printed.

2.4.343 VerticalPageBreaks

The VerticalPageBreaks record specifies a list of all explicit column page breaks in the sheet.

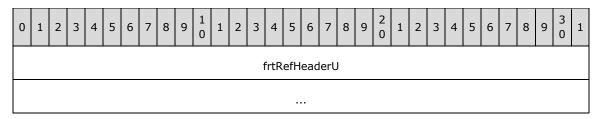

cbrk (2 bytes): An unsigned integer that specifies the number of page breaks. The value MUST be less than or equal to 255.

rgbrk (variable): An array of <u>VertBrk</u> that specifies all of the page breaks. The array MUST be sorted first by the **col** value and then by the **RowStart** value in each VertBrk. Two page breaks MUST NOT overlap. The number of VertBrk MUST equal the value of **cbrk**.

2.4.344 WebPub

The **WebPub** record specifies the information for a single **published** Web page.

•••						
tws	twd	Α	В	С	D	reserved2
reserved3		· ·				unused2
nStyleId						
cb						
	srcName (variable)					
stFileDest (variable)						
	stDivId (variable)					
stTitle (variable)						
crtID (optional)						
frtRgb (variable)						
unu	sed3					

frtRefHeaderU (12 bytes): An FrtRefHeaderU structure. If the value of tws is 4, then frtRefHeaderU.ref8 specifies the range of cells associated with this record and frtRefHeaderU.grbitFrt.fFrtRef MUST be 1. If the value of tws is not 4, then frtRefHeaderU.grbigFrt.fFrtRef MUST be zero.

tws (1 byte): An unsigned integer that specifies the type of Web source that was published. It MUST be a value from the following table:

Value	Meaning
0xFF	The source is undefined.
0x00	Workbook
0x01	Entire sheet
0x02	Print area
0x03	AutoFilter range
0x04	Range of cells
0x05	Chart

Value	Meaning		
0x06	PivotTable report		
0x07	Query table (external data range)		
0x08	Named range		

twd (1 byte): An unsigned integer that specifies the type of Web page created and whether the item is static or interactive. It MUST be a value from the following table:

Value	Meaning
0x00	Non-interactive page, only for viewing
0x01	Uses workbook functionality
0x02	Uses PivotTable functionality
0x03	Uses chart functionality

- A unused1 (1 bit): Undefined and MUST be ignored.
- B fAutoRepublish (1 bit): This bit specifies whether to republish the Web page when it is saved.
- C reserved1 (1 bit): MUST be zero and MUST be ignored.
- **D fMhtml (1 bit):** This bit specifies whether the file is published as a single Web page or as a Web page with references to other files.
- reserved2 (12 bits): MUST be zero and MUST be ignored.
- reserved3 (2 bytes): MUST be zero and MUST be ignored.
- unused2 (2 bytes): Undefined and MUST be ignored.
- **nStyleId (4 bytes):** An unsigned integer that specifies the unique identifier for this published content.
- **cb (4 bytes):** An unsigned integer that specifies the size of the data that follows in this record according to the following formula:
 - size of **srcName** + size of **stFileDest** + size of **stDivId** + size of **stTitle** + size of **crtID** + size of **frtRGB** + size of **unused3**

The value MUST be greater than 0.

- **srcName (variable):** A <u>WebPubString</u> structure that specifies the named range to be published. The field MUST exist if and only if the value of **tws** is greater than 4. The character count in the string MUST be less than or equal to 255.
- **stFileDest (variable):** A WebPubString structure that specifies the **URL** or the path to the location of the published page. The character count in the string MUST be less than or equal to 255.
- **stDivId (variable):** A WebPubString structure that specifies the destination bookmark of the published page. The character count in the string MUST be less than or equal to 255.
- stTitle (variable): A WebPubString structure that specifies the title of the published item.
- **crtID (4 bytes):** An MSOSPID structure, as specified in [MS-ODRAW], that specifies the published chart object. This field MUST exist if and only if **tws** equals 5.

frtRgb (variable): A binary stream that specifies the bytes reserved for future use. The size of this field in bytes is calculated according to the following formula:

size of this record - 30 - size of **srcName** - size of **stFileDest** - size of **stDivId** - size of **stTitle** - size of **crtID<143>**

unused3 (2 bytes): Undefined and MUST be ignored.

2.4.345 Window1

The **Window1** record specifies attributes of a window used to display a **sheet** (called "the window" within this record definition). For each Window1 record in the Globals Substream there MUST be an associated <u>Window2</u> record in each <u>chart sheet</u>, <u>worksheet</u>, <u>macro sheet</u>, and <u>dialog sheet</u> substream that exists in the **workbook**. The Window2 record in a given substream associated with a given Window1 record is the Window2 record whose ordinal position in the collection of Window2 records in the containing substream is equal to the ordinal position of the given Window1 record in the collection of Window1 records in the <u>Globals Substream</u>. Each Window2 record specifies extended properties of the associated Window1 record.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

dxWn								dyWn																							
Α	В	С	D	Е	F	G				res	serv	ed				itabCur															
	itabFirst								ctabSel																						
	wTabRatio																														

- **xWn (2 bytes):** A signed integer that specifies the horizontal position, in **twips**, of the window. The value is relative to the **logical left** edge of the **client area** of the window.
- **yWn (2 bytes):** A signed integer that specifies the vertical position, in twips, of the window. The value is relative to the top edge of the client area of the window.
- **dxWn (2 bytes):** A signed integer that specifies the width, in twips, of the window. MUST be greater than or equal to 1.
- **dyWn (2 bytes):** A signed integer that specifies the height, in twips, of the window. MUST be greater than or equal to 1.
- A fHidden (1 bit): A bit that specifies whether the window is in the list of hidden windows.
- **B fIconic (1 bit):** A bit that specifies whether the window is minimized.
- **C fVeryHidden (1 bit):** A bit that specifies whether the window has the properties of **fHidden** and that also specifies that the user cannot see that the window is in the list of hidden windows.
- **D fDspHScroll (1 bit):** A bit that specifies whether a horizontal scroll bar is displayed.
- E fDspVScroll (1 bit): A bit that specifies whether a vertical scroll bar is displayed.
- F fBotAdornment (1 bit): A bit that specifies whether sheet tabs are displayed.

G - fNoAFDateGroup (1 bit): A bit that specifies whether dates are grouped hierarchically in the **AutoFilter** menu or listed chronologically in the AutoFilter menu.

Value	Meaning
0	Dates are grouped by year, month and day in the AutoFilter menu.
1	Dates are listed chronologically in the AutoFilter menu.

reserved (9 bits): MUST be zero, and MUST be ignored.

itabCur (2 bytes): A TabIndex structure that specifies the selected sheet tab.

itabFirst (2 bytes): A TabIndex structure that specifies the first displayed sheet tab.

ctabSel (2 bytes): An unsigned integer that specifies the number of sheet tabs that are selected. The value MUST be less than or equal to the number of sheets in the workbook. Each **sheet stream** in the <u>workbook stream</u> specifies a sheet.

wTabRatio (2 bytes): An unsigned integer that specifies the ratio of the width of the sheet tabs to the width of the horizontal scroll bar, multiplied by 1000. MUST be less than or equal to 1000.

2.4.346 Window2

The **Window2** record specifies attributes of the window used to display a **sheet** in a **workbook** and that specifies the beginning of a collection of records as defined by the <u>Chart Sheet substream</u> **ABNF**, <u>Macro Sheet substream</u> ABNF, and <u>Worksheet substream</u> ABNF. The collection of records specifies the settings of a **Page Layout view** for a sheet, the zoom of the current view, the position of either **frozen panes** or **unfrozen panes**, and the **selected cells** within the sheet. When this record is contained in a macro sheet substream or a worksheet substream, it has a length of 18 bytes. When this record is contained in a chart sheet substream, it has a length of 10 bytes (which are the first 10 bytes of the original 18-byte record) and only the **fSelected** field is used. This record specifies extended properties of an associated <u>Window1</u> record, and that association is specified in Window1.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

colLeft									icvHdr																						
reserved2									wScaleSLV																						
	wScaleNormal									unused																					
	reserved3																														

- **A fDspFmlaRt (1 bit):** A bit that specifies whether the window displays formulas (section 2.2.2) or values. If the value is 1, the window displays formulas (section 2.2.2). This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **B fDspGridRt (1 bit):** A bit that specifies whether the window displays **gridlines**.

Value	Meaning
0	The window does not display gridlines.
1	The window displays gridlines.

This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

C - fDspRwColRt (1 bit): A bit that specifies whether the window displays row headings and column headings.

Value	Meaning
0	The window does not display row headings and column headings.
1	The window displays row headings and column headings.

This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

- **D fFrozenRt (1 bit):** A bit that specifies whether the panes in the window are **frozen**. The value MUST be 0 if either the value of **colLeft** is 255 or the value of **rwTop** is 65535. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- E fDspZerosRt (1 bit): A bit that specifies whether the window displays zero values.

V	alue	Meaning
0		The window displays cells that have a value of zero as blank.
1		The window displays cells that have a value of zero as a zero.

This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

F - fDefaultHdr (1 bit): A bit that specifies whether the gridlines of the window are drawn in the window's default **foreground color** or in the color specified by the value of **icvHdr**. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

Value	Meaning
0	Gridlines of the window are drawn in the color specified by the value of icvHdr .
1	Gridlines of the window are drawn in the default foreground color of the window.

G - fRightToLeft (1 bit): A bit that specifies whether the text is displayed in **right-to-left** mode in the window.

Value	Meaning
0	The text is displayed in left-to-right mode.
1	The text is displayed in right-to-left mode.

This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

- **H fDspGuts (1 bit):** A bit that specifies whether the window displays the **outline state**. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- I fFrozenNoSplit (1 bit): A bit that specifies whether the panes in the window are frozen without pane splits or frozen with pane splits. If the value of fFrozenRt is 0, the value of fFrozenNoSplit MUST be 0.

Value	Meaning
0	The panes in the window are frozen with pane splits.
1	The panes in the window are frozen without pane splits.

This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

- J fSelected (1 bit): A bit that specifies whether the sheet tab is selected.
- **K fPaged (1 bit):** A bit that specifies whether the sheet is currently being displayed in the window. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.

- L fSLV (1 bit): A bit that specifies whether the sheet is in Page Break Preview view. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **M reserved1 (4 bits):** MUST be zero, and MUST be ignored. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **rwTop (2 bytes):** A <u>RwU</u> structure that specifies a zero-based row index of the first **visible** row of the sheet. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **colLeft (2 bytes):** A <u>ColU</u> structure that specifies a zero-based column index of the **logical left**-most visible column. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **icvHdr (2 bytes):** An <u>Icv</u> structure that specifies the color of the gridlines. MUST be less than or equal to 64. MUST be 64 if and only if the value of **fDefaultHdr** is 1. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- **reserved2 (2 bytes):** MUST be zero, and MUST be ignored. This field is undefined and MUST be ignored if this record is contained in a chart sheet substream.
- wScaleSLV (2 bytes): An unsigned integer that specifies the zoom level in the Page Break Preview view. If the value of fSLV is 1 and this record has an associated Scl as specified in the ABNF in Common Productions, the value of wScaleSLV is undefined and MUST be ignored. MUST<144> be either 0 or greater than or equal to 10 and less than or equal to 400. A value of 0 specifies the default zoom level. This field MUST NOT exist if this record is contained in a chart sheet substream.
- wScaleNormal (2 bytes): An unsigned integer that specifies the zoom level in the Normal view. If the value of fSLV is 0 and the value of the fPageLayoutView field of the PLV, as specified in the ABNF in Common Productions, is 0 and this record has an associated Scl, then the value of wScaleNormal is undefined and MUST be ignored. MUST<145> be either 0 or greater than or equal to 10 and less than or equal to 400. A value of 0 specifies the default zoom level. This field MUST NOT exist if this record is contained in a chart sheet substream.
- **unused (2 bytes):** Undefined and MUST be ignored. This field MUST NOT exist if this record is contained in a chart sheet substream.
- **reserved3 (2 bytes):** MUST be zero, and MUST be ignored. This field MUST NOT exist if this record is contained in a chart sheet substream.

2.4.347 WinProtect

The **WinProtect** record specifies whether the **workbook** windows can be resized or moved and whether the **window state** can be changed.

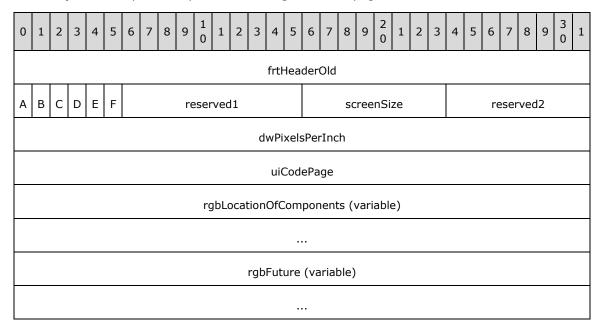

fLockWn (2 bytes): A Boolean (section 2.5.14) that specifies whether the windows can be resized or moved and whether the window state can be changed. It MUST be a value from the following table:

Value	Meaning
0x0000	The workbook windows can be resized or moved and the window state can be changed.

Value	Meaning
0x0001	The workbook windows cannot be resized or moved and the
	window state cannot be changed.

2.4.348 WOpt

The **WOpt** record specifies options for saving as a Web page.

frtHeaderOld (4 bytes): An <u>FrtHeaderOld</u> structure. The value of the frtHeaderOld.rt field MUST be 0x080B.

- A fRelyOnCSS (1 bit): A bit that specifies whether cascading style sheets (CSS) is used for font formatting when viewing the saved file in a Web browser.
- **B fOrganizeInFolder (1 bit):** A bit that specifies whether all supporting files, such as background textures and graphics, are organized in a separate **folder** when saving this file as a Web page. MUST be a value from the following table:

Value	Meaning
0	All supporting files are saved in the same folder as the Web page.
1	All supporting files are organized in a separate folder.

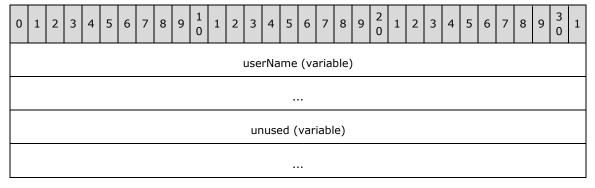

C - fUseLongFileNames (1 bit): A bit that specifies whether **long file names** are used when saving this file as a Web page.

- D fDownloadComponents (1 bit): A bit that specifies whether the necessary Microsoft Office Web Components are downloaded if they are not installed when viewing the saved file in a Web browser.
- **E fRelyOnVML (1 bit):** A bit that specifies whether the application uses **VML** to display graphics in a Web browser.
- **F fAllowPNG (1 bit):** A bit that specifies whether Portable Network Graphics (PNG) format is allowed as an image format when saving this file as a Web page.
- reserved1 (10 bits): MUST be zero, and MUST be ignored.
- **screenSize (1 byte):** A **WebScreenSizeEnum**, as specified in [MS-OSHARED] section 2.2.1.4, that specifies the ideal minimum screen size of the target monitor used to view the saved file in a Web browser.
- reserved2 (1 byte): MUST be zero, and MUST be ignored.
- **dwPixelsPerInch (4 bytes):** An unsigned integer that specifies the density, in pixels per inch, of graphics images and **table** cells when saving this file as a Web page. The value MUST be greater than or equal to 19 and less than or equal to 480.
- uiCodePage (4 bytes): An unsigned integer that specifies the code page. The value MUST be one of the code page values specified in [CODEPG], to be used by the Web browser when viewing the saved file.
- **rgbLocationOfComponents (variable):** An <u>LPWideString</u> structure that specifies the **URL** or the file path to the location from which authorized users can download Microsoft Office Web Components when viewing the saved file as a Web page. The value of **rgbLocationOfComponents.cch** MUST be less than or equal to 2083.
- **rgbFuture (variable):** A binary stream that specifies the bytes reserved for future use. The size of this field in bytes is calculated according to the following formula:

size of this record - 16 - size of rgbLocationOfComponents

2.4.349 WriteAccess

The WriteAccess record specifies the name of the user who last created, opened, or modified the file.

userName (variable): An <u>XLUnicodeString</u> structure that specifies the **user name**. The value of **userName.cch** MUST be less than or equal to 54. If the value of **userName.rgb** is equal to "\0x20\0x20" no user name is specified.

unused (variable): Undefined and MUST be ignored. The size of this field in bytes

MUST be equal to the value of the following formula: (112 - number of bytes of **userName**).

2.4.350 WriteProtect

The existence of the **WriteProtect** record specifies that the file is write-**protected**.

2.4.351 WsBool

The **WsBool** record specifies information about a **sheet**.

()	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
,	١		В		O	D	Е	F	G	Н	I		J	K	L	М																

- A fShowAutoBreaks (1 bit): A bit that specifies whether page breaks inserted automatically are visible on the sheet.
- **B reserved1 (3 bits):** MUST be zero, and MUST be ignored.
- C fDialog (1 bit): A bit that specifies whether the sheet is a dialog sheet.
- **D fApplyStyles (1 bit):** A bit that specifies whether to apply styles in an **outline** when an outline is applied.
- **E fRowSumsBelow (1 bit):** A bit that specifies whether summary rows appear below an outline's detail rows.
- **F fColSumsRight (1 bit):** A bit that specifies whether summary columns appear to the right or left of an outline's detail columns. Valid values are specified in the following table:

Value	Meaning
0	The summary columns appear to the right, if the sheet is displayed left-to-right , or appear to the left, if the sheet is displayed right-to-left .
1	The summary columns appear to the left, if the sheet is displayed left-to-right, or appear to the right, if the sheet is displayed right-to-left.

- **G fFitToPage (1 bit):** A bit that specifies whether to fit the printable contents to a single page when printing this sheet.
- H reserved2 (1 bit): MUST be zero, and MUST be ignored.
- I unused (2 bits): Undefined and MUST be ignored.
- **J fSyncHoriz (1 bit):** A bit that specifies whether horizontal scrolling is synchronized across multiple windows displaying this sheet.
- **K fSyncVert (1 bit):** A bit that specifies whether vertical scrolling is synchronized across multiple windows displaying this sheet.
- L fAltExprEval (1 bit): A bit that specifies whether the sheet uses transition formula evaluation.
- M fAltFormulaEntry (1 bit): A bit that specifies whether the sheet uses transition formula entry.

2.4.352 XCT

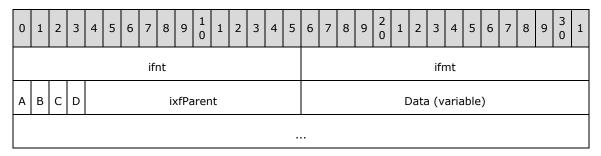

The **XCT** record specifies the beginning of an <u>external cell cache</u> and that specifies the beginning of a collection of <u>CRN</u> records as defined in the <u>Globals Substream</u> **ABNF**. The collection of CRN records specifies the values of **cells** in a **sheet** in the external cell cache.

- **ccrn (2 bytes):** A signed integer of which the absolute value specifies the number of CRN records immediately following this record. A value less than zero specifies that the most recent SupBook preceding this record contains a link that is not valid.
- **itab (2 bytes):** An unsigned integer that specifies a zero-based index into the **rgst** array of the most recent instance of a SupBook preceding this record in the file. The element of the **rgst** array specified by this field contains the name of the sheet that contains the cached cells. The value of **itab** MUST be less than the value of the **ctab** field of the most recent instance of SupBook.

2.4.353 XF

The **XF** record specifies formatting properties for a **cell** or a <u>cell style</u>.

ifnt (2 bytes): A FontIndex structure that specifies a Font record.

ifmt (2 bytes): An IFmt structure that specifies a number format identifier.

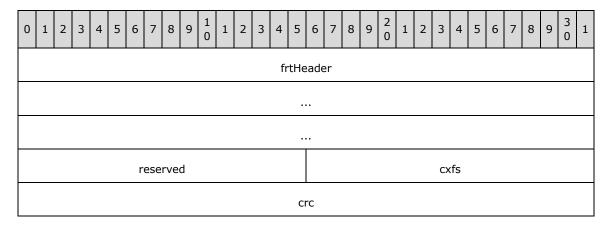

- A fLocked (1 bit): A bit that specifies whether the locked protection property is set to true.
- **B fHidden (1 bit):** A bit that specifies whether the **hidden protection** property is set to true.
- **C fStyle (1 bit):** A bit that specifies whether this record specifies a <u>cell XF</u> or a <u>cell style XF</u>. If the value is 1, this record specifies a cell style XF.
- **D f123Prefix (1 bit):** A bit that specifies whether prefix characters are present in the cell. The possible prefix characters are single quote (0x27), double quote (0x22), caret (0x5E), and backslash (0x5C).<146> If **fStyle** equals 1, this field MUST equal 0.
- ixfParent (12 bits): An unsigned integer that specifies the zero-based index of a cell style XF record in the collection of XF records in the Globals Substream that this cell format inherits properties from. Cell style XF records are the subset of XF records with an fStyle field equal to 1. See XFIndex for more information about the organization of XF records in the file.

If **fStyle** equals 1, this field SHOULD equal 0xFFF, indicating there is no inheritance from a cell style XF. \leq 147 \geq

Data (variable): If the value of **fStyle** equals 0, this field contains a <u>CellXF</u> that specifies additional properties of the cell XF. If the value of **fStyle** equals 1, this field contains a <u>StyleXF</u> that specifies additional properties of the cell style XF.

2.4.354 XFCRC

The **XFCRC** record specifies the number of <u>XF</u> records contained in this file and that contains a **checksum** of the data in those records. This record MUST exist if and only if there are <u>XFExt</u> records in the file.

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x87C.

reserved (2 bytes): MUST be zero, and MUST be ignored.

cxfs (2 bytes): An unsigned integer that specifies the number of XF records in this file. MUST be greater than or equal to 16 and less than or equal to 4050.

crc (4 bytes): An unsigned integer that specifies a checksum, as specified by [MS-OSHARED] section 2.4.3, of the data portion of the XF records. This checksum is used to detect whether the XF records in the file were modified by an application that does not support the formatting feature extensions in XFExt records.

2.4.355 XFExt

The **XFExt** record specifies a set of formatting property extensions to an XF record in this file.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
														fr	tHe	ade	er														
						re	eser	vec	11														ix	fe							
	reserved2 cexts																														
	rgExt (variable)																														

...

frtHeader (12 bytes): An FrtHeader structure. The frtHeader.rt field MUST be 0x087D.

reserved1 (2 bytes): MUST be zero and MUST be ignored.

ixfe (2 bytes): An XFIndex structure that specifies the XF record in the file that this record extends. MUST be less than or equal to 4050.

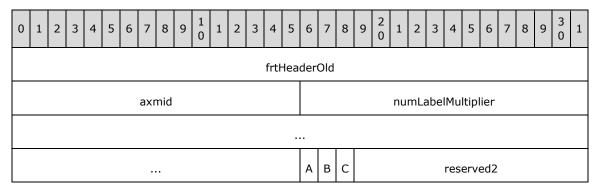

reserved2 (2 bytes): MUST be zero and MUST be ignored.

cexts (2 bytes): An unsigned integer that specifies the number of elements in rgExt.

rgExt (variable): An array of ExtProp. Each array element specifies a formatting property extension.

2.4.356 YMult

The **YMult** record specifies properties of the value multiplier for a value <u>axis</u> and that specifies the beginning of a collection of records as defined by the <u>Chart Sheet substream</u> **ABNF**. The collection of records specifies a **display units** label.

frtHeaderOld (4 bytes): An FrtHeaderOld structure. The frtHeaderOld.rt field MUST be 0x0857.

axmid (2 bytes): A signed integer that specifies the axis multiplier type. MUST be a value from the following table:

Value	Multiplier type
0xFFFF (-1)	Custom multiplier, multiplier value MUST be stored in numLabelMultiplier
0x0000	Values on axis are multiplied by 1.0
0x0001	Values on axis are multiplied by 100.0
0x0002	Values on axis are multiplied by 1000.0
0x0003	Values on axis are multiplied by 10,000.0
0x0004	Values on axis are multiplied by 100,000.0
0x0005	Values on axis are multiplied by 1,000,000.0
0x0006	Values on axis are multiplied by 10,000,000.0
0x0007	Values on axis are multiplied by 100,000,000.0
0x0008	Values on axis are multiplied by 1,000,000,000.0
0x0009	Values on axis are multiplied by 1,000,000,000,000.0

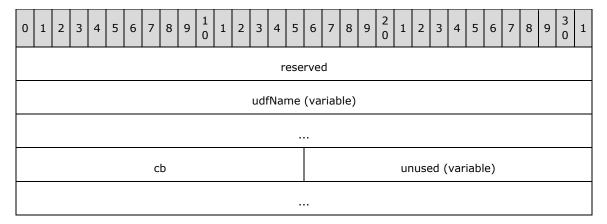

- **numLabelMultiplier (8 bytes):** An Xnum (section <u>2.5.342</u>) structure that specifies a custom multiplier. The value on the axis are multiplied by the value of this field. MUST be greater than 0.0. If **axmid** is set to a value other than 0xFFFF, this field is ignored.
- A reserved1 (1 bit): MUST be 1, and MUST be ignored.
- **B fAutoShowMultiplier (1 bit):** A bit that specifies whether the display units label is displayed.
- C fBeingEditted (1 bit): A bit that specifies whether the display units label is currently being edited.

reserved2 (13 bits): MUST be zero, and MUST be ignored.

2.5 Structures

2.5.1 AddinUdf

The **AddinUdf** structure specifies the data for a **UDF** reference on an **XLL** or **COM add-in** in the ExternName record.

reserved (4 bytes): MUST be zero, and MUST be ignored.

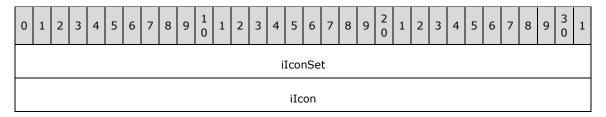

udfName (variable): A <u>ShortXLUnicodeString</u> that specifies the name of the referenced UDF. udfName.cch MUST be less than or equal to 255. For COM add-in functions only, it also specifies the ProgID of the COM object that implements the add-in function (XLL add-in functions do not have their implementing libraries uniquely specified).

cb (2 bytes): An unsigned integer that specifies the size of **unused** in bytes.

unused (variable): Undefined and MUST be ignored. The size of this field in bytes is specified by cb.

2.5.2 AF12CellIcon

The **AF12CellIcon** structure specifies the **icon** for an advanced **AutoFilter** comparison.

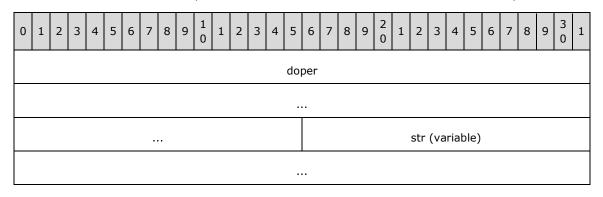

iIconSet (4 bytes): An unsigned integer that specifies the **icon set** number. MUST be a value as specified in <u>KPISets</u>.

iIcon (4 bytes): An unsigned integer that specifies the icon number within the icon set. MUST be a value as specified in the following table:

iIconSet value	Valid iIcon values
KPINIL (no icon)	0xFFFFFFF
KPI3ARROWS	0x00000000, 0x00000001, or 0x00000002
KPI3ARROWSGRAY	0x00000000, 0x00000001, or 0x00000002
KPI3FLAGS	0x00000000, 0x00000001, or 0x00000002
KPI3TRAFFICLIGHTS1	0x00000000, 0x00000001, or 0x00000002
KPI3TRAFFICLIGHTS2	0x00000000, 0x00000001, or 0x00000002
KPI3SIGNS	0x00000000, 0x00000001, or 0x00000002
KPI3SYMBOLS	0x00000000, 0x00000001, or 0x00000002
KPI3SYMBOLS2	0x0000000, 0x00000001, or 0x00000002
KPI4ARROWS	0x00000000, 0x00000001, 0x000000002, or 0x000000003
KPI4ARROWSGRAY	0x00000000, 0x00000001, 0x000000002, or 0x000000003
KPI4REDTOBLACK	0x00000000, 0x00000001, 0x00000002, or 0x00000003
KPI4RATING	0x00000000, 0x00000001, 0x00000002, or 0x00000003
KPI4TRAFFICLIGHTS	0x00000000, 0x00000001, 0x00000002, or 0x00000003
KPI5ARROWS	0x00000000, 0x00000001, 0x000000002, 0x000000003, or 0x00000004
KPI5ARROWSGRAY	0x00000000, 0x00000001, 0x000000002, 0x000000003, or 0x00000004
KPI5RATING	0x00000000, 0x00000001, 0x000000002, 0x000000003, or 0x00000004
KPI5QUARTERS	0x00000000, 0x00000001, 0x000000002, 0x000000003, or 0x00000004

2.5.3 AF12Criteria

The AF12Criteria structure specifies the criteria for an advanced AutoFilter comparison.

doper (10 bytes): An AFDOper that specifies the comparison condition.

str (variable): An <u>XLUnicodeStringNoCch</u> that specifies the string value to use for the comparison. MUST exist if and only if **doper.vt** equals 0x06. The length MUST be equal to **doper.vtValue.cch**.

2.5.4 AF12DateInfo

The **AF12DateInfo** structure specifies the date and time for an advanced **AutoFilter** comparison.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
year											month																				
															da	ау															
	hour												minute																		
							sec	ond														ι	ınus	sed:	1						
	rese									ser	ved	11																			
	nodeType																														

year (2 bytes): An unsigned integer that specifies the year.

month (2 bytes): An unsigned integer that specifies the month. MUST be greater than or equal to 1 and less than or equal to 12.

day (4 bytes): An unsigned integer that specifies the day of the month. MUST be greater than or equal to 1 < 148 > and less than or equal to 31.

hour (2 bytes): An unsigned integer that specifies the hour. MUST be greater than or equal to 0 and less than or equal to 23.

minute (2 bytes): An unsigned integer that specifies the minute. MUST be greater than or equal to 0 and less than or equal to 59.

second (2 bytes): An unsigned integer that specifies the second. MUST be greater than or equal to 0 and less than or equal to 59.

unused1 (2 bytes): Undefined and MUST be ignored.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

nodeType (4 bytes): An unsigned integer that specifies the date and time to filter on. MUST be one
 of the values from the table:

Value	Meaning
0x00000000	Filter on year field.
0x0000001	Filter on year and month fields.
0x00000002	Filter on year, month, and day fields.
0x00000003	Filter on year , month , day , and hour fields.
0x00000004	Filter on year, month, day, hour, and minute fields.
0x00000005	Filter on year, month, day, hour, minute, and second fields.

2.5.5 AFDOper

The **AFDOper** structure specifies an <u>AutoFilter</u> data operation.

vt (1 byte): An unsigned integer that specifies the type of comparison. MUST be a value as specified in the table listed under vtValue. If this structure is part of an AutoFilter12 record, the value of vt MUST NOT be 0x02.

grbitSign (1 byte): An unsigned integer that specifies the comparison operation between a cell value and vtValue. MUST be one of the following values:

Value	Meaning
0x01	Cell value is displayed if it is less than the value specified in vtValue.
0x02	Cell value is displayed if it is equal to the value specified in vtValue .
0x03	Cell value is displayed if it is less than or equal to the value specified in vtValue .
0x04	Cell value is displayed if it is greater than the value specified in vtValue .
0x05	Cell value is displayed if it is not equal to the value specified in vtValue .
0x06	Cell value is displayed if it is greater than or equal to the value specified in vtValue .

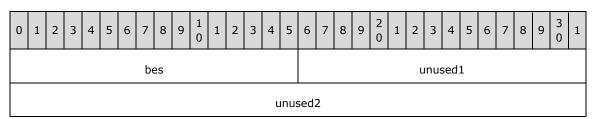

If vt is equal to 0x00, this field is undefined and MUST be ignored.

vtValue (8 bytes): A variable type field whose type and meaning is dictated by the value of **vt**, as specified in the following table:

Value of vt	Meaning of vtValue
0x00	vtValue is 8 bytes which are undefined and MUST be ignored.
0x02	vtValue is an AFDOperRk that specifies a numeric value. MUST exist if and only if this structure is part of an AutoFilter record.
0x04	vtValue is an Xnum (section 2.5.342) that specifies a numeric value.
0x06	vtValue is an AFDOperStr that specifies a string value.
0x08	vtValue is an AFDOperBoolErr that specifies a Boolean or error value.
0x0C	All blanks are matched. vtValue is 8 bytes which are reserved, MUST be 0, and MUST be ignored.
0x0E	All non-blanks are matched. vtValue is 8 bytes which are reserved, MUST be 0, and MUST be ignored.

2.5.6 AFDOperBoolErr

The **AFDOperBoolErr** structure specifies a Boolean or error value for an <u>AutoFilter</u> comparison.

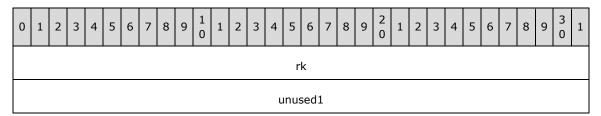

bes (2 bytes): A Bes that specifies the Boolean or error value.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

2.5.7 AFDOperRk

The **AFDOperRk** structure specifies a numeric value for an <u>AutoFilter</u> comparison.

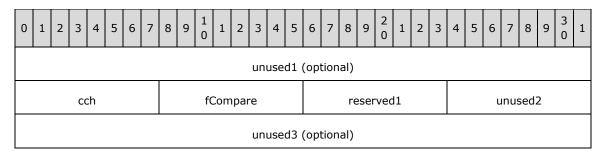

rk (4 bytes): An RkNumber that specifies a numeric value.

unused1 (4 bytes): Undefined and MUST be ignored.

2.5.8 AFDOperStr

The **AFDOperStr** structure specifies a string value for an <u>AutoFilter</u> comparison. The string location is specified by the record or structure that contains this structure.

A question mark character ('?') in the string specifies a matching condition on any single character. An asterisk character ('*') in the string specifies a matching condition on a sequence of zero or more characters.

unused1 (4 bytes): Undefined and MUST be ignored. MUST exist if and only if this structure is part of an AutoFilter, a <u>Feature11</u> or a <u>Feature12</u> record.

cch (1 byte): An unsigned integer that specifies the number of characters in the string. MUST be greater than or equal to 1.

fCompare (1 byte): A Boolean (section 2.5.14) that specifies whether the string comparison contains question mark or asterisk characters. MUST be a value from the following table:

Value	Meaning
0	String comparison contains question mark or asterisk characters.
1	String comparison does not contain question mark or asterisk characters.

reserved1 (1 byte): MUST be zero, and MUST be ignored.

unused2 (1 byte): Undefined and MUST be ignored.

unused3 (4 bytes): Undefined and MUST be ignored. MUST exist if and only if this structure is part of an AutoFilter12.

2.5.9 **AutoFmt8**

The **AutoFmt8** enumeration specifies the following auto formatting styles<149>.

Name	Value	Meaning
XL8_ITBLSIMPLE	0×0000	Simple
XL8_ITBLCLASSIC1	0×0001	Classic 1
XL8_ITBLCLASSIC2	0×0002	Classic 2
XL8_ITBLCLASSIC3	0x0003	Classic 3
XL8_ITBLACCOUNTING1	0x0004	Accounting 1
XL8_ITBLACCOUNTING2	0x0005	Accounting 2
XL8_ITBLACCOUNTING3	0x0006	Accounting 3
XL8_ITBLACCOUNTING4	0x0007	Accounting 4
XL8_ITBLCOLORFUL1	0x0008	Colorful 1
XL8_ITBLCOLORFUL2	0x0009	Colorful 2
XL8_ITBLCOLORFUL3	0x000A	Colorful 3
XL8_ITBLLIST1	0x000B	List 1
XL8_ITBLLIST2	0x000C	List 2
XL8_ITBLLIST3	0x000D	List 3
XL8_ITBL3DEFFECTS1	0x000E	3Deffects 1
XL8_ITBL3DEFFECTS2	0x000F	3Deffects 2
XL8_ITBLNONE_GEN	0x0010	None
XL8_ITBLJAPAN2	0x0011	Japan 2
XL8_ITBLJAPAN3	0x0012	Japan 3
XL8_ITBLJAPAN4	0x0013	Japan 4
XL8_ITBLNONE_JPN	0x0014	Japan None
XL8_ITBLREPORT1	0x1000	Report 1
XL8_ITBLREPORT2	0x1001	Report 2
XL8_ITBLREPORT3	0x1002	Report 3
XL8_ITBLREPORT4	0x1003	Report 4
XL8_ITBLREPORT5	0x1004	Report 5
XL8_ITBLREPORT6	0x1005	Report 6

Name	Value	Meaning
XL8_ITBLREPORT7	0x1006	Report 7
XL8_ITBLREPORT8	0x1007	Report 8
XL8_ITBLREPORT9	0x1008	Report 9
XL8_ITBLREPORT10	0x1009	Report 10
XL8_ITBLTABLE1	0x100A	Table 1
XL8_ITBLTABLE2	0x100B	Table 2
XL8_ITBLTABLE3	0x100C	Table 3
XL8_ITBLTABLE4	0x100D	Table 4
XL8_ITBLTABLE5	0x100E	Table 5
XL8_ITBLTABLE6	0x100F	Table 6
XL8_ITBLTABLE7	0x1010	Table 7
XL8_ITBLTABLE8	0x1011	Table 8
XL8_ITBLTABLE9	0x1012	Table 9
XL8_ITBLTABLE10	0x1013	Table 10
XL8_ITBLPTCLASSIC	0x1014	Table PTClassic
XL8_ITBLPTNONE	0x1015	None

2.5.10 Bes

The **Bes** structure specifies either a Boolean (section 2.5.14) value or an error value. **bBoolErr** specifies the value and **fError** specifies the value's type.

bBoolErr (1 byte): An unsigned integer that specifies either a Boolean value or an error value, depending on the value of **fError**.

A Boolean value MUST be a value from the following table:

Value	Meaning
0x00	False
0x01	True

An error value MUST be a value from the following table:

Value	Meaning
0x00	#NULL!
0x07	#DIV/0!
0x0F	#VALUE!

Value	Meaning
0x17	#REF!
0x1D	#NAME?
0x24	#NUM!
0x2A	#N/A
0x2B	#GETTING_DATA

fError (1 byte): A Boolean that specifies whether **bBoolErr** contains an error code or a Boolean value. MUST be a value from the following table:

Value	Meaning
0x00	bBoolErr SHOULD<150> contain a Boolean value.
0x01	bBoolErr contains an error value.

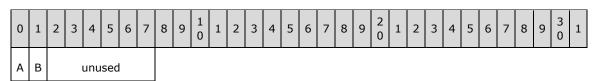

2.5.11 Bold

The **Bold** enumeration specifies the **font face weight**.

Name	Value	Meaning					
BLSNORMAL	0x0190	Normal font weight					
BLSBOLD	0x02BC	Bold font weight					

2.5.12 BookExt_Conditional11

The **BookExt_Conditional11** structure specifies two properties of a **workbook**.

- A fBuggedUserAboutSolution (1 bit): A bit that specifies whether a warning is requested before loading a manifest that is a smart document.
- **B fShowInkAnnotation (1 bit):** A bit that specifies whether **ink comments** are visible in this workbook.

unused (6 bits): Undefined and MUST be ignored.

2.5.13 BookExt_Conditional12

The **BookExt_Conditional12** structure specifies **workbook** related information.

- A reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **B fPublishedBookItems (1 bit):** A bit that specifies whether only specific **selected** items, including **defined names**, **tables**, <u>chart</u> object and <u>PivotTables</u>, are shown when the workbook is published to a server.

Value	Meaning
0	All sheets or selected sheets are published. Each sheet is published, unless the <u>SheetExt</u> record for the sheet exists and the fNotPublished field of the <u>SheetExtOptional</u> structure of the SheetExt record is 1.
1	Only selected items are published. For each item, the fPublished field in the record or structure within the record that specifies the item determines whether the item is published. For each type of item, the records and structures that contain the fPublished flag are as follows:
	Chart object: FtCmo structure of the Obj record
	Table: <u>TableFeatureType</u> structure of the <u>Feature11</u> record
	Defined name: Lbl record
	Defined name: NamePublish record
	PivotTable: SXAddl SXCView SXDVer12Info record

C - fShowPivotChartFilter (1 bit): A bit that specifies whether to show the PivotChart filter pane.

reserved2 (5 bits): MUST be zero, and MUST be ignored.

2.5.14 Boolean

An unsigned integer greater than 1 bit in size that specifies a Boolean value. MUST be a value from the following table. All other bits in the field MUST be 0.

Value	Meaning
0x0	Boolean value FALSE
0x1	Boolean value TRUE

2.5.15 BorderStyle

The **BorderStyle** enumeration specifies the border line **style**.

Name	Value	Meaning
NONE	0x0000	No border
THIN	0x0001	Thin line
MEDIUM	0x0002	Medium line
DASHED	0x0003	Dashed line
DOTTED	0x0004	Dotted line
тніск	0x0005	Thick line
DOUBLE	0x0006	Double line

Name	Value	Meaning					
HAIR	0x0007	Hairline					
MEDIUMDASHED	0x0008	Medium dashed line					
DASHDOT	0x0009	Dash-dot line					
MEDIUMDASHDOT	0x000A	Medium dash-dot line					
DASHDOTDOT	0x000B	Dash-dot-dot line					
MEDIUMDASHDOTDOT	0x000C	Medium dash-dot-dot line					
SLANTDASHDOT	0x000D	Slanted dash-dot-dot line					

2.5.16 BuiltInStyle

The **BuiltInStyle** structure specifies the type of a built-in <u>cell style</u>. For **row outline** and **column outline** types this structure also specifies the **outline level** of the **style**.

istyBuiltIn (1 byte): An unsigned integer that specifies the type of the built-in cell style. SHOULD be a value from the list of built in cell styles specified in [ECMA-376] Part 4: Markup Language Reference, section 3.8.7.151>

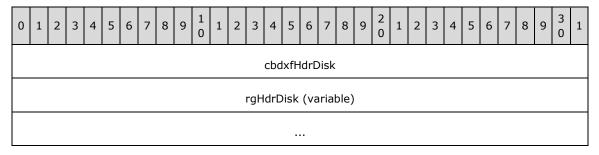

iLevel (1 byte): An unsigned integer that specifies the depth level of row/column automatic outlining. If **istyBuiltIn** equals 0x01 or 0x02, this value MUST be one of the following:

Value	Meaning
0x00	Outline level is 1
0x01	Outline level is 2
0x02	Outline level is 3
0x03	Outline level is 4
0x04	Outline level is 5
0x05	Outline level is 6
0x06	Outline level is 7

Otherwise, this value MUST be 0xFF and MUST be ignored.

2.5.17 Cached Disk Header

The **CachedDiskHeader** structure specifies the formatting information of a **table** column heading.

cbdxfHdrDisk (4 bytes): An unsigned integer that specifies the size, in bytes, of the **rgHdrDisk** field.

rgHdrDisk (variable): A DXFN12List structure that specifies the formatting of the column heading.

strStyleName (variable): An <u>XLUnicodeString</u> that specifies the name of the **style** to use for the column heading. The name of the style MUST equal the **user** field of a <u>Style</u> record in the <u>Globals Substream</u> **ABNF**, or the name of a built-in style, as specified by the <u>BuiltInStyle</u> record. This field is present only if the **fSaveStyleName** field of the containing <u>Feat11FieldDataItem</u> structure is set to 0x1.

If present, the formatting as specified by **strStyleName** is applied first, before the formatting as specified by **rgHdrDisk** is applied.

2.5.18 Cch255

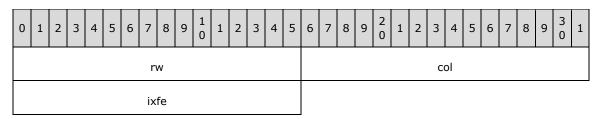

A 2 byte unsigned integer that specifies a string size in characters.

The value 0xFFFF specifies that the string is NULL.

The value MUST be 0xFFFF or less than or equal to 0x00FF.

2.5.19 Cell

The **Cell** structure specifies a **cell** in the current **sheet**.

rw (2 bytes): An Rw that specifies the row.

col (2 bytes): A Col that specifies the column.

ixfe (2 bytes): An IXFCell that specifies the XF record.

2.5.20 CellXF

This structure specifies formatting properties for a cell.

0		1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	a	alc		Α	i	alcV	/	В				tr	trot			(Inc	dent	t	С	D	Е		F		G	Н	Ι	J	K	L	
	d	lgL	.eft		Ó	dgR	ight	t		dg⁻	Гор		М				ic	vLe	ft					icv	/Rig	ıht			١	٧		

icvTop	icvBottom	icvDiag	dgDiag	0	fls
icvFore	icvBack	P Q			

alc (3 bits): A HorizAlign that specifies the horizontal alignment.

A - fWrap (1 bit): A bit that specifies whether the cell text is wrapped.

alcV (3 bits): A VertAlign that specifies the vertical alignment.

B - fJustLast (1 bit): A bit that specifies whether the justified or distributed alignment of the cell is used on the last line of text (setting this to 1 is typical for East Asian text but not typical in other contexts). If this field equals 1, then **alc** MUST equal 7.

trot (1 byte): An XFPropTextRotation that specifies the text rotation.

cIndent (4 bits): An unsigned integer that specifies the text **indentation level**. MUST be less than or equal to 15.

C - fShrinkToFit (1 bit): A bit that specifies whether the cell is shrink to fit.

D - reserved1 (1 bit): MUST be 0, and MUST be ignored.

E - iReadOrder (2 bits): A ReadingOrder that specifies the reading order.

F - reserved2 (2 bits): MUST be 0, and MUST be ignored.

G - fAtrNum (1 bit): A bit that specifies that if the **ifmt** field of the <u>XF</u> record specified by the **ixfParent** field of the containing XF record is updated, the corresponding field of the containing XF record will not be set to the same value. MUST be a value from the following table:

Value	Meaning
0x0	The ifmt field of the containing XF record is updated when the corresponding field of the XF record specified by the ixfParent field of the containing XF record is changed.
0x1	The ifmt field of the containing XF record is not updated when the corresponding field of the XF record specified by the ixfParent field of the containing XF record is changed.

H - fAtrFnt (1 bit): A bit that specifies that if the ifnt field of the XF record specified by the ixfParent field of the containing XF record is updated, the corresponding field of the containing XF record will not be set to the same value. MUST be a value from the following table:

Value	Meaning
0x0	The ifnt field of the containing XF record is updated when the corresponding field of the XF record specified by the ixfParent field of the containing XF record is changed.
0x1	The ifnt field of the containing XF record is not updated when the corresponding field of the XF record specified by the ixfParent field of the containing XF record is changed.

I - fAtrAlc (1 bit): A bit that specifies that if the alc field, or the fWrap field, or the alcV field, or the fJustLast field, or the trot field, or the cIndent field, or the fShrinkToFit field or the iReadOrder field of the XF record specified by the ixfParent field of the containing XF record is updated, the corresponding fields of this structure will not be set to the same values. MUST be a value from the following table:

Value	Meaning
0x0	The alc , fWrap , alcV, fJustLast, trot, cIndent, fShrinkToFit, iReadOrder fields are updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.
0×1	The alc , fWrap , alcV, fJustLast, trot, cIndent, fShrinkToFit, iReadOrder fields are not updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.

J - fAtrBdr (1 bit): A bit that specifies that if the dgLeft field, or the dgRight field, or the dgTop field, or the dgBottom field, or the dgDiag field, or the icvLeft field, or the icvRight field, or the grbitDiag field, or the icvTop field, or the icvBottom field, or the icvDiag field of the XF record specified by the ixfParent field of the containing XF record is updated, the corresponding fields of this structure will not be set to the same values. MUST be a value from the following table:

Value	Meaning
0x0	The dgLeft, dgRight, dgTop, dgBottom, dgDiag, icvLeft, icvRight, grbitDiag, icvTop, icvBottom, icvDiag fields are updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.
0x1	The dgLeft, dgRight, dgTop, dgBottom, dgDiag, icvLeft, icvRight, grbitDiag, icvTop, icvBottom, icvDiag fields are not updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.

K - fAtrPat (1 bit): A bit that specifies that if the fls field, the icvFore field, or the icvBack field of the XF record specified by the ixfParent field of the containing XF record is updated, the corresponding fields of this structure will not be set to the same values. MUST be a value from the following table:

Value	Meaning
0x0	The fls , icvFore , and icvBack fields are updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.
0x1	The fls , icvFore , and icvBack fields are not updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.

L - fAtrProt (1 bit): A bit that specifies that if the fLocked field or the fHidden field of the XF record specified by the ixfParent field of the containing XF record is updated, the corresponding fields of the containing XF record will not be set to the same values. MUST be a value from the following table:

Value	Meaning
0x0	The fLocked and fHidden fields of the containing XF record are updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.
0x1	The fLocked and fHidden fields of the containing XF record are not updated when the corresponding fields of the XF record specified by the ixfParent field of the containing XF record are changed.

dgLeft (4 bits): A BorderStyle that specifies the logical left border formatting.

dgRight (4 bits): A BorderStyle that specifies the logical right border formatting.

dgTop (4 bits): A BorderStyle that specifies the top border formatting.

M - dgBottom (4 bits): A BorderStyle that specifies the bottom border formatting.

icvLeft (7 bits): An unsigned integer that specifies the color of the logical left **border**. The value MUST be one of the values specified in IcvXF or 0. A value of 0 means the logical left border color has not been specified. If this value is 0, then **dgLeft** MUST also be 0.

icvRight (7 bits): An unsigned integer that specifies the color of the logical right border. The value MUST be one of the values specified in IcvXF or 0. A value of 0 means the logical right border color has not been specified. If this value is 0, then **dqRight** MUST also be 0.

N - grbitDiag (2 bits): An unsigned integer that specifies which diagonal borders are present (if any). MUST be a value from the following table:

Value	Meaning
0x0	No diagonal border
0x1	Diagonal-down border
0x2	Diagonal-up border
0x3	Both diagonal-down and diagonal-up

icvTop (7 bits): An unsigned integer that specifies the color of the top border. The value MUST be one of the values specified in IcvXF or 0. A value of 0 means the top border color has not been specified. If this value is 0, then **dgTop** MUST also be 0.

icvBottom (7 bits): An unsigned integer that specifies the color of the bottom border. The value MUST be one of the values specified in IcvXF or 0. A value of 0 means the bottom border color has not been specified. If this value is 0 then **dgBottom** MUST also be 0.

icvDiag (7 bits): An unsigned integer that specifies the color of the diagonal border. The value MUST be one of the values specified in IcvXF or 0. A value of 0 means the diagonal border color has not been specified. If this value is 0 then **dqDiag** MUST also be 0.

dgDiag (4 bits): A BorderStyle that specifies the diagonal border formatting.

O - fHasXFExt (1 bit): A bit that specifies whether an XFExt will extend the information in this XF.

- **fls (6 bits):** A <u>FillPattern</u> that specifies the **fill pattern**. If this value is 1, which specifies a solid fill pattern, then only **icvFore** is rendered.
- icvFore (7 bits): An IcvXF that specifies the foreground color of the fill pattern.
- icvBack (7 bits): An unsigned integer that specifies the background color of the fill pattern. The value SHOULD<152> be an IcvXF value.
- **P fsxButton (1 bit):** A bit that specifies whether the XF record is attached to a pivot field drop-down button.
- **Q reserved3 (1 bit):** MUST be 0 and MUST be ignored.

2.5.21 CFColor

The **CFColor** structure specifies a color in **conditional formatting** records or in a **SheetExt** record.

0	1	2	З	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	З	4	5	6	7	8	9	0	1
	xclrType																														
	xclrValue																														
	numTint																														

- xclrType (4 bytes): An XColorType that specifies the type of color reference. MUST be different from XCLRNINCHED. MUST be different from XCLRAUTO unless it is contained in a SheetExt record.
- **xclrValue (4 bytes):** A structure that specifies the color value. The type of structure depends on the color reference type specified by **xclrType** and MUST be a structure from the following table:

Value of xclrType	Туре
XCLRAUTO	Ignored
XCLRINDEXED	ColorICV
XCLRRGB	LongRGBA<153>
XCLRTHEMED	<u>ColorTheme</u>

numTint (8 bytes): An Xnum (section 2.5.342) that specifies the tint and **shade** value to be applied to the color. MUST be greater than or equal to -1.0 and less than or equal to 1.0

2.5.22 CFDatabar

The **CFDatabar** structure specifies the parameters of a **conditional formatting** rule that uses **databar** formatting.

C	1	2	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	unused											re	eser	ved	11			Α	В		re	eser	ved	2								

iPercentMin	iPercentMax	color (16 bytes)									
	cfvoDB1 (variable)										
cfvoDB2 (variable)											

unused (2 bytes): Undefined and MUST be ignored.

reserved1 (1 byte): MUST be zero and MUST be ignored.

A - fRightToLeft (1 bit): A bit that specifies whether the data bars are drawn starting from the right of the cell. MUST be a value from the following table:

Value	Meaning
0x0	Data bars are drawn starting from the left of the cell
0x1	Data bars are drawn starting from the right of the cell

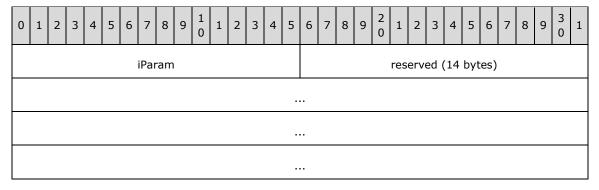

B - fShowValue (1 bit): A bit that specifies whether the numerical value of the cell appears in the cell along with the data bar.

reserved2 (6 bits): MUST be zero and MUST be ignored.

- **iPercentMin (1 byte):** An unsigned integer that specifies the length of a data bar, as a percentage of the cell width, that is applied to cells with values equal to the <u>CFVO</u> value specified by **cfvoDB1**. MUST be less than or equal to 100.
- **iPercentMax (1 byte):** An unsigned integer that specifies the length of a data bar, as a percentage of the cell width, that is applied to cells with values equal to the CFVO value specified by **cfvoDB2**. MUST be greater than **iPercentMin** and less than or equal to 100.
- color (16 bytes): A CFColor structure that specifies the color of the data bar.
- **cfvoDB1 (variable):** A CFVO that specifies the maximum **cell value** that will be represented with a minimum width data bar. All cell values that are less than or equal to the CFVO value specified by this field are represented with a data bar of **iPercentMin** percent of the cell width.
- **cfvoDB2 (variable):** A CFVO that specifies the minimum cell value that will be represented with a maximum width data bar. All cell values that are greater than or equal to the CFVO value specified by this field are represented with a data bar of **iPercentMax** percent of the cell width.

2.5.23 CFExAveragesTemplateParams

This structure specifies the parameters for an above or below average **conditional formatting** rule in a containing <u>CF12</u> record or <u>CFExNonCF12</u> structure.

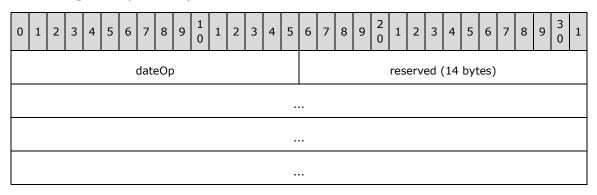

iParam (2 bytes): An unsigned integer that specifies the number of standard deviations above or below the average for the rule. MUST be a value from the following table:

Value	Meaning
0x0000	The threshold is not offset by a multiple of the standard deviation.
0x0001	The threshold is offset by 1 standard deviation.
0x0002	The threshold is offset by 2 standard deviations.

reserved (14 bytes): MUST be zero and MUST be ignored.

2.5.24 CFExDateTemplateParams

The **CFExDateTemplateParams** structure specifies parameters for the date-related **conditional formatting** rules specified by a <u>CF12</u> record or <u>CFExNonCF12</u> structure.

dateOp (2 bytes): An unsigned integer that specifies the type of date comparison. The value of this field MUST be equal to the value that corresponds to the **icfTemplate** field in the containing CF12 record or CFExNonCF12 structure, according to the following table:

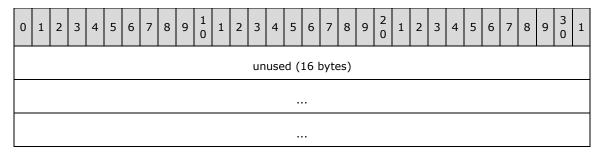

Value of icfTemplate	Value of this field
----------------------	---------------------

Value of icfTemplate	Value of this field
15	0
16	6
17	1
18	2
19	5
20	8
21	3
22	7
23	4
24	9

reserved (14 bytes): MUST be zero and MUST be ignored.

2.5.25 CFExDefaultTemplateParams

This structure specifies that there are no parameters for extensions to **conditional formatting** rules specified by <u>CFEx</u>.

unused (16 bytes): Undefined and MUST be ignored.

2.5.26 CFExFilterParams

The **CFExFilterParams** structure specifies parameters for a **conditional formatting** rule of type **filter**.

0	1	2	3	4	5	6	7	8	8 9 1 1 2 3 4 5 6 7 8 9 2 1 2 3 4 5 6 7 8								9	3	1
Α	A B reserved1 iParam reserved2 (13 bytes))									

A - fTop (1 bit): A bit that specifies whether the top or bottom items are displayed with the conditional formatting. MUST be one of the following values:

Value	Meaning
Value	ricalling

Value	Meaning
0x0	Bottom items are displayed with the conditional formatting
0x1	Top items are displayed with the conditional formatting

B - fPercent (1 bit): A bit that specifies whether a percentage of the top or bottom items are displayed with the conditional formatting, or whether a set number of the top or bottom items are displayed with the conditional formatting. MUST be one of the following values:

Value	Meaning
0x0	A set number of top or bottom items, specified by iParam , are displayed with the conditional formatting.
0x1	A percentage of top or bottom items, specified by iParam, are displayed with the conditional formatting

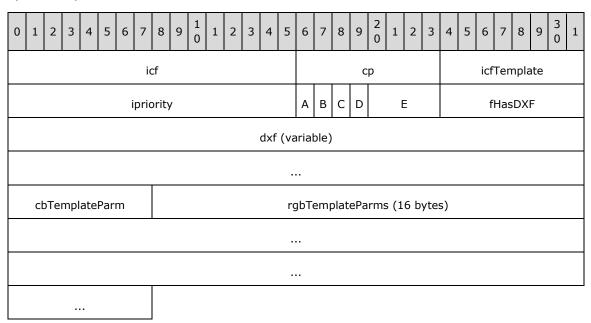

reserved1 (6 bits): MUST be zero and MUST be ignored.

iParam (2 bytes): An unsigned integer that specifies how many values are displayed with the conditional formatting. If **fPercent** equals 1 then this field represents a percent and MUST be less than or equal to 100. Otherwise, this field represents a set number of **cells** and MUST be less than or equal to 1000.

reserved2 (13 bytes): MUST be zero and MUST be ignored.

2.5.27 CFExNonCF12

The **CFExNonCF12** structure specifies properties that extend a **conditional formatting** rule that is specified by a <u>CF</u> record.

icf (2 bytes): An unsigned integer that specifies a zero-based index of a CF record in the collection of CF records directly following the <u>CondFmt</u> record that is referenced by the parent <u>CFEx</u> record with the **nID** field. The referenced CF specifies the conditional formatting rule to be extended.

cp (1 byte): An unsigned integer that specifies the type of comparison operation to use when the ct field of the CF record referenced by the icf field of this structure is equal to 0x01. MUST be zero when the ct field of the CF record is not equal to 1. SHOULD<154> be equal to the cp field in the referenced CF record.

In the following table, v represents the **cell** value, and v1 and v2 represent the results of evaluating the formulas specified by **rgce1** and **rgce2** fields of the referenced CF record specified by icf. The value of this field MUST be a value from the following table:

Value	Comparison Operation
0x00	No comparison
0x01	v2 is greater than or equal to $v1$, and v is greater than or equal to $v1$ and less than or equal to $v2$ $-Or v1$ is greater than $v2$, and v is greater than or equal
0.00	to v2 and less than or equal to v1
0x02	v2 is greater than or equal to $v1$, and v is less than $v1$ or greater than $v2$
	-Or-
	v1 is greater than $v2$, and v is less than $v2$ or greater than $v1$
0x03	v is equal to v1
0x04	v is not equal to v1
0x05	v is greater than v1
0x06	v is less than v1
0x07	v is greater than or equal to $v1$
0x08	\emph{v} is less than or equal to $\emph{v1}$

- **icfTemplate (1 byte):** An unsigned integer that specifies the template from which the rule was created. MUST be the least significant byte of one of the valid values specified for the **icfTemplate** field in the <u>CF12</u> record.
- **ipriority (2 bytes):** An unsigned integer that specifies the priority of the rule. Rules that apply to the same cell are evaluated in increasing order of **ipriority**. MUST be unique across all CF12 records and CFExNonCF12 structures in the <u>worksheet</u> substream.
- A fActive (1 bit): A bit that specifies whether the rule is active. If set to zero, the rule will be ignored.
- **B fStopIfTrue (1 bit):** A bit that specifies whether, when a cell fulfills the condition corresponding to this rule, the lower priority conditional formatting rules that apply to this cell are evaluated. MUST be one of the following values:

Value	Meaning
0x0	Evaluate lower priority conditional formatting rules that apply to this cell
0x1	If the cell fulfills the condition corresponding to this rule, do not evaluate lower priority conditional formatting rules that apply to this cell

- C reserved1 (1 bit): MUST be zero and MUST be ignored.
- **D** unused (1 bit): Undefined and MUST be ignored.
- **E reserved2 (4 bits):** MUST be zero and MUST be ignored.
- **fHasDXF (1 byte):** A Boolean (section 2.5.14) that specifies whether cell formatting data is part of this record extension. MUST be a value from the following table:

Value	Meaning
0x00	No formatting data in this record extension.
0x01	Formatting data is part of this record extension.

- **dxf (variable):** A <u>DXFN12</u> structure that specifies the format to use for cells that satisfy the condition. MUST NOT be present when **fHasDXF** is zero.
- **cbTemplateParm (1 byte):** An unsigned integer that specifies the size of the **rgbTemplateParms** field in bytes. MUST be equal to 16.
- **rgbTemplateParms (16 bytes):** A <u>CFExTemplateParams</u> that specifies parameters for the rule specified by this structure.

2.5.28 CFExTemplateParams

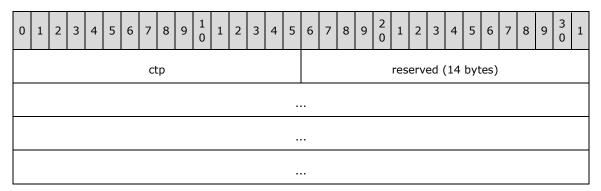

The **CFExTemplateParams** structure specifies parameters for **conditional formatting** rules of type <u>CF12</u> or <u>CFExNonCF12</u>. The type of this structure depends on the **icfTemplate** field in the containing structure as specified in the following table:

Value of icfTemplate	Type of CFExTemplateParams
0x05	<u>CFExFilterParams</u>
0x08	<u>CFExTextTemplateParams</u>
0x0F	<u>CFExDateTemplateParams</u>
0x10	CFExDateTemplateParams
0x11	CFExDateTemplateParams
0x12	CFExDateTemplateParams
0x13	CFExDateTemplateParams
0x14	CFExDateTemplateParams
0x15	CFExDateTemplateParams
0x16	CFExDateTemplateParams
0x17	CFExDateTemplateParams
0x18	CFExDateTemplateParams
0x19	<u>CFExAveragesTemplateParams</u>
0x1A	CFExAveragesTemplateParams
0x1D	CFExAveragesTemplateParams

Value of icfTemplate	Type of CFExTemplateParams
0x1E	CFExAveragesTemplateParams
other	<u>CFExDefaultTemplateParams</u>

2.5.29 CFExTextTemplateParams

The **CFExTextTemplateParams** structure specifies parameters for text-related **conditional formatting** rules as specified by a <u>CF12</u> record or <u>CFExNonCF12</u> structure.

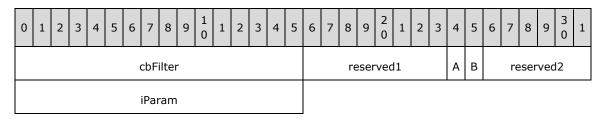

ctp (2 bytes): An unsigned integer that specifies the type of text rule. MUST be a value from the following table:

Value	Meaning
0x0000	Text contains
0x0001	Text does not contain
0x0002	Text begins with
0x0003	Text ends with

reserved (14 bytes): MUST be zero and MUST be ignored.

2.5.30 CFFilter

The **CFFilter** structure specifies the parameters of a **conditional formatting** rule of type **top N filter**.

cbFilter (2 bytes): An unsigned integer that specifies the size of the structure in bytes, excluding the **cbFilter** field itself.

reserved1 (1 byte): MUST be zero and MUST be ignored.

A - fTop (1 bit): A bit that specifies whether the top or bottom items are displayed with the conditional formatting. MUST be one of the following values:

Value	Meaning							
0x0 Bottom items are displayed with the conditional formatting								
0x1	Top items are displayed with the conditional formatting							

B - fPercent (1 bit): A bit that specifies whether a percentage of top or bottom items are displayed with the conditional formatting, or a set number of top or bottom items are displayed with the conditional formatting. MUST be one of the following values:

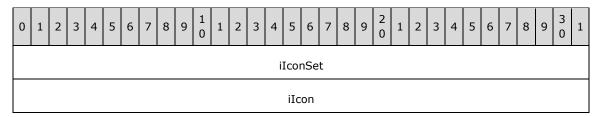

Value	Meaning								
0x0	Top or bottom iParam items are displayed with the conditional formatting.								
0x1	Top or bottom iParam percent of items are displayed with the conditional formatting								

reserved2 (6 bits): MUST be zero and MUST be ignored.

iParam (2 bytes): An unsigned integer that specifies how many values are displayed with the conditional formatting. If **fPercent** is set to 1 then this field represents a percent and MUST be less than or equal to 100, otherwise this field is a number of **cells** and MUST be less than or equal to 1000.

2.5.31 CFFlag

The **CFFlag** structure specifies the conditional format flag information.

iIconSet (4 bytes): A KPISets that identifies an icon set.

iIcon (4 bytes): A signed integer that specifies an **icon** in the set. The value of this field changes the **sort order** for custom sorts that are based on icon sets.

MUST be a value from the following table:

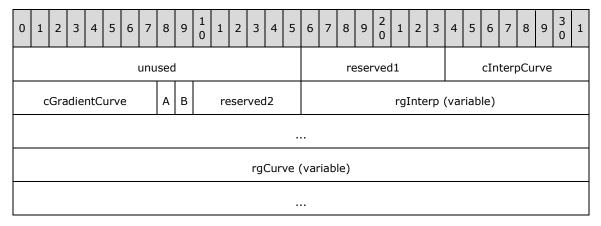

Value	Meaning							
-1	No icon							
0	First icon in the icon set							
1	Second icon in the icon set							
2	Third icon in the icon set							
3	Fourth icon in the icon set							
4	Fifth icon in the icon set							

2.5.32 CFGradient

The **CFGradient** structure specifies the parameters of a **conditional formatting** rule that uses **color scale** formatting. Color scale formatting maps **cell** values to colors through the following process:

- 1. An interpolation curve maps cell values to values between 0 and 1. The first and last control points, as specified in **rgInterp**, specify the cell values that map to 0 and 1 respectively.
- 2. A gradient curve maps values between 0 and 1 to colors.

Both curves are determined by two or three control points, with linear interpolation between those points.

unused (2 bytes): Undefined and MUST be ignored.

reserved1 (1 byte): MUST be zero and MUST be ignored.

cInterpCurve (1 byte): An unsigned integer that specifies the number of control points in the interpolation curve. It MUST be 0x2 or 0x3.

cGradientCurve (1 byte): An unsigned integer that specifies the number of control points in the gradient curve. It MUST be equal to **cInterpCurve**.

- A fClamp (1 bit): A bit that specifies that the cell values are not used when they are out of the range of the interpolation curve. The minimum or the maximum of the interpolation curve is used instead of the cell value. The value SHOULD<155> be 1.
- **B fBackground (1 bit):** A bit that specifies that the color scale formatting applies to the background of the cells. It MUST be 1.

reserved2 (6 bits): MUST be zero and MUST be ignored.

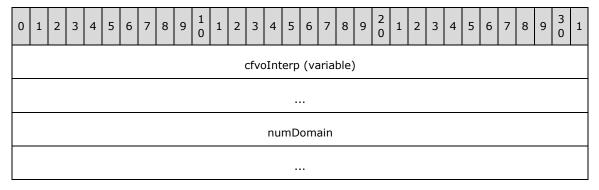

rgInterp (variable): An array of <u>CFGradientInterpItem</u>. Each element is a control point of the interpolation curve. Its element count MUST be **cInterpCurve**.

rgCurve (variable): An array of <u>CFGradientItem</u>. Each element is a control point of the gradient curve. Its element count MUST be **cGradientCurve**.

2.5.33 CFGradientInterpItem

The **CFGradientInterpItem** structure specifies one control point in the interpolation curve. The interpolation curve maps **cell values** to colors for a **conditional formatting** rule using **color scale**

formatting. The color is specified as the numerical value associated with the color in the corresponding **CFGradient.rgCurve** array of the containing **CFGradient** structure.

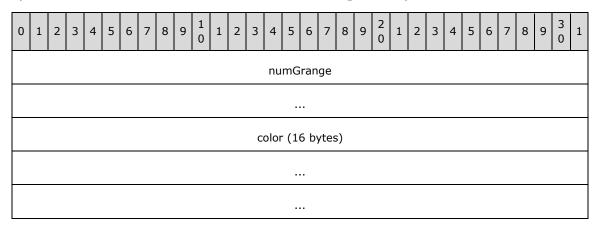

cfvoInterp (variable): A <u>CFVO</u> structure that specifies the cell value associated with the numerical value specified in **numDomain**.

numDomain (8 bytes): An Xnum (section 2.5.342) structure that specifies the numerical value of this control point. MUST be equal to 0.0 if the structure is the first item in the rbct.rgInterp array of the containing CF12 record. MUST be equal to 1.0 if this structure is the last item in the rbct.rgInterp array of the containing CF12 record. MUST be equal to 0.5 if this structure is the second item in the rbct.rgInterp array of the containing CF12 record and rbct.cInterpCurve field of the containing CF12 record is equal to 0x03.

2.5.34 CFGradientItem

The **CFGradientItem** structure specifies one control point in the gradient curve. The gradient curve specifies a **color scale** used in **conditional formatting** and maps numerical values to colors.

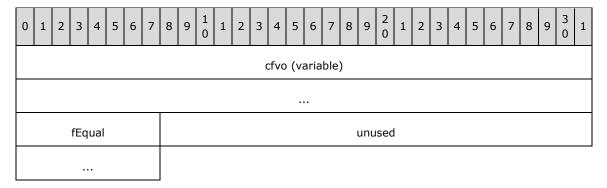

numGrange (8 bytes): An Xnum (section 2.5.342) that specifies the numerical value of the control point. MUST be equal to 0.0 if this structure is the first element in the rbct.rgcurve array of the containing CF12 record. MUST be equal to 1.0 if this structure is the last element in the rbct.rgcurve array of the containing CF12 record. MUST be equal to 0.5 if this structure is the second element in the rbct.rgcurve array of the containing CF12 record and the rbct.cInterpCurve field of the containing CF12 record is equal to 0x03.

color (16 bytes): A <u>CFColor</u> that specifies the color associated with the numerical value specified in **numGrange**.

2.5.35 CFMStateItem

The **CFMStateItem** structure specifies the threshold value associated with an **icon** for a <u>CFMultistate</u> **conditional formatting** rule.

cfvo (variable): A <u>CFVO</u> that specifies the threshold value.

fEqual (1 byte): A Boolean (section 2.5.14) that MUST be a value from the following table:

Value	Meaning
0x00	Cell values that are equal to the threshold value do not pass the threshold
0x01	Cell values that are equal to the threshold value pass the threshold.

unused (4 bytes): Undefined and MUST be ignored.

2.5.36 CFMultistate

The **CFMultistate** structure specifies the parameters for a **conditional formatting** rule that represents **cell** values with icons from an **icon set**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
unused												reserved1 cStates																			
		į.	Icor	าSe	t		A B C reserved3 rgStates (variable)																								

unused (2 bytes): Undefined and MUST be ignored.

reserved1 (1 byte): MUST be zero and MUST be ignored.

cStates (1 byte): An unsigned integer that specifies the number of items in the icon set. MUST be the value from the following table:

Value of iIconSet	Value of cStates
Between 0x00 and 0x07 included	0x03
Between 0x08 and 0x0C included	0x04
Between 0x0D and 0x10 included	0x05

iIconSet (1 byte): An unsigned integer that specifies the icon set that represents the cell values. MUST be the value from the following table:

Value	Meaning
0x00	
0x01	↑ ⇒ ↓
0x02	b b b
0x03	
0x04	
0x05	
0x06	
0x07	✓
0x08	↑ ✓ ✓
0x09	4 1 1 1 1 1
0x0A	
0x0B	. He. He. He. He.
0x0C	
0x0D	
0x0E	
0x0F	
0x10	\bullet \bullet \bullet \bullet \bullet

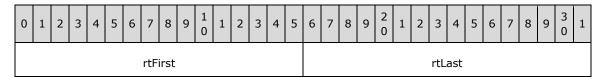

- A fIconOnly (1 bit): A bit that specifies whether only the icon will be displayed in the sheet and that the cell value will be hidden.
- **B reserved2 (1 bit):** MUST be zero and MUST be ignored.
- C fReverse (1 bit): A bit that specifies whether the order of the icons in the set is reversed.

reserved3 (5 bits): MUST be zero and MUST be ignored.

rgStates (variable): An array of <u>CFMStateItem</u>. Each element specifies a threshold for the respective icon in the set, below which cell values are represented by the next icon in the set. The element count MUST be equal to **cStates**.

2.5.37 CFrtId

The **CFrtId** structure specifies a **range** of <u>Future Record Type</u> identifier values.

rtFirst (2 bytes): An unsigned integer that specifies the first Future Record Type in the range. The value MUST be less than or equal to **rtLast**.

rtLast (2 bytes): An unsigned integer that specifies the last Future Record Type in the range.

2.5.38 CFT

The **CFT** enumeration specifies **custom filter** types.

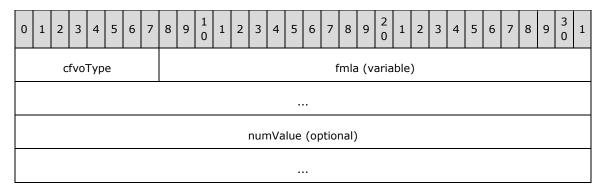

Name	Value	Meaning
CFTNIL	0x00000000	None
CFTTOP10	0x00000003	Top N filter
CFTEQUALDATE	0x00000004	Equal to date
CFTBEFORE	0x00000005	Before
CFTAFTER	0x00000006	After
CFTBETWEENDATE	0x00000007	Between dates
CFTTOMORROW	0x00000008	Tomorrow
CFTTODAY	0x00000009	Today
CFTYESTERDAY	0x0000000A	Yesterday
CFTNEXTWEEK	0x0000000B	Next week
CFTTHISWEEK	0x000000C	This week
CFTLASTWEEK	0x000000D	Last week
CFTNEXTMONTH	0x000000E	Next month
CFTTHISMONTH	0x000000F	This month
CFTLASTMONTH	0x0000010	Last month
CFTNEXTQUARTER	0x00000011	Next quarter
CFTTHISQUARTER	0x00000012	This quarter
CFTLASTQUARTER	0x00000013	Last quarter
CFTNEXTYEAR	0x00000014	Next year
CFTTHISYEAR	0x00000015	This year
CFTLASTYEAR	0x0000016	Last year
CFTYEARTODATE	0x0000017	Year to date
CFTQ1	0x0000018	First quarter
CFTQ2	0x0000019	Second quarter
СҒТQЗ	0x000001A	Third quarter
CFTQ4	0x000001B	Fourth quarter
CFTM1	0x000001C	January

Name	Value	Meaning
CFTM2	0x000001D	February
СҒТМЗ	0x000001E	March
CFTM4	0x000001F	April
CFTM5	0x00000020	May
СҒТМ6	0x00000021	June
CFTM7	0x00000022	July
СҒТМ8	0x00000023	August
СҒТМ9	0x00000024	September
CFTM10	0x00000025	October
CFTM11	0x00000026	November
CFTM12	0x00000027	December
CFTNOTEQUALDATE	0x00000028	Does not equal date
CFTBEFOREOREQUAL	0x00000029	Equal or earlier date
CFTAFTEROREQUAL	0x0000002A	Equal or later date
CFTNOTBETWEENDATE	0x0000002B	Not between two dates

2.5.39 CFVO

The **CFVO** structure specifies a Conditional Formatting Value Object (CFVO) that specifies how to calculate a value from the **range** of cells that a **conditional formatting** rule applies to.

The value this structure specifies how to calculate is referred to as a CFVO value in other records.

cfvoType (1 byte): An unsigned integer that specifies how the CFVO value is determined. In the following table, X represents a parameter value. If fmla.cce is greater than zero, then X is the result of evaluating fmla, otherwise, X is numValue. cfvoType MUST be one of the following values:

Value	Meaning of CFVO Value
0x01	X
0x02	The minimum value from the range of cells that the conditional formatting rule applies to.

Value	Meaning of CFVO Value
0x03	The maximum value from the range of cells that the conditional formatting rule applies to.
0x04	The minimum value in the range of cells that the conditional formatting rule applies to plus X percent of the difference between the maximum and minimum values in the range of cells that the conditional formatting rule applies to. For example, if the min and max values in the range are 1 and 10 respectively, and X is 10, then the CFVO value is 1.9.
0x05	The minimum value of the cell that is in X percentile of the range of cells that the conditional formatting rule applies to.
0x07	The result of evaluating fmla .

fmla (variable): A <u>CFVOParsedFormula</u> that specifies the formula used to calculate the CFVO value. If **cfvoType** is 0x07, then **fmla.cce** MUST be greater than zero.

numValue (8 bytes): An Xnum (section <u>2.5.342</u>) that specifies a static value used to calculate the CFVO value. MUST be omitted if **fmla.cce** is greater than zero, or if **cfvoType** is equal to 0x02 or 0x03. MUST be greater than 0.0 and less than 100.0 if **cfvoType** is either 0x04 or 0x05

2.5.40 ChartNumNillable

ChartNumNillable is an 8-byte union that specifies a floating-point value, or a non-numeric value defined by the containing record. The type and meaning of the union contents are determined by the most significant 2 bytes, and is defined in the following table:

Value of most significant 2 bytes	Type and meaning of union contents
0xFFFF	A <u>NilChartNum</u> that specifies a non-numeric value, as defined by the containing record.
Any other value.	An Xnum (section <u>2.5.342</u>) that specifies a floating-point value.

2.5.41 Col

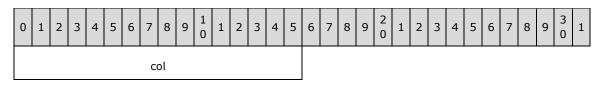

The **Col** structure specifies the zero-based column index of a column in a **sheet**.

col (2 bytes): An unsigned integer that specifies the zero-based column index of the column in the sheet that contains this structure. MUST be greater than or equal to the colMic field of the Dimensions record of the sheet that contains this structure and MUST be less than the colMac field of the Dimensions record of the sheet that contains this structure. MUST be less than or equal to 0x00FF.

2.5.42 Col_NegativeOne

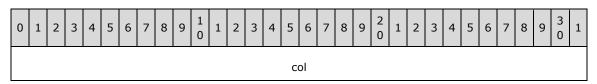

The **Col_NegativeOne** structure specifies the zero-based index of a column in a **sheet**.

col (2 bytes): A signed integer that specifies the zero-based index of a column in the sheet that contains this structure. The value 0xFFFF specifies a null column index. MUST be greater than or equal to 0xFFFF and less than or equal to 0x00FF.

2.5.43 Col12

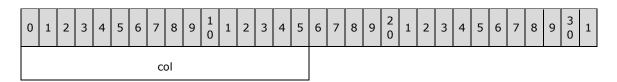

The Col12 structure specifies the zero-based index of a column in a sheet.

col (4 bytes): A signed integer that specifies a zero-based index of the sheet. MUST be greater than or equal to zero, and MUST be less than or equal to 0x3FFF.

2.5.44 Col256U

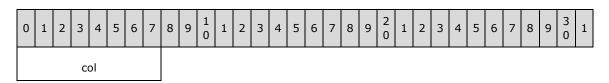

The Col256U structure specifies the zero-based index of a column in a sheet.

col (2 bytes): An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure. MUST be less than or equal to 0x0100. The value 0x0100 specifies that the formatting in the containing record also specifies the default column formatting. If additional columns become visible at the extreme right of the column range because of column deletion, those columns have this default formatting applied.

2.5.45 ColByte

The **ColByte** structure specifies the zero-based index of a column in a **sheet**.

col (1 byte): An unsigned integer that specifies the zero-based index of the column in the sheet that contains this structure. MUST be greater than or equal to the colMic field of the <u>Dimensions</u> record of the sheet that contains this structure and MUST be less than the colMac field of the <u>Dimensions</u> record of the sheet that contains this structure.

2.5.46 ColByteU

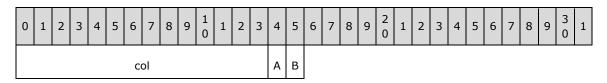

The **ColByteU** structure specifies the zero-based index of a column in a **sheet**.

col (1 byte): An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure.

2.5.47 ColElfU

The **ColEifU** structure specifies the zero-based index of a column in a **sheet** and **relative reference** information for this column index and a corresponding row index.

col (14 bits): An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure. MUST be less than or equal to 0x00FF.

A - fQuoted (1 bit): A bit that specifies if the label occurrences in the natural language formula are surrounded by single quote characters.

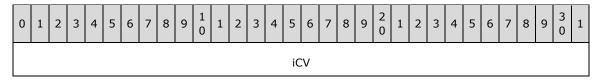

B - fRelative (1 bit): A bit that specifies whether a corresponding row index from the containing structure and **column** are relative or absolute. MUST be a value from the following table:

Value	Meaning
0x0	A corresponding row index from the containing structure and column are absolute coordinates and are specified by a fixed position in a sheet.
0x1	A corresponding row index from the containing structure and column are relative coordinates and are specified by their position in relation to the current row or current column.

2.5.48 ColorICV

The **ColorICV** structure specifies a color in the color table.

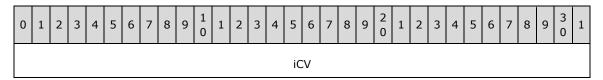

This structure differs from the \underline{IcvXF} structure in size (4 bytes versus 7 bits), and the validity of the values 0x40 and 0x41.

iCV (4 bytes): An unsigned integer that specifies a color in the color table. The value MUST be an IcvXF value. The value MUST NOT be 0x000000040 or 0x000000041.

2.5.49 ColorTheme

The **ColorTheme** structure specifies a color from the document's **theme**.

iCV (4 bytes): An unsigned integer that specifies one of the colors defined in the **color scheme** of the document's Theme record. MUST be one of the following values:

Value	Color from the color scheme
0x00000000	Dark 1
0x00000001	Light 1
0x00000002	Dark 2
0x00000003	Light 2
0x00000004	Accent 1
0x00000005	Accent 2
0x00000006	Accent 3
0x00000007	Accent 4
0x00000008	Accent 5
0x00000009	Accent 6
0x0000000A	Hyperlink
0x0000000B	Followed hyperlink

If this structure is contained in a CF12 record, the value MUST be different from 0x0000000B.

2.5.50 ColRelNegU

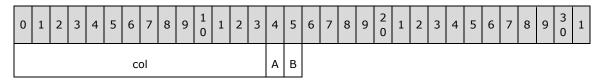

The **ColRelNegU** structure specifies the zero-based column index of a column in a **sheet** offset information for this column index and a corresponding row index.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	col					Α	В																								

- col (14 bits): A signed integer that specifies the zero-based column index or offset of a column in the sheet that contains this structure. MUST be greater than or equal to -255 be less than or equal to 255.
- A colRelative (1 bit): A bit that specifies whether col is an offset.
- **B rowRelative (1 bit):** bit that specifies whether a row index corresponding to **col** in the structure containing this structure is an offset.

2.5.51 ColRelU

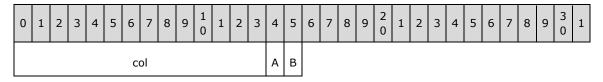

The **ColRelU** structure specifies the zero-based index of a column in a **sheet** and **relative reference** information for this column index and a corresponding row index.

- **col (14 bits):** An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure. MUST be less than or equal to 0x00FF.
- A colRelative (1 bit): A bit that specifies whether col is a relative reference.
- **B rowRelative (1 bit):** A bit that specifies whether a row index corresponding to **col** in the structure containing this structure is a relative reference.

2.5.52 ColSlco8U

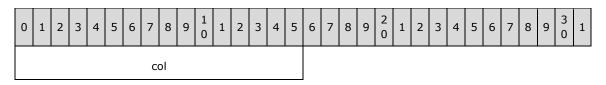

The **ColSico8U** structure specifies the zero-based index of a column in a **sheet** and information about whether a **cell** has been deleted.

- **col (14 bits):** An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure. MUST be less than or equal to 0x00FF.
- A fDeleted (1 bit): A bit that specifies whether the cell that is referenced by the containing structure, has been deleted. When set to 1, the cell reference of the containing structure MUST be ignored.
- **B unused (1 bit):** Undefined and MUST be ignored.

2.5.53 ColU

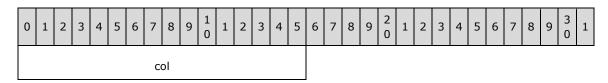

The **ColU** structure specifies the zero-based index of a column in a **sheet**.

col (2 bytes): An unsigned integer that specifies the zero-based index of a column in the sheet that contains this structure. MUST be less than or equal to 0x00FF.

2.5.54 Colx

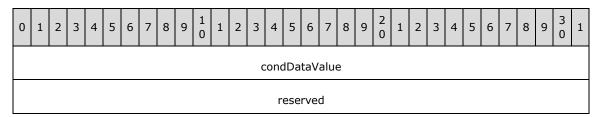

The Colx structure specifies the zero-based column index of a column in a sheet.

col (2 bytes): An unsigned integer that specifies the zero-based column index of a column in the sheet. The value MUST be 0, 0xFF or be greater than or equal to the colMic field of the <u>Dimensions</u> record of the sheet that contains this structure and less than the colMac field of the <u>Dimensions</u> record of the sheet that contains this structure.

2.5.55 CondDataValue

The **CondDataValue** structure specifies the conditional data information.

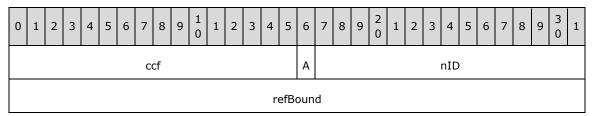

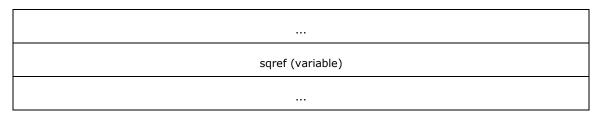

condDataValue (4 bytes): An unsigned integer that specifies a conditional data value. If <u>SortCond12</u>.sortOn is 0x1 or 0x2, it specifies the zero-based index of a <u>DXF</u> record in the collection of DXF records in the <u>Globals Substream</u>. The referenced DXF specifies the formatting. If SortCond12.sortOn is 0x0, this MUST be zero, and MUST be ignored.

reserved (4 bytes): MUST be zero, and MUST be ignored.

2.5.56 CondFmtStructure

The **CondFmtStructure** structure specifies **conditional formatting** rules that are associated with a set of cells in a containing <u>CondFmt12</u> record.

- **ccf (2 bytes):** An unsigned integer that specifies the count of <u>CF12</u> records that follow the containing record. MUST be greater than or equal to 0x0001.
- **A fToughRecalc (1 bit):** A bit that specifies that the appearance of the **cell** requires significant processing. This information can be used to optimize the redraw of conditional formatting when data values change.

For example, an application could determine that a conditional formatting rule that contains certain functions or a conditional formatting rule that takes more than a predetermined amount of time to calculate designates that the conditional formatting requires significant processing, and could set this bit to 1.

nID (15 bits): An unsigned integer that identifies this record.

refBound (8 bytes): A <u>Ref8U</u> structure that specifies bounds of the set of cells to which the rules are applied. The set of cells that it represents MUST include all of the cells represented by field **sqref**.

sqref (variable): A <u>SqRefU</u> structure that specifies the cells to which the conditional formatting rules apply. **sqref.cref** MUST be greater than zero and less than or equal to 1026.

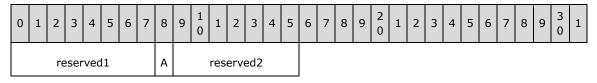

2.5.57 ConnGrbitDbt

The **ConnGrbitDbt** structure is a 2 byte variable-type structure that specifies <u>external connection</u> properties for the containing record. Its meaning depends on the value of the **dbt** field of the containing record.

Value	Meaning
4	A <u>ConnGrbitDbtWeb</u> that specifies the query flags for a Web data connection.
5	A <u>ConnGrbitDbtOledb</u> that specifies the query flags for an OLE DB data connection.
7	A <u>ConnGrbitDbtAdo</u> that specifies the query flags for an ADO data connection.
Any other value	A 2 byte unsigned integer. Unused and MUST be 0.

2.5.58 ConnGrbitDbtAdo

The **ConnGrbitDbtAdo** structure specifies the **query** flags for an **ADO** data connection.

reserved1 (8 bits): MUST be zero and MUST be ignored.

A - fAdoRefreshable (1 bit): A bit that specifies if the ADO query can be refreshed.

reserved2 (7 bits): MUST be zero and MUST be ignored.

2.5.59 ConnGrbitDbtOledb

The **ConnGrbitDbtOledb** structure specifies the <u>external connection</u> properties for an **OLE DB** data connection.

dbost (3 bits): An unsigned integer that specifies the OLE DB command type. This field applies to the database command strings that are saved with the parent records. MUST be a value from the following table:

Name	Value	Meaning
CMDNULL	0x0	The string is not specified.
CMDCUBE	0x1	The string specifies the name of a cube within an OLAP database, see also <u>OLAP</u> <u>Connections</u> .
CMDSQL	0x2	The string specifies an SQL statement.
CMDTABLE	0x3	The string specifies a database table name.
CMDDEFALT	0x4	The string specifies a statement in the default language of the database.
CMDSPLIST	0x5	The string specifies a list from a Web-based data provider.

A - fLocalConn (1 bit): A bit that specifies which connection string to use for this external connection. MUST be a value from the following table:

Value	Meaning
0x0	Uses the main connection string, as specified by a value of 0 in the fLocal field in <u>OleDbConn</u> , or by a value of 0 or 1 in the rgIOleDbValid of a <u>DConnConnectionOleDb</u> .
0x1	Uses the alternate connection string, as specified by a value of 1 in the fLocal field in OleDbConn, or by a value of 2 or 3 in the rgIOleDbValid of a DConnConnectionOleDb.

- **B fNoRefreshCube (1 bit):** A bit that specifies whether any local cache of data from the OLAP **data source** is to be flushed when the a refresh is done. The value zero specifies any local cache of data from the OLAP data source is to be flushed when the a refresh is done. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- **C fUseOfficeLcid (1 bit):** A bit that specifies whether the user's **locale** information is provided to the OLAP data source for retrieval of translated data and errors. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- **D fSrvFmtNum (1 bit):** A bit that specifies whether to apply OLAP data source number formatting to the PivotTable. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- **E fSrvFmtBack (1 bit):** A bit that specifies whether to apply OLAP data source **fill** colors to the PivotTable. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- **F fSrvFmtFore (1 bit):** A bit that specifies whether to apply OLAP data source **font** colors to the PivotTable. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- **G fSrvFmtFlags (1 bit):** A bit that specifies whether to apply OLAP data source font formatting to the PivotTable. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.

- **H fSupportsLangCellProp (1 bit):** A bit that specifies whether the user's locale information is provided to the OLAP data source to support **member (2) localization**. MUST be zero and MUST be ignored if the **dbost** field does not equal 0x1.
- I fSrvSupportsClientCube (1 bit): A bit that specifies that the server supports local embedded data storage.
- **J reserved (4 bits):** MUST be zero and MUST be ignored.

2.5.60 ConnGrbitDbtWeb

The **ConnGrbitDbtWeb** structure specifies the **query** flags for a Web data connection.

A - fParsePreFormatted (1 bit): A bit that specifies how text enclosed in <PRE> tags is handled.

Value	Meaning
0x0	Each row of text enclosed in <pre> tags will be imported as a single cell.</pre>
0x1	The text is parsed as tables.

B - fConsecDelim (1 bit): A bit that specifies how consecutive delimiters are treated.

Value	Meaning
0x0	Each consecutive delimiter is treated as a separate delimiter.
0x1	Consecutive delimiters is treated as a single delimiter.

C - fSameSettings (1 bit): A bit that specifies how tables inside <PRE> blocks are parsed.

Value	Meaning
0x0	Each table is parsed separately.
0x1	All tables are parsed with the same width settings as the first row of the first table.

D - fXL97Format (1 bit): A bit that specifies whether the query was created by a specific version of the application<156>.

Value	Meaning
0x0	The query was created by specific versions of the application $\leq 157 \geq 100$.
0x1	The query was created by a specific version of the application $\leq 158 >$.

E - fNoDateRecog (1 bit): A bit that specifies how dates are imported.

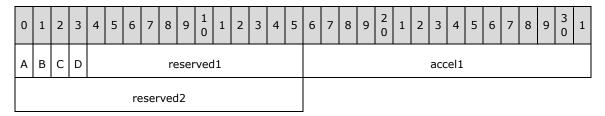

Value	Meaning
0x0	Dates are imported as values of type date.
0x1	Dates are imported as text.

F - fRefreshedInXI9 (1 bit): A bit that specifies whether the query was refreshed in a specific version of the application<159>.

reserved (10 bits): MUST be zero and MUST be ignored.

2.5.61 ControlInfo

The **ControlInfo** structure specifies the properties of some **form** control in a <u>Dialog Sheet</u>. The control MUST be a group, radio button, label, button or checkbox.

- **A fDefault (1 bit):** A bit that specifies whether this control dismisses the Dialog Sheet and performs the default behavior. If the control is not a button, the value MUST be 0.
- **B fHelp (1 bit):** A bit that specifies whether this control is intended to load context-sensitive help for the Dialog Sheet. If the control is not a button, the value MUST be 0.
- **C fCancel (1 bit):** A bit that specifies whether this control dismisses the Dialog Sheet and take no action. If the control is not a button, the value MUST be 0.
- **D fDismiss (1 bit):** A bit that specifies whether this control dismisses the Dialog Sheet. If the control is not a button, the value MUST be 0.

reserved1 (12 bits): MUST be zero and MUST be ignored.

accel1 (2 bytes): A signed integer that specifies the **Unicode** character of the control's **accelerator key**. The value MUST be greater than or equal to 0x0000. A value of 0x0000 specifies there is no accelerator associated with this control.

reserved2 (2 bytes): Reserved. MUST be 0x0000.

2.5.62 CrtLayout12Mode

The **CrtLayout12Mode** record specifies a layout mode. Each layout mode specifies a different meaning of the **x**, **y**, **dx**, and **dy** fields of <u>CrtLayout12</u> and <u>CrtLayout12A</u>.

Name	Value	Meaning
L12MAUTO	0×0000	Position and dimension (2) are determined by the application. x , y , dx and dy MUST be ignored.
L12MFACTOR	0x0001	${\bf x}$ and ${\bf y}$ specify the offset of the top left corner, relative to its default position, as a fraction of the chart area (section 2.2.3.17). MUST be greater than or equal to -1.0 and MUST be less than or equal to 1.0. ${\bf dx}$ and ${\bf dy}$ specify the width and height, as a fraction of the chart area, MUST be greater than or equal to 0.0, and MUST be less than or equal to 1.0.
L12MEDGE	0x0002	x and y specify the offset of the upper-left corner; dx and dy specify the offset of the bottom-right corner. x , y , dx and dy are specified relative to the upper-left corner of the chart area (section 2.2.3.17) as a fraction of the chart area. x , y , dx and dy MUST be greater than or equal to 0.0, and MUST be less than or equal to 1.0.

2.5.63 DataFunctionalityLevel

The **DataFunctionalityLevel** is a 1 byte unsigned integer that specifies a <u>data functionality level<160></u>. SHOULD<u><161></u> be 0, 1, or 3. MUST be greater than or equal to 0 and less than or equal to 254.

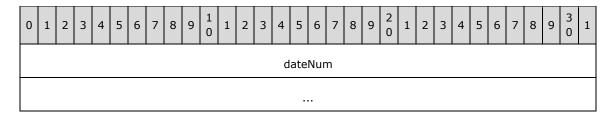

2.5.64 DataSourceType

The **DataSourceType** enumeration specifies the **data source** types.

Name	Value	Meaning
DBT_ODBC	0x0001	ODBC-based source
DBT_DAO	0x0002	DAO-based source
DBT_WEB	0x0004	Web query
DBT_OLEDB	0x0005	OLE DB-based source
DBT_TXT	0x0006	Text-based source created via text query
DBT_ADO	0x0007	ADO record set

2.5.65 DateAsNum

The **DateAsNum** structure specifies a date and time value stored as an Xnum (section 2.5.342).

dateNum (8 bytes): An Xnum that specifies a date and time value. The value uses the double-precision floating point number in the Xnum structure as follows: The integer part of the number specifies the date as a number of days from a base date<162>, and the fractional part specifies the time of day as a fraction of a 24-hour day. The base date for the number of days is determined by the date system used in the workbook, as specified by the Date1904 record in the Globals Substream, according to the following table:

Date system	Meaning
1900	A value of 1 to dateNum specifies 00:00:00 on January 1, 1900.
1904	A value of 0 to dateNum specifies 00:00:00 on January 1, 1904.

2.5.66 DateUnit

The **DateUnit** enumeration specifies the unit of measurement of a date value.

Name	Value Meaning							
DUDAYS	0x0000	Time value is measured in days.						
DUMONTHS	0x0001	Time value is measured in months.						
DUYEARS	0x0002	Time value is measured in years.						

2.5.67 DCol

The **DCol** structure specifies a count of column indexes in a **sheet**.

dcol (2 bytes): An unsigned integer that specifies the count of column indexes in a sheet.

2.5.68 DColByteU

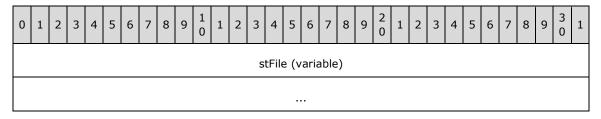

The **DColByteU** structure specifies a count or difference of column indexes in a **sheet**.

dcol (1 byte): An unsigned integer that specifies the count of column indexes in a sheet.

2.5.69 DConFile

The **DConFile** structure specifies the **workbook** file or workbook file and **sheet** that contain a **data source range**. This structure is used by the <u>DConBin</u>, <u>DConRef</u> and <u>DConName</u> records.

stFile (variable): An <u>XLUnicodeStringNoCch</u> that specifies the workbook file or workbook file and sheet that contain the range specified in the DConBin, DConRef or DConName record.

MUST be a string that conforms to the following ABNF grammar:

See <u>VirtualPath</u> for the definition of the volume, unc-volume, rel-volume, transfer-protocol, startup, alt-startup, library, file-path and sheet-name rules used in the **ABNF** grammar. Note that the volume, unc-volume, rel-volume, transfer-protocol, startup, alt-startup, library, and file-path rules specify that an optional sheet name can be included.

If this structure is contained in a DConName or DConBin record and the **defined name** has a workbook scope, then this string MUST satisfy the external-virt-path rule and MUST NOT specify a sheet name. Otherwise a sheet name MUST be specified.

2.5.70 DConnConnectionOleDb

The **DConnConnectionOleDb** structure specifies data connection properties of an **OLE DB** data connection.

0 1	2 3	4	5 6	6 7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
										nD	rillt	:hro	ugh	ıRo	ws													
				сО	leDb)											rg	IOl	eDb	Val	id (var	iabl	e)				
									rgI(Ole	DbI	nva	lid	(va	riab	ole)												
	unused rgConn (variable)																											

- **nDrillthroughRows (4 bytes):** An unsigned integer that specifies the maximum number of rows that the application will retrieve during a **drillthrough** operation on a <u>PivotTable</u> based on this data connection.
- **cOleDb (2 bytes):** An unsigned integer that specifies the number of **connection strings** associated with the OLE DB connection specified in **rgConn**. MUST be less than or equal to 4. MUST be equal to 0 if the **fStandAlone** field of the associated <u>DConn</u> of structure is 0.
- **rgIOleDbValid (variable):** An array of 2-byte unsigned integers that specify the type of connection strings in **rgConn.** The size of the array MUST be equal to **cOleDb**. Each element of the array MUST be unique within **rgIOleDbValid**. Each element of the array MUST be from the following table:

Value	Meaning of string in rgConn
0	The main connection string of the connection. This element MUST exist.
1	The variant of the main connection string that has the password removed.
2	The connection string to the local cube file.
3	The variant of the connection string to the local cube file that has the password removed.

rgIOleDbInvalid (variable): Undefined and MUST be ignored. The size of the field, in bytes, MUST equal the value specified by the following formula:

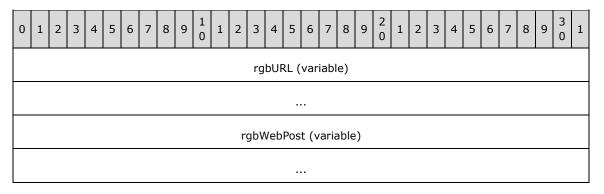

2 * (4 - cOleDb)

unused (2 bytes): Undefined and MUST be ignored.

rgConn (variable): An array of <u>DConnUnicodeStringSegmented</u>. The array specifies the connection strings associated with the OLE DB connection that correspond to the elements in rgIOleDbValid. The number of elements in the array MUST be equal to cOleDb. This field MUST NOT exist if cOleDb equals 0. The meaning of each item in rgConn is defined by the item with a matching index in rgIOleDbValid as defined in the table under rgIOleDbValid.

2.5.71 DConnConnectionWeb

The **DConnConnectionWeb** structure specifies data connection properties of **Web query** data connections.

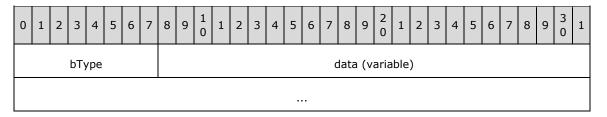

rgbURL (variable): A DConnStringSequence that specifies the URL for a Web query.

rgbWebPost (variable): A DConnStringSequence that specifies the post method for a Web query.

2.5.72 DConnId

The **DConnId** structure specifies the identifier of the object that a connection is associated with.

bType (1 byte): An unsigned integer that specifies the identifier type. MUST be a value as specified in the table listed under field **data**.

data (variable): A variable field that specifies the identifier of the object whose type and meaning are dictated by the value of field **bType**, as specified in the following table:

bType Value	Meaning
0	This field does not exist. There is no associated object.
1	A <u>DConnUnicodeStringSegmented</u> that specifies the name of a query table .
2	An <u>SXStreamID</u> that specifies the stream in the <u>PivotCache storage</u> .

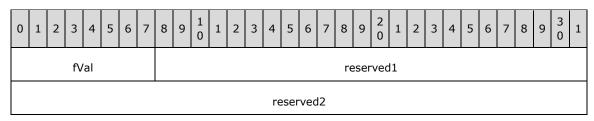

2.5.73 DConnParamBinding

The **DConnParamBinding** structure that specifies a parameter's binding value based on field **pbt** of structure DConnParameter.

Value	Meaning
0	A <u>DConnUnicodeStringSegmented</u> that specifies the parameter prompt.
1	A <u>DConnParamBindingValType</u> structure that specifies the parameter value as defined in the query .

2.5.74 DConnParamBindingValByte

The **DConnParamBindingValByte** structure specifies the parameter binding.

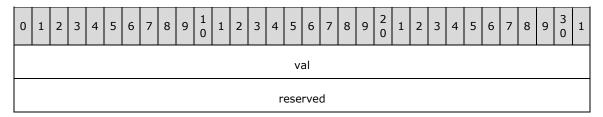

fVal (8 bits): An unsigned integer that specifies the binding Boolean value.

reserved1 (24 bits): MUST be zero and MUST be ignored.

reserved2 (4 bytes): MUST be zero and MUST be ignored.

2.5.75 DConnParamBindingValInt

The **DConnParamBindingValInt** structure specifies the parameter binding.

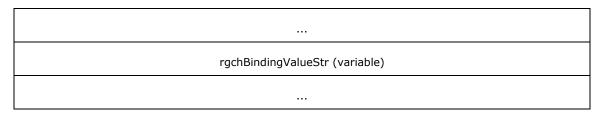

val (4 bytes): An unsigned integer that specifies the binding value.

reserved (4 bytes): MUST be zero and MUST be ignored.

2.5.76 DConnParamBindingValString

The **DConnParamBindingValString** structure specifies properties for a data connection parameter that has a string data type.

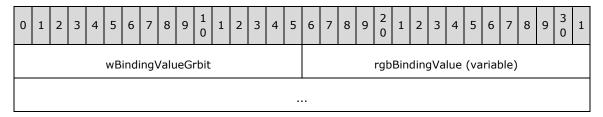

reserved (8 bytes): MUST be zero and MUST be ignored.

rgchBindingValueStr (variable): A <u>DConnUnicodeStringSegmented</u> that specifies the value for a data connection parameter.

2.5.77 DConnParamBindingValType

The **DConnParamBindingValType** structure specifies properties for a data connection parameter.

wBindingValueGrbit (2 bytes): An unsigned integer that specifies the data type of the parameter. MUST be a value from the table as specified in the **rgbBindingValue** field.

rgbBindingValue (variable): A variable type field whose type and meaning are specified by the value of **wBindingValueGrbit** as specified in the following table:

wBindingValueGrbit Value	Meaning
0x0001	An Xnum (section 2.5.342) that specifies the value for a parameter that has a numeric data type.
0x0002	A <u>DConnParamBindingValString</u> that specifies the value for a parameter that has a string data type.
0x0004	A <u>DConnParamBindingValByte</u> that specifies the value for a parameter that has a Boolean data type.
0x0800	A <u>DConnParamBindingValInt</u> that specifies the value for a parameter that has an integer data type.

2.5.78 DConnParameter

The **DConnParameter** structure specifies a parameter of a **parameterized query**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rgchName (variable)																														
	pbt reserved wTypeSql																														

Α	unused	paramBinding (variable)

rgchName (variable): A <u>DConnUnicodeStringSegmented</u> that specifies the name of the parameter.

pbt (3 bits): An unsigned integer that specifies the parameter type. MUST be a value from the following table:

Value	Meaning
0x0	Prompt. User is prompted for the value of the parameter.
0x1	Value. The parameter value is specified in the query .

reserved (13 bits): MUST be zero and MUST be ignored.

wTypeSql (2 bytes): An <u>ODBCType</u> structure that specifies the **ODBC** data type as returned by the ODBC provider of the data. This signed integer specifies the **SQL** data type.

A - fDefaultName (1 bit): A bit that specifies whether a default name has been assigned by the application to the parameter. MUST be a value from the following table:

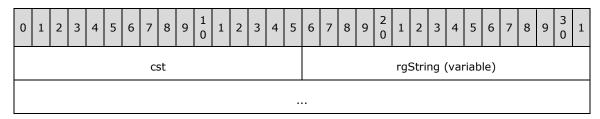

Value	Meaning
0x0	The user specified a name for the parameter.
0x1	The application specified a name for the parameter.

unused (15 bits): Undefined and MUST be ignored.

paramBinding (variable): A <u>DConnParamBinding</u> structure that specifies the parameter's bindings.

2.5.79 DConnStringSequence

The **DConnStringSequence** structure specifies a sequence of strings.

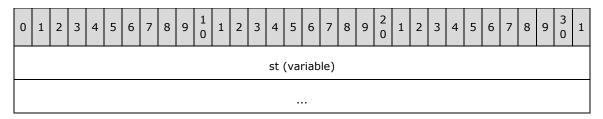

cst (2 bytes): An unsigned integer that specifies the number of strings in the rgString array.

rgString (variable): An array of DConnUnicodeStringSegmented that specifies a segmented Unicode string.

2.5.80 DConnUnicodeStringSegmented

The **DConnUnicodeStringSegmented** structure specifies a segmented Unicode string.

st (variable): An XLUnicodeStringSegmented that specifies a segmented Unicode string.

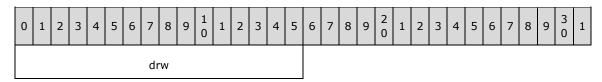

2.5.81 DJoin

The **DJoin** enumeration specifies the join type for two data operations.

Name	Value	Meaning					
DJOINNULL	0x00000000	None					
DJOINAND	0x00000001	And					
DJOINOR	0x00000002	Or					

2.5.82 DRw

The **DRw** structure specifies a count of row indexes in a **sheet**.

drw (2 bytes): An unsigned integer that specifies the count or difference of row indexes in a sheet.

2.5.83 DRwByteU

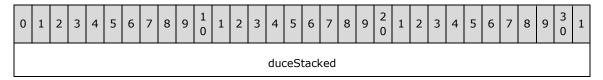

The **DRwByteU** structure specifies a count of row indexes in a **sheet**.

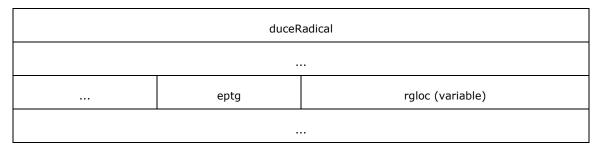

drw (1 byte): An unsigned integer that specifies the count or difference of row indexes in a sheet.

2.5.84 Duce

The **Duce** structure specifies additional undo data that is applied to an **expression** that uses a **natural language formula** if the **revision** is rejected.

duceStacked (4 bytes): A <u>DuceStacked</u> that specifies additional undo data used for the natural language formula.

duceRadical (9 bytes): A <u>DuceRadical</u> that specifies additional undo data used for the natural language formula. If **eptg** does not specify that this natural language formula is an ElfRadical, then this field is undefined and MUST be ignored.

eptg (1 byte): An unsigned integer that specifies the type of natural language formula. **eptg** MUST equal the second byte of the Ptg specified by the ptg field of the Ducr that contains this structure. The type of the natural language formula is either ElfStacked or ElfRadical, neither or both.

eptg MUST be a value from the following table.

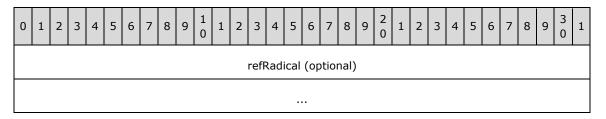

Value	ElfStacked	ElfRadical
0x02	No	No
0x03	No	No
0x06	No	No
0x07	No	No
0x0A	No	Yes
0x0B	Yes	Yes
0x0D	Yes	No
0x0F	Yes	No

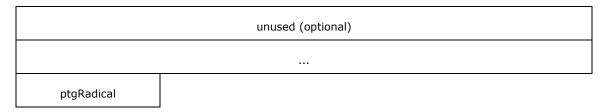

ElfStacked: A natural language formula is considered to be stacked if more than one **cell** is used for the label.ElfRadical: A natural language formula is considered to be radical if the formula (section 2.2.2) refers to more than one cell.

rgloc (variable): An array of <u>RRLoc</u> structures. The number of elements is specified by the **cLoc** field of **duceStacked**. MUST exist if and only if the type of the natural language formula as specified by **eptg** is ElfStacked. The **fNoDollarOnLabel** field of each RRLoc structure in the array is undefined and MUST be ignored.

2.5.85 DuceRadical

The **DuceRadical** structure specifies additional undo data associated with a **natural language formula**.

refRadical (8 bytes): A <u>Ref8U</u> that specifies the **cells** referenced by the natural language formula. MUST exist if and only if **ptgRadical** is a <u>PtgArea</u>.

unused (8 bytes): An array of 1-byte signed integers. Undefined and MUST be ignored. MUST exist if and only if **ptgRadical** is equal to <u>PtgAreaErr</u>.

ptgRadical (1 byte): An unsigned integer that specifies the next <u>Ptg</u> in the formula (section <u>2.2.2</u>) associated with this natural language formula. MUST either by a PtgArea or a PtgAreaErr.

2.5.86 DuceStacked

The type and meaning of the **DuceStacked** structure are specified by the type of the **eptg** field of the <u>Duce</u> structure that contains this structure, as specified in the following table:

Value	Meaning
1	This structure specifies an <u>SQEIfFlags</u> that specifies additional undo data associated with the natural language formula .
0	This structure specifies an RRLoc that specifies the location affected by the natural language formula.

2.5.87 Ducr

The **Ducr** structure specifies undo data that is applied to an **expression** that was affected by an <u>insertion / deletion of rows / columns revision</u> or a <u>move cells revision</u> if the **revision** is rejected.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	5 6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	reserved1																														
	iptg ptg A B reserved2																														
	duce (variable)																														
												d	uce	Rac	dic	cal (o	ptic	onal	l)												
												dı	ucr_	_COI	nd	l_1 (v	/ari	able	e)												
	ducr_cond_2 (optional)																														

...

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

iptg (2 bytes): An unsigned integer that specifies a zero-based index of a <u>Ptg</u> structure in the array specified by the <u>Rgce</u> structure associated with the affected expression. The referenced Ptg specifies which Ptg is affected by the revision.

ptg (1 byte): The Ptg before the revision action occurred.

A - fLbl (1 bit): A bit that specifies whether the affected expression is contained in a defined name.

B - fUseSh2 (1 bit): A bit that specifies whether the affected expression is on a different **sheet**. MUST be zero for RRDInsDel.

reserved2 (6 bits): MUST be zero, and MUST be ignored.

duce (variable): A <u>Duce</u> that specifies additional undo data that is used for a **natural language formula**. MUST exist if and only if **ptg** is equal to 0x18.

duceRadical (8 bytes): A variable type field with the type and meaning determined by the value of **ptg**, as specified in the following table. MUST exist if and only if **ptg** is not equal to 0x18.

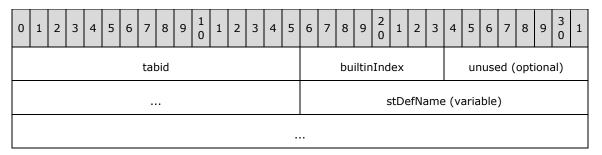

ptg Value	Туре
<u>PtgRef</u>	A RgceLoc8 that specifies the cell reference originally contained by the expression.
PtgRef3d	A RgceLoc8 that specifies the cell reference originally contained by the expression.
<u>PtgArea</u>	A <u>RgceArea</u> that specifies a reference to a rectangular range of cells originally contained by the expression.
PtgArea3d	A RgceArea that specifies a reference to a rectangular range of cells originally contained by the expression.
All other values	MUST be zero, and MUST be ignored.

ducr_cond_1 (variable): A <u>DucrConditionalLbl</u> that specifies defined name information associated with the affected expression. MUST exist if and only if **fLbl** equals 1.

ducr_cond_2 (6 bytes): A <u>DucrConditionalNoLbl</u> that specifies location information associated with the affected expression. MUST exist if and only if **fLbl** equals 0.

2.5.88 DucrConditionalLbl

The **DucrConditionalLbl** structure specifies information associated with the **defined name** in the <u>Ducr</u> structure.

tabid (2 bytes): A <u>TabId</u> that specifies the **sheet** containing the defined name. A value of 0xFFFF specifies that the defined name is not associated with the sheet.

builtinIndex (1 byte): An unsigned integer that specifies the identifier of a **built-in name**. MUST be a value from the following table:

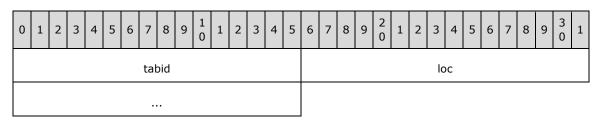

Value	Meaning
0x00	Not a built-in name
0x01	The built-in name is "Consolidate_Area"
0x02	The built-in name is "Auto_Open"
0x03	The built-in name is "Auto_Close"
0x04	The built-in name is "Extract"
0x05	The built-in name is "Database"
0x06	The built-in name is "Criteria"
0x07	The built-in name is "Print_Area"
0x08	The built-in name is "Print_Titles"
0x09	The built-in name is "Recorder"
0x0A	The built-in name is "Data_Form"
0x0B	The built-in name is "Auto_Activate"
0x0C	The built-in name is "Auto_Deactivate"
0x0D	The built-in name is "Sheet_Title"
0x0E	The built-in name is "_FilterDatabase"

unused (3 bytes): Undefined and MUST be ignored. MUST exist if and only if builtinIndex is not equal to zero.

stDefName (variable): An <u>XLUnicodeString</u> that specifies the defined name. MUST exist if and only if **builtinIndex** is equal to zero.

2.5.89 DucrConditionalNoLbl

The ${\bf DucrConditionalNoLbl}$ structure specifies location information associated with the ${\bf \underline{Ducr}}$ structure.

tabid (2 bytes): A TabId that specifies the sheet containing the affected expression.

loc (4 bytes): An RRLoc that specifies the location of the cell containing the affected expression. The fQuotesOnLabel and fNoDollarOnLabel fields in the RRLoc structure are undefined and MUST be ignored.

2.5.90 DwQsiFuture

The **DwQsiFuture** structure specifies option flags for a **query table**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е	F	G	Н	Ι		reserved5										re	eser	vec	16								

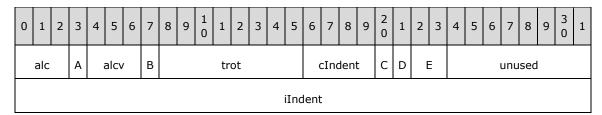

- A fPreserveFmt (1 bit): A bit that specifies whether the user applied formatting is preserved.
- B fAutoFit (1 bit): A bit that specifies whether columns be auto fit after a data refresh.
- C reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **D reserved2 (1 bit):** MUST be zero, and MUST be ignored.
- **E fExtDataList (1 bit):** A bit that specifies whether an **external data** list is the **data source** for the query table.
- **F reserved3 (1 bit):** MUST be zero, and MUST be ignored.
- **G fCreateQTList (1 bit):** A bit that specifies whether a query table list is to be created.
- H fDummyList (1 bit): A bit that specifies whether a dummy query table list is created.
- I reserved4 (1 bit): MUST be zero, and MUST be ignored.

reserved5 (7 bits): MUST be zero, and MUST be ignored.

reserved6 (16 bits): MUST be zero, and MUST be ignored.

2.5.91 DXFALC

The **DXFALC** structure specifies the text alignment properties within a containing <u>DXFN</u> structure.

alc (3 bits): A HorizAlign that specifies the horizontal alignment of the text.

A - fWrap (1 bit): A bit that specifies the text display when the text is wider than the cell.

Value	Meaning
0	The text is truncated.
1	The text is wrapped into more than one line.

alcv (3 bits): A VertAlign that specifies the vertical alignment of the text.

B - fJustLast (1 bit): A bit that specifies whether cell text is **justify distributed**. If **fJustLast is** 1 the text is justify distributed and **alc** MUST be 0x7.

trot (8 bits): An XFPropTextRotation that specifies the text rotation.

- **cIndent (4 bits):** An unsigned integer that specifies the absolute level of indentation. The absolute level of indentation will replace any previous indentation. MUST be ignored when **iIndent** is not 255. MUST be less than or equal to 15.
- **C fShrinkToFit (1 bit):** A bit that specifies whether the character sizes in the text MUST be reduced so that the text fits in the cell.
- **D fMergeCell (1 bit):** A bit that specifies that the cell MUST be merged.
- **E iReadingOrder (2 bits):** A <u>ReadingOrder</u> that specifies the <u>reading order</u>. If **fZeroInited** in the parent structure is zero, then it is undefined and MUST be ignored.
- unused (8 bits): Undefined and MUST be ignored.
- **iIndent (4 bytes):** A signed integer that specifies the relative level of indentation. The relative level of indentation will be added to any previous indentation. The value MUST be greater than or equal to -15 and less than or equal to 255. The value SHOULD <163> be greater than or equal to -15 and less than or equal to 15, or be equal to 255. The values -250 through 250 specify a relative indentation level, and the value 255 specifies the absence of a relative indentation level.

2.5.92 DXFBdr

The **DXFBdr** structure specifies the **style** of **cell** borders in a containing DXFN structure.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	dgLeft dgRight dgTop				Ą		icvLeft							icvRight							В	С									
	icvTop icvBottom									ic	√Dia	ag		·	(dgD	iag				ur	านร	ed								

- **dgLeft (4 bits):** A BorderStyle that specifies the grid **line style** for the left **border** of the cell.
- dgRight (4 bits): A BorderStyle that specifies the grid line style for the right border of the cell.
- dgTop (4 bits): A BorderStyle that specifies the grid line style for the top border of the cell.
- **A dgBottom (4 bits):** A BorderStyle that specifies the grid line style for the bottom border of the cell.
- icvLeft (7 bits): An LevXF that specifies the color of the left border of the cell or unused. This value is unused and MUST be ignored if **dgLeft** is 0 or if the **glLeftNinch** field in the containing DXFN structure is 1.
- **icvRight (7 bits):** An IcvXF that specifies the color of the right border of the cell or unused. This value is unused and MUST be ignored if **dgRight** is 0 or if the **glRightNinch** field in the containing DXFN structure is 1.
- **B bitDiagDown (1 bit):** A bit that specifies if the cell has a downward diagonal drawn.
- C bitDiagUp (1 bit): A bit that specifies if the cell has an upward diagonal drawn.
- icvTop (7 bits): An IcvXF that specifies the color of the top border of the cell or unused. This value is unused and MUST be ignored if dgTop is 0 or if the glTopNinch field in the containing DXFN structure is 1.
- icvBottom (7 bits): An IcvXF that specifies the color of the bottom border of the cell or unused. This value is unused and MUST be ignored if dgBottom is 0 or if the glBottomNinch field in the containing DXFN structure is 1.

icvDiag (7 bits): An IcvXF that specifies the color of the diagonals of the cell or unused. This value is unused and MUST be ignored if dgDiag is 0 or if the glDiagDownNinch and the glDiagUpNinch fields in the containing DXFN are both 1.

dgDiag (4 bits): A BorderStyle that specifies the grid line style for the diagonals of the cell..

unused (7 bits): Undefined and MUST be ignored.

2.5.93 DXFFntD

The **DXFFntD** structure specifies a **font** and its format attributes.

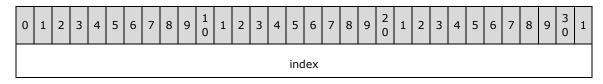

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		c	chF	ont	t											S	tFo	ntN	ame	e (v	aria	able	e)								
													unı	use	d1 ((vaı	riab	le)													
													s	txp	(16	5 by	/tes	5)													
															icvF		<u> </u>														
															ese																
															tsNi																
														fS	SssN	Vinc	:h														
														fl	JIsN	linc	h														
														fE	BlsN	linc	h														
														u	ınus	sed2	2														
															ic	:h															
cch																															
							iF	nt																							

cchFont (1 byte): An unsigned integer that specifies the number of characters of the font name string.

- **stFontName (variable):** An <u>XLUnicodeStringNoCch</u> that specifies the font name. MUST exist if and only if **cchFont** is greater than zero. The number of characters in the string is specified in **cchFont**. If **stFontName.fHighByte** equals 0x0, **cchFont** MUST be less than or equal to 62. If **stFontName.fHighByte** equals 0x1, **cchFont** MUST be less than or equal to 31.
- unused1 (variable): Undefined and MUST be ignored. The size of this field is 63 minus the size of the stFontName field. If the stFontName field doesn't exist, the size of this field is 63.
- **stxp (16 bytes):** A <u>Stxp</u> that specifies the font attributes.
- **icvFore (4 bytes):** An integer that specifies the color of the font. The value MUST be -1, 32767 or any of the values of the <u>IcvFont</u> structure. A value of -1 specifies that this value is ignored. A value of 32767 specifies that the color of the font is the default foreground text color. Any other value specifies the color of the font as specified in the IcvFont structure.
- reserved (4 bytes): MUST be zero, and MUST be ignored.
- tsNinch (4 bytes): A <u>Is</u> structure that specifies how the value of stxp.ts is to be interpreted. If tsNinch.ftsItalic is set to 1 then the value of stxp.ts.ftsItalic MUST be ignored. If tsNinch.ftsStrikeout is set to 1 then the value of the stxp.ts.ftsStrikeout MUST be ignored.
- **fSssNinch (4 bytes):** A Boolean (section <u>2.5.14</u>) that specifies whether the value of **stxp.sss** MUST be ignored.
- fUlsNinch (4 bytes): A Boolean that specifies whether the value of stxp.uls MUST be ignored.
- **fBIsNinch (4 bytes):** A Boolean that specifies whether the value of **stxp.bls** MUST be ignored.
- unused2 (4 bytes): Undefined and MUST be ignored.
- **ich (4 bytes):** A signed integer that specifies the zero based index of the first character to which this font applies. MUST be greater than or equal to 0xFFFFFFFF. MUST be set to 0xFFFFFFFF when the font is to be updated.
- **cch (4 bytes):** A signed integer that specifies the number of characters to which this font applies. MUST be greater than or equal to **ich** field. MUST be set to 0xFFFFFFF if the **ich** field is set to 0xFFFFFFF.
- **iFnt (2 bytes):** An unsigned integer that specifies the font. If the value is 0 then the default font is used. If the value is greater than 0 then the font to be applied is determined by the font name specified in **stFontName**.

2.5.94 DXFId

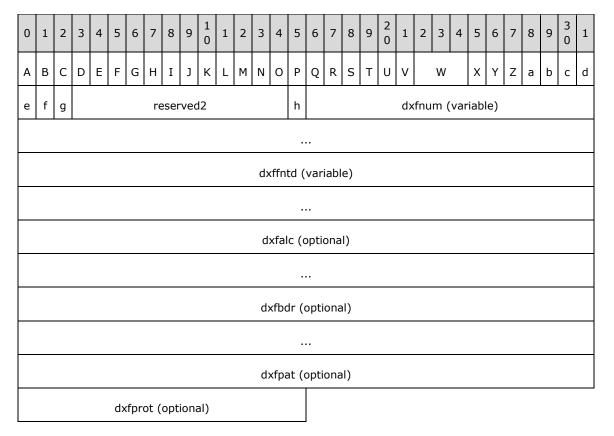

The **DXFId** structure specifies a <u>DXF</u> structure.

index (4 bytes): An unsigned integer that specifies a zero-based index of a DXF record in the collection of DXF records in the <u>Globals Substream</u>.

2.5.95 DXFN

The **DXFN** structure specifies differential formatting.

- A alchNinch (1 bit): A bit that specifies whether the value of dxfalc.alc MUST be ignored.
- **B alcvNinch (1 bit):** A bit that specifies whether the value of **dxfalc.alcv** MUST be ignored.
- C wrapNinch (1 bit): A bit that specifies whether the value of dxfalc.fWrap MUST be ignored.
- **D trotNinch (1 bit):** A bit that specifies whether the value of **dxfalc.trot** MUST be ignored.
- E kintoNinch (1 bit): A bit that specifies whether the value of dxfalc.fJustLast MUST be ignored .
- **F cIndentNinch (1 bit):** A bit that specifies whether the values of **dxfalc.cIndent** and **dxfalc.iIndent** MUST be ignored.
- **G fShrinkNinch (1 bit):** A bit that specifies whether the value of **dxfalc.fShrinkToFit** MUST be ignored.
- **H fMergeCellNinch (1 bit):** A bit that specifies whether the value of **dxfalc.fMergeCell** MUST be ignored.
- I lockedNinch (1 bit): A bit that specifies whether the value of dxfprot.fLocked MUST be ignored.
- **J hiddenNinch (1 bit):** A bit that specifies whether the value of **dxfprot.fHidden** MUST be ignored.
- K glLeftNinch (1 bit): A bit that specifies whether the values of dxfbdr.dgLeft and dxfbdr.icvLeft MUST be ignored .
- L glRightNinch (1 bit): A bit that specifies whether the values of dxfbdr.dgRight and dxfbdr.icvRight MUST be ignored.

- **M glTopNinch (1 bit):** A bit that specifies whether the values of **dxfbdr.dgTop** and **dxfbdr.icvTop** MUST be ignored.
- N glBottomNinch (1 bit): A bit that specifies whether the values of dxfbdr.dgBottom and dxfbdr.icvBottom MUST be ignored.
- O glDiagDownNinch (1 bit): A bit that specifies whether the value of dxfbdr.bitDiagDown MUST be ignored. When both glDiagDownNinch and glDiagUpNinch are set to 1, the values of dxfbdr.dgDiag and dxfbdr.icvDiag MUST be ignored.
- **P glDiagUpNinch (1 bit):** A bit that specifies whether the value of **dxfbdr.bitDiagUp** MUST be ignored. When both **glDiagDownNinch** and **glDiagUpNinch** are set to 1, the values of **dxfbdr.dgDiag** and **dxfbdr.icvDiag** MUST be ignored.
- **Q flsNinch (1 bit):** A bit that specifies whether the value of **dxfpat.fls** MUST be ignored.
- **R icvFNinch (1 bit):** A bit that specifies whether the value of **dxfpat.icvForeground** MUST be ignored.
- **S icvBNinch (1 bit):** A bit that specifies whether the value of **dxfpat.icvBackground** MUST be ignored.
- T ifmtNinch (1 bit): A bit that specifies whether the value of dxfnum.ifmt MUST be ignored.
- U fIfntNinch (1 bit): A bit that specifies whether the value of dxffntd.ifnt MUST be ignored.
- V unused1 (1 bit): Undefined and MUST be ignored.
- W reserved1 (3 bits): MUST be zero and MUST be ignored.
- X ibitAtrNum (1 bit): A bit that specifies whether number formatting information is part of this structure.
- Y ibitAtrFnt (1 bit): A bit that specifies whether font information is part of this structure.
- **Z ibitAtrAlc (1 bit):** A bit that specifies whether alignment information is part of this structure.
- a ibitAtrBdr (1 bit): A bit that specifies whether border formatting information is part of this structure.
- **b** ibitAtrPat (1 bit): A bit that specifies whether pattern information is part of this structure.
- c ibitAtrProt (1 bit): A bit that specifies whether rotation information is part of this structure.
- **d iReadingOrderNinch (1 bit):** A bit that specifies whether the value of **dxfalc.iReadingOrder** MUST be ignored.
- **e fIfmtUser (1 bit):** A bit that specifies that the **number format** used is a user-defined **format string**. When set to 1, **dxfnum** contains a format string.
- f unused2 (1 bit): Undefined and MUST be ignored.
- g fNewBorder (1 bit): A bit that specifies how the border formats apply to a range of cells.

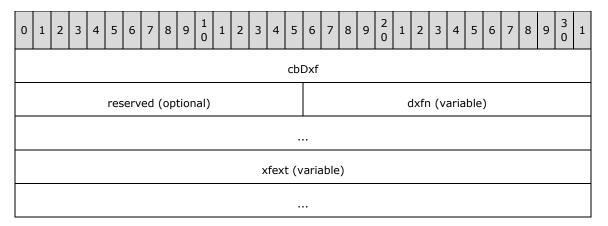

Value	Description
0	Border formats apply to all cells in the range.
1	Border formats only apply to the outline of the range.

For example, if the bit is set to 1 and there is a left border format, that left border format will only apply to the cells on the left edge of the range of cells.

- reserved2 (12 bits): MUST be zero and MUST be ignored.
- h fZeroInited (1 bit): A bit that specifies whether the value of dxfalc.iReadingOrder MUST be taken into account.
- **dxfnum (variable):** A <u>DXFNum</u> that specifies the number formatting. MUST exist if and only if **ibitAtrNum** is nonzero.
- **dxffntd (variable):** A <u>DXFFntD</u> that specifies the font. MUST exist if and only if **ibitAtrFnt** is nonzero.
- **dxfalc (8 bytes):** A <u>DXFALC</u> that specifies the text alignment properties. MUST exist if and only if **ibitAtrAlc** is nonzero.
- **dxfbdr (8 bytes):** A <u>DXFBdr</u> that specifies the border properties. MUST exist if and only if **ibitAtrBdr** is nonzero.
- **dxfpat (4 bytes):** A <u>DXFPat</u> that specifies the pattern and colors. MUST exist if and only if **ibitAtrPat** is nonzero.
- **dxfprot (2 bytes):** A <u>DXFProt</u> that specifies the **protection** attributes. MUST exist if and only if **ibitAtrProt** is nonzero.

2.5.96 DXFN12

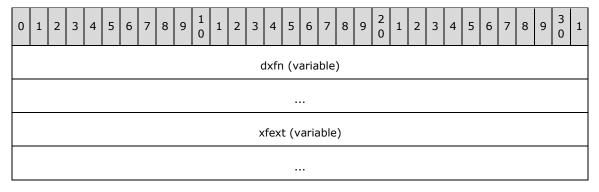

The **DXFN12** structure specifies differential formatting and is an extension to DXFN.

- **cbDxf (4 bytes):** An unsigned integer that specifies the size of the structure in bytes. If greater than zero, it MUST be the total byte count of **dfxn** and **xfext**. Otherwise it MUST be zero.
- **reserved (2 bytes):** MUST be zero and MUST be ignored. MUST be omitted when **cbDxf** is greater than zero.
- **dxfn (variable):** A DXFN that specifies part of the differential formatting. MUST be omitted if **cbDxf** is 0x00000000.
- **xfext (variable):** An <u>XFExtNoFRT</u> that specifies extensions for the differential formatting. MUST be omitted if **cbDxf** is equal to the byte count of **dxfn**.

2.5.97 DXFN12List

The **DXFN12List** structure specifies <u>differential formatting</u> used by <u>table block-level formatting</u>. This structure also specifies extensions to the <u>DXFN</u> formatting properties.

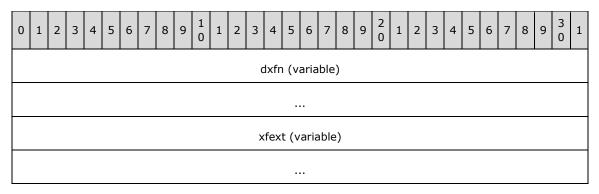

dxfn (variable): A DXFN structure that specifies differential formatting used by table block-level formatting.

xfext (variable): An <u>XFExtNoFRT</u> structure that specifies the set of extensions to the differential formatting properties specified in **dxfn**. MUST exist if and only if the size of this structure is greater than the size of the **dxfn** field.

2.5.98 DXFN12NoCB

The **DXFN12NoCB** structure specifies <u>differential formatting</u> and is an extension to <u>DXFN</u>.

dxfn (variable): A DXFN that specifies part of the differential formatting.

xfext (variable): An optional XFExtNoFRT that specifies extensions for the differential formatting.

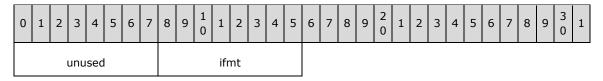

2.5.99 DXFNum

The **DXFNum** structure specifies the **number format** in a containing \underline{DXFN} structure. Its type depends on the **fIfmtUser** field of DXFN

Value	Meaning
0	<u>DXFNumIFmt</u>
1	<u>DXFNumUsr</u>

2.5.100 DXFNumIFmt

The **DXFNumIFmt** structure specifies the number format in a containing <u>DXFN</u> structure when a format identifier is used.

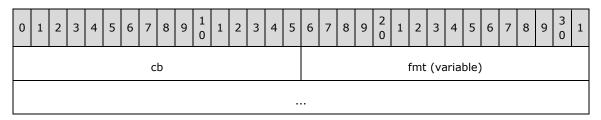

unused (8 bits): Undefined and MUST be ignored.

ifmt (8 bits): An unsigned integer that specifies the identifier of the **number format** to use as specified in IFmt.

2.5.101 DXFNumUsr

The **DXFNumUsr** structure specifies the **number format** in a containing <u>DXFN</u> structure when a **format string** is used.

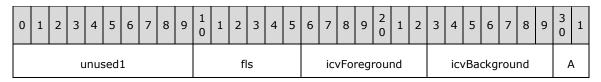

cb (2 bytes): An unsigned integer that specifies the size of this structure, in bytes.

fmt (variable): An <u>XLUnicodeString</u> that specifies the number format to use as specified in the **stFormat** field of <u>Format</u>.

2.5.102 DXFPat

The **DXFPat** structure specifies the **fill pattern** and color within a containing <u>DXFN</u> structure.

unused1 (10 bits): Undefined and MUST be ignored.

fls (6 bits): A FillPattern that specifies the fill pattern.

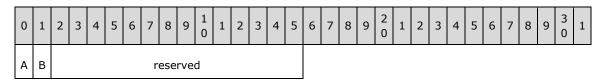

icvForeground (7 bits): An unsigned integer that specifies the color of the foreground of the cell. The value MUST be an IcvXF value. This value is unused and MUST be ignored if the IcvFNinched field in the containing DXFN structure is 1.

icvBackground (7 bits): An unsigned integer that specifies the color of the background of the cell. The value MUST be an IcvXF value. This value is unused and MUST be ignored if the **icvBNinched** field in the containing DXFN structure is 1.

A - unused2 (2 bits): Undefined and MUST be ignored.

2.5.103 DXFProt

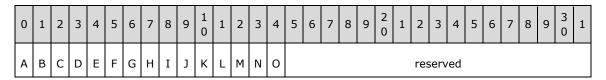

The **DXFProt** structure specifies the protection attributes inside a containing <u>DXFN</u> structure.

- A fLocked (1 bit): A bit that specifies if the cell content is locked when the workbook is protected.
- **B fHidden (1 bit):** A bit that specifies if the cell content is hidden when the workbook is protected. **reserved (14 bits):** MUST be zero and MUST be ignored.

2.5.104 EnhancedProtection

The **EnhancedProtection** structure specifies protection settings for <u>Shared Features</u> of the Enhanced Protection type as specified by <u>SharedFeatureType</u>.ISFPROTECTION. These settings apply to a protected **sheet**.

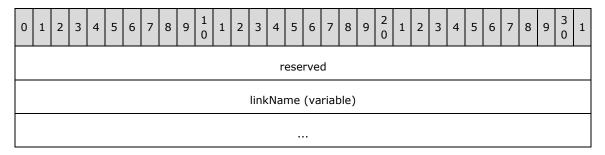

- A iprotObjects (1 bit): A bit that specifies whether linked objects or embedded objects can be edited.
- **B iprotScenarios (1 bit):** A bit that specifies whether **scenarios** can be edited.
- C iprotFormatCells (1 bit): A bit that specifies whether cells can be formatted.
- **D** iprotFormatColumns (1 bit): A bit that specifies whether columns can be formatted.
- **E iprotFormatRows (1 bit):** A bit that specifies whether rows can be formatted.
- F iprotInsertColumns (1 bit): A bit that specifies whether columns can be inserted.
- **G iprotInsertRows (1 bit):** A bit that specifies whether rows can be inserted.
- **H iprotInsertHyperlinks (1 bit):** A bit that specifies whether **hyperlinks** can be inserted.
- I iprotDeleteColumns (1 bit): A bit that specifies whether columns can be deleted.
- J iprotDeleteRows (1 bit): A bit that specifies whether rows can be deleted.
- **K iprotSelLockedCells (1 bit):** A bit that specifies whether locked cells can be selected.
- L iprotSort (1 bit): A bit that specifies whether cells can be sorted.
- **M iprotAutoFilter (1 bit):** A bit that specifies whether cells can be filtered.
- N iprotPivotTables (1 bit): A bit that specifies whether PivotTable reports can be created or modified.
- O iprotSelUnlockedCells (1 bit): A bit that specifies whether unlocked cells can be selected.

reserved (17 bits): MUST be zero, and MUST be ignored.

2.5.105 ExternDdeLinkNoOper

The **ExternDdeLinkNoOper** structure specifies the data for a <u>DDE data item</u> in the <u>ExternName</u> record.

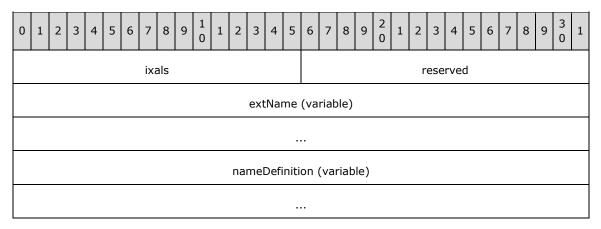

reserved (4 bytes): MUST be 0 and MUST be ignored.

linkName (variable): A <u>ShortXLUnicodeString</u> that specifies the DDE data item name. The value MUST be "StdDocumentName".

2.5.106 ExternDocName

The **ExternDocName** structure specifies the data for an $\underline{\text{external defined name}}$ in the $\underline{\text{ExternName}}$ record.

ixals (2 bytes): If the external defined name specified by extName is a local name, this unsigned integer specifies a one-based index of an XLUnicodestring in the rgst field of the preceding SupBook record. The XLUnicodestring specifies the name of the sheet where the external defined name specified by extName is scoped. Otherwise this MUST be 0. The value MUST be less than or equal to the value of the ctab field in the preceding SupBook record.

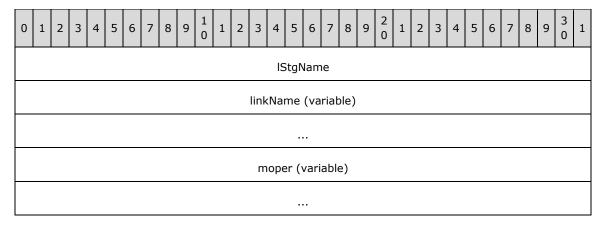

reserved (2 bytes): MUST be zero, and MUST be ignored.

extName (variable): A <u>ShortXLUnicodeString</u> that specifies the name of the external defined name. **extName.cch** MUST be less than or equal to 255.

nameDefinition (variable): An <u>ExtNameParsedFormula</u> that specifies the formula (section <u>2.2.2</u>) of the external defined name.

2.5.107 ExternOleDdeLink

The **ExternOleDdeLink** structure specifies the data for an <u>OLE data item</u> or a <u>DDE data item</u> in the <u>ExternName</u> record. If the **fOleLink** field in the owned ExternName record is 1, the referenced item MUST be an OLE data item.

IStgName (4 bytes): An unsigned integer that specifies a <u>link storage</u> that specifies the linked **OLE** object. This name of the link storage MUST be the concatenation of "LNK" and the eight byte hexadecimal representation of this value. The value MUST be 0 for a DDE data item.

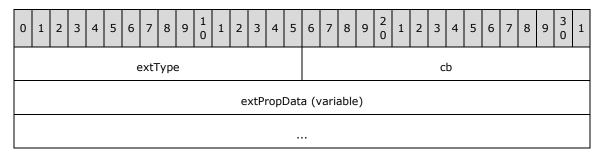

linkName (variable): A <u>ShortXLUnicodeString</u> that specifies the name of OLE data item or DDE data item. **linkName.cch** MUST be less than or equal to 255.

moper (variable): An optional <u>MOper</u> that specifies current **cell** values for the linked data. This field MUST exist if and only if

(byte size of owning ExternName record -6 - byte size of **linkName** > 0).

2.5.108 ExtProp

The **ExtProp** structure specifies an extension to a formatting property.

extType (2 bytes): An unsigned integer that specifies the type of the extension. MUST be a value from the table as specified in the **extPropData** field.

cb (2 bytes): An unsigned integer that specifies the size of this ExtProp structure.

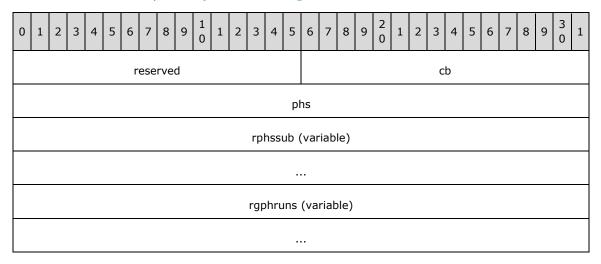

extPropData (variable): This field specifies the extension data. The size and data type of this field varies based on the property type as specified in **extType** as follows:

extType value	extPropData field Data and Meaning
0x0004	A <u>FullColorExt</u> that specifies the cell interior foreground color .
0x0005	A FullColorExt that specifies the cell interior background color .

extType value	extPropData field Data and Meaning
0x0006	An XFExtGradient that specifies a cell interior gradient fill.
0x0007	A FullColorExt that specifies the top cell border color.
0x0008	A FullColorExt that specifies the bottom cell border color.
0x0009	A FullColorExt that specifies the left cell border color.
0x000A	A FullColorExt that specifies the right cell border color.
0x000B	A FullColorExt that specifies the diagonal cell border color.
0x000D	A FullColorExt that specifies the cell text color.
0x000E	A 2-byte unsigned integer that specifies a FontScheme .
0x000F	A 2-byte unsigned integer that specifies the text indentation level . MUST be less than or equal to 250.

2.5.109 ExtRst

The ExtRst structure specifies phonetic string data.

reserved (2 bytes): MUST be 1, and MUST be ignored.

cb (2 bytes): An unsigned integer that specifies the size, in bytes, of the phonetic string data.

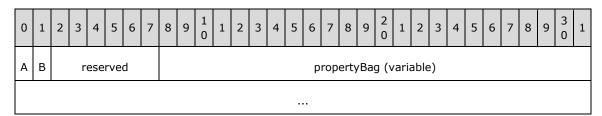

phs (4 bytes): A Phs that specifies the formatting information for the phonetic string.

rphssub (variable): An <u>RPHSSub</u> that specifies the phonetic string.

rgphruns (variable): An array of PhRuns. This specifies the phonetic text runs. Each PhRuns specifies a phonetic text run within rphssub.st that is displayed above a text run in the rgb field of the XLUnicodeRichExtendedString that contains this structure. The first character of the phonetic text run is the character specified by the ichFirst field of PhRuns. The first character in the rgb field of the XLUnicodeRichExtendedString that contains this structure that the phonetic text run appears earlier is specified by the ichMom field of PhRuns. Each ichMom field of a PhRuns in the array MUST be less than the ichMom field of the subsequent PhRuns in the array. Each ichFirst field of a PhRuns in the array MUST be less than the ichFirst of the subsequent PhRuns in the array. The sum of the cchMom fields of all PhRuns in the array MUST be less than or equal to the number of characters in rgb field of the XLUnicodeRichExtendedString that contains this structure. The number of elements in this array is rphssub.crun.

2.5.110 FactoidData

The FactoidData structure specifies information about a smart tag.

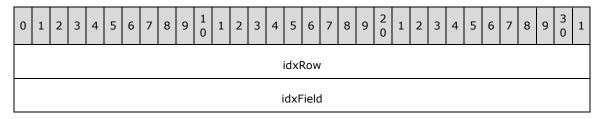

- A fDelete (1 bit): A bit that specifies whether the smart tag is deleted.
- **B fXMLBased (1 bit):** A bit that specifies whether the smart tag is **XML**-based. For more information about XML-based smart tags, see [MSDN-OSTD].

reserved (6 bits): MUST be 0, and MUST be ignored.

propertyBag (variable): A PropertyBag as defined in [MS-OSHARED] section 2.3.4.3 that specifies smart tag properties. Each entry in the PropertyBag is a pair of indexes into the **stringTable** field of the PropertyBagStore as defined in [MS-OSHARED] section 2.3.4.1 that specify the key/value pair representing a property of the smart tag.

2.5.111 Feat11CellStruct

The Feat11CellStruct structure specifies a cell.

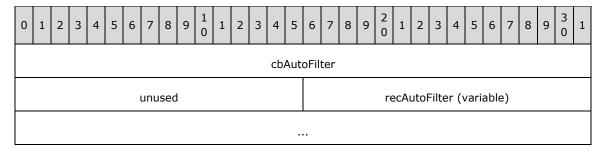

idxRow (4 bytes): An unsigned integer that specifies the row identifier of the row in the table. The row identifiers are stored in a table column with the strName of Feat11FieldDataItem equal to "ID". The row identifier specified in this field MUST match a row identifier stored in the LISTDATA element of the List Data stream. It MUST also match a row identifier stored in the LISTSCHEMA element of the List Data stream, under the Field node, where the "name" attribute of the Field node is equal to "ID".

idxField (4 bytes): An unsigned integer that specifies a column identifier. MUST be equal to the **idField** field of an item in the fielddata array of the containing *TableFeatureType* structure.

2.5.112 Feat11FdaAutoFilter

The **Feat11FdaAutoFilter** structure specifies the definition of an automatically generated **filter**, or **AutoFilter**.

cbAutoFilter (4 bytes): An unsigned integer that specifies the size, in bytes, of the **recAutoFilter** field. MUST be less than or equal to 2080 bytes.

unused (2 bytes): Undefined and MUST be ignored.

recAutoFilter (variable): An <u>AutoFilter</u> structure that specifies the filter that is applied to the **table** column.

2.5.113 Feat11FieldDataItem

The **Feat11FieldDataItem** structure specifies a column of a **table**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	Ę	5 6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1

wssInfo (variable)
qsif (optional)
dskHdrCache (variable)

idField (4 bytes): An unsigned integer that specifies the identifier of the column. MUST be nonzero and MUST be unique within the **FieldData** array in the containing <u>TableFeatureType</u> structure.

Ifdt (4 bytes): An unsigned integer that specifies the column's Web based data provider data type. If the **It** field of the containing TableFeatureType structure is not set to 0x00000001, this field MUST be 0x00000000; otherwise it MUST be a value from the following table. For more information about the data types, see [MS-WSSTS] section 2.3.

Value	Web Based Data Provider Data Type
0x0000001	Text
0x00000002	Number

Value	Web Based Data Provider Data Type
0x00000003	Boolean
0x00000004	Date Time
0x00000005	Note
0x00000006	Currency
0x00000007	Lookup
0x00000008	Choice
0x00000009	URL
0x0000000A	Counter
0x0000000B	Multiple Choices

Ifxidt (4 bytes): An unsigned integer that specifies the column's **XML** data type. If the **It** field of the containing TableFeatureType structure is not set to 0x00000002, this field MUST be 0x00000000; otherwise it MUST be a value from the following table. For more information about the data types, see [MSDN-SOM].

Value	MS-XML Data Type
0x00001000	SOMITEM_SCHEMA
0x00001001	SOMITEM_ATTRIBUTE

0x00004803	SOMITEM_NULL_ELEMENT	

ilta (4 bytes): An unsigned integer that specifies the **aggregation function** to use for the **total row** of the column. MUST be a value from the following table:

Value	Aggregation Formula					
0x00000000 No formula (section <u>2.2.2</u>)						
0x00000001	Average					
0x00000002	Count					
0x00000003	Count Numbers					
0x00000004	Max					

Value	Aggregation Formula
0x00000005	Min
0x00000006	Sum
0x00000007	Standard Deviation
0x00000008	Variance
0x00000009	Custom formula<164>

cbFmtAgg (4 bytes): An unsigned integer that specifies the size, in bytes, of the dxfFmtAgg field.

- **istnAgg (4 bytes):** An unsigned integer that specifies the zero-based index of the <u>Style</u> record in the <u>Globals Substream</u> **ABNF** that is used for the total row of the column. If this value equals 0xFFFFFFFF, the total row of the column uses built-in table styles.
- A fAutoFilter (1 bit): A bit that specifies whether the column has an AutoFilter.
- **B fAutoFilterHidden (1 bit):** A bit that specifies whether the column has an AutoFilters that is not displayed. When this field is set to 1, **fAutoFilter** MUST be set to 1.
- **C fLoadXmapi (1 bit):** A bit that specifies whether the **rgXmap** field is present. MUST be 0 if the **It** field of the containing TableFeatureType structure is not equal to 0x00000002.
- **D fLoadFmla (1 bit):** A bit that specifies whether the **fmla** field is present for a table whose **data source** is a Web based data provider list. MUST be 0 if the **lt** field of the containing TableFeatureType structure is not equal to 0x00000001.
- **E unused1 (2 bits):** Undefined, and MUST be ignored.
- F reserved2 (1 bit): MUST be zero, and MUST be ignored.
- **G fLoadTotalFmla (1 bit):** A bit that specifies whether the **totalFmla** field is present. SHOULD<165> be 1 if **ilta** is 0x00000009, MUST be 0 otherwise.
- **H fLoadTotalArray (1 bit):** A bit that specifies whether the formula specified by **totalFmla** is an array formula. MUST be 0 when **fLoadTotalFmla** is 0.
- I fSaveStyleName (1 bit): A bit that specifies whether the dskHdrCache.strStyleName field is present.
- **J fLoadTotalStr (1 bit):** A bit that specifies whether the **strTotal** field is present. MUST be 0 when **ilta** is not 0x00000000.
- **K fAutoCreateCalcCol (1 bit):** A bit that specifies whether the column has a calculated column formula. MUST be 0 if the **It** field of the containing TableFeatureType structure is set to 0x00000001.
- unused2 (20 bits): Undefined, and MUST be ignored.
- **cbFmtInsertRow (4 bytes):** An unsigned integer that specifies the size, in bytes, of the **dxfFmtInsertRow** field.
- **istnInsertRow (4 bytes):** An unsigned integer that specifies the zero-based index of the Style record in the Globals Substream ABNF that is used for the **insert row** of the column. If this value equals 0xFFFFFFFF, the insert row of the column uses built-in table styles.

- **strFieldName (variable):** An <u>XLUnicodeString</u> that specifies the name of the column, as provided by the data source. MUST contain at least one character and less than or equal to 255 characters. MUST be unique within the **FieldData** array in the containing TableFeatureType structure if the **It** field of the containing TableFeatureType structure is set to 0x00000001 or 0x00000003.
- strCaption (variable): An XLUnicodeString that specifies the caption of the column. MUST contain at least one character and less than or equal to 255 characters. MUST be unique within the FieldData array in the containing TableFeatureType structure. MUST be equal to the value within the header cell at the location of the column title if the crwHeader field of the containing TableFeatureType structure is greater than 0. This field is present if and only if the fSingleCell field of the containing TableFeatureType structure is set to 0. MUST NOT contain the characters from the following table:

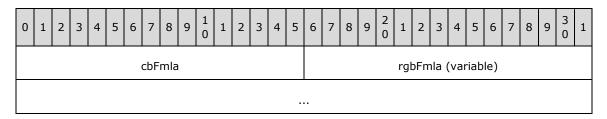

Invalid Characters	Unicode range
Lower control characters	0x0000-0x0031
Invalid Unicode surrogate pairs	High surrogate with a value of 0xD800 to 0xDBFF followed by a low surrogate with a value of 0xDC00 to 0xDFFF.
Reserved characters	0xFFFE, 0xFFFF, 0xF00B

- **dxfFmtAgg (variable):** A <u>DXFN12List</u> that specifies the formatting of the total row of the column, if different from the **style** specified by **istnAgg** or built-in table styles. This field is present if and only if the **cbFmtAgg** field is greater than 0x00000000.
- **dxfFmtInsertRow (variable):** A DXFN12List that specifies the formatting of the insert row of the column, if different from the style specified by **istnInsertRow** or built-in table styles. This field is present if and only if the **cbFmtInsertRow** field is more than 0x00000000.
- **AutoFilter (variable):** A Feat11FdaAutoFilter that specifies the characteristics of the AutoFilter for the column. This field is present if and only if the **fAutoFilter** field of the containing TableFeatureType structure is set to 1.
- **rgXmap (variable):** A <u>Feat11XMap</u> structure that specifies the mapping to the column data within an XML data source. This field is present if and only if the **fLoadXmapi** bit is set to 1.
- **fmla (variable):** A <u>Feat11Fmla</u> structure that specifies the **column formula** whose data source is a Web based data provider list. The specified formula applies to every row of the column, except the total row and the **header row**. This field is present if and only if the **fLoadFmla** bit is set to 1.
- **totalFmla (variable):** A <u>Feat11TotalFmla</u> structure that specifies the formula to use for the total row of the column. This field is present if and only if the **fLoadTotalFmla** bit is set to 1.
- **strTotal (variable):** An XLUnicodeString structure that specifies the text to use for the total row of the column. MUST contain less than or equal to 32767 characters. This field is present if and only if the **fLoadTotalStr** bit is set to 1.
- wssInfo (variable): A Feat11WSSListInfo that specifies the relationship between the column and a Web based data provider list. This field is present if and only if the It field of the containing TableFeatureType structure is set to 0x00000001.
- qsif (4 bytes): An unsigned integer that specifies the relationship between the column and its Microsoft Query data source. MUST be equal to the idField field of a Qsif record within the Worksheet Substream. This field is present if and only if the It field of the containing TableFeatureType structure is set to 0x00000003 (External data source). MUST be greater than zero and MUST be unique within the FieldData array in the containing TableFeatureType structure.

dskHdrCache (variable): A <u>CachedDiskHeader</u> that specifies the column header formatting information. This field is present if and only if the **crwHeader** field of the containing TableFeatureType structure is set to 0x0000 and the **fSingleCell** field of the containing TableFeatureType structure is set to 0.

2.5.114 Feat11Fmla

The **Feat11Fmla** structure specifies a formula (section <u>2.2.2</u>) that is used as a **column formula**.

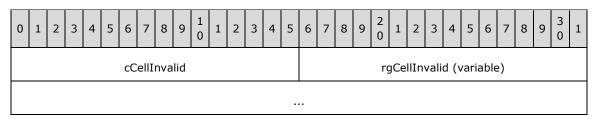

cbFmla (2 bytes): An unsigned integer that specifies the size, in bytes, of the rgbFmla field.

rgbFmla (variable): A ListParsedFormula that specifies the parsed expression of the column formula.

2.5.115 Feat11RgInvalidCells

The **Feat11RgInvalidCells** structure specifies the **cells** in a **table** linked to a Web-based **data provider data source** which could not be synchronized.

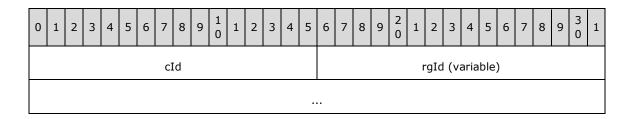

cCellInvalid (2 bytes): An unsigned integer that specifies the number of items in the **rgCellInvalid** field.

rgCellInvalid (variable): An array of <u>Feat11CellStruct</u> that specifies the cells that could not be synchronized with a Web-based data provider data source.

2.5.116 Feat11RgSharepointIdChange

The **Feat11RgSharepointIdChange** structure specifies the identifier of modified rows in a **table** linked to a Web-based **data provider**. This information is used when synchronizing between the local copy of the table, and the Web-based data provider.

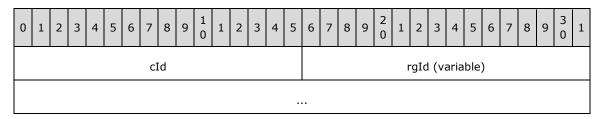

cId (2 bytes): An unsigned integer that specifies the number of elements in rgId.

rgId (variable): An array of 4-byte unsigned integers that specifies identifiers of rows that were modified. The length of the array is specified by the **cId** field, and each entry of the array specifies the identifier of one row. The row identifier specified in this field MUST match a row identifier stored in the **LISTDATA** element of the <u>List Data</u> stream, as well as the row identifier stored in the column with a title "ID" in the table.

2.5.117 Feat11RgSharepointIdDel

The **Feat11RgSharepointIdDel** structure specifies the identifier of deleted rows in a **table** linked to a Web-based **data provider**. This information is used when synchronizing between the local copy of the table, and the Web-based data provider.

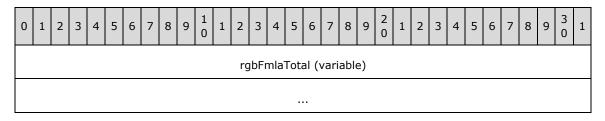

cId (2 bytes): An unsigned integer that specifies the number of elements in rgId.

rgId (variable): An array of 4-byte unsigned integers that specifies identifiers of rows that were deleted. The length of the array is specified by the **cId** field, and each entry of the array specifies the identifier of one row. The row identifier specified in this field MUST match a row identifier stored in the **LISTDATA** element of the <u>List Data</u> stream.

2.5.118 Feat11TotalFmla

The **Feat11TotalFmla** structure specifies a formula (section 2.2.2) that can be used as a **total row** formula < 166>.

rgbFmlaTotal (variable): A <u>ListParsedFormula</u> or <u>ListParsedArrayFormula</u> that specifies the <u>parsed expression</u> of the total row formula. When the **fLoadTotalArray** field of the containing <u>Feat11FieldDataItem</u> structure is set to 1, this field is a ListParsedArrayFormula; otherwise, it is a ListParsedFormula.

2.5.119 Feat11WSSListInfo

The **Feat11WSSListInfo** structure specifies the relationship between a table column and a Webbased **data provider** list.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

Н	Ι	J	K	L	М	N	0		bDefaultType unused2																						
	rgbDV (variable)																														
	strFormula (variable)																														
	reserved																														

LCID (4 bytes): An unsigned integer that specifies the **language code identifier (LCID)** of the source data.

cDec (4 bytes): An unsigned integer that specifies the number of decimal places for a numeric column.

- **A fPercent (1 bit):** A bit that specifies whether the numeric values in the column are displayed as percentages.
- **B fDecSet (1 bit):** A bit that specifies whether the numeric values in the column are displayed with a fixed decimal point. The position of the decimal point is specified by the **cDec** field.
- **C fDateOnly (1 bit):** A bit that specifies whether only the date part of date/time values is displayed.
- **D fReadingOrder (2 bits):** An unsigned integer that specifies the **reading order**. MUST be a value from the following table:

Value	Meaning
0x0	Reading order is determined by the application based on the reading order of the cells surrounding the table.
0x1	Reading order is left-to-right.
0x2	Reading order is right-to-left.

- E fRichText (1 bit): A bit that specifies whether the column contains rich text.
- **F fUnkRTFormatting (1 bit):** A bit that specifies whether the column contains unrecognized rich text formatting.
- **G fAlertUnkRTFormatting (1 bit):** A bit that specifies whether the column contains unrecognized rich text formatting that requires notifying the user.

unused1 (24 bits): Undefined and MUST be ignored.

- H fReadOnly (1 bit): A bit that specifies whether the column is read only.
- I fRequired (1 bit): A bit that specifies whether every item in this column has to contain data.
- **J fMinSet (1 bit):** A bit that specifies whether a minimum numeric value for the column exists. The minimum value is stored in the <u>List Data</u> stream within the LISTSCHEMA element, under the Field node's Min attribute.
- **K fMaxSet (1 bit):** A bit that specifies whether a maximum numeric value for the column exists. The maximum value is stored in the List Data stream within the LISTSCHEMA element, under the Field node's Max attribute.
- L fDefaultSet (1 bit): A bit that specifies whether there is a default value for the column.
- **M fDefaultDateToday (1 bit):** A bit that specifies whether the default value for the column is the current date.
- **N fLoadFormula (1 bit):** A bit that specifies whether a validation formula exists for this column. The formula is specified by the **strFormula** field.
- O fAllowFillIn (1 bit): A bit that specifies whether a choice field allows custom user entries.

bDefaultType (8 bits): An unsigned integer that specifies the type of the **rgbDV** default value. This field MUST be ignored if **fDefaultSet** is not 0x1; otherwise, it MUST be a value from the following table:

Value	Meaning
0x00	There is no default value specified.
0x01	rgbDV is a string.
0x02	rgbDV is a Boolean.
0x03	rgbDV is a number.

unused2 (16 bits): Undefined, MUST be ignored.

rgbDV (variable): A field of variable data type that specifies the default value for the column. The data type is specified in the **Ifdt** field of the containing <u>Feat11FieldDataItem</u> structure. MUST be one of the data types specified in the following table:

Ifdt of the containing Feat11FieldDataItem	Data Type	rgbDV data type and meaning
0x00000001	Short Text	An XLUnicodeString with a maximum length of 255 Unicode characters.
0x00000002	Number	An Xnum (section 2.5.342).
0x00000003	Yes/No	A 32-bit Boolean (section 2.5.14).
0x00000004	Date time	A <u>DateAsNum</u> .
0x00000005	Invalid	rgbDV does not exist.
0x00000006	Currency	An Xnum.
0x00000007	Invalid	rgbDV does not exist.
0x00000008	Choice	An XLUnicodeString with a maximum length of 255 Unicode characters.

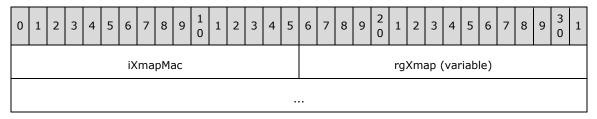

Ifdt of the containing Feat11FieldDataItem	Data Type	rgbDV data type and meaning
0x00000009	Invalid	rgbDV does not exist.
0x0000000A	Invalid	rgbDV does not exist.
0x0000000B	Multi-choice	An XLUnicodeString with a maximum length of 255 Unicode characters.

strFormula (variable): An XLUnicodeString that specifies the validation formula as defined by the Web based data provider. This field exists if and only if **fLoadFormula** is set to 0x1.

reserved (4 bytes): MUST be 0x00000000, and MUST be ignored.

2.5.120 Feat11XMap

The **Feat11XMap** structure specifies the mapping between a table column's data and an XML **data source**.

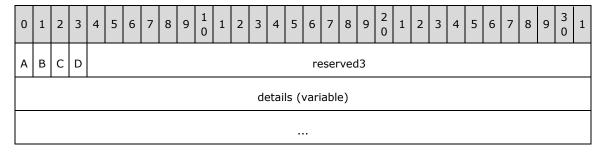

iXmapMac (2 bytes): An unsigned integer that specifies the number of items in the **rgXmap** array. MUST be less than or equal to 0x0001.

rgXmap (variable): An array of <u>Feat11XMapEntry</u> that specifies the mapping between the current table column and an XML data source. The number of items in **rgXmap** MUST be equal to **iXmapMac**.

2.5.121 Feat11XMapEntry

The **Feat11XMapEntry** structure specifies a mapping to an XML **data source**.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - fLoadXMap (1 bit): MUST be 1, and MUST be ignored.

C - fCanBeSingle (1 bit): A bit that specifies whether **details.rgbXPath** resolves to a single **XML node** or a collection of XML nodes. This field MUST be a value from the following table:

Value	Meaning
0	Specifies that details.rgbXPath resolves to a collection of XML nodes.
1	Specifies that details.rgbXPath resolves to a single XML node.

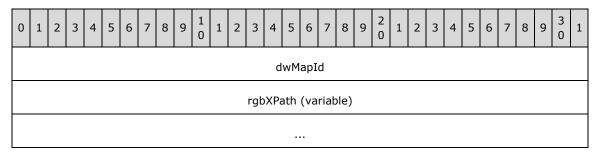

D - reserved2 (1 bit): MUST be zero, and MUST be ignored.

reserved3 (28 bits): MUST be zero, and MUST be ignored.

details (variable): A Feat11XMapEntry2 that specifies the mapping between the data and the XML data source.

2.5.122 Feat11XMapEntry2

The Feat11XMapEntry2 structure specifies the mapping to an XML data source.

dwMapId (4 bytes): An unsigned integer that specifies the **XML schema** associated with this **table** column. The value MUST equal the value of the **ID** attribute of a **Map** element contained within the **XML stream** (section 2.1.7.22).

rgbXPath (variable): An <u>XLUnicodeString</u> that contains the **XPath expression** that specifies the mapped element in the XML schema specified by **dwMapId**. The length of this string MUST be less than 32000.

2.5.123 FeatFormulaErr2

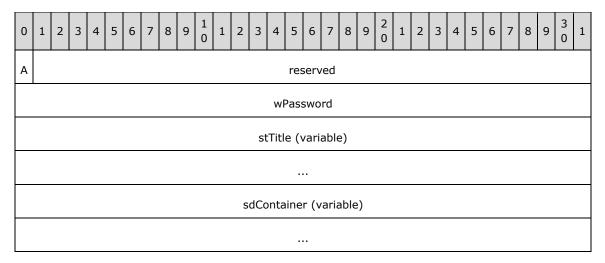

The **FeatFormulaErr2** structure specifies formula evaluation information for a <u>Shared Feature</u> of type ISFFEC2 as specified in <u>SharedFeatureType</u>.

grffecIgnore (4 bytes): A FFErrorCheck that specifies the type of errors that will be ignored.

2.5.124 FeatProtection

The **FeatProtection** structure specifies data for a <u>shared feature</u>.

A - fSD (1 bit): A bit that specifies whether this structure contains self-relative **security descriptor** data. For more information about self-relative security descriptors see [MSDN-ASRSD].

reserved (31 bits): MUST be zero, and MUST be ignored.

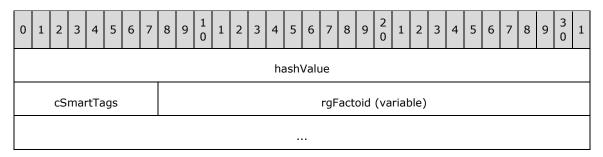

wPassword (4 bytes): An unsigned integer that specifies the verifier for the password required to edit the referenced **ranges** of a **protected sheet**. A value of zero indicates that the password is empty. The algorithm to generate the password verifier is documented in the <u>password verifier algorithm</u>.

stTitle (variable): An XLUnicodeString that specifies the title for this protection feature.

sdContainer (variable): An <u>SDContainer</u> that specifies security information that identifies who can edit the referenced ranges of a protected sheet without needing a password.

2.5.125 FeatSmartTag

The **FeatSmartTag** structure specifies data for a <u>Shared Feature</u> of type ISFFACTOID as described in <u>SharedFeatureType</u>.

hashValue (4 bytes): An unsigned integer that specifies a hash value for the string representation of the content of a cell. This hash value is used to detect cell changes with the purpose of validating, updating or removing the smart tags associated with the cell. If the string representation of the cell content is the empty string, hashValue MUST be 0; otherwise, hashValue MUST be computed using the following algorithm:

SET hashValue to zero

FOR each byteValue (1-byte unsigned integer) in the input string

Bitwise shift hashValue to the left by 4 and add byteValue

SET overflow (4-byte unsigned integer) to the bitwise AND of hashValue and 0xF0000000

IF overflow is not zero THEN

```
SET the most significant 4 bits of hashValue to zero
Bitwise shift overflow to the right by 24
SET hashValue to XOR of hashValue and overflow
END IF
END FOR
IF hashValue is zero
SET hashValue to 1
END IF
```

cSmartTags (1 byte): An unsigned integer that specifies the number of items in the **rgFactoid** array.

rgFactoid (variable): An array of FactoidData. Each element specifies data for a smart tag.

2.5.126 FFErrorCheck

The **FFErrorCheck** structure specifies the types of error conditions that can be checked in a formula evaluation for a <u>Shared Feature</u>.

- A ffecCalcError (1 bit): A bit that specifies whether to check for calculation errors.
- **B ffecEmptyCellRef (1 bit):** A bit that specifies whether to check for references to empty cells.
- **C ffecNumStoredAsText (1 bit):** A bit that specifies whether to check the format of numeric values.
- **D ffecInconsistRange (1 bit):** A bit that specifies whether to check formulas in the **range** of the shared feature with references to less than the entirety of a range containing continuous data.
- **E ffecInconsistFmla (1 bit):** A bit that specifies whether to check formulas in the range of the shared feature that are inconsistent with formulas in neighboring cells.
- F ffecTextDateInsuff (1 bit): A bit that specifies whether to check the format of date/time values.
- **G ffecUnprotFmla (1 bit):** A bit that specifies whether to check for unprotected formulas.
- **H ffecDataValidation (1 bit):** A bit that specifies whether to perform data validation.

reserved (24 bits): MUST be zero, and MUST be ignored.

2.5.127 FillPattern

The **FillPattern** enumeration specifies the **fill pattern**.<a href="mailto:

Name	Value	Meaning
FLSNULL	0x00	No fill pattern
FLSSOLID	0x01	Solid
FLSMEDGRAY	0x02	50% gray
FLSDKGRAY	0x03	75% gray

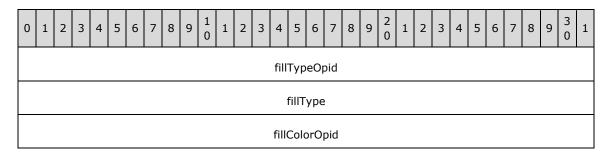

Name	Value	Meaning
FLSLTGRAY	0x04	25% gray
FLSDKHOR	0x05	Horizontal stripe
FLSDKVER	0x06	Vertical stripe
FLSDKDOWN	0x07	Reverse diagonal stripe
FLSDKUP	0x08	Diagonal stripe
FLSDKGRID	0x09	Diagonal crosshatch
FLSDKTRELLIS	0x0A	Thick Diagonal crosshatch
FLSLTHOR	0x0B	Thin horizontal stripe
FLSLTVER	0x0C	Thin vertical stripe
FLSLTDOWN	0x0D	Thin reverse diagonal stripe
FLSLTUP	0x0E	Thin diagonal stripe
FLSLTGRID	0x0F	Thin horizontal crosshatch
FLSLTTRELLIS	0x10	Thin diagonal crosshatch
FLSGRAY125	0x11	12.5% gray
FLSGRAY0625	0x12	6.25% gray

2.5.128 FillStylePropertiesForShapePropsStreamChecksum

The **FillStylePropertiesForShapPropsStreamChecksum** structure specifies the fill-style data used to compute the **checksum** of the **ShapePropsStream** record.

The related <u>GelFrame</u> record referenced in the following field specifications is the GelFrame record that exists along with the ShapePropsStream record in one of the following sets of records.

- A sequence of records that conforms to the <u>FRAME</u> rule.
- A sequence of records that conforms to the DROPBAR rule.
- A sequence of records that conforms to the AXS rule if the **wObjContext** field in the ShapePropsStream record is equal to 0x0003.
- A sequence of records that conforms to the SS rule. If multiple ShapePropsStream records exist in
 the set, then the ShapePropsStream record related to the GelFrame record MUST contain a
 wObjContext field value equal to 0x0001. If a single ShapePropsStream record exists in the set,
 it is related to the GelFrame record.

- **fillTypeOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillType property. MUST be 0x0180, which is the same value as the **opid.opid** field of the fillType property as specified in [MS-ODRAW] section 2.3.7.1.
- **fillType (4 bytes):** An unsigned integer that specifies the fillType property. MUST equal the value specified by the **fillType** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillColorOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillColor property. MUST be 0x0181, which is the same value as the **opid.opid** field of the fillColor property as specified in [MS-ODRAW] section 2.3.7.2.
- **fillColor (4 bytes):** An unsigned integer that specifies the fillColor property. MUST equal the value specified by the **fillColor** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillOpacityOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillOpacity property. MUST be 0x0182, which is the same value as the **opid.opid** field of the fillOpacity property as specified in [MS-ODRAW] section 2.3.7.3.
- **fillOpacity (4 bytes):** An unsigned integer that specifies the fillOpacity property. MUST equal the value specified by the **fillOpacity** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillBackColorOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillBackColor property. MUST be 0x0183, which is the same value as the **opid.opid** field of the fillBackColor property as specified in [MS-ODRAW] section 2.3.7.4.

- **fillBackColor (4 bytes):** An unsigned integer that specifies the fillBackColor property. MUST equal the value specified by the **fillBackColor** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillBackOpacityOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillBackOpacity property. MUST be 0x0184, which is the same value as the **opid.opid** field of the fillBackOpacity property as specified in [MS-ODRAW] section 2.3.7.5.
- **fillBackOpacity (4 bytes):** An unsigned integer that specifies the fillBackOpacity property. MUST equal the value specified by the **fillBackOpacity** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillCrModOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillCrMod property. MUST be 0x0185, which is the same value as the **opid.opid** field of the fillCrMod property as specified in [MS-ODRAW] section 2.3.7.6.
- **fillCrMod (4 bytes):** An unsigned integer that specifies the fillCrMod property. MUST equal the value specified by the **fillCrMod** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillBlipOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillBlip property. MUST be 0x0186, which is the same value as the **opid.opid** field of the fillBlip property as specified in [MS-ODRAW] section 2.3.7.7.
- **fillBlip (4 bytes):** An unsigned integer that specifies the fillBlip property. MUST equal the value specified by the **fillBlip** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillBlip_complex_md4uid (16 bytes):** An MD4 digest, as specified in [RFC1320], that MUST equal the value specified by the **fillBlip_complex.rgbUid1** field of the related GelFrame record. This field MUST be present when **fillBlip** is greater than zero. MUST NOT be present when **fillBlip** is zero.
- **fillBlipNameOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillBlipName property. MUST be 0x0187, which is the same value as the **opid.opid** field of the fillBlipName property as specified in [MS-ODRAW] section 2.3.7.9.
- **fillBlipName (4 bytes):** An unsigned integer that specifies the fillBlipName property. MUST equal the value specified by the **fillBlipName** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillBlipName_complex (variable):** A Unicode null-terminated string that MUST equal the value specified by the **fillBlipName_complex** field of the related GelFrame record. This field MUST be present when **fillBlipName** is greater than zero. MUST NOT be present when **fillBlipName** is zero.
- **fillBlipFlagsOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillBlipFlags property. MUST be 0x0188, which is the same value as the **opid.opid** field of the fillBlipFlags property as specified in [MS-ODRAW] section 2.3.7.11.
- **fillBlipFlags (4 bytes):** An unsigned integer that specifies the fillBlipFlags property. MUST equal the value specified by the **fillBlipFlags** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillWidthOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillWidth property. MUST be 0x0189, which is the same value as the **opid.opid** field of the fillWidth property as specified in [MS-ODRAW] section 2.3.7.12.

- **fillWidth (4 bytes):** An unsigned integer that specifies the fillWidth property. MUST equal the value specified by the **fillWidth** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillHeightOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillHeight property. MUST be 0x018A, which is the same value as the **opid.opid** field of the fillHeight property as specified in [MS-ODRAW] section 2.3.7.13.
- **fillHeight (4 bytes):** An unsigned integer that specifies the fillHeight property. MUST equal the value specified by the **fillHeight** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillAngleOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillAngle property. MUST be 0x018B, which is the same value as the **opid.opid** field of the fillAngle property as specified in [MS-ODRAW] section 2.3.7.14.
- **fillAngle (4 bytes):** An unsigned integer that specifies the fillAngle property. MUST equal the value specified by the **fillAngle** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillFocusOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillFocus property. MUST be 0x018C, which is the same value as the **opid.opid** field of the fillFocus property as specified in [MS-ODRAW] section 2.3.7.15.
- **fillFocus (4 bytes):** An unsigned integer that specifies the fillFocus property. MUST equal the value specified by the **fillFocus** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillToLeftOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillToLeft property. MUST be 0x018D, which is the same value as the **opid.opid** field of the fillToLeft property as specified in [MS-ODRAW] section 2.3.7.16.
- **fillToLeft (4 bytes):** An unsigned integer that specifies the fillToLeft property. MUST equal the value specified by the **fillToLeft** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillToTopOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillToTop property. MUST be 0x018E, which is the same value as the **opid.opid** field of the fillToTop property as specified in [MS-ODRAW] section 2.3.7.17.
- **fillToTop (4 bytes):** An unsigned integer that specifies the fillToTop property. MUST equal the value specified by the **fillToTop** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillToRightOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillToRight property. MUST be 0x018F, which is the same value as the **opid.opid** field of the fillToRight property as specified in [MS-ODRAW] section 2.3.7.18.
- **fillToRight (4 bytes):** An unsigned integer that specifies the fillToRight property. MUST equal the value specified by the **fillToRight** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillToBottomOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillToBottom property. MUST be 0x0190, which is the same value as the **opid.opid** field of the fillToBottom property as specified in [MS-ODRAW] section 2.3.7.19.
- **fillToBottom (4 bytes):** An unsigned integer that specifies the fillToBottom property. MUST equal the value specified by the **fillToBottom** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.

- **fillRectLeftOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillRectLeft property. MUST be 0x0191, which is the same value as the **opid.opid** field of the fillRectLeft property as specified in [MS-ODRAW] section 2.3.7.20.
- **fillRectLeft (4 bytes):** An unsigned integer that specifies the fillRectLeft property. MUST equal the value specified by the **fillRectLeft** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillRectTopOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillRectTop property. MUST be 0x0192, which is the same value as the **opid.opid** field of the fillRectTop property as specified in [MS-ODRAW] section 2.3.7.21.
- **fillRectTop (4 bytes):** An unsigned integer that specifies the fillRectTop property. MUST equal the value specified by the **fillRectTop** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillRectRightOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillRectRight property. MUST be 0x0193, which is the same value as the **opid.opid** field of the fillRectRight property as specified in [MS-ODRAW] section 2.3.7.22.
- **fillRectRight (4 bytes):** An unsigned integer that specifies the fillRectRight property. MUST equal the value specified by the **fillRectRight** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillRectBottompOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillRectBottom property. MUST be 0x0194, which is the same value as the **opid.opid** field of the fillRectBottom property as specified in [MS-ODRAW] section 2.3.7.23.
- **fillRectBottom (4 bytes):** An unsigned integer that specifies the fillRectBottom property. MUST equal the value specified by the **fillRectbottom** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillDztypeOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillDztype property. MUST be 0x0195, which is the same value as the **opid.opid** field of the fillDztype property as specified in [MS-ODRAW] section 2.3.7.24.
- **fillDztype (4 bytes):** An unsigned integer that specifies the fillDztype property. MUST equal the value specified by the **fillDztype** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillShadePresetOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillShadePreset property. MUST be 0x0196, which is the same value as the **opid.opid** field of the fillShadePreset property as specified in [MS-ODRAW] section 2.3.7.25.
- **fillShadePreset (4 bytes):** An unsigned integer that specifies the fillShadePreset property. MUST equal the value specified by the **fillShadePreset** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillShadeColorsOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillShadeColors property. MUST be 0x0197, which is the same value as the **opid.opid** field of the fillShadeColors property as specified in [MS-ODRAW] section 2.3.7.26.
- **fillShadeColors (4 bytes):** An unsigned integer that specifies the number of bytes of data in the following **fillShadeColors_complex** field.
- **fillShadeColors_complex (variable):** An IMsoArray as specified in [MS-ODRAW] section 2.2.51 that specifies the fillShadeColors_complex property. This field MUST be present when **fillShadeColors** is greater than zero. MUST equal the value specified by the **fillShadeColors_complex** field of the related GelFrame record. MUST NOT be present when **fillShadeColors** is zero.

- **fillOriginXOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillOriginX property. MUST be 0x0198, which is the same value as the **opid.opid** field of the fillOriginX property as specified in [MS-ODRAW] section 2.3.7.28.
- **fillOriginX (4 bytes):** An unsigned integer that specifies the fillOriginX property. MUST equal the value specified by the **fillOriginX** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillOriginYOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillOriginY property. MUST be 0x0199, which is the same value as the **opid.opid** field of the fillOriginY property as specified in [MS-ODRAW] section 2.3.7.29.
- **fillOriginY (4 bytes):** An unsigned integer that specifies the fillOriginY property. MUST equal the value specified by the **fillOriginY** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillShapeOriginXOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillShapeOriginX property. MUST be 0x019A, which is the same value as the **opid.opid** field of the fillShapeOriginX property as specified in [MS-ODRAW] section 2.3.7.30.
- **fillShapeOriginX (4 bytes):** An unsigned integer that specifies the fillShapeOriginX property. MUST equal the value specified by the **fillShapeOriginX** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillShapeOriginYOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillShapeOriginY property. MUST be 0x019B, which is the same value as the **opid.opid** field of the fillShapeOriginY property as specified in [MS-ODRAW] section 2.3.7.31.
- **fillShapeOriginY (4 bytes):** An unsigned integer that specifies the fillShapeOriginY property. MUST equal the value specified by the **fillShapeOriginY** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillShadeTypeOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillShadeType property. MUST be 0x019C, which is the same value as the **opid.opid** field of the fillShadeType property as specified in [MS-ODRAW] section 2.3.7.32.
- **fillShadeType (4 bytes):** An unsigned integer that specifies the fillShadeType property. MUST equal the value specified by the **fillShadeType** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillColorExtOpid (4 bytes):** An unsigned integer that specifies the identifier of the fillColorExt property. MUST be 0x019E, which is the same value as the **opid.opid** field of the fillColorExt property as specified in [MS-ODRAW] section 2.3.7.33.
- **fillColorExt (4 bytes):** An unsigned integer that specifies the fillColorExt property. MUST equal the value specified by the **fillColorExt** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **reserved415Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved415 property. MUST be 0x019F, which is the same value as the **opid.opid** field of the reserved415 property as specified in [MS-ODRAW] section 2.3.7.34.
- reserved1 (4 bytes): MUST be 0xFFFFFFF.
- **fillColorExtModOpid (4 bytes):** An unsigned integer that specifies the identifier of fillColorExtMod property. MUST be 0x01A0, which is the same value as the **opid.opid** field of the fillColorExtMod property as specified in [MS-ODRAW] section 2.3.7.35.

- **fillColorExtMod (4 bytes):** An unsigned integer that specifies the fillColorExtMod property. MUST equal the value specified by the **fillColorExtMod** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **reserved417Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved417 property. MUST be 0x01A1, which is the same value as the **opid.opid** field of the reserved417 property as specified in [MS-ODRAW] section 2.3.7.36.
- reserved2 (4 bytes): MUST be 0x00000000.
- **fillBackColorExtOpid (4 bytes):** An unsigned integer that specifies the identifier of fillBackColorExt property. MUST be 0x01A2, which is the same value as the **opid.opid** field of the fillBackColorExt property as specified in [MS-ODRAW] section 2.3.7.37.
- **fillBackColorExt (4 bytes):** An unsigned integer that specifies the fillBackColorExt property. MUST equal the value specified by the **fillBackcolorExt** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **reserved419Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved419 property. MUST be 0x01A3, which is the same value as the **opid.opid** field of the reserved419 property as specified in [MS-ODRAW] section 2.3.7.38.
- reserved3 (4 bytes): MUST be 0xFFFFFFF.
- **fillBackColorExtModOpid (4 bytes):** An unsigned integer that specifies the identifier of fillBackColorExtMod property. MUST be 0x01A4, which is the same value as the **opid.opid** field of the fillBackColorExtMod property as specified in [MS-ODRAW] section 2.3.7.39.
- **fillBackColorExtMod (4 bytes):** An unsigned integer that specifies the fillBackColorExtMod property. MUST equal the value specified by the **fillBackColorExtMod** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **reserved421Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved421 property. MUST be 0x01A5, which is the same value as the **opid.opid** field of the reserved421 property as specified in [MS-ODRAW] section 2.3.7.40.
- reserved4 (4 bytes): MUST be 0x00000000.
- **reserved422Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved422 property. MUST be 0x01A6, which is the same value as the **opid.opid** field of the reserved422 property as specified in [MS-ODRAW] section 2.3.7.41.
- reserved5 (4 bytes): MUST be 0xFFFFFFF.
- **reserved423Opid (4 bytes):** An unsigned integer that specifies the identifier of the reserved423 property. MUST be 0x01A7, which is the same value as the **opid.opid** field of the reserved423 property as specified in [MS-ODRAW] section 2.3.7.42.
- reserved6 (4 bytes): MUST be 0xFFFFFFF.
- **fillstyle_fFilledOpid (4 bytes):** An unsigned integer that specifies the identifier of the fFilled property. MUST be 0x01BB.
- **fillstyle_ffilled (4 bytes):** An unsigned integer that specifies the ffilled property. MUST equal the value specified by the **ffilled** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillstyle_ffillShapeOpid (4 bytes):** An unsigned integer that specifies the identifier of the ffillShape property. MUST be 0x01BD.

- **fillstyle_ffillShape (4 bytes):** An unsigned integer that specifies the ffillShape property. MUST equal the value specified by the **ffillShape** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.
- **fillstyle_ffillUseRectOpid (4 bytes):** An unsigned integer that specifies the identifier of the ffillUseRect property. MUST be 0x01BE.
- **fillstyle_ffillUseRect (4 bytes):** An unsigned integer that specifies the ffillUseRect property. MUST equal the value specified by the **ffillUseRect** field of the related GelFrame record or the default value if the field is not present in the GelFrame record.

2.5.129 FontIndex

The **FontIndex** structure specifies a **Font** record in the file.

ifnt (2 bytes): An unsigned integer. If this value is less than 4, then it specifies a zero-based index of a Font record in the collection of Font records in the <u>Globals Substream</u>. If this value is greater than 4, then it specifies a one-based index of a Font record in the collection of Font records in the <u>Globals Substream</u>. MUST NOT equal 4, and MUST be less than or equal to 1022. SHOULD<168> be less than or equal to 510.

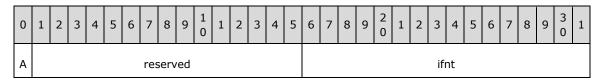

The Font records in the <u>Globals Substream</u> are organized into two sections. The first section contains four Font records which MUST be present and MUST be ordered as follows <169>:

Ifnt value	Meaning
0	Default font
1	Default font, bold
2	Default font, italic
3	Default font, bold and italic

The second section, which is optional, contains Font records for any additional font formatting properties present in the file. For example, the 5^{th} Font record in the file is referred to by **ifnt** value 5.

2.5.130 FontInfo

The **FontInfo** structure specifies a **font** entry used by the <u>FrtFontList</u> record.

A - fScaled (1 bit): A bit that specifies whether the fonts are scaled. MUST be a value from the following table <170>:

Value	Meaning
0x0	Font has fixed size
0x1	Font scales with chart area (section 2.2.3.17) in a <u>chart</u> , or plot area

reserved (15 bits): MUST be zero, and MUST be ignored.

ifnt (2 bytes): A FontIndex that specifies the font used by the FrtFontList record.

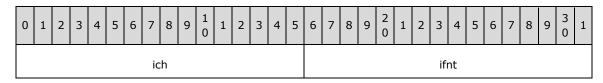

2.5.131 FontScheme

The **FontScheme** enumeration specifies the **font scheme** to which this **font** belongs. When a font is part of a theme as specified in [ECMA-376] part 1, section 14.2.7, the font is categorized as a **major scheme** or a **minor scheme**.

Name	Value	Meaning							
XFSNONE	0x00	No font scheme							
XFSMAJOR	0x01	Major scheme							
XFSMINOR	0x02	Minor scheme							
XFSNIL	0xFF	Ninched state							

2.5.132 FormatRun

The **FormatRun** structure specifies formatting information for a **text run**.

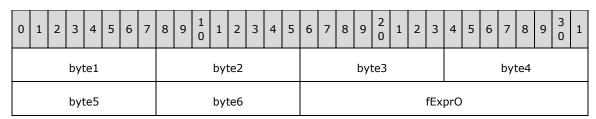

ich (2 bytes): An unsigned integer that specifies the zero-based index of the first character of the text that contains the text run. When this record is used in an array, this value MUST be in strictly increasing order.

ifnt (2 bytes): A <u>FontIndex</u> structure that specifies the **font**. If **ich** is equal to the length of the text, this record is undefined and MUST be ignored.

2.5.133 Formula Value

The **FormulaValue** structure specifies the current value of a formula. It can be a numeric value, a Boolean value, an error value, a string value, or a blank string value. If **fExprO** is not 0xFFFF, the 8 bytes of this structure specify an Xnum (section 2.5.342). If **fExprO** is 0xFFFF, this structure specifies a Boolean value, an error value, a string value, or a blank string value.

byte1 (1 byte): If **fExpr0** is 0xFFFF, **byte1** is an unsigned integer that specifies the formula value type and MUST be a value from the following table:

Value	Meaning
0x00	String value. The string value is stored in a <u>String</u> record that immediately follows this record.
0x01	Boolean value.
0x02	Error value.
0x03	Blank string value.

If **fExprO** is not 0xFFFF, **byte1** specifies the first byte of the Xnum.

byte2 (1 byte): If **fExprO** is 0xFFFF, **byte2** is undefined and MUST be ignored. If **fExprO** is not 0xFFFF, **byte2** specifies the second byte of the Xnum (section 2.5.342).

byte3 (1 byte): The meaning of byte3 is specified in the following table:

Value	Meaning
fExprO is 0xFFFF and byte1 is 0x00	byte3 is undefined and MUST be ignored.
fExprO is 0xFFFF and byte1 is 0x01	byte3 specifies a Boolean value.
fExprO is 0xFFFF and byte1 is 0x02	byte3 specifies a <u>BErr</u> .
fExprO is 0xFFFF and byte1 is 0x03	byte3 is undefined and MUST be ignored.
fExprO is not 0xFFFF	byte3 specifies the third byte of the Xnum.

byte4 (1 byte): If **fExprO** is 0xFFFF, **byte4** is undefined and MUST be ignored. If **fExprO** is not 0xFFFF, **byte4** specifies the fourth byte of the Xnum.

byte5 (1 byte): If **fExprO** is 0xFFFF, **byte5** is undefined and MUST be ignored. If **fExprO** is not 0xFFFF, **byte5** specifies the fifth byte of the Xnum.

byte6 (1 byte): If **fExprO** is 0xFFFF, **byte6** is undefined and MUST be ignored. If **fExprO** is not 0xFFFF, **byte6** specifies the sixth byte of the Xnum.

fExprO (2 bytes): If **fExprO** is 0xFFFF, this structure specifies a Boolean value, an error value, a string value, or a blank string value. If **fExprO** is not 0xFFFF, **fExprO** specifies the last two bytes of the Xnum.

2.5.134 FrtFlags

The **FrtFlags** structure specifies flags used in <u>future record</u> headers.

A - fFrtRef (1 bit): A bit that specifies whether the containing record specifies a range of cells.

MUST be a value from the following table:

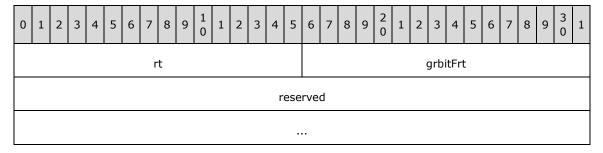

Value	Meaning
0	The containing record does not specify a range of cells. The containing record's ref8.rwFirst, ref8.rwLast, ref8.colFirst, and ref8.colLast fields SHOULD<171> all be zero.
1	The containing record specifies a range of cells.

B - fFrtAlert (1 bit): A bit that specifies whether to alert the user of possible problems when saving the file without having recognized this record.

reserved (14 bits): MUST be zero, and MUST be ignored.

2.5.135 FrtHeader

The **FrtHeader** structure specifies a <u>future record</u> type header.

rt (2 bytes): An unsigned integer that specifies the record type identifier. MUST be identical to the record type identifier of the containing record.

grbitFrt (2 bytes): An FrtFlags that specifies attributes for this record. The value of grbitFrt.fFrtRef MUST be zero. The value of grbitFrt.fFrtAlert MUST be zero.

reserved (8 bytes): MUST be zero, and MUST be ignored.

2.5.136 FrtHeaderOld

The **FrtHeaderOld** structure specifies a <u>future record</u> type header.

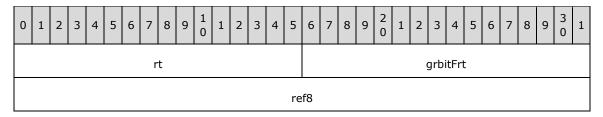

rt (2 bytes): An unsigned integer that specifies the record type identifier. MUST be identical to the record type identifier of the containing record.

grbitFrt (2 bytes): An FrtFlags that specifies attributes for this record. The value of grbitFrt.fFrtRef MUST be zero. The value of grbitFrt.fFrtAlert MUST be zero.

2.5.137 FrtRefHeader

The **FrtRefHeader** structure specifies a <u>future record</u> type header.

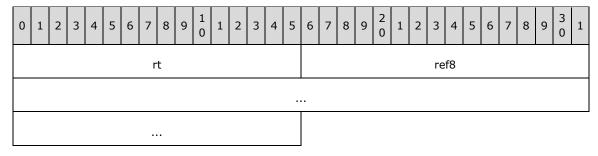

...

- **rt (2 bytes):** An unsigned integer that specifies the record type identifier. MUST be identical to the record type identifier of the containing record.
- **grbitFrt (2 bytes):** A <u>FrtFlags</u> that specifies attributes for this record. The value of **grbitFrt.fFrtAlert** MUST be zero.
- ref8 (8 bytes): A Ref8 that references the range of cells associated with the containing record. If grbitFrt.fFrtRef is zero then ref8.rwFirst MUST be zero, ref8.rwLast MUST be zero, ref8.colFirst MUST be zero, and ref8.colLast MUST be zero.

2.5.138 FrtRefHeaderNoGrbit

The **FrtRefHeaderNoGrbit** structure specifies a <u>future record</u> type header.

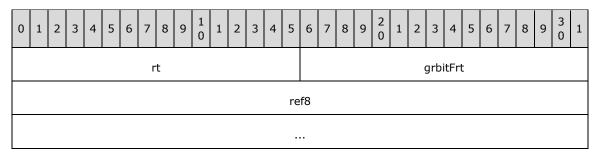

rt (2 bytes): An unsigned integer that specifies the record type identifier. MUST be identical to the record type identifier of the containing record.

ref8 (8 bytes): A Ref8U that references the range of cells associated with the containing record.

2.5.139 FrtRefHeaderU

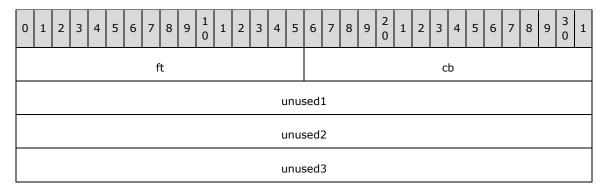

The **FrtRefHeaderU** structure specifies a <u>future record</u> type header.

- **rt (2 bytes):** An unsigned integer that specifies the record type identifier. MUST be identical to the record type identifier of the containing record.
- grbitFrt (2 bytes): A FrtFlags that specifies attributes for this record. The value of grbitFrt.fFrtAlert MUST be zero.
- **ref8 (8 bytes):** A Ref8U that references the **range** of **cells** associated with the containing record. If **rt** is Feature11 (0x0872) or Feature12 (0x0878), this field MUST be ignored.

2.5.140 FtCbls

The **FtCbls** structure appears as part of an Obj record that represents a checkbox or radio button.

ft (2 bytes): Reserved. MUST be 0x000A.

cb (2 bytes): Reserved. MUST be 0x000C.

unused1 (4 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

unused3 (4 bytes): Undefined and MUST be ignored.

2.5.141 FtCblsData

The **FtCblsData** structure specifies the properties of the checkbox or radio button <u>Obj</u> that contains this FtCblsData.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft													cb																	
						f	Che	cke	d							accel															
	reserved												A unused																		

ft (2 bytes): Reserved. MUST be 0x0012.

cb (2 bytes): Reserved. MUST be 0x0008.

fChecked (2 bytes): An unsigned integer that specifies the state of the checkbox or radio button control. MUST be a value from the following table:

Value	Meaning
0x0000	The control is in an unchecked state.
0x0001	The control is in a checked state.

Value	Meaning
0x0002	The control is in a mixed state. The fChecked field MUST NOT have this value if the cmo.ot field of the Obj record that contains this FtPioGrbit is not equal to 0x0B.

accel (2 bytes): An unsigned integer that specifies the **Unicode** character of the control's **accelerator key**. A value of 0x0000 specifies there is no accelerator associated with this control. This field MUST be ignored unless this structure is used in the <u>Dialog Sheet Substream</u>.

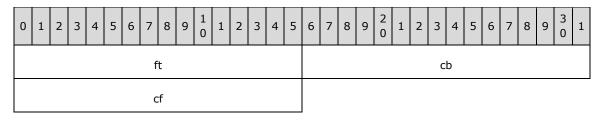

reserved (2 bytes): Reserved. MUST be 0x0000.

A - fNo3d (1 bit): A bit that specifies whether the control is expected to be displayed without threedimensional effects.

unused (15 bits): Undefined and MUST be ignored.

2.5.142 FtCf

The FtCf structure specifies the clipboard format of the picture-type Obj record containing this FtCf.

ft (2 bytes): Reserved. MUST be 0x0007.

cb (2 bytes): Reserved. MUST be 0x0002.

cf (2 bytes): An unsigned integer that specifies the Windows clipboard format of the data associated with the picture. This field's value MUST be in the following table:

Value	Format
0x0002	Specifies the format of the picture is an enhanced metafile .
0x0009	Specifies the format of the picture is a bitmap.
0xFFFF	Specifies the picture is in an unspecified format that is neither and enhanced metafile nor a bitmap.

2.5.143 FtCmo

The **FtCmo** structure specifies the common properties of the Obj record that contains this FtCmo.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft														cb																
	ot														id																
Α	В	С	D	Е	F	G	Н	Ι	J	K	L	М	N	0	Р							u	ınus	sed8	3						
																unused9															
														unused10																	

ft (2 bytes): Reserved. MUST be 0x15.

cb (2 bytes): Reserved. MUST be 0x12.

ot (2 bytes): An unsigned integer that specifies the type of object represented by the Obj record that contains this FtCmo. MUST be a value from the following table:

Value	Type of Object
0x0000	Group
0x0001	Line
0x0002	Rectangle
0x0003	Oval
0x0004	Arc
0x0005	Chart
0x0006	Text
0x0007	Button
0x0008	Picture
0x0009	Polygon
0x000B	Checkbox
0x000C	Radio button
0x000D	Edit box
0x000E	Label
0x000F	Dialog box
0x0010	Spin control
0x0011	Scrollbar
0x0012	List

Value	Type of Object
0x0013	Group box
0x0014	Dropdown list
0x0019	Note
0x001E	OfficeArt object

- **id (2 bytes):** An unsigned integer that specifies the identifier of this object. This object identifier is used by other types to refer to this object. The value of **id** MUST be unique among all Obj records within the Chart Sheet Substream ABNF, Macro Sheet Substream ABNF and Worksheet Substream ABNF.
- A fLocked (1 bit): A bit that specifies whether this object is locked.
- **B reserved (1 bit):** Reserved. MUST be 0.
- **C fDefaultSize (1 bit):** A bit that specifies whether the application is expected to choose the object's size.
- **D fPublished (1 bit):** A bit that specifies whether this is a <u>chart</u> object that is expected to be **published** the next time the **sheet** containing it is published<<u>172></u>. This bit is ignored if the **fPublishedBookItems** field of the BookExt Conditional12 structure is zero.
- **E fPrint (1 bit):** A bit that specifies whether the image of this object is intended to be included when printed.
- F unused1 (1 bit): Undefined and MUST be ignored.
- G unused2 (1 bit): Undefined and MUST be ignored
- H fDisabled (1 bit): A bit that specifies whether this object has been disabled.
- **I fUIObj (1 bit):** A bit that specifies whether this is an auxiliary object that can only be automatically inserted by the application (as opposed to an object that can be inserted by a user).
- **J fRecalcObj (1 bit):** A bit that specifies whether this object is expected to be updated on load to reflect the values in the **range** associated with the object. This field MUST be ignored unless the **pictFmla.key** field of the containing Obj exists and **pictFmla.key.fmlaListFillRange.cbFmla** of the containing Obj is not equal to 0.
- K unused3 (1 bit): Undefined and MUST be ignored.
- L unused4 (1 bit): Undefined and MUST be ignored.
- **M fRecalcObjAlways (1 bit):** A bit that specifies whether this object is expected to be updated whenever the value of a **cell** in the range associated with the object changes. This field MUST be ignored unless the **pictFmla.key** field of the containing Obj exists and **pictFmla.key.fmlaListFillRange.cbFmla** of the containing Obj is not equal to 0.
- N unused5 (1 bit): Undefined and MUST be ignored.
- O unused6 (1 bit): Undefined and MUST be ignored.
- P unused7 (1 bit): Undefined and MUST be ignored.
- unused8 (4 bytes): Undefined and MUST be ignored.

unused9 (4 bytes): Undefined and MUST be ignored.

unused10 (4 bytes): Undefined and MUST be ignored.

2.5.144 FtEdoData

This structure specifies the properties of the edit box Obj record that contains this FtEdoData.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
ft													cb																		
	ivtEdit												fMultiLine																		
fVScroll											id																				

ft (2 bytes): Reserved. MUST be 0x0010.

cb (2 bytes): Reserved. MUST be 0x0008.

ivtEdit (2 bytes): An unsigned integer that specifies what input **data validation** is expected to be performed by this edit box. MUST be a value from the following table:

Value	Strings accepted by validation
0x0000	Any string; no validation is expected.
0x0001	An integer.
0x0002	A number.
0x0003	A range reference.
0×0004	A formula (section 2.2.2).

fMultiLine (2 bytes): A Boolean (section 2.5.14) that specifies whether this edit box supports multiple lines of text. MUST be a value from the following table:

Value	Meaning
0x0000	Only one line is supported.
0x0001	Multiple lines are supported.

fVScroll (2 bytes): A Boolean that specifies whether this edit box contains a vertical scrollbar. MUST be a value from the following table:

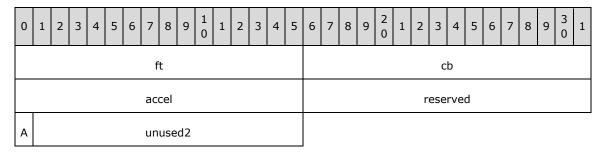

Value	Meaning
0x0000	Scrollbar is expected not to be displayed.

Value	Meaning
0x0001	Scrollbar is expected to be displayed.

id (2 bytes): An ObjId that specifies the associated list control. The associated list control is the control specified by the Obj record whose **cmo.id** field is equal to **id.id**. A value of **id.id** equal to 0 specifies that there is no list control associated with this edit box.

2.5.145 FtGboData

The **FtGboData** structure specifies the properties of the group box <u>Obj</u> record that contains this FtGboData.

ft (2 bytes): Reserved. MUST be 0x000F.

cb (2 bytes): Reserved. MUST be 0x0006.

accel (2 bytes): An unsigned integer that specifies the **Unicode** character of the object's **accelerator key**. A value of 0x0000 specifies there is no accelerator key associated with this object. This field MUST be ignored unless this object is in a **dialog sheet**.

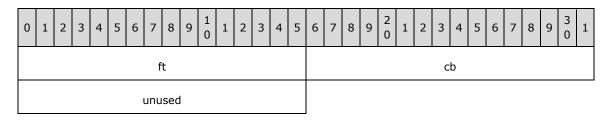

reserved (2 bytes): Reserved. MUST be 0x0000.

A - fNo3d (1 bit): A bit that specifies whether this control is expected to be displayed without three-dimensional effects.

unused2 (15 bits): Undefined and MUST be ignored.

2.5.146 FtGmo

The **FtGmo** structure appears in a group-type Obj record.

ft (2 bytes): Reserved. MUST be 0x0006.

cb (2 bytes): Reserved. MUST be 0x0002

unused (2 bytes): Undefined and MUST be ignored.

2.5.147 FtLbsData

The **FtLbsData** structure specifies the properties of a list or drop-down list **embedded object** in a **sheet**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft														cbFContinued																
	fmla (variable)																														
cLines iSel																															
Α	В	С	D	Е	Ξ	F	G				lc	ct				idEdit															
													dro	pDa	ata	ı (va	riat	ole)													
													rg	Line	es	(var	iabl	e)													
													b	sels	s ('	varia	able)													

ft (2 bytes): Reserved. MUST be 0x0013.

cbFContinued (2 bytes): An unsigned integer that indirectly specifies whether some of the data in this structure appear in a subsequent <u>Continue</u> record. If cbFContinued is 0x0000, all of the fields in this structure except ft and cbFContinued MUST NOT exist. If this entire structure is contained within the same record, then cbFContinued MUST be greater than or equal to the size, in bytes, of this structure, not including the four bytes for the ft and cbFContinued fields. If part of this structure is in one or more subsequent Continue records, then the cbFContinued field MUST hold the value calculated according to the following formula:

cbFContinued = size of the fields of this structure in the current record - 1.

fmla (variable): An ObjFmla that specifies the range of cell values that are the items in this list.

cLines (2 bytes): An unsigned integer that specifies the number of items in the list. MUST be less than or equal to 0x7FFF.

iSel (2 bytes): An unsigned integer that specifies the one-based index of the first selected item in this list. A value of 0x0000 specifies there is no currently **selected** item. MUST be less than or equal to **cLines**.

A - fUseCB (1 bit): A bit that specifies whether the lct field MUST be ignored. MUST be a value from the following table:

Value	Meaning
0	The lct field MUST be ignored.
1	The lct field MUST NOT be ignored.

- **B fValidPlex (1 bit):** A bit that specifies whether the **rgLines** field exists.
- **C fValidIds (1 bit):** A bit that specifies whether the **idEdit** field MUST be ignored. MUST be a value from the following table:

Value	Meaning
0	The idEdit field MUST be ignored.
1	The idEdit field MUST NOT be ignored.

D - fNo3d (1 bit): A bit that specifies whether this control is displayed without 3-dimensional effects. MUST be a value from the following table:

Value	Meaning
0	The control is displayed with 3-dimentional effects.
1	The control is not displayed with 3-dimentional effects.

E - wListSelType (2 bits): An unsigned integer that specifies the type of **selection** behavior this list control is expected to support. MUST be a value from the following table:

Value	Meaning
0	The list control is only allowed to have one selected item.
1	The list control is allowed to have multiple items selected by clicking on each item.
2	The list control is allowed to have multiple items selected by holding the CTRL key and clicking on each item.

- **F unused (1 bit):** Undefined and MUST be ignored.
- **G reserved (1 bit):** MUST be zero, and MUST be ignored.
- **Ict (8 bits):** An unsigned integer that specifies the behavior class of this list. MUST be ignored if the **fUseCB** field is 0. Otherwise, MUST be a value from the following table:

Value	Expected behavior of the control
0x00	Regular sheet dropdown control (like a list box object).

Value	Expected behavior of the control
0x01	PivotTable page field dropdown.
0x03	AutoFilter dropdown. The lct field MUST NOT have this value unless this object is in a worksheet or macro sheet.
0x05	AutoComplete dropdown.
0x06	Data validation list dropdown. The lct field MUST NOT have this value unless this object is in a worksheet or macro sheet.
0x07	PivotTable row or column field dropdown.
0x09	Dropdown for the Total Row of a table.

idEdit (2 bytes): An ObjId that specifies the edit box associated with this list. A value of **idEdit.id** equal to 0x0000 or a value of **fValidIds** equal to 0 specifies that there is no edit box associated with this list.

dropData (variable): An optional <u>LbsDropData</u> that specifies properties for this dropdown control. This field MUST exist if and only if the containing Obj's **cmo.ot** is equal to 0x0014.

rgLines (variable): An optional array of <u>XLUnicodeString</u>. Each string in this array specifies an item in the list. This array MUST exist if and only if the **fValidPlex** field is equal to 1. The number of elements in this array, if it exists, MUST be **cLines**. The **cch** field of each string in this array MUST be less than or equal to 0x00FF. If this array does not fit in the owning Obj record, Continue records are used. Each string in this array MUST be entirely contained within the same record.

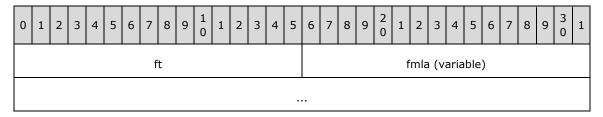

bsels (variable): An optional array of one-byte Booleans (section <u>2.5.14</u>) that specifies which items in the list are part of a multiple selection. This array MUST exist if and only if the **wListSelType** field is not equal to 0. The number of elements in this array, if it exists, MUST be **cLines**. The nth byte in this array specifies whether the nth list item is part of the multiple selection. The value of each element MUST be taken from the following table:

Value	Meaning
0x00	List item is not part of the multiple selection.
0x01	List item is part of the multiple selection.

If this array does not fit in the current record, or would come within eight bytes of the end of the maximum allowable size of that record, Continue records are used.

2.5.148 FtMacro

The **FtMacro** structure specifies an action associated with this control.

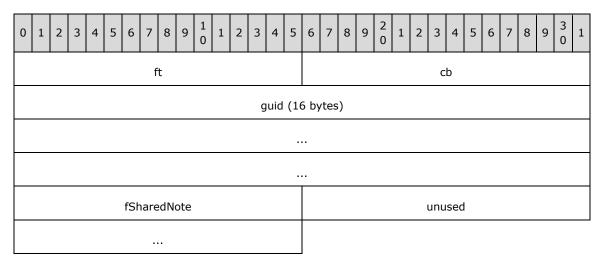

ft (2 bytes): Reserved. MUST be 0x0004.

fmla (variable): An ObjFmla that specifies the name of a macro. The **fmla** field MUST refer to a name defined through an Lbl whose **fProc** field is 1.

2.5.149 FtNts

The **FtNts** structure specifies the properties of the note-type Obj record containing this FtNts.

ft (2 bytes): Reserved. MUST be 0x000D.

cb (2 bytes): Reserved. MUST be 0x0016.

guid (16 bytes): A GUID as specified by [MS-DTYP] that specifies the Globally Unique identifier of this **comment**.

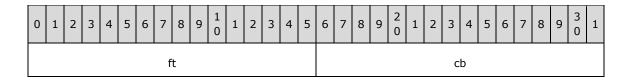

fSharedNote (2 bytes): A Boolean (section 2.5.14) that specifies whether the comment is shared. MUST be a value from the following table:

Value of fSharedNote	Meaning
0x0000	Not shared
0x0001	Shared

unused (4 bytes): Undefined and MUST be ignored.

2.5.150 FtPictFmla

The **FtPictFmla** structure specifies the location of the data associated with the picture <u>Obj</u> that contains this FtPictFmla.

fmla (variable)
lPosInCtlStm (optional)
cbBufInCtlStm (optional)
key (variable)

ft (2 bytes): Reserved. MUST be 0x0009.

cb (2 bytes): An unsigned integer that specifies the length, in bytes of this FtPicFmla, not including **ft** and **cb** fields.

fmla (variable): An ObjFmla that specifies the location of the data for the object associated with the Obj record that contains this FtPictFmla. If the **pictFlags.fDde** field of the Obj record that contains this FtPictFmla is 1, **fmla** MUST refer to a name which is defined in an ExternName record whose **fOle** field is 1. If the **pictFlags.fCamera** field of the Obj record that contains this FtPictFmla is 1, **fmla** MUST refer to a **range**. Otherwise, the **fmla.cce** field of this **fmla** MUST be 0x5 and the **fmla.rgce** field of this **fmla** MUST contain a PtgTbl followed by four bytes that are undefined and MUST be ignored.

IPosInCtlStm (4 bytes): An optional unsigned integer whose meaning depends on the value of the **cmo.fPrstm** field of the Obj record that contains this FtPictFmla. This field MUST exist if and only if this structure's **fmla.fmla.rgce** field starts with a PtgTbl. The following table explains the two possible meanings of **IPosInCtlStm**:

Value of cmo.fPrstm	Meaning of IPosInCtlStm
0	The object's data MUST reside in an embedding storage whose name is the concatenation of "MBD" and the eight byte hexadecimal representation of lPosInCtlStm's value.
1	IPosInCtIStm specifies the zero-based offset of this object's data within the control stream (Ctls).

cbBufInCtlStm (4 bytes): An optional unsigned integer that specifies the size of this object's data within the control stream. This field MUST exist if and only if the **pictFlags.fPrstm** field of the Obj record that contains this FtPictFmla equals 1.

key (variable): An optional <u>PictFmlaKey</u>. MUST exist if and only if the **pictFlags.fCtl** field of the Obj record that contains this FtPictFmla equals 1.

2.5.151 FtPioGrbit

The **FtPioGrbit** structure specifies Boolean properties of the picture **Obj** containing this FtPioGrbit.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft																	C	b												
Α	В	С	D	Е	F	G	Н	I	J		unused2																				

ft (2 bytes): Reserved. MUST be 0x0008.

cb (2 bytes): Reserved. MUST be 0x0002.

- A fAutoPict (1 bit): A bit that specifies whether the picture's aspect ratio is preserved when rendered in different views (Normal view, Page Break Preview view, Page Layout view and printing).
- **B fDde (1 bit):** A bit that specifies whether the **pictFmla** field of the Obj record that contains this FtPioGrbit specifies a **DDE** reference.
- **C fPrintCalc (1 bit):** A bit that specifies whether this object is expected to be updated on print to reflect the values in the **cell** associated with the object.
- **D fIcon (1 bit):** A bit that specifies whether the picture is displayed as an icon.
- **E fCtl (1 bit):** A bit that specifies whether this object is an **ActiveX control**. It MUST NOT be the case that both **fCtl** and **fDde** are equal to 1.
- **F fPrstm (1 bit):** A bit that specifies whether the object data are stored in an embedding storage or in the controls stream (ctls). See FtPictFmla's IPosInCtlStm and cbBufInCtlStm fields for more detail.

Value of fPrstm	Location of object data
0	An embedding storage.
1	The controls stream (ctls).

- **G unused1 (1 bit):** Undefined and MUST be ignored.
- **H fCamera (1 bit):** A bit that specifies whether this is a **camera picture**.
- I fDefaultSize (1 bit): A bit that specifies whether this picture's size has been explicitly set. The value of fDefaultSize MUST be taken from the following table:

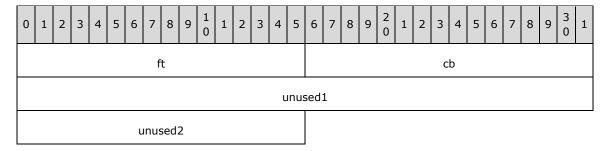

Value	Meaning								
0	This picture's size has been explicitly set.								
1 This picture's size has not been explicitly set.									

J - fAutoLoad (1 bit): A bit that specifies whether the **OLE server** for the object is called to load the object's data automatically when the parent **workbook** is opened.

unused2 (6 bits): Undefined and MUST be ignored.

2.5.152 FtRbo

The **FtRbo** structure appears as part of an Obj record that represents a radio button.

ft (2 bytes): Reserved. MUST be 0x000B.

cb (2 bytes): Reserved. MUST be 0x0006.

 $\boldsymbol{unused1}$ (4 $\boldsymbol{bytes}):$ Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

2.5.153 FtRboData

The **FtRboData** structure specifies the properties of the radio button **Obj** containing this FtRboData.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft													cb																	
	idRadNext																			f	Firs	tBt	n								

ft (2 bytes): Reserved. MUST be 0x0011.

cb (2 bytes): Reserved. MUST be 0x0004.

idRadNext (2 bytes): An ObjId that specifies the next radio button in a group of radio buttons. A value of **idRadNext.id** equal to 0 or equal to the containing Obj's **cmo.id** specifies there is no next radio button.

fFirstBtn (2 bytes): A Boolean (section 2.5.14) that specifies whether this is the first radio button in its group. MUST be a value from the following table:

Value	Meaning
0x0000	This is not the first radio button.
0x0001	This is the first radio button in the group.

2.5.154 FtSbs

The **FtSbs** structure specifies the properties of the scrollable control represented by the <u>Obj</u> record that contains this FtSbs.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	ft														cb																
	unus														used1																
	iVal														iMin																
	iMax														dInc																
	dPage																					fHo	oriz								
	dxScroll													Α	В	С	D					u	ınus	sed2	2						

ft (2 bytes): Reserved. MUST be 0x000C.

cb (2 bytes): Reserved. MUST be 0x0014.

unused1 (4 bytes): Undefined and MUST be ignored.

iVal (2 bytes): A signed integer that specifies the current value of the control. This value MUST be greater than or equal to **iMin**. This value MUST be less than or equal to **iMax**.

iMin (2 bytes): A signed integer that specifies the minimum allowable value of the control.

iMax (2 bytes): A signed integer that specifies the maximum allowable value of the control. This value MUST be greater than or equal to **iMin**.

dInc (2 bytes): A signed integer that specifies the amount by which the control's value is changed when the user clicks on one of the control's minor increment regions. MUST be greater than or equal to 0x0000.

dPage (2 bytes): A signed integer that specifies the amount by which the control's value is changed when the user clicks on the scrollbar's page up or page down region. MUST be greater than or equal to 0x0000.

fHoriz (2 bytes): A Boolean (section 2.5.14) that specifies whether this control scrolls horizontally or vertically. MUST be a value from the following table:

0x0000	Vertical scrolling
0x0001	Horizontal scrolling

dxScroll (2 bytes): A signed integer that specifies the width in pixels of the scrollbar. MUST be greater than or equal to 0x0000.

- A fDraw (1 bit): A bit that specifies whether this control is expected to be displayed.
- **B fDrawSliderOnly (1 bit):** A bit that specifies whether only the slider portion of this control is expected to be displayed.
- **C fTrackElevator (1 bit):** A bit that specifies whether the control is expected to interactively track a mouse drag of the control's scroll thumb (aka elevator).
- **D fNo3d (1 bit):** A bit that specifies whether the control is expected to be displayed without three-dimensional effects.

unused2 (12 bits): Undefined and MUST be ignored.

2.5.155 FullColorExt

The FullColorExt structure specifies a color.

0	1	2	З	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	З	4	5	6	7	8	9	0	1
	xclrType nTintShade																														
	xclrValue																														
	unused																														

xclrType (2 bytes): An XColorType that specifies how the color information is stored.

nTintShade (2 bytes): A signed integer that specifies the tint of the color. Positive values lighten the color, and negative values darken the color.

xcIrValue (4 bytes): An unsigned integer that specifies the color data. If xcIrType equals 0x00 or 0x04, this value MUST be 0. If xcIrType equals 0x01, this field contains an IcvXF that specifies a color in the color table. If xcIrType equals 0x02, this field contains a LongRGBA that specifies an red-green-blue-alpha (RGBA) value. If xcIrType equals 0x03, this field contains a ColorTheme that specifies a theme color.

unused (8 bytes): Undefined and MUST be ignored.

2.5.156 GradStop

The **GradStop** structure specifies a **gradient stop** for a **gradient fill**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
						×	clr	Тур	e													x	clr∖	/alu	е						
											numPosition																				
																	r	num	Tin	t											

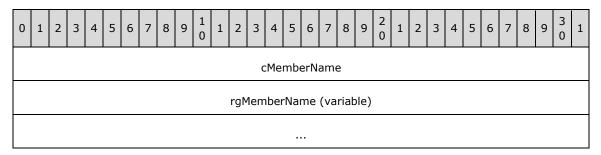

xclrType (2 bytes): An **XColorType** that specifies how the color information is stored.

- xcIrValue (4 bytes): An unsigned integer that specifies the color data. If xcIrType equals 0x00 or 0x04, this value MUST be 0. If xcIrType equals 0x01, this field contains an IcvXF that specifies color in the color table. If xcIrType equals 0x02, this field contains a LongRGBA that specifies an RGBA value. If xcIrType equals 0x03, this field contains a ColorTheme that specifies a theme color
- **numPosition (8 bytes):** An Xnum (section 2.5.342) that specifies the gradient stop position as the percentage of the gradient range. The gradient stop position is the position within the gradient range where this gradient stop's color begins. MUST be greater than or equal to 0.0 and less than or equal to 1.0.
- **numTint (8 bytes):** An Xnum that specifies the tint of the color. MUST be greater than or equal to 1.0 and less than or equal to 1.0. Positive values lighten the color, and negative values darken the color.

2.5.157 HiddenMemberSet

The **HiddenMemberSet** structure specifies **OLAP members hidden** from a <u>PivotTable view</u> that are in the same level in an **OLAP hierarchy**.

cMemberName (4 bytes): An unsigned integer that specifies the number of elements in **rgMemberName**.

rgMemberName (variable): An array of <u>XLUnicodeString</u> structures. Each element specifies the name of a hidden OLAP member. MUST exist if and only if the value of **cMemberName** is greater than 0.

2.5.158 HideObjEnum

The **HideObjEnum** enumeration specifies how **ActiveX objects**, **OLE objects**, and **drawing objects** appear in a window that contains the **workbook**.

Name	Value	Meaning
SHOWALL	0×0000	ActiveX objects, OLE objects, and drawing objects are displayed in the window that contains the workbook.
SHOWPLACEHOLDER	0x0001	Placeholders are displayed in place of ActiveX objects, OLE objects, and drawing objects in the window that contains the workbook.

Name	Value	Meaning
HIDEALL	0x0002	ActiveX objects, OLE objects, and drawing objects are not displayed in the window that contains the workbook.

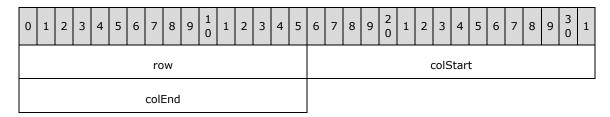

2.5.159 HorizAlign

The **HorizAlign** enumeration specifies the horizontal alignment.

Name	Value	Meaning
ALCNIL	0xFF	Alignment not specified
ALCGEN	0x00	General alignment
ALCLEFT	0x01	Left alignment
ALCCTR	0x02	Centered alignment
ALCRIGHT	0x03	Right alignment
ALCFILL	0x04	Fill alignment
ALCJUST	0x05	Justify alignment
ALCCONTCTR	0x06	Center-across-selection alignment
ALCDIST	0x07	Distributed alignment

2.5.160 HorzBrk

The **HorzBrk** structure specifies one horizontal **page break**.

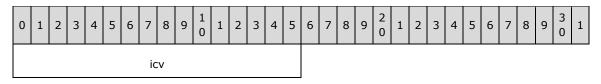

row (2 bytes): A RWU that specifies the zero-based index of the first row below the page break.

colStart (2 bytes): An unsigned integer that specifies the zero-based index of the first column on the page. MUST be less than or equal to 16383.

colEnd (2 bytes): An unsigned integer that specifies the zero-based index of the last column on the page. The value MUST be greater than **colStart** and less than or equal to 16383.

2.5.161 Icv

The **Icv** structure specifies a color in the color table.

icv (2 bytes): An unsigned integer that specifies a color from the color table. The value MUST be one of the following values: a value greater than or equal to 0x000 and less than or equal to 0x0041, a value greater than or equal to 0x004D and less than or equal to 0x004F, 0x0051, or 0x7FFF.

The values that are greater than or equal to 0x0000 and less than or equal to 0x0007 specify built-in color constants. This part of the color table is:

icv value	Color description	Red value	Green value	Blue value
0x0000	Black	0	0	0
0x0001	White	255	255	255
0x0002	Red	255	0	0
0x0003	Green	0	255	0
0x0004	Blue	0	0	255
0x0005	Yellow	255	255	0
0x0006	Magenta	255	0	255
0x0007	Cyan	0	255	255

The next 56 values in the table, the **icv** values greater than or equal to 0x0008 and less than or equal to 0x003F, specify the palette colors in the table. If a <u>Palette</u> record exists in this file, these **icv** values specify colors from the **rgColor** array in the Palette record. If no Palette record exists, these values specify colors in the default palette. The next 56 values in this part of the color table specify the following:

Value	If a palette record exists in this file:	Default red value (if no palette record in file)	Default green value (if no palette record in file)	Default blue value (if no palette record in file)
0x0008	Field rgColor [0] of Palette	0	0	0
0x0009	Field rgColor [1] of Palette	255	255	255
0x000A	Field rgColor [2] of Palette	255	0	0
0x000B	Field rgColor [3] of Palette	0	255	0
0x000C	Field rgColor [4] of Palette	0	0	255

		Default	Default	Default
		red value	green value	blue value
Value	If a palette record exists in this file:	(if no palette record in file)	(if no palette record in file)	(if no palette record in file)
0x000D	Field rgColor [5] of Palette	255	255	0
0x000E	Field rgColor [6] of Palette	255	0	255
0x000F	Field rgColor [7] of Palette	0	255	255
0x0010	Field rgColor[8] of Palette	128	0	0
0x0011 0x0012	Field rgColor [9] of Palette Field rgColor [10] of Palette	0	128	128
0x0012	Field rgColor [11] of Palette	128	128	0
0x0014	Field rgColor [12] of Palette	128	0	128
0x0015	Field rgColor [13] of Palette	0	128	128
0x0016	Field rgColor [14] of Palette	192	192	192
0x0017	Field rgColor [15] of Palette	128	128	128
0x0018	Field rgColor [16] of Palette	153	153	255
0x0019	Field rgColor [17] of Palette	153	51	102
0x001A	Field rgColor [18] of Palette	255	255	204
0x001B	Field rgColor [19] of Palette	204	255	255
0x001C	Field rgColor [20] of Palette	102	0	102
0x001D	Field rgColor [21] of Palette	255	128	128
0x001E	Field rgColor [22] of Palette	0	102	204
0x001F	Field rgColor [23] of Palette	204	204	255
0x0020	Field rgColor [24] of Palette	0	0	128
0x0021	Field rgColor [25] of Palette	255	0	255
0x0022	Field rgColor [26] of Palette	255	255	0
0x0023	Field rgColor [27] of Palette	0	255	255
0x0024	Field rgColor [28] of Palette	128	0	128
0x0025	Field rgColor [29] of Palette	128	0	0
0x0026	Field rgColor [30] of Palette	0	128	128
0x0027	Field rgColor [31] of Palette	0	0	255
0x0028	Field rgColor [32] of Palette	0	204	255
0x0029	Field rgColor [33] of Palette	204	255	255
0x002A	Field rgColor [34] of Palette	204	255	204
0x002B	Field rgColor [35] of Palette	255	255	153

		Default	Default	Default
		red value	green value	blue value
Value	If a palette record exists in this file:	(if no palette record in file)	(if no palette record in file)	(if no palette record in file)
0x002C	Field rgColor [36] of Palette	153	204	255
0x002D	Field rgColor [37] of Palette	255	153	204
0x002E	Field rgColor [38] of Palette	204	153	255
0x002F	Field rgColor [39] of Palette	255	204	153
0x0030	Field rgColor [40] of Palette	51	102	255
0x0031	Field rgColor [41] of Palette	51	204	204
0x0032	Field rgColor [42] of Palette	153	204	0
0x0033	Field rgColor [43] of Palette	255	204	0
0x0034	Field rgColor [44] of Palette	255	153	0
0x0035	Field rgColor [45] of Palette	255	102	0
0x0036	Field rgColor [46] of Palette	102	102	153
0x0037	Field rgColor [47] of Palette	150	150	150
0x0038	Field rgColor [48] of Palette	0	51	102
0x0039	Field rgColor [49] of Palette	51	153	102
0x003A	Field rgColor [50] of Palette	0	51	0
0x003B	Field rgColor [51] of Palette	51	51	0
0x003C	Field rgColor [52] of Palette	153	51	0
0x003D	Field rgColor [53] of Palette	153	51	102
0x003E	Field rgColor [54] of Palette	51	51	153
0x003F	Field rgColor [55] of Palette	51	51	51

The remaining values in the color table specify colors associated with application display settings as follows:

Value	Meaning
0x0040	Default foreground color. This is the window text color in the sheet display.
0x0041	Default background color. This is the window background color in the sheet display and is the default background color for a cell .
0x004D	Default <u>chart</u> foreground color. This is the window text color in the chart display.
0x004E	Default chart background color. This is the window background color in the chart display.
0x004F	Chart neutral color which is black, an RGB value of (0,0,0).
0x0051	ToolTip text color. This is the automatic font color for

Value	Meaning
	comments.
0x7FFF	Font automatic color. This is the window text color.

The **IcvChart** structure specifies a color in the <u>Chart</u> color table. The Chart color table is a subset of the full color table. See <u>Icv</u> for more information about the colors in the Chart color table.

icv (2 bytes): An Icv that specifies a color from the chart color table. This value MUST be greater than or equal to 0x0000 and less than or equal to 0x0041, or greater than or equal to 0x0004D and less than or equal to 0x00004F. This value SHOULD NOT<173> be less than 0x00008.

2.5.163 IcvFont

The **IcvFont** structure specifies a color that is used by **fonts**. The font colors are a subset of the full color table.

icv (2 bytes): An $\underline{\text{Lcv}}$ that specifies a font color. MUST be greater than or equal to 0x0008 and less than or equal to 0x003F or 0x0051 or 0x7FFF.

2.5.164 IcvXF

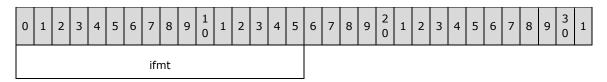

The IcvXF structure specifies a color in the color table used by cell and style formatting properties.

icv (7 bits): An unsigned integer that specifies a formatting property color. The value MUST be 0x48, or an $\underline{\text{Lcv}}$ with a value greater than or equal to 0x01 and less than or equal to 0x3F, the default foreground color (0x40), or the default background color (0x41). This value SHOULD NOT<174> be 0x48, or less than or equal to 0x07.

2.5.165 IFmt

The **IFmt** structure specifies the identifier of a **number format**.

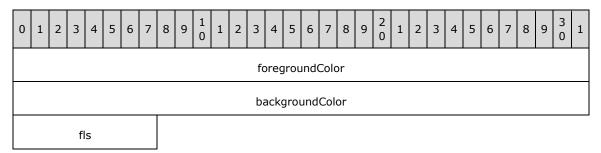

ifmt (2 bytes): An unsigned integer that specifies the identifier of a number format. The identifier specified by this field MUST be a valid built-in number format identifier or the identifier of a custom number format as specified using a Format record. Custom number format identifiers MUST be greater than or equal to 0x00A4 and less than or equal to 0x0188, and SHOULD<175> be less than or equal to 0x017E. The built-in number formats are listed in [ECMA-376] Part 4: Markup Language Reference, section 3.8.30.

2.5.166 InteriorColorPropertiesForShapePropsStreamChecksum

The **InteriorColorPropertiesForShapePropsStreamChecksum** structure specifies the interior color data used to compute the **checksum** of the <u>ShapePropsStream</u> record.

The related <u>AreaFormat</u> record referenced in the following field specifications is the AreaFormat record that exists along with the ShapePropsStream record in one of the following sets of records.

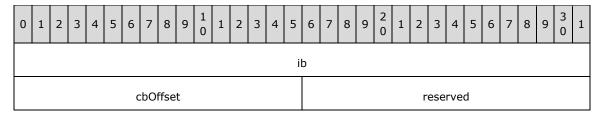

- A sequence of records that conforms to the <u>FRAME</u> rule.
- A sequence of records that conforms to the DROPBAR rule.
- A sequence of records that conforms to the AXS rule if the field wObjContext in the ShapePropsStream record is equal to 0x0003.
- A sequence of records that conforms to the SS rule.
- If the field **wObjContext** in the ShapePropsStream record is equal to 0x0001, then the **foregroundColor** and **backgroundColor** properties are obtained from the <u>MarkerFormat</u> record in the sequence of records that conforms to the SS rule instead.

- **foregroundColor (4 bytes):** A <u>LongRGB</u> that specifies the **foreground color** of the **fill pattern**. MUST equal the value specified by the **rgbFore** field of the related AreaFormat or MarkerFormat records.
- **backgroundColor (4 bytes):** A LongRGB that specifies the **background color** of the fill pattern. MUST equal the value specified by the **rgbBack** field of the related AreaFormat or MarkerFormat records.
- **fls (1 byte):** An unsigned integer that specifies the type of the fill pattern. MUST equal the value specified by the **fls** field of the related AreaFormat record.

2.5.167 ISSTInf

The **ISSTInf** structure is the array element used in the **rgISSTinf** field of the <u>ExtSST</u> record. **ib** and **cbOffset** provide a way to access the first string in the set of strings specified by this structure.

ib (4 bytes): A FilePointer as specified in [MS-OSHARED] section 2.2.1.5 that specifies the zero-based offset into the <u>workbook stream</u> where the first string in the set of strings starts.

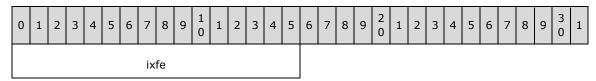

cbOffset (2 bytes): An unsigned integer that specifies the zero-based offset into the <u>SST</u> or <u>Continue</u> record, in which the first string in the set of strings starts. MUST be less than **ib**. The size of the SST or Continue record is determined by reading the record header at the location specified by the following formula:

ib - cbOffset

reserved (2 bytes): MUST be zero, and MUST be ignored.

2.5.168 IXFCell

The **IXFCell** structure specifies the index of a <u>cell XF</u>.

ixfe (2 bytes): An unsigned integer that specifies a zero-based index of a cell XF record in the collection of XF records in the Globals Substream. Cell XF records are the subset of XF records with an fStyle field equal to 0. This value MUST be greater than or equal to 15, or equal to 0. The value 0 indicates that this value MUST be ignored. See XFIndex for more information about the organization of XF records in the file.

2.5.169 **KPIProp**

The **KPIProp** enumeration specifies the types of MDX KPI properties.

Name	Value	Meaning
KPIPROPVALUE	0x01	Value.
KPIPROPGOAL	0x02	Goal.
KPIPROPSTATUS	0x03	Status.
KPIPROPTREND	0x04	Trend.
KPIPROPWEIGHT	0x05	Weight.

Name	Value	Meaning
KPIPROPCURRENTTIMEMEMBER	0x06	Current time member (2).

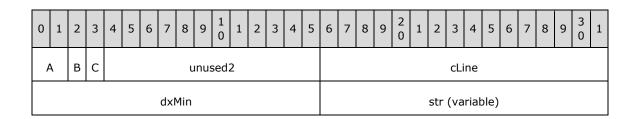

2.5.170 KPISets

The **KPISets** structure specifies icon sets.

Name	Value	Meaning
KPINIL	0xFFFFFFF	Sort by no-icon
KPI3ARROWS	0x00000000	Kpi3 Arrows set
KPI3ARROWSGRAY	0x00000001	Kpi3 Arrows Gray set
KPI3FLAGS	0x00000002	Kpi3 Flags set
KPI3TRAFFICLIGHTS1	0x00000003	Kpi3 Traffic Lights 1 set
KPI3TRAFFICLIGHTS2	0x00000004	Kpi3 Traffic Lights 2 set
KPI3SIGNS	0x00000005	Kpi3 Signs set
KPI3SYMBOLS	0x00000006	Kpi3 Symbols set
KPI3SYMBOLS2	0x00000007	Kpi3 Symbols 2 set
KPI4ARROWS	0x00000008	Kpi4 Arrows set
KPI4ARROWSGRAY	0x00000009	Kpi4 Arrows Gray set
KPI4REDTOBLACK	0x0000000A	Kpi4 Red To Black set
KPI4RATING	0x0000000B	Kpi4 Rating set
KPI4TRAFFICLIGHTS	0x000000C	Kpi4 Traffic Lights set
KPI5ARROWS	0x000000D	Kpi5 Arrows set
KPI5ARROWSGRAY	0x000000E	Kpi5 Arrows Gray set
KPI5RATING	0x000000F	Kpi5 Rating set
KPI5QUARTERS	0x0000010	Kpi5 Quarters set

2.5.171 LbsDropData

The **LbsDropData** structure specifies properties of the dropdown <u>Obj</u> that contains this LbsDropData.

unused3 (optional)

A - wStyle (2 bits): An unsigned integer that specifies the style of this dropdown. MUST be a value from the following table:

Value	Meaning
0	Combo dropdown control
1	Combo Edit dropdown control
2	Simple dropdown control (just the dropdown button)

- **B unused1 (1 bit):** Undefined and MUST be ignored.
- **C fFiltered (1 bit):** A bit that specifies whether the data displayed by the dropdown has been filtered in some way.

unused2 (12 bits): Undefined and MUST be ignored.

cLine (2 bytes): An unsigned integer that specifies the number of lines to be displayed in the dropdown. If there are more lines than that in the list, a scrollbar can appear. MUST be less than or equal to 0x7FFF.

dxMin (2 bytes): An unsigned integer that specifies the smallest width in pixels allowed for the dropdown window. MUST be less than or equal to 0x7FFF.

str (variable): An XLUnicodeString that specifies the current string value in the dropdown.

unused3 (1 byte): Optional, undefined and MUST be ignored. This field MUST exist if and only if the size of **str** in bytes is an odd number.

2.5.172 **LEMMode**

The **LEMMode** enumeration specifies the different edit modes for a **table**.

Name	Value	Meaning
LEMNORMAL	0x00000000	The table can be directly edited inline.
LEMREFRESHCOPY	0x0000001	The table is refreshed before editing is allowed because is it a copy of a table whose source is a Web based data provider list.
LEMREFRESHCACHE	0x00000002	The table is refreshed before editing is allowed because caching a user change failed.
LEMREFRESHCACHEUNDO	0x00000003	The table is refreshed before editing is allowed because undoing a cached user change failed.
LEMREFRESHLOADED	0x00000004	The table is refreshed before editing is allowed because on load the table source could not be reconnected.

Name	Value	Meaning
LEMREFRESHTEMPLATE	0x00000005	The table is refreshed before editing is allowed because it was saved without having its data cached.
LEMREFRESHREFRESH	0x00000006	The table is refreshed before editing is allowed because a previous refresh failed.
LEMNOINSROWSSPREQUIRED	0x00000007	Rows cannot be inserted into this web based data provider list because there are hidden required columns.
LEMNOINSROWSSPDOCLIB	0x00000008	Rows cannot be inserted into this Web based data provider list because it is a document library .
LEMREFRESHLOADDISCARDED	0x00000009	The table is refreshed before editing is allowed because the user selected to discard cached changes upon loading.
LEMREFRESHLOADHASHVALIDATION	0x0000000A	The table is refreshed before editing is allowed because the validation of the table's data area failed upon loading.
LEMNOEDITSPMODVIEW	0x0000000B	Cannot allow the user to edit this table because of the type of moderated Web based data provider list it is.

2.5.173 LinePropertiesForShapePropsStreamChecksum

The **LinePropertiesForShapePropsStreamChecksum** record specifies the line properties data used to compute the **checksum** of the <u>ShapePropsStream</u> record.

The related <u>LineFormat</u> record referenced in the following field specifications is the LineFormat record that exists along with the ShapePropsStream record in one of the following sets of records.

- A set of records in a <u>chart group</u> but not in the sequence of records that conforms to the <u>LD</u> rule or the sequence of records that conforms to the DROPBAR rule.
- If more than one LineFormat and ShapePropsStream records exist in the set, then a pair of LineFormat and ShapePropsStream records are related when the chart element identified by the ID field of the <u>CrtLine</u> record preceding the LineFormat record is the same chart element as the one identified by the wObjContext field of the ShapePropsStream record.
- A sequence of records that conforms to the FRAME rule.
- A sequence of records that conforms to the DROPBAR rule.
- A sequence of records that conforms to the AXS rule.
- If more than one LineFormat and ShapePropsStream records exist in the sequence of records, then a pair of LineFormat and ShapePropsStream records are related when the chart element identified by the ID field of the AxisLine record preceding the LineFormat record is be the same chart element as the one identified by the WObjContext field of the ShapePropsStream record.
- A sequence of records that conforms to the SS rule when the **wObjContext** field of the ShapePropsStream record is 0x0000.

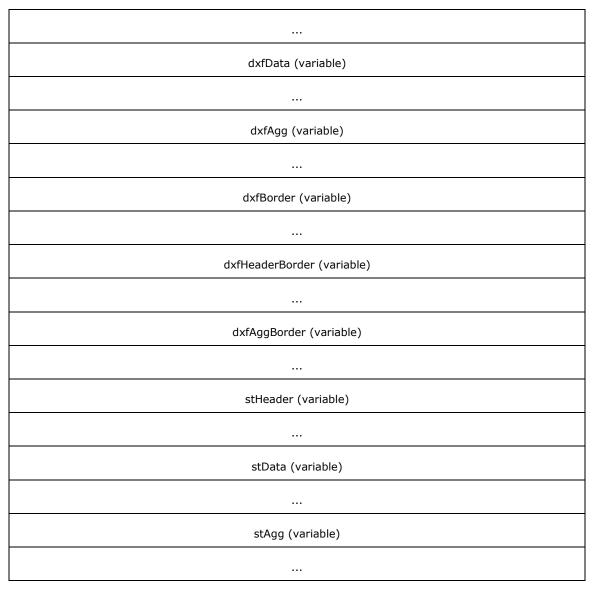

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			ic	:V						ı	patt	terr	1					tł	nick	nes	SS			Α			ur	านระ	ed		
															со	lor															

- icv (1 byte): An <u>IcvChart</u> that specifies the palette color value for the line. The color MUST match the color specified by color field. MUST equal the value specified by the icv field of the related LineFormat record.
- pattern (1 byte): An unsigned integer that specifies the pattern of the line. MUST equal the value specified by the Ins field of the related LineFormat record.
- **thickness (1 byte):** A signed integer that specifies the thickness of the line. MUST equal the value specified by the **we** field of the related LineFormat record plus one.
- **A fIsLineStyleAutomatic (1 bit):** A bit that specifies whether the line has default formatting. MUST contain the value specified by the **fAuto** field of the related LineFormat record.
- unused (7 bits): Unused and MUST be zero.
- **color (4 bytes):** A <u>LongRGB</u> that specifies the color of the line. The color MUST match the color specified by **icv**. MUST equal the value specified by the **rgb** field of the related LineFormat record.

2.5.174 List12BlockLevel

The **List12BlockLevel** structure specifies default **block-level formatting** information for a **table**, to be applied when the table expands. Style gets applied before DXFN12List for each table region.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
														cbo	dxfF	lead	der														
														ist	tnHe	ead	er														
														cł	odxt	fDat	ta														
														į	stn[Data	а														
														С	bdx	fAg	g														
														i	istn	Agg	J														
														cb	dxfE	Boro	der														
													cbo	dxfl	lead	derl	Bor	der													
													С	bdx	fAg	gBo	orde	er													
												(dxfl	Неа	der	(va	aria	ble))												

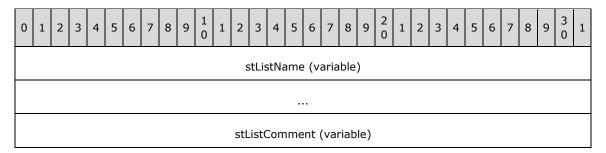

- **cbdxfHeader (4 bytes):** A signed integer that specifies the byte count for **dxfHeader** field. MUST be greater than or equal to zero.
- **istnHeader (4 bytes):** A signed integer that specifies a zero-based index to a Style record in the collection of Style records in the <u>Globals Substream</u>. The referenced Style specifies the <u>cell style XF</u> used for the table's **header row cells**. If the value is -1, no style is specified for the table's header row cells.
- **cbdxfData (4 bytes):** A signed integer that specifies the byte count for **dxfData** field. MUST be greater than or equal to zero.
- **istnData (4 bytes):** A signed integer that specifies a zero-based index to a Style record in the collection of Style records in the <u>Globals Substream</u>. The referenced Style specifies the <u>cell style</u> used for the table's data cells. If the value is -1, no style is specified for the table's data cells.
- **cbdxfAgg (4 bytes):** A signed integer that specifies the byte count for **dxfAgg** field. MUST be greater than or equal to zero.

- **istnAgg (4 bytes):** A signed integer that specifies a zero-based index to a Style record in the collection of Style records in the <u>Globals Substream</u>. The referenced Style specifies the cell style used for the table's **total row**. If the value is -1, no style is specified for the table's total row.
- **cbdxfBorder (4 bytes):** A signed integer that specifies the byte count for **dxfBorder** field. MUST be greater than or equal to zero.
- **cbdxfHeaderBorder (4 bytes):** A signed integer that specifies the byte count for **dxfHeaderBorder** field. MUST be greater than or equal to zero.
- **cbdxfAggBorder (4 bytes):** A signed integer that specifies the byte count for **dxfAggBorder** field. MUST be greater than or equal to zero.
- **dxfHeader (variable):** An optional DXFN12List that specifies the formatting for the table's header row cells. MUST exist if and only if **cbdxfHeader** is nonzero.
- **dxfData (variable):** An optional DXFN12List that specifies the formatting for the table's data cells. MUST exist if and only if **cbdxfData** is nonzero.
- **dxfAgg (variable):** An optional DXFN12List that specifies the formatting for the table's total row. MUST exist if and only if **cbdxfAgg** is nonzero.
- **dxfBorder (variable):** An optional DXFN12 that specifies the formatting for the **border** of the table's data cells. MUST exist if and only if **cbdxfBorder** is nonzero.
- **dxfHeaderBorder (variable):** An optional DXFN12List that specifies the formatting for the border of the table's header row cells. MUST exist if and only if **cbdxfHeaderBorder** is nonzero.
- **dxfAggBorder (variable):** An optional DXFN12List that specifies the formatting for the border of the table's total row. MUST exist if and only if **cbdxfAggBorder** is nonzero.
- **stHeader (variable):** An optional <u>XLUnicodeString</u> that specifies the name of the **style** for the table's header row cells. MUST exist if and only if **istnHeader** is not equal to -1. MUST be equal to the name of the Style record specified by **istnHeader**. If the style is a user-defined style, **stHeader** MUST be equal to the **user** field of the Style record.
- **stData (variable):** An optional XLUnicodeString that specifies the name of the style for the table's data cells. MUST exist if and only if **istnData** is not equal to -1. MUST be equal to the name of the Style record specified by **istnData**. If the style is a user-defined style, **stData** MUST be equal to the **user** field of the Style record.
- **stAgg (variable):** An optional XLUnicodeString that specifies the name of the style for the table's total row. MUST exist if and only if **istnAgg** is not equal to -1. MUST be equal to the name of the Style record specified by **istnAgg**. If the style is a user-defined style, **stAgg** MUST be equal to the **user** field of the Style record.

2.5.175 List12DisplayName

The **List12DisplayName** structure specifies the name and comment strings for the **table**.

...

stListName (variable): An XLNameUnicodeString that specifies the table name. MUST be an empty string if the rgbName field of the TableFeatureType structure embedded in the Feature11 or Feature12 record that specifies the table is not empty. If the table name is not the same as the rgbName field of the TableFeatureType structure for this table, the table name is specified in stListName which is a case-insensitive unique name among all table names and defined names in the workbook.

stListComment (variable): An XLUnicodeString that specifies a comment about the table.

2.5.176 List12TableStyleClientInfo

The **List12TableStyleClientInfo** record specifies information about the style applied to a **table**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	E		F				uni	use	d2								stLi	istS	tyle	Naı	me	(va	riat	ole)				

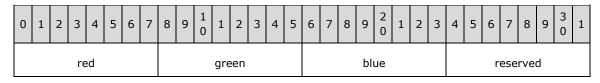

- A fFirstColumn (1 bit): A bit that specifies whether any <u>table style elements</u> (as specified by <u>TableStyleElement</u>) with a **tseType** field equal to 0x00000003 will be applied.
- **B fLastColumn (1 bit):** A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000004 will be applied.
- C fRowStripes (1 bit): A bit that specifies whether any table style elements (as specified by TableStyleElement) with a tseType field equal to 0x00000005 or 0x00000006 will be applied.
- **D fColumnStripes (1 bit):** A bit that specifies whether any table style elements (as specified by TableStyleElement) with a **tseType** field equal to 0x00000007 or 0x00000008 will be applied.
- **E unused1 (2 bits):** Undefined and MUST be ignored.
- **F fDefaultStyle (1 bit):** A bit that specifies whether the style whose name is specified by **stListStyleName** is the default <u>table style</u>.

unused2 (9 bits): Undefined and MUST be ignored.

stListStyleName (variable): An <u>XLUnicodeString</u> that specifies the name of the table style for the table. Length MUST be greater than zero and less than or equal to 255 characters. If the table style is a custom style, it is defined in a <u>TableStyle</u> record that has **rgchName** equal to this value.

2.5.177 LongRGB

The **LongRGB** structure specifies a color as a combination of red, green, and blue.

red (1 byte): An unsigned integer that specifies the relative intensity of red.

green (1 byte): An unsigned integer that specifies the relative intensity of green.

blue (1 byte): An unsigned integer that specifies the relative intensity of blue.

reserved (1 byte): MUST be zero, and MUST be ignored.

2.5.178 LongRGBA

The **LongRGBA** structure specifies a color as a combination of red, green, blue and alpha values.

red (1 byte): An unsigned integer that specifies the relative intensity of red.

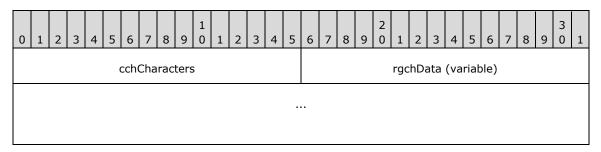

green (1 byte): An unsigned integer that specifies the relative intensity of green.

blue (1 byte): An unsigned integer that specifies the relative intensity of blue.

alpha (1 byte): An unsigned integer that specifies the alpha value.

2.5.179 LPWideString

The **LPWideString** type specifies a **Unicode** string which is prefixed by a length.

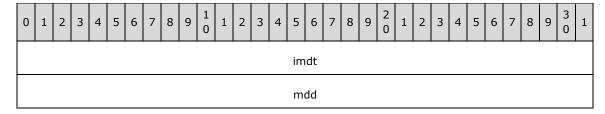

cchCharacters (2 bytes): An unsigned integer that specifies the number of characters.

rgchData (variable): An array of Unicode characters that specifies the characters of the string. The size of this array in bytes MUST equal the following formula:

cchCharacters * 2

2.5.180 MDir

The **MDir** structure specifies the <u>MDTInfoIndex</u> and the index of a specific <u>MDX metadata</u> record.

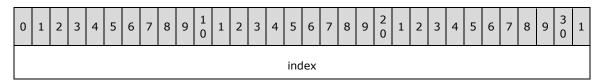

imdt (4 bytes): An MDTInfoIndex that identifies the MDTInfo record.

mdd (4 bytes): An unsigned integer that specifies the zero-based index of an MDX metadata record in the collection of MDX metadata records in the <u>Globals Substream</u>. The referenced record specifies a MDX metadata record corresponding to the record type specified by imdt. The MDX metadata records include <u>MDXTuple</u>, <u>MDXSet</u>, <u>MDXProp</u> and <u>MDXKPI</u> records.

2.5.181 MDTInfoIndex

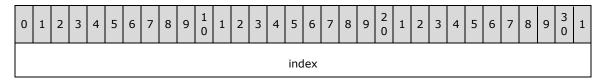

The MDTInfoIndex structure specifies an index which identifies an MDTInfo record.

index (4 bytes): A signed integer that specifies the one-based index of an MDTInfo record in the collection of MDTInfo records in the <u>Globals Substream</u>. The value MUST be greater than 0 and less than or equal to the total number of the MDTInfo records in the file.

2.5.182 MDXStrIndex

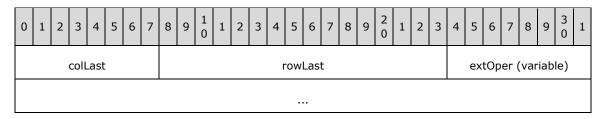

The MDXStrIndex structure specifies the index of an MDXStr record.

index (4 bytes): A signed integer that specifies the zero-based index of an MDXStr record in the collection of MDXStr records in the <u>Globals Substream</u>. The value MUST be greater than or equal to 0 and less than the total number of the MDXStr records that have been read so far.

2.5.183 MOper

The **MOper** structure specifies multiple operands of an **OLE link** or a **DDE link** for the ExternOleDdeLink structure.

colLast (1 byte): A <u>ColByteU</u> that specifies the zero-based index of last column associated with the link.

rowLast (2 bytes): A RWU that specifies the zero-based index of last row associated with the link.

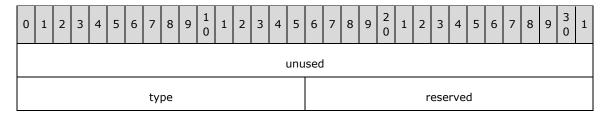

extOper (variable): This array specifies current values for the linked data. Each <u>SerAr</u> specifies a cell value. The number of elements in the array is

$$(colLast + 1) * (rowLast + 1).$$

If this array does not fit in the owning <u>ExternName</u> record, <u>Continue</u> records are used. Each SerAr MUST stay in the same record.

2.5.184 NilChartNum

The **NilChartNum** structure specifies a non-numeric value (also known as "NaN" or "Not a Number") that is used in place of a numeric value.

unused (4 bytes): Undefined and MUST be ignored.

type (2 bytes): An unsigned integer that specifies the interpretation of this value. This field is undefined and MUST be ignored, unless otherwise defined by the containing record.

reserved (2 bytes): MUST be 0xFFFF and MUST be ignored.

2.5.185 NoteRR

The **NoteRR** structure specifies a <u>revision record</u> for a **comment** associated with a **cell**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														rrd	(14	by	tes))													
																А	В						re	eser	vec	11					
							rc	w										I					C	ol							
С	D		res	erv	ed3	1	Е	F	C	ì	Н			I							g	juid	(16	5 by	/tes	5)					
																							ichl	End							
																						(cchľ	Vote	e						
																					stA	luth	or	(va	riab	le)					
						ι	ınu	sed?	2																						

- **rrd (14 bytes):** An RRD that specifies the <u>revision record</u> information used to track changes in a shared workbook. The **rrd.revt** MUST be equal to 0x000D. The **rrd.tabid** MUST NOT be 0xFFFF.
- A bitfDelNote (1 bit): A bit that specifies whether the revision record deletes the comment.
- **B bitfAddNote (1 bit):** A bit that specifies whether the revision record adds text to the comment.

Value	Meaning
0	Text has not been added to the comment.
1	A new comment is being added or additional text is being appended to an existing comment.

reserved1 (14 bits): MUST be 0 and MUST be ignored.

row (2 bytes): A RWU that specifies the row of the cell associated with the comment.

col (2 bytes): A ColU that specifies the column of the cell associated with the comment.

C - reserved2 (1 bit): MUST be 0 and MUST be ignored.

D - fShow (1 bit): A bit that specifies whether the comment is shown.

reserved3 (5 bits): MUST be 0 and MUST be ignored.

E - fRwHidden (1 bit): A bit that specifies whether the row specified by row is hidden.

F - fColHidden (1 bit): A bit that specifies whether the column specified by col is hidden.

G - reserved4 (2 bits): MUST be 0 and MUST be ignored.

H - unused1 (1 bit): Unused and MUST be ignored.

I - reserved5 (4 bits): MUST be 0 and MUST be ignored.

guid (16 bytes): A **GUID** as specified by [MS-DTYP] that identifies the comment, specified by a NoteSh structure, which is modified by this revision record. The GUID for a comment is specified in the Obj record specified by the **idObj** field in the NoteSh structure. In the Obj record, the GUID is stored in the **nts.quid** field. If **bitfDelNote** is 1, this field MUST be zero.

ichEnd (4 bytes): An unsigned integer that specified the length of the comment before the revision is made.

cchNote (4 bytes): An unsigned integer that specifies the length of the string that was added to the comment in the revision record. The sum of **ichEnd** and **cchNote** MUST be less than or equal to 32767.

stAuthor (variable): An <u>XLUnicodeString</u> that specifies the original author of the comment. The length MUST be greater than or equal to 1 and less than or equal to 54.

unused2 (2 bytes): Undefined and MUST be ignored.

2.5.186 NoteSh

The **NoteSh** structure specifies a **comment** associated with a **cell**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
							ro	w															C	ol							
Α	В												ed4										idC	Obj							
													stA	uth	or	(vaı	riab	le)													
		U	ınus	sed	2																										

row (2 bytes): A RW that specifies the row of the cell to which this comment is associated.

col (2 bytes): A Col that specifies the column of the cell to which this comment is associated.

A - reserved1 (1 bit): MUST be zero and MUST be ignored.

B - fShow (1 bit): A bit that specifies whether the comment is shown at all times.

C - reserved2 (1 bit): MUST be zero and MUST be ignored.

D - unused1 (1 bit): Undefined and MUST be ignored.

E - reserved3 (3 bits): MUST be zero and MUST be ignored.

F - fRwHidden (1 bit): A bit that specifies whether the row specified by row is hidden.

G - fColHidden (1 bit): A bit that specifies whether the column specified by col is hidden.

reserved4 (7 bits): MUST be zero and MUST be ignored.

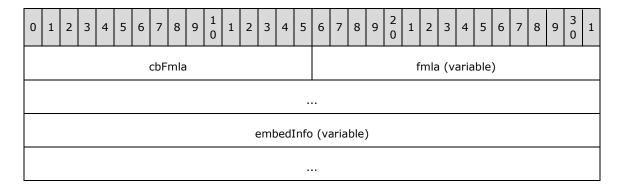

idObj (2 bytes): An ObjId that specifies the Obj record that specifies the comment text.

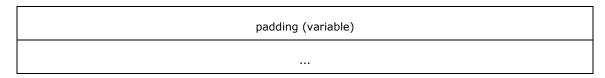

stAuthor (variable): An <u>XLUnicodeString</u> that specifies the name of the comment author. String length MUST be greater than or equal to 1 and less than or equal to 54.

unused2 (1 byte): Undefined and MUST be ignored.

2.5.187 ObjFmla

The **ObjFmla** structure specifies a formula (section 2.2.2) in an Obj record.

cbFmla (2 bytes): An unsigned integer that specifies the number of bytes in this ObjFmla, not counting the two bytes of the **cbFmla** field itself. This number MUST be even.

fmla (variable): An optional <u>ObjectParsedFormula</u> that specifies the formula. This field MUST exist if and only if **cbFmla** is greater than 0x0000.

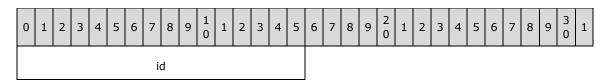

embedInfo (variable): An optional <u>PictFmlaEmbedInfo</u>. This field MUST exist if and only if the structure containing this ObjFmla is an <u>FtPictFmla</u>, the **fmla** field exists, and the **fmla.rgce** field starts with a <u>PtgTbl</u>.

padding (variable): An array of bytes whose size is given by: **cbFmla** minus size of **fmla** minus size of **embedInfo**.

It is possible for this array to be empty. The value of the elements in this array are undefined and MUST be ignored.

2.5.188 ObjId

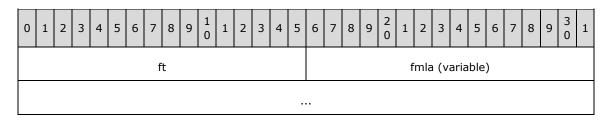

The **ObjId** structure specifies a reference to an **Obj**.

id (2 bytes): An unsigned integer that specifies the value of the **cmo.id** field of an Obj in the same **drawing**. A value of 0 specifies that this ObjId does not reference an Obj.

2.5.189 ObjLinkFmla

The **ObjLinkFmla** structure specifies the formula (section 2.2.2) that specifies a **range** which contains a value that is linked to the control represented by the <u>Obj</u> record containing this ObjLinkFmla.

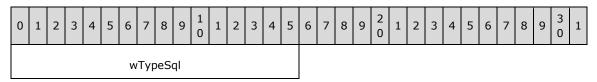

ft (2 bytes): Reserved. MUST be 0x0014 if the **cmo.ot** of the containing Obj is equal to 0x0B or 0x0C. MUST be 0x000E if the **cmo.ot** field of the containing Obj is equal to 0x10, 0x11, 0x12, or 0x14. Note that this ObjLinkFmla MUST NOT exist if **cmo.ot** is any other value.

fmla (variable): An ObjFmla that specifies the formula which specifies a range which contains a value that is linked to the state of the control.

2.5.190 **ODBCType**

The **ODBCType** structure specifies an **ODBC** data type identifier.

wTypeSql (2 bytes): A signed integer that specifies an ODBC data type. The following are example data types supported by ODBC. For more information about ODBC, see [MSDN-OpenDBConnectivity].

Value	SQL Type	Data Type
0x0000	SQL_TYPE_NULL	Undetermined type, data source does not support typed data. Data type determined based on data content: date and time, decimal or text.
0x0001	SQL_CHAR	Fixed-length string of ANSI characters
0x0003	SQL_DECIMAL	Fixed-precision, Fixed-scale numbers
0x0004	SQL_INTEGER	32-bit signed integer
0x0005	SQL_SMALLINT	16-bit signed integer
0x0006	SQL_FLOAT	User-specified precision floating-point
0x0007	SQL_REAL	7-digits precision floating-point
0x0008	SQL_DOUBLE	15-digits precision floating-point
0x000B	SQL_TIMESTAMP	Date and Time
0x000C	SQL_VARCHAR	Variable-length string of ANSI characters
0xFFF9	SQL_BIT	Bit (1 or 0)
0xFFFE	SQL_BINARY	Fixed-length binary data

2.5.191 OfficeArtClientAnchorChart

The **OfficeArtClientAnchorChart** structure specifies the anchor position of a **drawing object** embedded in a <u>chart</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rh																														
Α	В	C D E unused																	l×	(1											

 ly1
 lx2
 ly2

rh (8 bytes): An OfficeArtRecordHeader as specified in [MS-ODRAW] section 2.2.1 that specifies the header for this structure. **rh.recVer** MUST be 0x0. **rh.recInstance** MUST be 0x0. **rh.recType** MUST be 0xF010. **rh.recLen** MUST be 0x0012.

A - fMove (1 bit): MUST be 0 and MUST be ignored.

B - fSize (1 bit): A bit that specifies whether the drawing object resizes with the **chart area** (section 2.2.3.17). MUST be a value from the following table:

Value	Meaning
0x0	The drawing object resizes with the chart area (section 2.2.3.17).
0x1	The drawing object does not resize with the chart area (section 2.2.3.17).

C - reserved1 (1 bit): MUST be 0 and MUST be ignored.

D - reserved2 (1 bit): Undefined and MUST be ignored.

E - reserved3 (1 bit): MUST be 0 and MUST be ignored.

unused (11 bits): Undefined and MUST be ignored.

Ix1 (4 bytes): A signed integer that specifies the horizontal offset of the logical upper-left corner of the **bounding rectangle** of the drawing object, relative to the upper-left corner of the chart area (section 2.2.3.17) in <u>SPRC</u>.

ly1 (4 bytes): A signed integer that specifies the vertical offset of the logical upper-left corner of the bounding rectangle of the drawing object, relative to the upper-left corner of the chart area (section 2.2.3.17) in SPRC.

lx2 (4 bytes): A signed integer that specifies the horizontal offset of the logical bottom-right corner of the bounding rectangle of the drawing object, relative to the upper-left corner of the chart area (section 2.2.3.17) in SPRC.

ly2 (4 bytes): A signed integer that specifies the vertical offset of the logical bottom-right corner of the bounding rectangle of the drawing object, relative to the upper-left corner of the chart area (section 2.2.3.17) in SPRC.

2.5.192 OfficeArtClientAnchorHF

The **OfficeArtClientAnchorHF** structure specifies the dimension information of a picture specified in a <u>HFPicture</u> record.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	rh																														
	width																														
	height																														

rh (8 bytes): An OfficeArtRecordHeader as specified in [MS-ODRAW] that specifies the header for this structure. The sub-fields of OfficeArtRecordHeader are further specified in the following table:

Field	Meaning
rh.recVer	MUST be 0x0.
rh.recInstance	MUST be 0x0.
rh.recType	MUST be 0xF010.
rh.recLen	MUST be 8.

width (4 bytes): A signed integer that specifies the width of the picture in pixels. This value MUST be greater than 0.

height (4 bytes): A signed integer that specifies the height of the picture in pixels. This value MUST be greater than 0.

2.5.193 OfficeArtClientAnchorSheet

The **OfficeArtClientAnchorSheet** structure specifies the anchor position of a **drawing object** embedded in a **sheet**.

0 1 2 3 4 5 6 7 8 9 1 1 2 3 4 5	6 7 8 9 2 1 2 3 4 5 6 7 8 9 3 1											
r	h											
A B C D E unused	colL											
dxL	rwT											
dyT	colR											
dxR	rwB											
dyB												

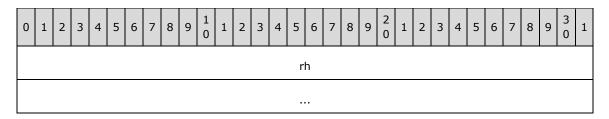

rh (8 bytes): An OfficeArtRecordHeader as defined in [MS-ODRAW] that specifies the header for this structure. The sub-fields of OfficeArtRecordHeader are further specified in the following table:

Field	Meaning	
rh.recVer	MUST be 0x0.	
rh.recInstance	MUST be 0x0.	
rh.recType	MUST be 0xF010.	
rh.recLen	An unsigned integer that specifies the number of bytes following the header. The value MUST be equal to 18.	

- A fMove (1 bit): A bit that specifies whether the shape will be kept intact when the cells are moved.
- **B fSize (1 bit):** A bit that specifies whether the shape will be kept intact when the cells are resized. If **fMove** is 1, the value MUST be 1.
- C reserved1 (1 bit): MUST be 0 and MUST be ignored.
- D reserved2 (1 bit): MUST be 0 and MUST be ignored
- **E reserved3 (1 bit):** MUST be 0 and MUST be ignored.
- unused (11 bits): Undefined and MUST be ignored.
- **colL (2 bytes):** A <u>Col256U</u> that specifies the column of the cell under the top left corner of the **bounding rectangle** of the shape.
- **dxL (2 bytes):** A signed integer that specifies the x coordinate of the top left corner of the bounding rectangle relative to the corner of the underlying cell. The value is expressed as 1024th's of that cell's width.
- **rwT (2 bytes):** A <u>RwU</u> that specifies the row of the cell under the top left corner of the bounding rectangle of the shape.
- **dyT (2 bytes):** A signed integer that specifies the y coordinate of the top left corner of the bounding rectangle relative to the corner of the underlying cell. The value is expressed as 256th's of that cell's height.
- **colR (2 bytes):** A Col256U that specifies the column of the cell under the bottom right corner of the bounding rectangle of the shape.
- **dxR (2 bytes):** A signed integer that specifies the x coordinate of the bottom right corner of the bounding rectangle relative to the corner of the underlying cell. The value is expressed as 1024th's of that cell's width.
- **rwB (2 bytes):** A RwU that specifies the row of the cell under the bottom right corner of the bounding rectangle of the shape.
- **dyB (2 bytes):** A signed integer that specifies the y coordinate of the bottom right corner of the bounding rectangle relative to the corner of the underlying cell. The value is expressed as 256th's of that cell's height.

2.5.194 OfficeArtClientData

The **OfficeArtClientData** structure specifies the client data of an **drawing object**. MUST be the last structure of the **rgChildRec** field of the current <u>MsoDrawing</u> record. And the next record MUST be <u>Obj</u>, which contains the detailed data information about this drawing object.

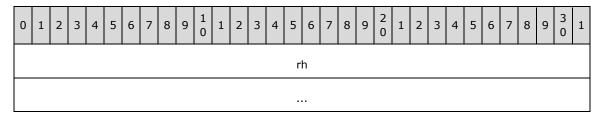

rh (8 bytes): An OfficeArtRecordHeader as specified in [MS-ODRAW] section 2.2.1 that specifies the header for this structure. The subfields of OfficeArtRecordHeader are further specified in the following table:

Field	Meaning	
rh.recVer	MUST be 0x0.	
rh.recInstance	MUST be 0x0.	
rh.recType	MUST be 0xF011.	
rh.recLen	An unsigned integer that specifies the number of bytes following the header. The value MUST be equal to 0.	

2.5.195 OfficeArtClientTextbox

The **OfficeArtClientTextbox** structure specifies the client textbox of an **drawing object**. MUST be the last structure of the **rgChildRec** field of the <u>MsoDrawing</u> record. And the next record MUST be <u>TxO</u>, which contains the detailed textbox information about this drawing object.

rh (8 bytes): An OfficeArtRecordHeader as specified in [MS-ODRAW] section 2.2.1 that specifies the header for this structure. The subfields of OfficeArtRecordHeader are further specified in the following table:

Field	Meaning
rh.recVer	MUST be 0x0.
rh.recInstance	MUST be 0x0.
rh.recType	MUST be 0xF00D.
rh.recLen	An unsigned integer that specifies the number of bytes following the header. The value MUST be equal to 0.

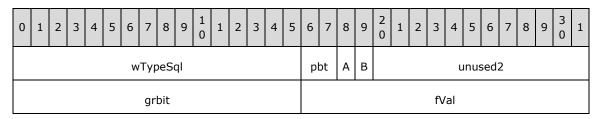

2.5.196 **PaneType**

The **PaneType** enumeration specifies the different types of **panes**.

Name	Value	Meaning
REVTPNNBOTRIGHT	0x00	logical bottom-right pane
REVTPNNTOPRIGHT	0x01	logical top-right pane
REVTPNNBOTLEFT	0x02	logical bottom-left pane
REVTPNNTOPLEFT	0x03	logical top-left pane

2.5.197 PARAMQRY_Fixed

PARAMQRY_Fixed structure contains information about **SQL** query parameters.

wTypeSql (2 bytes): An ODBCType structure that specifies the SQL data type.

pbt (2 bits): An unsigned integer that specifies the parameter type. MUST be a value from the following table:

Value	Meaning
0	Prompt. User is prompted for the value of the parameter.
1	Value. The parameter value is specified in the query.
2	Reference. The parameter value is specified in a cell.

- A unused1 (1 bit): Undefined and MUST be ignored.
- **B fNonDefaultName (1 bit):** A bit that specifies whether to use the default prompt if **pbt** is equal to 0. MUST be a value from the following table:

Value	Meaning
0	User entered prompt is used
1	Application's default prompt is used

unused2 (12 bits): Undefined and MUST be ignored.

grbit (2 bytes): An unsigned integer that specifies the type of data that follows this structure as specified in the following table or the presence of a Boolean value in fVal if pbt equals 1. MUST be a value from the following table if pbt equals 1:

Value	Meaning
0x001	Xnum (section <u>2.5.342</u>)
0x002	SXString

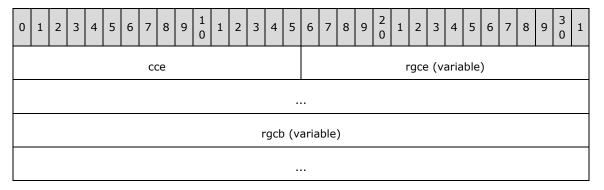

Value	Meaning
0x004	Boolean (section 2.5.14) value in fVal.
0x800	4 byte unsigned integer

fVal (2 bytes): A Boolean that specifies value such that if **pbt** equals 1 and **grbit** equals 4. MUST be equal to 0 or 1 if **pbt** equals 1 and **grbit** equals 4. MUST be ignored if **pbt** is not equal to 1 or **grbit** is not equal to 4.

2.5.198 Parsed Expressions

2.5.198.1 ArrayParsedFormula

The **ArrayParsedFormula** structure specifies an array formula (section 2.2.2).

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than
 0.

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula (section 2.2.2). MUST NOT contain PtgExp, PtgTbl, PtgRefN, PtgAreaN, or PtgSxName.

rgcb (variable): An RqbExtra that specifies ancillary data for the formula.

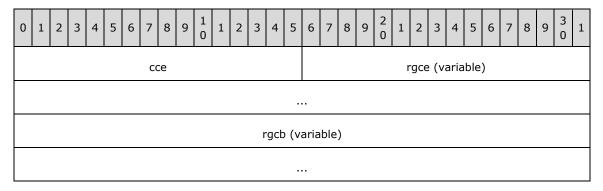

2.5.198.2 BErr

The **BErr** structure is a 1 byte unsigned integer that specifies an error. MUST be a value from the following table:

Value	Meaning
0x00	#NULL!
0x07	#DIV/0!
0x0F	#VALUE!
0x17	#REF!
0x1D	#NAME?
0x24	#NUM!
0x2A	#N/A

2.5.198.3 CellParsedFormula

The **CellParsedFormula** structure specifies a formula (section 2.2.2) stored in a **cell**.

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than 0.

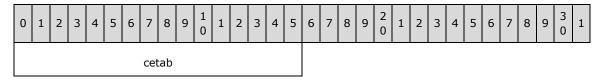

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST NOT contain <u>PtgRefN</u>, <u>PtgAreaN</u>, or <u>PtgSxName</u>.

The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

rgcb (variable): An RgbExtra that specifies ancillary data for the formula.

2.5.198.4 Cetab

The **Cetab** structure specifies a function that can be called from a formula (section 2.2.2). The definition of each function specifies the function name and the valid sequence of arguments.

cetab (2 bytes): An unsigned integer that specifies the function to be called. MUST be a value from the following table:

The elements ref and val are specified in Rgce.

Value	Meaning
0x0000	ВЕЕР
	beep-params = [val]
0x0001	OPEN
	open-params = *17(val)
0x0002	OPEN.LINKS
	open-links-params = *15(val)
0x0003	CLOSE.ALL

Value	Meaning
	This function takes no parameters
0x0004	SAVE
	This function takes no parameters
0x0005	SAVE.AS
	save-as-params = *7(val)
0x0006	FILE.DELETE
	file-delete-params = [val]
0x0007	PAGE.SETUP
	page-setup-params = *30(val)
0x0008	PRINT
	print-params = *17(val)
0x0009	PRINTER.SETUP
	printer-setup-params = [val]
0x000A	QUIT
	This function takes no parameters
0x000B	NEW.WINDOW
	This function takes no parameters
0x000C	ARRANGE.ALL
	arrange-All-params = *4(val)
0x000D	WINDOW.SIZE
	window-size-params = *3(val)
0x000E	WINDOW.MOVE
	window-move-params = *3(val)
0x000F	FULL
	full-params = [val]
0x0010	CLOSE
	close-params = *2(val)
0x0011	RUN
	run-params = [(ref / val), [val]]
0x0016	SET.PRINT.AREA
	set-print-area-params = [ref / val]
0x0017	SET.PRINT.TITLES

Value	Meaning
	set-print-titles-params = *2(ref / val)
0x0018	SET.PAGE.BREAK
	This function takes no parameters
0x0019	REMOVE.PAGE.BREAK
	remove-page-break-params = *2(val)
0x001A	FONT
	font-params = *2(val)
0x001B	DISPLAY
	display-params = *9(val)
0x001C	PROTECT.DOCUMENT
	protect-document-params = *7(val)
0x001D	PRECISION
	precision-params = [val]
0x001E	A1.R1C1
	a1-r1c1-params = [val]
0x001F	CALCULATE.NOW
	This function takes no parameters
0x0020	CALCULATION
	calculation-params = *11(val)
0x0022	DATA.FIND
	data-find-params = [val]
0x0023	EXTRACT
	extract-params = [val]
0x0024	DATA.DELETE
	This function takes no parameters
0x0025	SET.DATABASE
	This function takes no parameters
0x0026	SET.CRITERIA
	This function takes no parameters
0x0027	SORT
	sort-params = [val, [(ref / val), [(ref / va
0x0028	DATA.SERIES

Value	Meaning
	data-series-params = *6(val)
0x0029	TABLE
	table-params = *2(ref / val)
0x002A	FORMAT.NUMBER
	format-number-params = [val]
0x002B	ALIGNMENT
	alignment-params = *10(val)
0x002C	STYLE
	style-params = *2(val)
0x002D	BORDER
	border-params = *27(val)
0x002E	CELL.PROTECTION
	cell-protection-params = *2(val)
0x002F	COLUMN.WIDTH
	column-width-params = [val, *4(ref / val)]
0x0030	UNDO
	This function takes no parameters
0x0031	СИТ
	cut-params = *2(ref / val)
0x0032	COPY
	copy-params = *2(ref / val)
0x0033	PASTE
	paste-params = [ref / val]
0x0034	CLEAR
	clear-params = [val]
0x0035	PASTE.SPECIAL
	paste-special-params = *7(val)
0x0036	EDIT.DELETE
	edit-delete-params = [val]
0x0037	INSERT
	insert-params = *2(val)
0x0038	FILL.RIGHT

Value	Meaning
	This function takes no parameters
0x0039	FILL.DOWN
	This function takes no parameters
0x003D	DEFINE.NAME
	<pre>define-name-params = [val, [(ref / val), [(ref / val)</pre>
0x003E	CREATE.NAMES
	create-names-params = *4(val)
0x003F	FORMULA.GOTO
	formula-goto-params = [(ref / val), [val]]
0x0040	FORMULA.FIND
	formula-find-params = *12(val)
0x0041	SELECT.LAST.CELL
	This function takes no parameters
0x0042	SHOW.ACTIVE.CELL
	This function takes no parameters
0x0043	GALLERY.AREA
	gAllery-area-params = *2(val)
0x0044	GALLERY.BAR
	gAllery-bar-params = *2(val)
0x0045	GALLERY.COLUMN
	gAllery-column-params = *2(val)
0x0046	GALLERY.LINE
	gAllery-line-params = *2(val)
0x0047	GALLERY.PIE
	gAllery-pie-params = *2(val)
0x0048	GALLERY.SCATTER
	gAllery-scatter-params = *2(val)
0x0049	COMBINATION
	combination-params = [val]
0x004A	PREFERRED
	This function takes no parameters
0x004B	ADD.OVERLAY

Value	Meaning
	This function takes no parameters
0x004C	GRIDLINES
	gridlines-params = *7(val)
0x004D	SET.PREFERRED
	set-preferred-params = [val]
0x004E	AXES
	axes-params = *6(val)
0x004F	LEGEND
	legend-params = [val]
0x0050	ATTACH.TEXT
	attach-text-params = *3(val)
0x0051	ADD.ARROW
	This function takes no parameters
0x0052	SELECT.CHART
	This function takes no parameters
0x0053	SELECT.PLOT.AREA
	This function takes no parameters
0x0054	PATTERNS
	patterns-params = *13(val)
0x0055	MAIN.CHART
	main-chart-params = *10(val)
0x0056	OVERLAY
	overlay-params = *12(val)
0x0057	SCALE
	scale-params = *10(val)
0x0058	FORMAT.LEGEND
	format-legend-params = [val]
0x0059	FORMAT.TEXT
	format-text-params = *11(val)
0x005A	EDIT.REPEAT
	This function takes no parameters
0x005B	PARSE

Value	Meaning
	parse-params = [val, [ref / val]]
0x005C	JUSTIFY
	This function takes no parameters
0x005D	HIDE
	This function takes no parameters
0x005E	UNHIDE
	unhide-params = [val]
0x005F	WORKSPACE
	workspace-params = *16(val)
0x0060	FORMULA
	formula-params = [val, [ref / val]]
0x0061	FORMULA.FILL
	formula-fill-params = [val, [ref / val]]
0x0062	FORMULA.ARRAY
	formula-array-params = [val, [ref / val]]
0x0063	DATA.FIND.NEXT
	This function takes no parameters
0x0064	DATA.FIND.PREV
	This function takes no parameters
0x0065	FORMULA.FIND.NEXT
	This function takes no parameters
0x0066	FORMULA.FIND.PREV
	This function takes no parameters
0x0067	ACTIVATE
	activate-params = *2(val)
0x0068	ACTIVATE.NEXT
	activate-next-params = [val]
0x0069	ACTIVATE.PREV
	activate-prev-params = [val]
0x006A	UNLOCKED.NEXT
	This function takes no parameters
0x006B	UNLOCKED.PREV

Value	Meaning
	This function takes no parameters
0x006C	COPY.PICTURE
	copy-picture-params = *3(val)
0x006D	SELECT
	select-params = *2(ref / val)

2.5.198.5 CFParsedFormula

The **CFParsedFormula** structure specifies a formula (section $\underline{2.2.2}$) used in a **conditional formatting** rule.

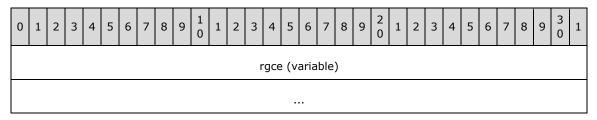

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes.

rgce (variable): An Rgce that specifies the sequence of Ptg structures for the formula. MUST NOT contain PtgExp, PtgTbl, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgSxName, PtgIsect, PtgUnion, PtgArray, PtgRef3d, PtgArea3d, PtgRefErr3d, PtgAreaErr3d, PtgNameX, PtgMemArea, or PtgMemNoMem. A PtgArea or a PtgAreaN MUST NOT be the only Ptg structure in the sequence.

The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

2.5.198.6 CFParsedFormulaNoCCE

The **CFParsedFormulaNoCCE** structure specifies a formula (section 2.2.2) used in a **conditional formatting** rule, in a <u>CF</u> or <u>CF12</u> record in which the size of the formula in bytes is specified.

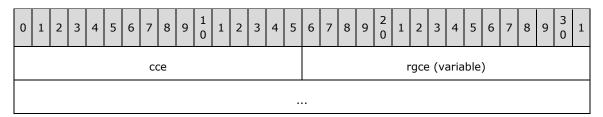

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgSxName, PtgIsect, PtgUnion, PtgArray, PtgRef3d, PtgArea3d, PtgRefErr3d, PtgAreaErr3d, PtgNameX, PtgMemArea, or PtgMemNoMem. A PtgArea or a PtgAreaN MUST NOT be the only Ptg in the sequence.

The root node of the parse tree of this field MUST be a VALUE TYPE, as described in Rgce.

2.5.198.7 CFVOParsedFormula

The **CFVOParsedFormula** structure specifies a formula (section 2.2.2) without **relative references** that is used in a **conditional formatting** rule.

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than
0.

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgSxName, PtgIsect, PtgUnion, PtgArray, PtgRef3d, PtgArea3d, PtgRefErr3d, PtgAreaErr3d, PtgNameX, PtgMemArea, or PtgMemNoMem. A PtgArea or a PtgAreaN MUST NOT be the only Ptg in the sequence.

If this field contains a PtqRef, then the loc.column.colRelative and loc.column.rowRelative fields in the PtqRef MUST be 0.

If this field contains a PtgRefN, then the loc.column.colRelative and loc.column.rowRelative fields in the PtgRefN MUST be 0.

If this field contains a PtgArea, then the area.columnFirst.colRelative, area.columnFirst.rowRelative, area.columnLast.colRelative, and area.columnLast.rowRelative fields in the PtgArea MUST be 0.

If this field contains a PtgAreaN, then the area.columnFirst.colRelative, area.columnFirst.rowRelative, area.columnLast.colRelative, and area.columnLast.rowRelative fields in the PtgAreaN MUST be 0.

The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

2.5.198.8 ChartParsedFormula

The **ChartParsedFormula** structure specifies a formula (section 2.2.2) used in a chart.

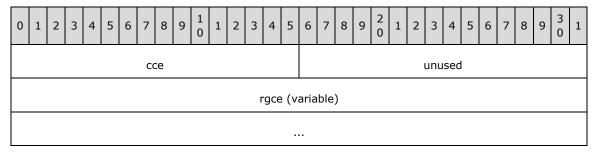

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes.

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST contain only the following Ptgs: <u>PtgParen</u>, <u>PtgUnion</u>, <u>PtgRef3d</u>, <u>PtgRefErr3d</u>, <u>PtgArea3d</u>, <u>PtgAreaErr3d</u>, <u>PtgNameX</u>, or <u>PtgMemFunc</u>.

2.5.198.9 DVParsedFormula

The **DVParsedFormula** structure specifies a formula (section 2.2.2) used in a data validation rule.

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes.

unused (2 bytes): Undefined and MUST be ignored.

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgSxName, PtgIsect, PtgUnion, PtgArray, PtgRef3d, PtgRefErr3d, PtgNameX, PtgMemArea, or PtgMemNoMem.

If the <u>Dv</u> record that contains this **DVParsedFormula** in its Dv.**formula1** field has a Dv.**valType** not equal to 3, then the following MUST be true:

- rgce MUST NOT contain a PtgArea3d or a PtgAreaErr3d.
- A PtgArea, a PtgAreaErr, or a PtgAreaN, MUST NOT be the only Ptg in rgce.
- The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

If the Dv record that contains this **DVParsedFormula** in its Dv.**formula1** field has a Dv.**valType** equal to 3, then the following MUST be true:

- If **rgce** contains a PtgArea3d or a PtgAreaErr3d then the PtgArea3d or PtgAreaErr3d MUST be the only Ptg in **rgce**.
- The root node of the parse tree of this field MUST NOT be a VALUE TYPE, as described in Rgce.

If this **DVParsedFormula** is in Dv.formula2 field, then the following MUST be true:

- **rgce** MUST NOT contain a PtgArea3d or a PtgAreaErr3d.
- A PtgArea, a PtgAreaErr, or a PtgAreaN, MUST NOT be the only Ptg in rgce.
- The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

2.5.198.10 ExtNameParsedFormula

The **ExtNameParsedFormula** structure specifies a formula (section <u>2.2.2</u>) used in an <u>external</u> <u>defined name</u>.

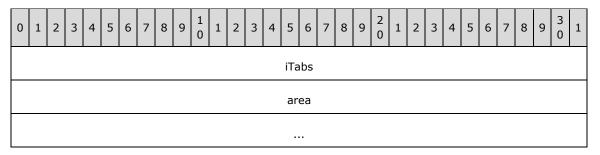

- **cb** (2 bytes): An unsigned integer that specifies the number of bytes in **extPtg** + the number of bytes in **val**. If the **defined name** that this external defined name specifies does not exist in its containing **workbook**, this value MUST be 0, and **extPtg** and **val** MUST NOT exist.
- **extPtg (1 byte):** An unsigned integer that specifies the formula type of **val**. This field MUST exist if and only if **cb** is greater than 0. MUST be one of the values as specified in the table in the **val** field section.
- val (variable): An optional field that specifies the formula of an external defined name. If the formula cannot be represented correctly with one formula types allowed in this field, then this field MUST specify an ExtPtgErr formula. This field MUST exist if and only if cb is greater than 0. The size and the type of the formula vary based on the value of extPtg as follows:

extPtg value	Val field Data and Meaning
0x3A	Specifies an ExtPtgRef3D formula.

extPtg value	Val field Data and Meaning
0x3B	Specifies an ExtPtgArea3D formula.
0x3C	Specifies an ExtPtgRefErr3D formula.
0x3D	Specifies an ExtPtgAreaErr3D formula.
0x1C	Specifies an ExtPtgErr formula.

2.5.198.11 ExtPtgArea3D

The **ExtPtgArea3D** structure is a variation of <u>PtgArea3d</u> that is used by formulas in an <u>external defined name</u>. It specifies a rectangular **cell** range on one or more **sheet**.

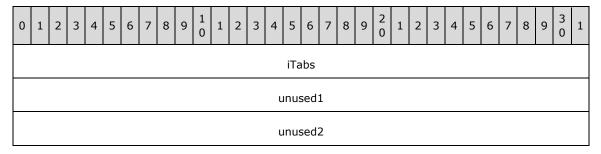

iTabs (4 bytes): An ExtSheetPair that specifies the sheet or sheets containing the range.

area (8 bytes): A RgceAreaRel that specifies the location of the range of cells within a sheet.

2.5.198.12 ExtPtgAreaErr3D

The **ExtPtgAreaErr3D** structure is a variation of <u>PtgAreaErr3d</u> that is used by formulas in an <u>external defined name</u>. It specifies an invalid reference to a regular range of cells on one or more **sheets**.

iTabs (4 bytes): An <u>ExtSheetPair</u> that specifies the sheet or sheets containing the target of this reference.

unused1 (4 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

2.5.198.13 ExtPtgErr

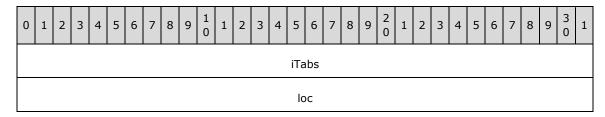

The **ExtPtgErr** structure is a variation of <u>PtgErr</u> that is used by formulas in an external defined name. It specifies an invalid **cell** reference.

err (1 byte): A BErr that specifies the value of this error. The value MUST be 0x17.

2.5.198.14 ExtPtgRef3D

The **ExtPtgRef3D** structure is a variation of <u>PtgRef3d</u> that is used by formulas in an <u>external defined</u> <u>name</u>. It specifies the location of a single **cell** on one or more **sheets**.

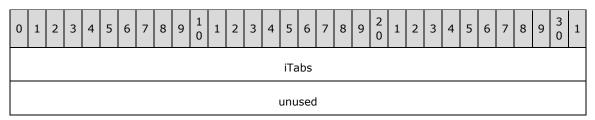

iTabs (4 bytes): An ExtSheetPair that specifies the sheet or sheets containing the cell.

loc (4 bytes): A RaceLocRel that specifies the location of a cell within a sheet.

2.5.198.15 ExtPtgRefErr3D

The **ExtPtgRefErr3D** structure is a variation of <u>PtgRefErr3d</u> that is used by formulas in an <u>external</u> <u>defined name</u>. It specifies an invalid single **cell** reference on one or more **sheets**.

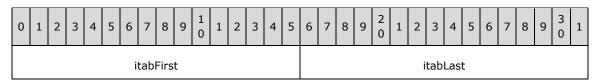

iTabs (4 bytes): An <u>ExtSheetPair</u> that specifies the sheet or sheets containing the target of this reference.

unused (4 bytes): Undefined and MUST be ignored.

2.5.198.16 ExtSheetPair

The **ExtSheetPair** structure specifies a pair of **sheets** in the formulas of an <u>external defined name</u>. The sheets are in the <u>External Workbook</u> as specified by the preceding <u>SupBook</u> record.

itabFirst (2 bytes): A signed integer that specifies the first sheet of a single or multi-sheet reference. It MUST be a value from the following table:

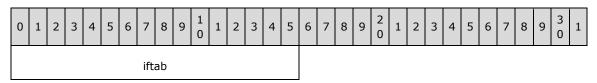

Value	Meaning
-1	Specifies that the first sheet of this reference could not be found.
>=0	This value specifies the zero-based index of an XLUnicodeString in the regst field of the preceding SupBook record. The XLUnicodeString specifies the name of the first referenced sheet within the supporting workbook. This value MUST be less than the value of the ctab field in the preceding SupBook record.

itabLast (2 bytes): A signed integer that specifies the last sheet of a single or multi-sheet reference. The value MUST be greater than or equal to **itabFirst** if it is not -1 and MUST be a value from the following table:

Value	Meaning
-1	Specifies that the last sheet of this reference could not be found.
>=0	This value specifies the zero-based index of an XLUnicodeString in the rgst field of the preceding SupBook record. The XLUnicodeString specifies the name of the last referenced sheet within the supporting workbook. This value MUST be less than the value of the ctab field in the preceding SupBook record.

2.5.198.17 Ftab

The **Ftab** structure specifies a function which can be called from a formula (section 2.2.2). The definition of each function specifies the function name and the valid sequence of arguments.

iftab (2 bytes): An unsigned integer that specifies the function to be called. MUST be a value from the following table:

The elements ref and val are specified in Rgce.

Value	Meaning
0x0000	COUNT
	count-params = (ref / val), *29(ref / val)
0x0001	IF
	if-params = val, *2(ref / val)
0x0002	ISNA
	isna-params = val
0x0003	ISERROR
	iserror-params = val
0x0004	SUM
	sum-params = (ref / val), *29(ref / val)

Value	Meaning
0x0005	AVERAGE
	average-params = (ref / val), *29(ref / val)
0x0006	MIN
	min-params = (ref / val), *29(ref / val)
0x0007	MAX
	max-params = (ref / val), *29(ref / val)
0x0008	ROW
	row-params = [ref]
0x0009	COLUMN
	column-params = [ref]
0x000A	NA
	This function takes no parameters
0x000B	NPV
	npv-params = val, (ref / val), *28(ref / val)
0x000C	STDEV
	stdev-params = (ref / val), *29(ref / val)
0x000D	DOLLAR
	dollar-params = val, [val]
0x000E	FIXED
	fixed-params = val, [val, [val]]
0x000F	SIN
	sin-params = val
0x0010	cos
	cos-params = val
0x0011	TAN
	tan-params = val
0x0012	ATAN
	atan-params = val
0x0013	PI
	This function takes no parameters
0x0014	SQRT
	sqrt-params = val

Value	Meaning
0x0015	EXP
	exp-params = val
0x0016	LN
	In-params = val
0x0017	LOG10
	log10-params = val
0x0018	ABS
	abs-params = val
0x0019	INT
	int-params = val
0x001A	SIGN
	sign-params = val
0x001B	ROUND
	round-params = val, val
0x001C	LOOKUP
	lookup-params = val, (ref / val), [ref / val]
0x001D	INDEX
	index-params = (ref / val), val, *2(val)
0x001E	REPT
	rept-params = val, val
0x001F	MID
	mid-params = val, val
0x0020	LEN
	len-params = val
0x0021	VALUE
	value-params = val
0x0022	TRUE
	This function takes no parameters
0x0023	FALSE
	This function takes no parameters
0x0024	AND
	and-params = (ref / val), *29(ref / val)

Value	Meaning
0x0025	OR
	or-params = (ref / val), *29(ref / val)
0x0026	NOT
	not-params = val
0x0027	MOD
	mod-params = val, val
0x0028	DCOUNT
	dcount-params = ref, (ref / val), (ref / val)
0x0029	DSUM
	dsum-params = ref, (ref / val), (ref / val)
0x002A	DAVERAGE
	daverage-params = ref, (ref / val), (ref / val)
0x002B	DMIN
	dmin-params = ref, (ref / val), (ref / val)
0x002C	DMAX
	dmax-params = ref, (ref / val), (ref / val)
0x002D	DSTDEV
	dstdev-params = ref, (ref / val), (ref / val)
0x002E	VAR
	var-params = (ref / val), *29(ref / val)
0x002F	DVAR
	dvar-params = ref, (ref / val), (ref / val)
0x0030	TEXT
	text-params = val, val
0x0031	LINEST
	linest-params = (ref / val), [(ref / val), *2(ref / val)]
0x0032	TREND
	trend-params = (ref / val), [(ref / val), [(ref / val), [ref / val]]]
0x0033	LOGEST
	logest-params = (ref / val), [(ref / val), *2(ref / val)]
0x0034	GROWTH
	growth-params = (ref / val), [(ref / val), [(ref / val), [ref / val]]]

Value	Meaning
0x0035	GOTO
	goto-params = ref
0x0036	HALT
	halt-params = [val]
0x0037	RETURN
	return-params = [ref / val]
0x0038	PV
	pv-params = val, val, *2(val)
0x0039	FV
	fv-params = val, val, *2(val)

2.5.198.18 Ilel

The **Ilel** structure specifies a deleted label in use by a **natural language formula**.<176>

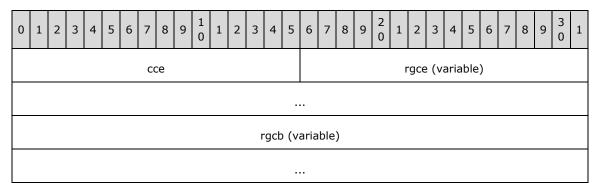

ilel (2 bytes): An unsigned integer used to calculate the index into the collection of <u>Lel</u> records in the <u>Globals Substream</u>. The referenced Lel specifies the deleted label in use. MUST be a value from the following table.

Value	Meaning									
0	Invalid index. The number of deleted labels is greater than 2047, the maximum size of the array of deleted labels.									
1	Invalid index.									

Value	Meaning
Greater than 1 and less than or equal to 2048	The one-based index plus 1 of the Lel record.

2.5.198.19 ListParsedArrayFormula

The ListParsedArrayFormula structure specifies a formula (section 2.2.2) used in a table.

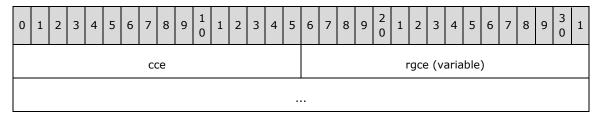

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than 0.

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST NOT contain <u>PtgExp</u>, <u>PtgTbl</u>, <u>PtgElfLel</u>, <u>PtgElfRw</u>, <u>PtgElfCol</u>, <u>PtgElfRwV</u>, <u>PtgElfColV</u>, <u>PtgElfRadical</u>, <u>PtgElfRadicalS</u>, <u>PtgElfColS</u>, <u>PtgElfColSV</u>, <u>PtgElfRadicalLel</u>, or <u>PtgSxName</u>.

rgcb (variable): An RgbExtra that specifies ancillary data for the formula.

2.5.198.20 ListParsedFormula

The **ListParsedFormula** structure specifies a formula (section 2.2.2) used in a table.

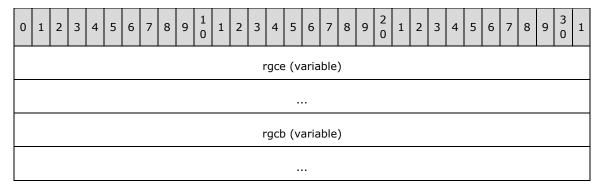

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than
0.

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST NOT contain <u>PtgExp</u>, <u>PtgElfLel</u>, <u>PtgElfRw</u>, <u>PtgElfRw</u>, <u>PtgElfRwV</u>, <u>PtgElfRolV</u>, <u>PtgElfRadical</u>, <u>PtgElfRadicalS</u>, <u>PtgElfColS</u>, <u>PtgElfColSV</u>, <u>PtgElfRadicalLel</u>, or <u>PtgSxName</u>.

2.5.198.21 NameParsedFormula

The **NameParsedFormula** structure specifies a formula (section 2.2.2) used in a **defined name**.

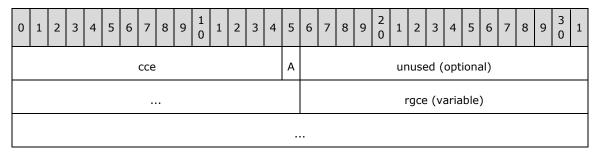

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgElfRed, PtgRefN, PtgRefErr, PtgArea, PtgAreaN, or PtgAreaErr. The size of rgce in bytes is specified by the cce field of the Lbl record.

rgcb (variable): An RgbExtra that specifies ancillary data for the formula.

2.5.198.22 ObjectParsedFormula

The **ObjectParsedFormula** structure specifies a formula (section <u>2.2.2</u>) used by an **embedded object**.

cce (15 bits): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than 0.

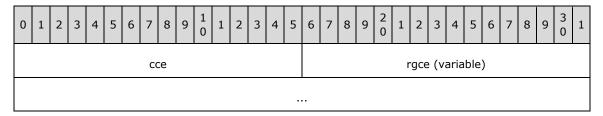

A - reserved (1 bit): MUST be zero, and MUST be ignored.

unused (4 bytes): Undefined and MUST be ignored.

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST contain one Ptg only, and this Ptg MUST be <u>PtgTbl</u>, <u>PtgName</u>, <u>PtgName</u>X, <u>PtgErr</u>, <u>PtgRefErr</u>, <u>PtgRefErr</u>, <u>PtgRef3d</u>, <u>PtgAreaErr</u>, <u>PtgAreaErr</u>, <u>PtgAreaErr</u>, <u>PtgAreaErr3d</u>.

2.5.198.23 ParameterParsedFormula

The **ParameterParsedFormula** structure specifies a formula (section 2.2.2) for a query parameter.

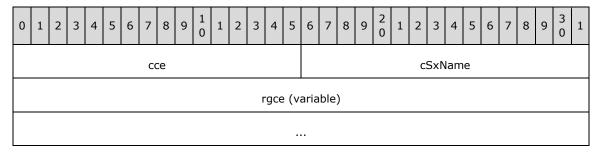

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than
0.

rgce (variable): An <u>Rgce</u> that specifies the sequence of Ptgs for the formula. MUST NOT contain <u>PtgExp</u>, <u>PtgTbl</u>, <u>PtgArray<177></u>, <u>PtgMemArea</u>, <u>PtgElfLel</u>, <u>PtgElfRw</u>, <u>PtgElfCol</u>, <u>PtgElfRwV</u>, <u>PtgElfRadical</u>, <u>PtgElfRadicalS</u>, <u>PtgElfRadicalS</u>, <u>PtgElfRadicalLel</u>, or <u>PtgSxName</u>.

The root node of the parse tree of this field MUST NOT be a VALUE_TYPE, as described in Rgce.

2.5.198.24 PivotParsedFormula

The **PivotParsedFormula** structure specifies a formula (section 2.2.2) used in a <u>PivotTable</u>.

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes.

cSxName (2 bytes): An unsigned integer that specifies number of contiguous <u>SxName</u> records that follow the <u>SxFmla</u> record that contains this formula.

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgUnion, PtgIsect, PtgRange, PtgArray, PtgAttrSpaceSemi, PtgAttrSemi, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgRef, PtgRefErr, PtgRefN, PtgArea, PtgAreaErr, PtgAreaN, PtgArea3d, PtgAreaErr3d, PtgAreaErr3d, PtgAreaErr3d, PtgName, PtgNameX, PtgMemArea, PtgMemErr, PtgMemNoMem, or PtgMemFunc.

If this field contains a PtgFunc, then the iftab field of the PtgFunc MUST be less than 0x0028 or greater than 0x002D and MUST NOT be equal to 0x002F, 0x00BD, 0x00C3, 0x00C4, or 0x00C7.

If this field contains a <u>PtgFuncVar</u>, then the **fCeFunc** field of the PtgFuncVar MUST be 0 and the **tab** field of the PtgFuncVar MUST NOT be equal to 0x00FF or 0x0166.

The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

2.5.198.25 Ptg

The **Ptg** structure specifies a single element of a formula (section 2.2.2). The value of the first byte determines which structure it represents and MUST be one of the values in the first column of the following table. If the value of the first byte is 0x18 or 0x19, then the second byte determines which structure it represents and MUST be one of the values in the second column of the following table.

First byte	Second byte	Ptg
0x01		<u>PtgExp</u>
0x02		<u>PtgTbl</u>
0x03		<u>PtgAdd</u>
0x04		<u>PtgSub</u>
0x05		<u>PtgMul</u>

First byte	Second byte	Ptg
0x06		PtgDiv
0x07		<u>PtgPower</u>
0x08		PtgConcat
0x09		PtgLt
0x0A		<u>PtgLe</u>
0x0B		<u>PtgEq</u>
0x0C		<u>PtgGe</u>
0x0D		<u>PtgGt</u>
0x0E		<u>PtgNe</u>
0x0F		<u>PtgIsect</u>
0x10		<u>PtgUnion</u>
0x11		<u>PtgRange</u>
0x12		<u>PtgUplus</u>
0x13		<u>PtgUminus</u>
0x14		<u>PtgPercent</u>
0x15		<u>PtgParen</u>
0x16		<u>PtgMissArg</u>
0x17		<u>PtgStr</u>
0x18	0x01	<u>PtgElfLel</u>
0x18	0x02	<u>PtgElfRw</u>
0x18	0x03	<u>PtgElfCol</u>
0x18	0x06	<u>PtgElfRwV</u>
0x18	0x07	<u>PtgElfColV</u>
0x18	0x0A	<u>PtgElfRadical</u>
0x18	0x0B	<u>PtgElfRadicalS</u>
0x18	0x0D	<u>PtgElfColS</u>
0x18	0x0F	<u>PtgElfColSV</u>
0x18	0x10	<u>PtgElfRadicalLel</u>
0x18	0x1D	<u>PtgSxName</u>
0x19	0x01	<u>PtgAttrSemi</u>
0x19	0x02	<u>PtgAttrIf</u>
0x19	0x04	<u>PtgAttrChoose</u>
0x19	0x08	<u>PtgAttrGoto</u>
0x19	0x10	<u>PtgAttrSum</u>
0x19	0x20	<u>PtgAttrBaxcel</u>
0x19	0x21	PtgAttrBaxcel
0x19	0x40	<u>PtgAttrSpace</u>
0x19	0x41	<u>PtgAttrSpaceSemi</u>
0x1C		<u>PtgErr</u>
0x1D		<u>PtgBool</u>

First byte	Second byte	Ptg
0x1E		<u>PtgInt</u>
0x1F		<u>PtgNum</u>
0x20		<u>PtgArray</u>
0x21		<u>PtgFunc</u>
0x22		<u>PtgFuncVar</u>
0x23		<u>PtgName</u>
0x24		<u>PtgRef</u>
0x25		<u>PtgArea</u>
0x26		<u>PtgMemArea</u>
0x27		<u>PtgMemErr</u>
0x28		<u>PtgMemNoMem</u>
0x29		<u>PtgMemFunc</u>
0x2A		<u>PtgRefErr</u>
0x2B		<u>PtgAreaErr</u>
0x2C		<u>PtgRefN</u>
0x2D		<u>PtgAreaN</u>
0x39		<u>PtgNameX</u>
0x3A		PtgRef3d
0x3B		PtgArea3d
0x3C		PtgRefErr3d
0x3D		PtgAreaErr3d
0x40		PtgArray
0x41		PtgFunc
0x42		PtgFuncVar
0x43		PtgName
0x44		PtgRef
0x45		PtgArea
0x46		PtgMemArea
0x47		PtgMemErr
0x48		PtgMemNoMem
0x49		PtgMemFunc
0x4A		PtgRefErr
0x4B		PtgAreaErr
0x4C		PtgRefN
0x4D		PtgAreaN
0x59		PtgNameX
0x5A		PtgRef3d
0x5B		PtgArea3d
0x5C		PtgRefErr3d
0x5D		PtgAreaErr3d

First byte	Second byte	Ptg
0x60		PtgArray
0x61		PtgFunc
0x62		PtgFuncVar
0x63		PtgName
0x64		PtgRef
0x65		PtgArea
0x66		PtgMemArea
0x67		PtgMemErr
0x68		PtgMemNoMem
0x69		PtgMemFunc
0x6A		PtgRefErr
0x6B		PtgAreaErr
0x6C		PtgRefN
0x6D		PtgAreaN
0x79		PtgNameX
0x7A		PtgRef3d
0x7B		PtgArea3d
0x7C		PtgRefErr3d
0x7D		PtgAreaErr3d

2.5.198.26 PtgAdd

The PtgAdd structure specifies a <u>binary-value-operator</u> that adds the second expression in a binary-value-expression to the first.

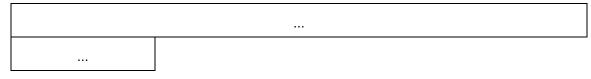

ptg (7 bits): Reserved. MUST be 0x03.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.27 PtgArea

The **PtgArea** operand specifies a reference to a rectangular **range** of **cells**.

(0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			ptg A B area																													

ptg (5 bits): Reserved. MUST be 0x05.

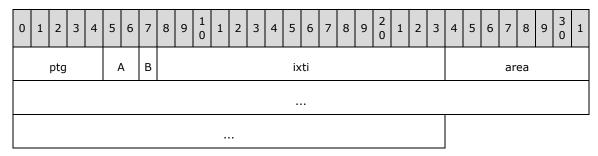

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

area (8 bytes): A RgceArea that specifies the referenced range of cells.

2.5.198.28 PtgArea3d

The **PtgArea3d** operand specifies a reference to the same rectangular **range** of **cells** on one or more **sheets**. If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview, then there MUST be a <u>RevExtern</u> in the <u>RgbExtra</u> corresponding to this PtgArea3d, which specifies those sheets.

ptg (5 bits): Reserved. MUST be 0x1B.

A - type (2 bits): A PtqDataType that specifies the required data type for the value of the Ptq

B - reserved (1 bit): MUST be zero, and MUST be ignored.

ixti (2 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview, then this value is an XtiIndex that specifies the XTI which specifies those sheets. Otherwise it is undefined and MUST be ignored.

area (8 bytes): A value that specifies coordinates of the referenced range of cells. If this PtgArea3d is part of a NameParsedFormula then this is an RgceAreaRel value. Otherwise it is an RgceArea

2.5.198.29 PtgAreaErr

The **PtgAreaErr** operand specifies an invalid reference to a **cell range**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		ptg			ļ	4	В		unused1 unused2														2								
unused3 unused4																															
									unused3 unused																						

ptg (5 bits): Reserved. MUST be 0x0B.

A - type (2 bits): A PtqDataType that specifies the data type for the value of this Ptq.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

unused3 (2 bytes): Undefined and MUST be ignored.

unused4 (2 bytes): Undefined and MUST be ignored.

2.5.198.30 PtgAreaErr3d

PtgAreaErr3d operand specifies an invalid reference to the same rectangular **range** of **cells** on one or more **sheets**. If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview, then there MUST be a <u>RevExtern</u> in the <u>RgbExtra</u> corresponding to this PtgAreaErr3d, which specifies those sheets.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		ptg		A B ixti															u	ınus	sed	1									
														ι	ınus	sed	2									u	ınus	sed:	3		
														l	ınus	sed ⁴	4														

ptg (5 bits): Reserved. MUST be 0x1D.

A - type (2 bits): A PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the required data type for the value of the PtgDataType that specifies the https://example.com/PtgDataType the https://example.com/PtgDataType that specifies the https://example.com/PtgDataType the <a href="http

B - reserved (1 bit): MUST be zero, and MUST be ignored.

ixti (2 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview, then this value is an XtiIndex that specifies the XTI which specifies those sheets. Otherwise it is undefined and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

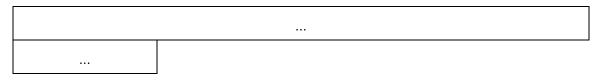

unused3 (2 bytes): Undefined and MUST be ignored.

unused4 (2 bytes): Undefined and MUST be ignored.

2.5.198.31 PtgAreaN

The **PtgAreaN** operand specifies a reference to a rectangular **range** of **cells** as an **RgceAreaRel**.

(1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		ptg			Å	۹	В												ar	ea											

ptg (5 bits): Reserved. MUST be 0x0D.

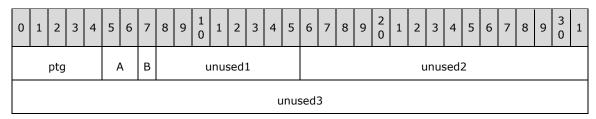

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

area (8 bytes): An RgceAreaRel that specifies the referenced range.

2.5.198.32 PtgArray

The **PtgArray** operand specifies an array of values. There MUST be a <u>PtgExtraArray</u> in the <u>RgbExtra</u> corresponding to this PtgArray. The correspondence between PtgArray and PtgExtraArray structures is specified in RgbExtra.

ptg (5 bits): Reserved. MUST be 0x00.

A - type (2 bits): A PtqDataType that specifies the data type for this array. MUST be 2 or 3.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

unused1 (1 byte): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

unused3 (4 bytes): Undefined and MUST be ignored.

2.5.198.33 PtgAttrBaxcel

The **PtgAttrBaxcel** structure specifies that the result of the <u>Rgce</u> is to be assigned to a local variable used in a **macro sheet**.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - bitSemi (1 bit): A bit that specifies whether this Rgce is **volatile**.

C - reserved2 (4 bits): MUST be zero, and MUST be ignored.

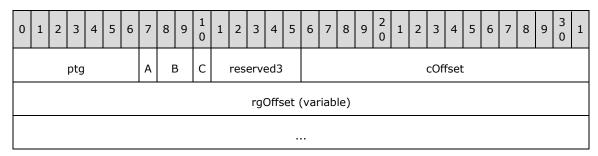

D - bitBaxcel (1 bit): Reserved. MUST be 1.

E - reserved3 (2 bits): MUST be zero, and MUST be ignored.

unused (2 bytes): Undefined and MUST be ignored.

2.5.198.34 PtgAttrChoose

The **PtgAttrChoose** structure specifies a <u>control token</u>.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - reserved2 (2 bits): MUST be zero, and MUST be ignored.

C - bitChoose (1 bit): Reserved. MUST be 1.

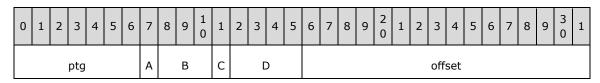

reserved3 (5 bits): MUST be zero, and MUST be ignored.

cOffset (2 bytes): An unsigned integer that specifies a value which is 1 less than the number of elements in **rgOffset.**

rgOffset (variable): An array of 2-byte unsigned integers that specifies the byte offsets.

2.5.198.35 PtgAttrGoto

The **PtgAttrGoto** structure specifies a <u>control token</u>.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - reserved2 (3 bits): MUST be zero, and MUST be ignored.

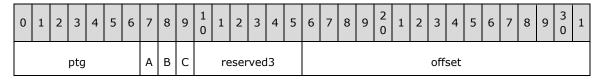

C - bitGoto (1 bit): If the formula (section <u>2.2.2</u>) containing this structure is not part of a <u>ArrayParsedFormula</u> then the bit is reserved and MUST be 1. If the formula containing this structure is part of an ArrayParsedFormula, then the bit is undefined and MUST be ignored.

D - reserved3 (4 bits): MUST be zero, and MUST be ignored.

offset (2 bytes): An unsigned integer that specifies a value 1 less than the byte offset.

2.5.198.36 PtgAttrIf

The **PtgAttrIf** structure specifies a <u>control token</u>.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - reserved2 (1 bit): MUST be zero, and MUST be ignored.

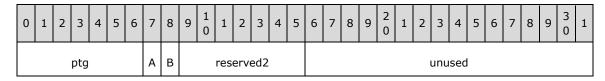

C - bitIf (1 bit): Reserved. MUST be 1

reserved3 (6 bits): MUST be zero, and MUST be ignored.

offset (2 bytes): An unsigned integer that specifies the byte offset.

2.5.198.37 PtgAttrSemi

The **PtgAttrSemi** structure specifies that this **Rgce** is **volatile**.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

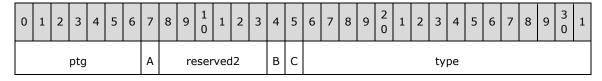

B - bitSemi (1 bit): Reserved. MUST be 1.

reserved2 (7 bits): MUST be zero, and MUST be ignored.

unused (2 bytes): Undefined and MUST be ignored.

2.5.198.38 PtgAttrSpace

The **PtgAttrSpace** <u>display token</u> specifies a number of space or carriage return characters that are displayed around the expression in a <u>display-precedence-expression</u>.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

reserved2 (6 bits): MUST be zero, and MUST be ignored.

B - bitSpace (1 bit): Reserved. MUST be 1.

C - reserved3 (1 bit): MUST be zero, and MUST be ignored.

type (2 bytes): A PtgAttrSpaceType that specifies a number of space or carriage return characters and the position of those characters

2.5.198.39 PtgAttrSpaceSemi

The **PtgAttrSpaceSemi** structure specifies a number of space or carriage return characters that are displayed around the expression in a display-precedence-specifier and that the Rgce is **volatile**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			ptg				Α			re	ser	vec	12										ty	ре							

ptg (7 bits): Reserved. MUST be 0x19.

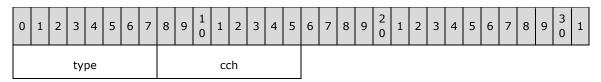

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

reserved2 (1 byte): Reserved. MUST be 0x41.

type (2 bytes): A PtgAttrSpaceType that specifies a number of space or carriage return characters and position of those characters

2.5.198.40 PtgAttrSpaceType

The **PtgAttrSpaceType** structure specifies the number of space or carriage return characters and position of those characters.

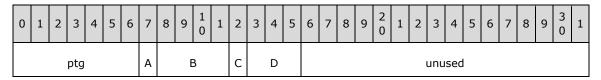

type (1 byte): An unsigned integer that specifies the character and position of the character. MUST be a value from the following table:

Value	Meaning
0x00	Specifies space characters before a <u>base-expression</u> .
0x01	Specifies carriage return characters before a base-expression.
0x02	Specifies space characters before the open parenthesis specified by PtgParen in a display-precedence-specifier.
0x03	Specifies carriage return characters before the open parenthesis specified by PtgParen in a display-precedence-specifier.
0x04	Specifies space characters before the close parenthesis specified by PtgParen in a display-precedence-specifier.
0x05	Specifies carriage return characters before the close parenthesis specified by PtgParen in a display-precedence-specifier.
0x06	Specifies space characters before an expression.

cch (1 byte): An unsigned integer that specifies the number of characters.

2.5.198.41 PtgAttrSum

The **PtgAttrSum** structure specifies the sum of an expression as defined in <u>function-call</u>.

ptg (7 bits): Reserved. MUST be 0x19.

A - reserved1 (1 bit): MUST be zero, and MUST be ignored.

B - reserved2 (4 bits): MUST be zero, and MUST be ignored.

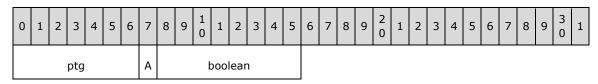

C - bitSum (1 bit): Reserved. MUST be 1.

D - reserved3 (3 bits): MUST be zero, and MUST be ignored.

unused (2 bytes): Undefined and MUST be ignored.

2.5.198.42 PtgBool

The **PtgBool** operand specifies a Boolean value.

ptg (7 bits): Reserved. MUST be 0x1D.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

boolean (1 byte): A Boolean (section 2.5.14) that specifies the value.

2.5.198.43 PtgConcat

The **PtgConcat** structure specifies a <u>binary-value-operator</u> that appends the second expression in binary-value-expression to the first.

ptg (7 bits): Reserved. MUST be 0x08.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

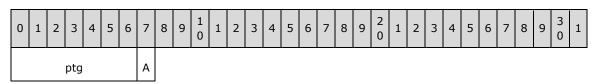

2.5.198.44 PtgDataType

The **PtgDataType** enumeration specifies the data type of a Ptg. MUST be a value from the following table:

Name	Value	Meaning
REFERENCE	0x1	Specifies a reference to a range .
VALUE	0x2	Specifies a single value of a simple type. The type can be a Boolean, a number, a string, or an error code.
ARRAY	0x3	Specifies an array of values.

2.5.198.45 PtgDiv

The **PtgDiv** structure specifies a <u>binary-value-operator</u> that divides the first expression in a binary-value-expression by the second.

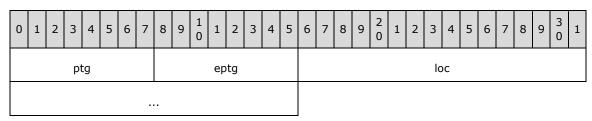

ptg (7 bits): Reserved. MUST be 0x06.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.46 PtgElfCol

The **PtgElfCol natural language formula** operand specifies a reference class reference to a range within a column which is represented by a single-cell **natural language label**.

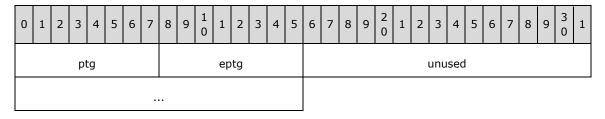

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x03.

loc (4 bytes): An RaceElfLoc that specifies the location of the label.

2.5.198.47 PtgElfColS

The **PtgElfColS natural language formula** <u>operand</u> specifies a <u>reference class</u> reference to a **range** within a column that is identified by a multiple-cell **natural language label**. There MUST be a <u>PtgExtraElf</u> in the <u>RgbExtra</u> corresponding to this PtgElfColS. The correspondence between PtgElfColS and PtgExtraElf structures is specified in RgbExtra.

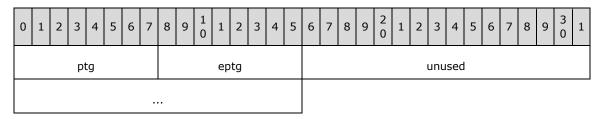

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x0D.

unused (4 bytes): Undefined and MUST be ignored.

2.5.198.48 PtgElfColSV

The **PtgElfColSV natural language formula** <u>operand</u> specifies a <u>value class</u> reference to a **range** within a column that is identified by a multiple-cell **natural language label**. There MUST be a <u>PtgExtraElf</u> in the <u>RgbExtra</u> corresponding to this PtgElfColSV. The correspondence between PtgElfColSV and PtgExtraElf structures is specified in RgbExtra.

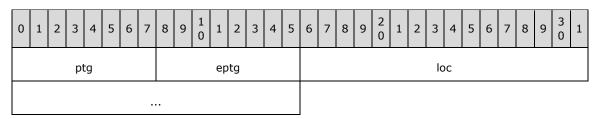

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x0F.

unused (4 bytes): Undefined and MUST be ignored.

2.5.198.49 PtgElfColV

The **PtgElfColV natural language formula** <u>operand</u> specifies a <u>value class</u> reference to a <u>range</u> within a column which is represented by a single-cell **natural language label**.

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x07.

loc (4 bytes): An RgceElfLoc that specifies the location of the label.

2.5.198.50 PtgElfLel

The **PtgElfLel natural language formula** operand specifies a reference to a **range** which is represented by a single-cell **natural language label** or a multiple-cell natural language label that has been deleted.

A reserved

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x01.

ilel (2 bytes): An <u>Ilel</u> that specifies the deleted label.

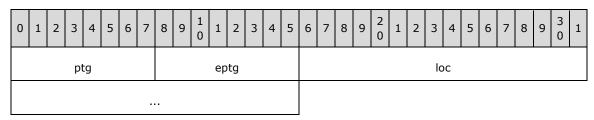

A - fQuoted (1 bit): A bit that specifies whether the occurrences of the label specified in **ilel** are surrounded by single quote characters in the formula (section 2.2.2).

reserved (15 bits): MUST be zero, and MUST be ignored.

2.5.198.51 PtgElfRadical

The **PtgElfRadical natural language formula** operand specifies a <u>reference class</u> reference to a **range** that is represented by a single-cell **natural language label**. The range is specified by <u>PtgArea</u> or <u>PtgAreaErr</u> that follows this PtgElfRadical in the formula (section <u>2.2.2</u>). If this structure is followed in the formula by PtgArea, then one but not both of the following MUST be true:

- The area.rowFirst field is equal to the area.rowLast field of PtgArea, and the loc field specifies
 a label location that is adjacent to the range specified by the area field of PtgArea. The loc.row
 field of this PtgElfRadical is equal to the area.rowFirst field of PtgArea
- The area.columnFirst field is equal to the area.columnLast field of PtgArea, and the loc field specifies a label location that is adjacent to the range specified by the area field of PtgArea. The loc.col field of this PtgElfRadical is equal to the area.columnFirst field of PtgArea

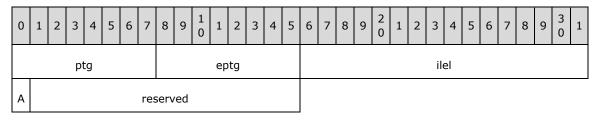

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x0A.

loc (4 bytes): An RgceElfLoc that specifies the location of the label.

2.5.198.52 PtgElfRadicalLel

The **PtgElfRadicalLel natural language formula** operand specifies a <u>reference class</u> reference to a **range** which is represented by a single-cell **natural language label** or a multiple-cell natural language label that has been deleted.

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x10.

ilel (2 bytes): An <u>Ilel</u> that specifies the deleted label.

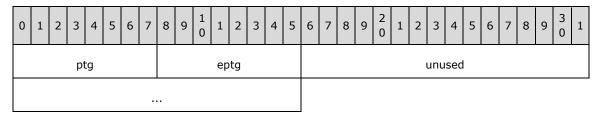

A - fQuoted (1 bit): A bit that specifies whether the occurrences of the label specified in **ilel** are surrounded by single quote characters in the formula (section 2.2.2).

reserved (15 bits): MUST be zero, and MUST be ignored.

2.5.198.53 PtgElfRadicalS

The **PtgElfRadicalS natural language formula** operand specifies a <u>reference class</u> reference to a **range** which is represented by a multiple-cell **natural language label**. The range is specified by the <u>PtgArea</u> or <u>PtgAreaErr</u> record which follows this PtgElfRadicalS in the formula (section <u>2.2.2</u>). There MUST be a <u>PtgExtraElf</u> in the <u>RgbExtra</u> corresponding to this PtgElfRadicalS. The correspondence between PtgElfRadicalS and PtgExtraElf structures is specified in RgbExtra.

If this PtgElfRadicalS is followed in the formula (section 2.2.2) by PtgArea, then the **area.columnFirst** field and the **area.columnLast** field of the PtgArea MUST be equal. Additionally, the last element in the **array** field of the corresponding PtgExtraElf MUST specify a label location that is adjacent to the range specified by the **area** field of PtgArea. The **column.col** field of the last element in the **array** field of PtgExtraElf MUST also be equal to the **area.columnFirst** field of PtgArea.

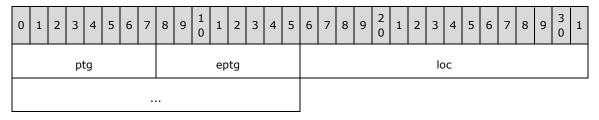

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x0B.

unused (4 bytes): Undefined and MUST be ignored.

2.5.198.54 PtgElfRw

The **PtgElfRw natural language formula** operand specifies a <u>reference class</u> reference to a <u>range</u> within a row which is represented by a single-cell <u>natural language label</u>.

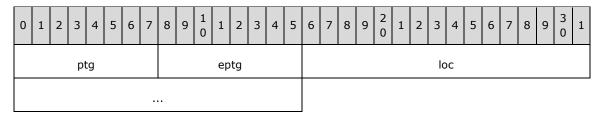

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x02.

loc (4 bytes): An RgceElfLoc that specifies the location of the label.

2.5.198.55 PtgElfRwV

The **PtgElfRwV** natural language formula operand specifies a value class reference to a range within a row which is represented by a single-cell natural language label.

ptg (1 byte): Reserved. MUST be 0x18.

eptg (1 byte): Reserved. MUST be 0x06.

loc (4 bytes): An RaceElfLoc that specifies the location of the label.

2.5.198.56 PtgEq

The **PtgEq** structure specifies the comparison of whether the first <u>expression</u> is equal to the second expression.

ptg (7 bits): Reserved. MUST be 0x0B.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.57 PtgErr

The **PtgErr** operand specifies an error code.

ptg (7 bits): Reserved. MUST be 0x1C.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

err (1 byte): A <u>BErr</u> that specifies the error code.

2.5.198.58 PtgExp

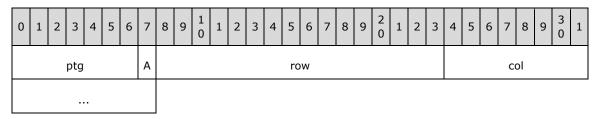

The **PtgExp** structure specifies that the containing $\underline{\text{Rgce}}$ is part of an array formula (section $\underline{2.2.2}$) or shared formula and specifies the row and column of the **cell** in which that formula exists.

The **row** and **col** fields of this structure specify a cell on the current **sheet**. There MUST be a <u>Formula</u> record where the **cell.rw** field of that record is equal to **row**, and **cell.col.col** field of that record is equal to **col**.

That Formula record MUST be followed by either a ShrFmla record or an Array record.

If that Formula record is followed by a ShrFmla, the **row** field of this structure MUST be greater than or equal to the **ref.rwFirst** field and less than or equal to the **ref.rwLast** field of the ShrFmla record, and the **col** field of this structure MUST be greater than or equal to the **ref.colFirst** field and less than or equal to the **ref.colLast** field of the ShrFmla record.

If that Formula record is followed by an Array, the **row** field of this structure MUST be equal to the **ref.rwFirst** field of the Array record, and the **col** field of this structure MUST be equal to the **ref.colFirst** field of the Array record.

ptg (7 bits): Reserved. MUST be 0x01.

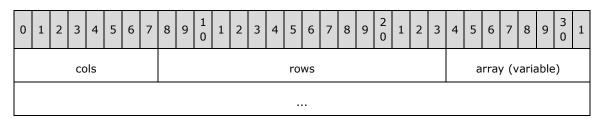

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

row (2 bytes): A <u>Rw</u> that specifies the row of the cell that contains the array formula or shared formula that the containing Rgce is a part of.

col (2 bytes): A <u>Col</u> that specifies the column of the cell that contains the array formula or shared formula that the containing Rgce is a part of.

2.5.198.59 PtgExtraArray

The **PtgExtraArray** structure specifies the values for the corresponding <u>PtgArray</u> as specified in RgbExtra.

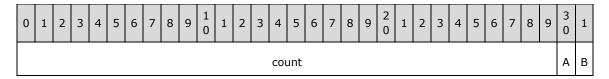

cols (1 byte): A DColByteU that specifies one less than the number of columns in the array.

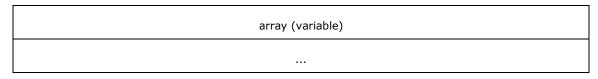

rows (2 bytes): A DRW that specifies one less than the number of rows in the array.

array (variable): An array of <u>SerAr</u> that specifies the values in row-major order. The number of elements MUST be equal to the product of **rows** and **cols**.

2.5.198.60 PtgExtraElf

The **PtgExtraElf** structure specifies a multiple-cell **natural language label** used in a **natural language formula**. The label is specified by a sequence of labels from the given array of **cells**.

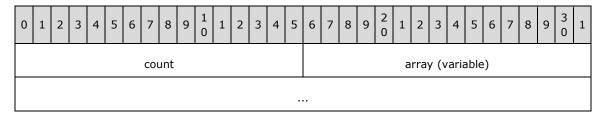

- **count (30 bits):** An unsigned integer that specifies the number of elements in **array**. MUST be greater than 0.
- A reserved (1 bit): MUST be zero, and MUST be ignored
- **B fRel (1 bit):** A bit that specifies whether **relative references** are used in the elements of **array**.
- **array (variable):** An array of RgceElfLocExtra elements that specifies the sequence of **cell references** that specifies the multiple-cell natural language label. The number of elements MUST be equal to **count**.

2.5.198.61 PtgExtraMem

The **PtgExtraMem** structure specifies a **range** that corresponds to a <u>PtgMemArea</u> as specified in RgbExtra.

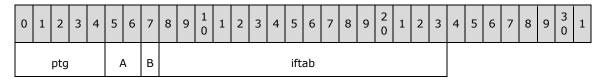

count (2 bytes): An unsigned integer that specifies the areas within the range.

array (variable): An array of <u>Ref8U</u> that specifies the range. The number of elements MUST be equal to **count**.

2.5.198.62 PtgFunc

The **PtgFunc** structure specifies a call to a function with a fixed number of parameters, as defined in function-call.

ptq (5 bits): Reserved. MUST be 0x01.

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

iftab (2 bytes): A <u>Ftab</u> that specifies the function to be called. MUST specify a function with a fixed number of parameters.

2.5.198.63 PtgFuncVar

The **PtgFuncVar** structure specifies a call to a function with a variable number of parameters as defined in <u>function-call</u>.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		ptg			ļ	4	В			C	par	am	S										tab								С

ptg (5 bits): Reserved. MUST be 0x02

A - type (2 bits): A PtqDataType that specifies the data type for the value of this Ptq.

B - reserved (1 bit): MUST be 0, MUST be ignored.

cparams (1 byte): An unsigned integer that specifies the number of parameters. MUST be within the range defined for the function specified by **tab.**

tab (15 bits): A structure that specifies the function to be called. If **fCeFunc** is 1, then this field specifies a **Cetab** value. If **fCeFunc** is 0, then this field specifies a **Ftab** value.

C - fCeFunc (1 bit): A bit that specifies whether tab specifies a Cetab value or a Ftab value.

2.5.198.64 PtgGe

The **PtgGe** structure specifies a <u>binary-value-operator</u> that compares whether the first expression in a binary-value-expression is greater than or equal to the second.

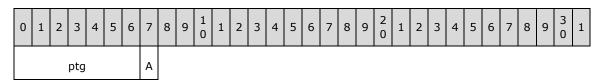

ptg (7 bits): Reserved. MUST be 0x0C.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.65 PtgGt

The **PtgGt** structure specifies a <u>binary-value-operator</u> that compares whether the first expression in a binary-value-expression is greater than the second.

ptg (7 bits): Reserved. MUST be 0x0D.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.66 PtgInt

The **PtgInt** operand specifies an unsigned integer value.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			ptg				Α								inte	ger															

ptg (7 bits): Reserved. MUST be 0x1E.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

integer (2 bytes): An unsigned integer that specifies the value.

2.5.198.67 PtgIsect

The **PtgIsect** structure specifies a <u>binary-reference-operator</u> that intersects the first expression in a binary-reference-expression with the second.

ptg (7 bits): Reserved. MUST be 0x0F.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.68 PtqLe

The **PtgLe** structure specifies a <u>binary-value-operator</u> that compares whether the first expression in a binary-value-expression is less than or equal to the second.

ptq (7 bits): Reserved. MUST be 0x0A.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.69 PtgLt

The **PtgLt** structure specifies a <u>binary-value-operator</u> that compares whether the first expression in a binary-value-expression is less than the second.

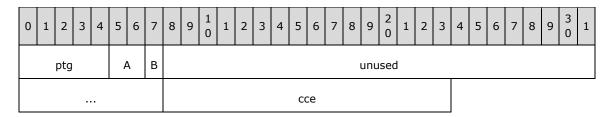

ptg (7 bits): Reserved. MUST be 0x09.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.70 PtgMemArea

The **PtgMemArea** <u>mem token</u> specifies that the result of a <u>binary-reference-expression</u> in a memarea-expression is a **range** of **cells**. The <u>RgbExtra</u> corresponding to this structure MUST contain a <u>PtgExtraMem</u> that specifies the range of cells.

ptg (5 bits): Reserved. MUST be 0x06.

A - type (2 bits): A Ptq.a.a.a.google-ptq.a.a.go

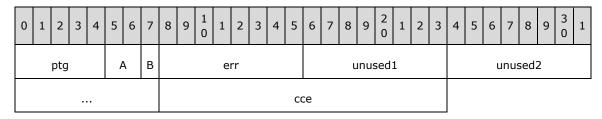

B - reserved (1 bit): MUST be zero, and MUST be ignored.

unused (4 bytes): Undefined and MUST be ignored.

cce (2 bytes): An unsigned integer that specifies the count of bytes in the binary-reference-expression following this structure.

2.5.198.71 PtgMemErr

The **PtgMemErr** mem token specifies that the result of a <u>binary-reference-expression</u> in a mem-area-expression is an error code.

ptg (5 bits): Reserved. MUST be 0x07.

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

err (1 byte): A <u>BErr</u> that specifies the error code value.

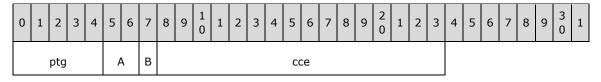

unused1 (1 byte): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

cce (2 bytes): An unsigned integer that specifies the count of bytes in the binary-reference-expression following this structure.

2.5.198.72 PtgMemFunc

The **PtgMemFunc** <u>mem token</u> specifies that the result of a <u>binary-reference-expression</u> in a memarea-expression is variable.

ptg (5 bits): Reserved. MUST be 0x09.

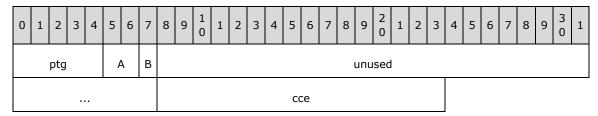

A - type (2 bits): A PtqDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

cce (2 bytes): An unsigned integer that specifies the count of bytes in the binary-reference-expression following this structure.

2.5.198.73 PtgMemNoMem

The **PtgMemNoMem** mem token specifies that the result of the <u>binary-reference-expression</u> in a mem-area-expression failed to cache.

ptg (5 bits): Reserved. MUST be 0x08.

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

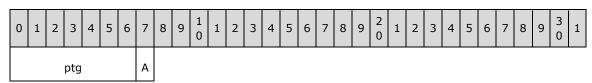

B - reserved (1 bit): MUST be zero, and MUST be ignored.

unused (4 bytes): Undefined and MUST be ignored.

cce (2 bytes): An unsigned integer that specifies the count of bytes in the binary-reference-expression following this structure.

2.5.198.74 PtgMissArg

The **PtgMissArg** operand specifies a missing value.

ptg (7 bits): Reserved. MUST be 0x16.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.75 PtgMul

The **PtgMul** structure specifies a <u>binary-value-operator</u> that multiplies the first and second expressions in a binary-value-expression.

ptg (7 bits): Reserved. MUST be 0x05.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.76 PtgName

The **PtgName** operand specifies a reference to a **defined name** in the same **workbook** as the containing Rgce.

If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview, then there MUST be a RevNameTabid in the RgbExtra corresponding to this PtgName, which specifies those defined name.

ptg (5 bits): Reserved. MUST be 0x03.

A - type (2 bits): A PtgDataType that specifies the required data type for the value of the Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

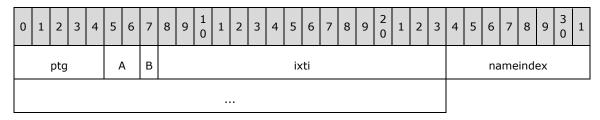

nameindex (4 bytes): If the formula containing this structure is part of a revision as specified in the Formulas overview, then this value is undefined and MUST be ignored. Otherwise it is an unsigned integer that specifies a one-based index of a <u>Lbl</u> record in the collection of Lbl records in the <u>Globals Substream</u>. The referenced Lbl specifies the referenced defined name. MUST be greater than 0 and less than or equal to the number of Lbl records in the workbook.

2.5.198.77 PtgNameX

The **PtgNameX** structure specifies a reference to a **defined name** in an external workbook.

If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview, then there MUST be a <u>RevName</u> in the <u>RgbExtra</u> corresponding to this PtgNameX that specifies the defined name.

If the formula containing this structure is not part of a revision as specified in the Formulas overview (section 2.2.2), then the referenced defined name is specified by an XtiIndex.

ptg (5 bits): Reserved. MUST be 0x19.

A - type (2 bits): A PtgDataType that specifies the required data type for the value of the Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

ixti (2 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview, this value is an XtiIndex that specifies the XTI that specifies the referenced defined name.

If the formula containing this structure is part of a revision as specified in the Formulas overview, this value is undefined and MUST be ignored.

nameindex (4 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview, this value is an unsigned integer that specifies the one-based index of an <u>ExternName</u> record in the collection of ExternName records directly following the <u>SupBook</u> record referenced by ixti. The referenced ExternName and its associated records specify the referenced defined name.

If the formula containing this structure is part of a revision as specified in the Formulas overview, this value is undefined and MUST be ignored.

2.5.198.78 PtgNe

The **PtgNe** structure specifies a <u>binary-value-operator</u> that compares whether the second expression in a binary-value-expression is not equal to the first.

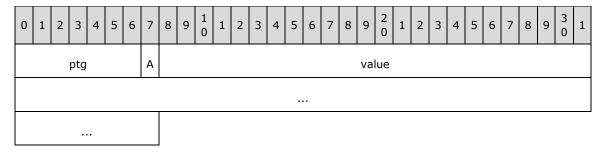

ptg (7 bits): Reserved. MUST be 0x0E.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.79 PtgNum

The **PtgNum** operand specifies a floating-point value.

ptg (7 bits): Reserved. MUST be 0x1F

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

value (8 bytes): An Xnum (section 2.5.342) that specifies the floating-point value.

2.5.198.80 PtgParen

The **PtgParen** <u>display token</u> specifies that parentheses are displayed around the expression in a <u>display-precedence-expression</u>.

ptg (7 bits): Reserved. MUST be 0x15.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.81 PtgPercent

The **PtgPercent** structure specifies a <u>unary-operator</u> which divides the expression in a unary-expression by 100.

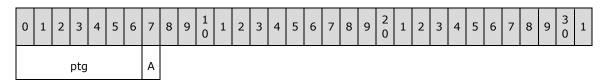

ptg (7 bits): Reserved. MUST be 0x14.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.82 PtgPower

The **PtgPower** structure specifies a <u>binary-value-operator</u> that raises the first expression in a binary-value-expression to the power of the second.

ptg (7 bits): Reserved. MUST be 0x07.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.83 PtgRange

The **PtgRange** structure specifies the range operation, where the minimum bounding rectangle of the first <u>expression</u> and the second expression is generated.

ptg (7 bits): Reserved. MUST be 0x11.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.84 PtgRef

The **PtgRef** operand specifies a reference to a single **cell** as an RgceLoc.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
		ptg			ļ	4	В												lo	С											

...

ptg (5 bits): Reserved. MUST be 0x04.

A - type (2 bits): A PtqDataType that specifies the data type for the value of this Ptq.

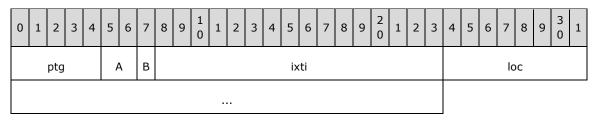

B - reserved (1 bit): MUST be zero, and MUST be ignored.

loc (4 bytes): A RgceLoc value that specifies the coordinates of the referenced cell.

2.5.198.85 PtgRef3d

The **PtgRef3d** operand specifies a reference to a single **cell** on one or more **sheets**.

If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview (section 2.2.2), then there MUST be a <u>RevExtern</u> in the <u>RgbExtra</u> corresponding to this PtgRef3d, which specifies those sheets.

ptg (5 bits): Reserved. MUST be 0x1A.

A - type (2 bits): A PtgDataType that specifies the required data type for the value of the Ptg.

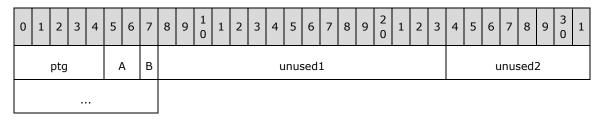

B - reserved (1 bit): MUST be zero, and MUST be ignored.

ixti (2 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview, then this value is an XtiIndex that specifies the XTI which specifies those sheets. Otherwise it is undefined and MUST be ignored.

loc (4 bytes): A value that specifies coordinates of the referenced cell. If this PtgRef3d is part of a NameParsedFormula then this is a RgceLocRel value. Otherwise it is a RgceLoc value.

2.5.198.86 PtgRefErr

The **PtgRefErr** operand specifies an invalid reference to a **cell**.

ptg (5 bits): Reserved. MUST be 0x0A.

A - type (2 bits): A PtqDataType that specifies the data type for the value of this Ptq.

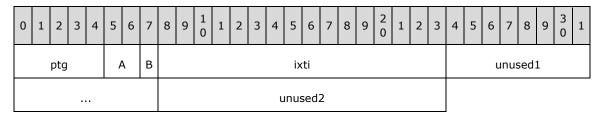

B - reserved (1 bit): MUST be zero, and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

2.5.198.87 PtgRefErr3d

The **PtgRefErr3d** operand specifies an invalid reference to a **cell** on one or more **sheets**. If the formula (section 2.2.2) containing this structure is part of a revision as specified in the Formulas overview (section 2.2.2), then there MUST be a <u>RevExtern</u> in the <u>RgbExtra</u> corresponding to this PtgRefErr3d, which specifies those sheets.

ptg (5 bits): Reserved. MUST be 0x1C.

A - type (2 bits): A PtgDataType that specifies the required data type for the value of the Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

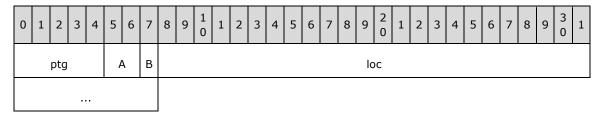

ixti (2 bytes): If the formula containing this structure is not part of a revision as specified in the Formulas overview (section 2.2.2), then this value is an XtiIndex that specifies the XTI which specifies those sheets. Otherwise it is undefined and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (2 bytes): Undefined and MUST be ignored.

2.5.198.88 PtgRefN

The **PtgRefN** operand specifies a reference to a single **cell** as an <u>RgceLocRel</u>.

ptg (5 bits): Reserved. MUST be 0x0C.

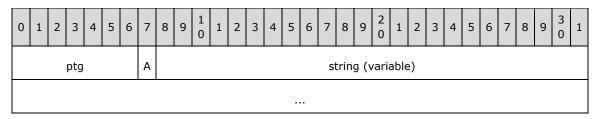

A - type (2 bits): A PtgDataType that specifies the data type for the value of this Ptg.

B - reserved (1 bit): MUST be zero, and MUST be ignored.

loc (4 bytes): An RgceLocRel that specifies the referenced cell.

2.5.198.89 PtgStr

The **PtgStr** operand specifies a **Unicode** string value.

ptg (7 bits): Reserved. MUST be 0x17.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

string (variable): A ShortXLUnicodeString value that specifies the string.

2.5.198.90 PtgSub

The **PtgSub** structure specifies a <u>binary-value operator</u> that subtracts the second expression in a binary-value-expression from the first.

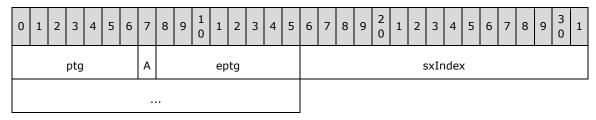

ptg (7 bits): Reserved. MUST be 0x04.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.91 PtgSxName

The **PtgSxName** structure specifies a reference to a <u>calculated field</u> or a <u>calculated item</u> found in a <u>PivotParsedFormula</u>. The <u>Rgce</u> that contains this Ptg MUST be part of the **formula** field of an <u>SxFmla</u> record.

ptg (7 bits): Reserved. MUST be 0x18.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

eptg (1 byte): Reserved. MUST be 0x1D.

sxIndex (4 bytes): An unsigned integer that specifies the zero-based index of an <u>SxName</u> record in the collection of SxName records following an SxFmla record. MUST be less than the value of **formula.cSxName** in the SxFmla record.

2.5.198.92 PtgTbl

The **PtgTbl** structure specifies that the <u>Rgce</u> that contains this PtgTbl is part of a **data table (1)** or an <u>ObjectParsedFormula</u>.

If the Rgce is not part of an ObjectParsedFormula, then there MUST be a <u>Table</u> record in the current part where the **ref.rwFirst** field in Table is equal to **row** and the **ref.colFirst** field in Table is equal to **col**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			ptg				Α								ro	w											C	ol			

ptg (7 bits): Reserved. MUST be 0x02

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

row (2 bytes): An unsigned integer that specifies the first row of the data table (1). MUST be less than 65536. If the Rgce that contains this PtgTbl is part of an ObjectParsedFormula, this field is undefined and MUST be ignored.

col (2 bytes): An unsigned integer that specifies the first column of the data table (1). MUST be less than 256. If the Rgce that contains this PtgTbl is part of an ObjectParsedFormula, this field is undefined and MUST be ignored.

2.5.198.93 PtgUminus

The **PtgUminus** structure specifies a <u>unary-operator</u> which generates the additive inverse of a unary-expression.

ptg (7 bits): Reserved. MUST be 0x13.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.94 PtgUnion

The **PtgUnion** structure specifies a <u>binary-reference-operator</u> that specifies a union of the first expression in a binary-reference-expression with the second.

ptg (7 bits): Reserved. MUST be 0x10.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.95 PtqUplus

The **PtgUplus** structure specifies a <u>unary-operator</u> which leaves a unary-expression unchanged.

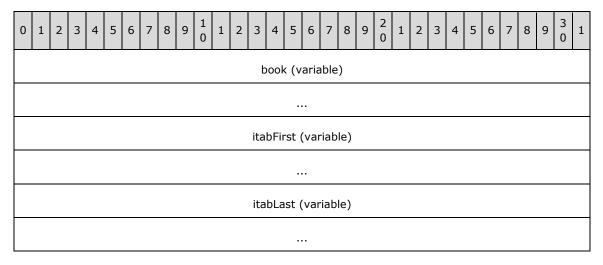

ptg (7 bits): Reserved. MUST be 0x12.

A - reserved0 (1 bit): MUST be zero, and MUST be ignored.

2.5.198.96 RevExtern

The **RevExtern** structure specifies a **range** of **sheets** on a **workbook** that is referenced by a formula (section 2.2.2) in a revision as specified in the Formulas overview (section 2.2.2).

book (variable): Specifies the workbook based on the value of the first byte, according to the following table:

Value	Meaning
0x01	Specifies the current workbook. This field is two bytes in size. The second byte MUST be 0x02.
Any value except 0x01	This field is a <u>VirtualPath</u> that specifies the workbook.

itabFirst (variable): A RevItab that specifies the first sheet in the range.

itabLast (variable): A RevItab that specifies the last sheet in the range.

2.5.198.97 RevItab

The **RevItab** structure specifies a **sheet** of a **workbook** referenced by a formula (section 2.2.2) in a revision as specified in the Formulas overview (section 2.2.2).

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
type tabid (optional) sheet (t (v	aria	able	e)														

type (1 byte): An unsigned integer that specifies the sheet. MUST be a value from the following table:

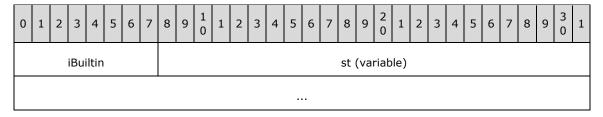

Value	Meaning
0x00	Specifies a sheet on the same workbook. The tabid field specifies the sheet.
0x01	Specifies a sheet on a different workbook. The sheet field specifies the sheet.
0x02	Specifies the same sheet specified by the preceding RevItab.
0x03	Specifies a missing sheet.

tabid (2 bytes): An unsigned integer that specifies a sheet identifier in the current workbook. MUST match a sheet identifier specified by RRTabId. This field MUST be present if and only if **type** is 0x00.

sheet (variable): A <u>XLUnicodeString</u> that specifies the sheet name. This field MUST be present if and only if **type** is 0x01.

2.5.198.98 RevLbIName

The **RevLbIName** structure specifies the name of a **defined name** that is referenced by a formula in a revision as specified in the Formulas overview (section 2.2.2).

iBuiltin (1 byte): An unsigned integer that specifies whether the defined name is a **built-in name**, and if so, which built-in name it is. The value MUST be from the following table:

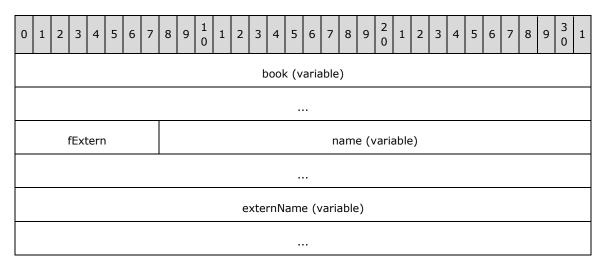

Value	Meaning
0x00	This is not a built-in name.
0x01	Consolidate_Area
0x02	Auto_Open
0x03	Auto_Close
0x04	Extract
0x05	Database
0x06	Criteria
0x07	Print_Area
0x08	Print_Titles

Value	Meaning
0x09	Recorder
0x0A	Data_Form
0x0B	Auto_Activate
0x0C	Auto_Deactivate
0x0D	Sheet_Title
0x0E	_FilterDatabase

st (variable): If **iBuiltin** is 0x00, then **st** is an <u>XLNameUnicodeString</u> that specifies the name of the defined name. Otherwise, **st** is an <u>XLUnicodeString</u> and the name of the defined name is specified as the concatenation of built-in name specified by **iBuiltin** and **st.** The concatenated string MUST match grammar specified for XLNameUnicodeString.

2.5.198.99 RevName

The **RevName** structure specifies a **defined name** referenced by a formula (section 2.2.2) in a revision as specified in the Formulas overview (section 2.2.2).

book (variable): Specifies the **workbook** based on the value of the first byte, according to the following table:

Value	Meaning
0x01	Specifies the current workbook. This field is two bytes in size. The second byte MUST be 0x02.
Any value except 0x01	This field is a <u>VirtualPath</u> that specifies the workbook.

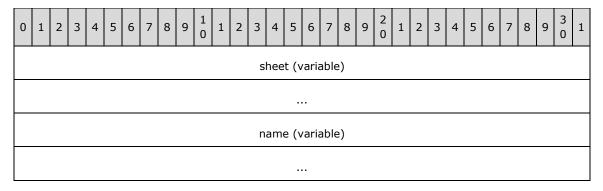

fExtern (1 byte): A Boolean (section 2.5.14) that specifies whether the defined name is defined in the current workbook. MUST be 0x00 if the first byte of **book** is 0x01, and 0x01 otherwise.

name (variable): A <u>RevNameTabid</u> that specifies the name and the scope of the defined name. This field MUST be present if and only if **fExtern** is 0x00.

externName (variable): A <u>RevNamePly</u> that specifies the name and the scope of the defined name. This field MUST be present if and only if **fExtern** is 0x01.

2.5.198.100 RevNamePly

The **RevNamePly** structure specifies a **defined name** in an <u>external workbook</u> that is referenced by a formula (section <u>2.2.2</u>) in a revision as specified in the Formulas overview (section 2.2.2), and the **sheet** on which it is defined.

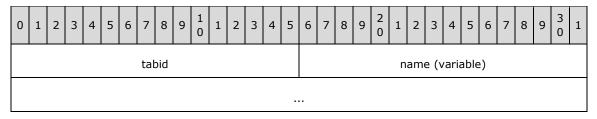

sheet (variable): A RevSheetName that specifies the sheet on which the defined name is defined.

name (variable): A RevLblName that specifies the defined name.

2.5.198.101 RevNameTabid

The **RevNameTabid** structure specifies a non-external **defined name** that is referenced by a formula (section 2.2.2) in a revision as specified in the Formulas overview (section 2.2.2).

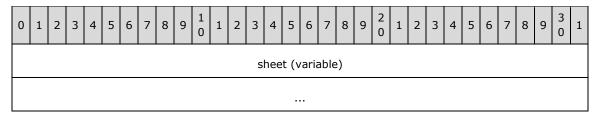

tabid (2 bytes): An unsigned integer that specifies the scope of the defined name. The value MUST be from the following table:

Value	Meaning
0xFFFF	Specifies that the scope is the entire workbook .
Greater than or equal to 1 and less than 0xFFFF	Specifies that the scope is a sheet from the workbook. The value is a sheet identifier which MUST match a sheet identifier specified by RRTabId in the Globals Substream .

name (variable): A RevLblName that specifies the name of the defined name.

2.5.198.102 RevSheetName

The **RevSheetName** structure specifies the **sheet** or **workbook** on which a **defined name** is defined, for a defined name that is referenced by a formula (section <u>2.2.2</u>) in a revision as specified in the Formulas overview (section 2.2.2).

sheet (variable): A <u>XLUnicodeString</u> that specifies the name of the sheet. The length of the string MUST be less than or equal to 31 characters. This field specifies the entire workbook if the length of the string is zero.

2.5.198.103 RgbExtra

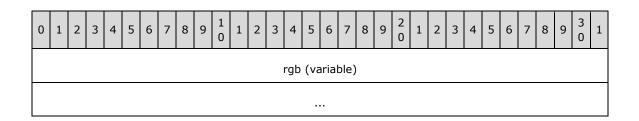

The **RgbExtra** structure specifies a set of structures, laid out sequentially in the file, that correspond to and MUST exist for certain Ptgs in the <u>Rgce</u>. The order of the structures MUST be the same as the order of the Ptgs in the Rgce that they correspond to.

The following Ptgs MUST have a corresponding structure in an RgbExtra.

Ptg	Required structure in an RgbExtra
<u>PtgArray</u>	<u>PtgExtraArray</u>
<u>PtgMemArea</u>	<u>PtgExtraMem</u>
<u>PtgElfRadicalS</u>	<u>PtgExtraElf</u>
<u>PtgElfColS</u>	PtgExtraElf
<u>PtgElfColSV</u>	PtgExtraElf

The following Ptgs MUST have a corresponding structure in an RgbExtra if and only if the formula (section 2.2.2) containing that Ptg is part of a revision as specified in the Formulas overview (section 2.2.2).

Ptg	Required structure in an RgbExtra
<u>PtgName</u>	<u>RevNameTabid</u>
<u>PtgNameX</u>	<u>RevName</u>
PtgRef3d	RevExtern
PtgRefErr3d	RevExtern
PtgArea3d	RevExtern
PtgAreaErr3d	RevExtern

rgb (variable): An array that contains the sequence of these structures.

2.5.198.104 Rgce

The **Rgce** structure specifies a set of <u>Ptq</u>s, laid out sequentially in the file.

The sequence of Ptgs MUST adhere to the following grammar.

EXPRESSION_SIZE is the sum of the sizes of a contiguous set of Ptgs in bytes.

The ACTUAL_PTG_SIZE of a Ptg is as follows:

Ptg	ACTUAL_PTG_SIZE
<u>PtgStr</u>	1 + (stringsize + 1) * 2 where stringsize is the string.cch field of the PtgStr structure
<u>PtgArray</u>	15
<u>PtgRef</u>	7
<u>PtgArea</u>	13
<u>PtgRefErr</u>	7
<u>PtgAreaErr</u>	13
<u>PtgRefN</u>	7
<u>PtgAreaN</u>	13
PtgRef3d	9
PtgArea3d	15
PtgRefErr3d	9
PtgAreaErr3d	16
Any other Ptg	Size of the Ptg in bytes

The ACTUAL_EXPRESSION_SIZE of a contiguous set of Ptgs is the sum of ACTUAL_PTG_SIZEs of those Ptgs. The ACTUAL EXPRESSION SIZE of all Ptgs in an Rgce MUST be less than or equal to 1800.

```
rgce = PtgExp / PtgTbl / [PtgAttrBaxcel / PtgAttrSemi / PtgAttrSpaceSemi] expression
expression = *PtgAttrSpace base-expression
```

The value of the **type** field of each PtgAttrSpace in an expression MUST be 0, 1, or 6.

Each Ptg in this definition is an operand token.

```
unary-expression = val unary-operator
unary-operator = PtgUplus / PtgUminus / PtgPercent
```

Each Ptg in this definition is an operator token.

```
binary-reference-expression = 2ref binary-reference-operator
binary-reference-operator = PtgIsect / PtgUnion / PtgRange
```

Each Ptg in this definition is an operator token.

```
binary-value-expression = 2val binary-value-operator
```

```
binary-value-operator = PtgAdd / PtgSub / PtgMul / PtgDiv / PtgPower / PtgConcat / PtgLt / PtgLe
/ PtgEq / PtgGe / PtgGt / PtgNe
```

Each Ptg in this definition is an operator token.

```
display-precedence-specifier = expression [PtgAttrSpace] PtgParen
```

The value of the **type** field of a PtqAttrSpace MUST be between 2 and 5 inclusive.

PtgAttrSpace and PtgParen are display tokens.

```
mem-area-expression = mem-ptg binary-reference-expression
```

The **cce** field in the Ptg of the mem-ptg rule MUST be equal to the EXPRESSION_SIZE of the Ptgs that comprise the binary-reference-expression.

If mem-ptg is not PtgMemFunc then the expression elements in the binary-reference-expression MUST NOT contain any mem-ptg elements, PtgFunc, PtgFuncVar, PtgF

```
mem-ptg = PtgMemArea / PtgMemErr / PtgMemNoMem / PtgMemFunc
```

Each Ptg in this definition is a mem token.

```
function-call = if-expression / choose-expression / [params-fixed] PtgFunc / params-variable
    PtgFuncVar / params-cetab PtgFuncVar / expression PtgAttrSum
```

The params-fixed element MUST NOT be specified if PtgFunc specifies a function that takes no parameters. Otherwise, it MUST conform to the ABNF rule for the function specified by PtgFunc.

```
if-expression = expression PtgAttrIf 1*2(expression PtgAttrGoto) PtgFuncVar
```

The value of the **offset** field in the PtgAttrIf MUST be equal to the EXPRESSION_SIZE of all Ptgs in the if-expression after the PtgAttrIf through the first PtgAttrGoto.

The value of the **offset** field in each PtgAttrGoto MUST be equal to one less than the EXPRESSION_SIZE of all Ptgs remaining in the if-expression after that PtgAttrGoto.

The value of the **fCeFunc** field of the PtgFuncVar MUST be zero. The value of the **tab** field of the PtgFuncVar MUST be 0x0001, which represents the IF function.

```
{\tt choose-expression = expression \  \, \underline{\tt PtgAttrChoose}} \ 1 \star 29 \, ({\tt expression \  \, PtgAttrGoto}) \  \, \underline{\tt PtgFuncVar}
```

The value of the **cOffset** field in the PtgAttrChoose MUST be equal to the number of times the expression in the repeated sequence group appears.

The first offset in the array of offsets in the **rgOffset** field in the PtgAttrChoose MUST be equal to four less than the size of the PtgAttrChoose in bytes.

For the n^{th} occurrence of the repeated sequence group, the $(n+1)^{th}$ offset in the array of offsets in the **rgOffset** field in the PtgAttrChoose MUST be equal to the EXPRESSION_SIZE of all Ptgs in the choose-expression after the PtgAttrChoose through the n^{th} PtgAttrGoto.

The value of the **offset** field in each PtgAttrGoto MUST equal one less than the EXPRESSION_SIZE of all Ptgs remaining in the choose-expression after that PtgAttrGoto.

The value of the **fCeFunc** field of the PtgFuncVar MUST be zero. The value of the **tab** field of the PtgFuncVar MUST be 0x0064, which represents the CHOOSE function.

val = expression

Additional restrictions are specified under VALUE_TYPE. The params-fixed, params-variable and params-cetab rules also use val.

ref = expression

Additional restrictions are specified under VALUE_TYPE. The params-fixed, params-variable and params-cetab rules also use ref.

If the value of the **useselfs** field of the <u>UsesELFs</u> record is zero then an Rgce MUST NOT contain PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfColV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, and PtgElfRadicalLel.

PtgElfRw, PtgElfRw, PtgElfRol, PtgElfRwV, PtgElfRolV, PtgElfRadical, PtgElfRadicalS, PtgElfRolS, PtgElfRolSV, and PtgElfRadicalLel SHOULD NOT<178> be used.

Additional restrictions on the contents of this structure are specified in terms of a parse tree. For this purpose, a parse tree is a means of organizing the components of an Rgce. Each node in the parse tree represents a Ptg or an ABNF rule described previously. Non-leaf nodes represent rules and have one child node for each element in the rule. Leaf nodes represent only a Ptg.

For a leaf node in the parse tree, NESTING_DEPTH is the number of function-call nodes in the path from the root node to that leaf.

For a node in the parse tree, OPERAND_COUNT is as follows:

- The OPERAND COUNT of each Ptg appearing in the operand rule definition is one.
- The OPERAND_COUNT of all other Ptgs is zero.
- The OPERAND_COUNT of a node that has n child nodes with nonzero OPERAND_COUNT is equal to the maximum, across all the n child nodes, of (n-1) plus the OPERAND_COUNT of the nth child that has nonzero OPERAND_COUNT.

For a node in the parse tree, VALUE_TYPE is a state indicating that the node represents a single value of a simple type or an array of such values. A node that is not a VALUE_TYPE represents a reference to a **range**. Elements in an expression MUST represent either values or references, based on the specific Ptgs used in the expression. The following rules specify how to traverse the parse tree from the bottom up and determine whether each node is a VALUE_TYPE, which determines whether the sequence of Ptgs comprising the formula correctly satisfies the requirements of each expression in the formula. A node is determined to be a VALUE_TYPE as follows:

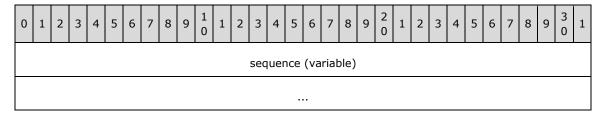

- Leaf nodes:
- PtgMissArg, PtgStr, PtgSxName, PtgErr, PtgBool, PtgInt, PtgNum, PtgArray, PtgRefErr, PtgAreaErr, PtgRefErr3d, PtgAreaErr3d, PtgElfLel, PtgElfRwV, PtgElfColV, PtgElfColSV, PtgElfRadicalLel,

PtgUplus, PtgUminus, PtgPercent, PtgAdd, PtgSub, PtgMul, PtgDiv, PtgPower, PtgConcat, PtgLt, PtgLe, PtgGe, PtgGe, PtgGt, and PtgNe leaf nodes are VALUE TYPEs.

- PtgName, PtgRef, PtgArea, PtgRefN, PtgAreaN, PtgNameX, PtgRef3d, PtgArea3d, PtgFunc, PtgFuncVar, PtgMemArea, PtgMemErr, PtgMemNoMem, and PtgMemFunc leaf nodes are VALUE TYPEs if and only if the value of the type field is value or array.
- All other leaf nodes are not VALUE_TYPEs.
- Non-leaf nodes:
- Any non-leaf node with a single child node MUST be a VALUE_TYPE if and only if the child node is a VALUE TYPE.
- Any non-leaf node with a mem-ptg, unary-operator, binary-value-operator, binary-reference-operator, PtgAttrSum, PtgFunc or PtgFuncVar child node is a VALUE_TYPE if and only if that child node is a VALUE_TYPE. Other child nodes are ignored for the purposes of determining whether the non-leaf node is a VALUE TYPE.
- Any non-leaf node corresponding to a val rule MUST be a VALUE_TYPE.
- Any non-leaf node corresponding to a ref rule MUST NOT be a VALUE_TYPE.
- Otherwise, a non-leaf node with an expression child node is a VALUE_TYPE if and only if that expression child node is a VALUE_TYPE.

A parse tree for an Rgce MUST meet the following conditions:

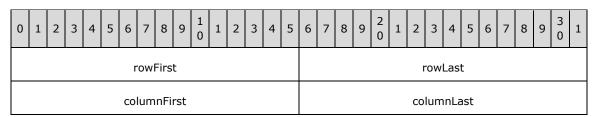

- The NESTING_DEPTH of each leaf node MUST NOT exceed 8.
- The OPERAND_COUNT of the root node MUST NOT exceed 40.

sequence (variable): An array of Ptg that specifies the sequence of Ptgs.

2.5.198.105 RgceArea

The **RgceArea** structure specifies a reference to a rectangular **range** of **cells** where **relative references** are stored as coordinates.

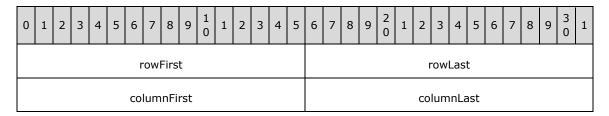

rowFirst (2 bytes): An <u>RwU</u> that specifies the row number of the first row of the rectangular range of cells.

rowLast (2 bytes): An RwU that specifies the row number of the last row of the rectangular range of cells.

- **columnFirst (2 bytes):** A <u>ColRelU</u> that specifies the column number of the first column of the rectangular range of cells and relative reference information.
- **columnLast (2 bytes):** A ColReIU that specifies the column number of the last column of the rectangular range of cells and relative reference information.

2.5.198.106 RgceAreaRel

The **RgceAreaRel** structure specifies a rectangular **range** of **cells** where the relative portions of **relative references** are specified as offsets from the cell in which the formula (section <u>2.2.2</u>) is evaluated.

- rowFirst (2 bytes): An RwU that specifies information about the first row of the cell reference. If columnFirst.rowRelative is 0, then rowFirst specifies the first row coordinate of the cell reference. If columnFirst.rowRelative is 1, then rowFirst specifies the first row as an offset from the cell in which the formula is evaluated.
- rowLast (2 bytes): An RwU that specifies information about the last row of the cell reference. If columnLast.rowRelative is 0, then rowLast specifies the last row coordinate of the cell reference. If columnLast.rowRelative is 1, then rowLast specifies the last row as an offset from the cell in which the formula is evaluated.
- **columnFirst (2 bytes):** A <u>ColRelNegU</u> that specifies information about the first row and column in the range. If **columnFirst.colRelative** is 0, then **columnFirst.col** is an unsigned integer that specifies the first column coordinate of the cell reference and MUST be less than 256. If **columnFirst.colRelative** is 1, then **columnFirst.col** is a signed integer that specifies the first column as an offset from the cell in which the formula is evaluated.
- columnLast (2 bytes): A ColRelNegU that specifies information about the first row and column in the range. If columnLast.colRelative is 0, then columnLast.col is an unsigned integer that specifies the last column coordinate of the cell reference and MUST be less than 256. If columnLast.colRelative is 1, then columnLast.col is a signed integer that specifies the last column as an offset from the cell in which the formula is evaluated.

2.5.198.107 RgceElfLoc

The **RgceElfLoc** structure specifies a location of a **cell** that contains a label used in a **natural language formula** to refer to a contiguous **range** of cells from the same row or column as the cell with the label.

row (2 bytes): An RwU that specifies the zero-based row coordinate of the cell.

column (2 bytes): A <u>ColElfU</u> that specifies the zero-based column coordinate of the cell and other information about the cell reference.

2.5.198.108 RgceElfLocExtra

The **RgceElfLocExtra** structure specifies a single **cell reference** which specifies a part of a multiple-cell **natural language label**. The **cell** is specified as the intersection of the given row and column.

row (2 bytes): An <u>RwU</u> that specifies the row coordinate of the cell reference.

column (2 bytes): A <u>ColReIU</u> that specifies the column coordinate of the cell reference. The values of **column.colRelative** and **column.rowRelative** MUST be ignored.

2.5.198.109 RgceLoc

The **RgceLoc** structure specifies a reference to a single **cell** where **relative references** are stored as coordinates.

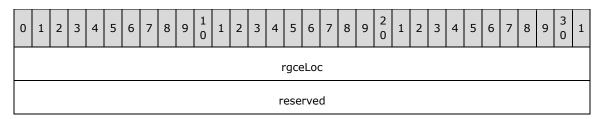

row (2 bytes): An RwU that specifies the row coordinate of the cell reference.

column (2 bytes): A <u>ColRelU</u> that specifies the column coordinate of the cell reference and relative reference information.

2.5.198.110 RgceLoc8

The **RgceLoc8** structure specifies a single **cell** reference.

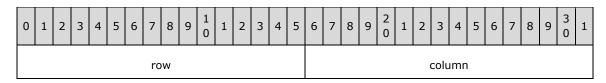

rgceLoc (4 bytes): A RqceLoc that specifies a single cell reference.

reserved (4 bytes): MUST be zero, and MUST be ignored.

2.5.198.111 RgceLocRel

The **RgceLocRel** structure specifies a single **cell** reference where the relative portions of **relative references** are specified as offsets from the cell in which the formula (section 2.2.2) is evaluated.

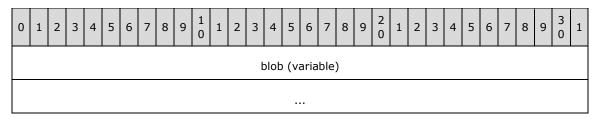

row (2 bytes): An RwU that specifies information about the row of the cell reference. If column.rowRelative is 0, then row specifies the row coordinate of the cell reference. If column.rowRelative is 1, then row specifies the row as an offset from the cell in which the formula is evaluated. If the signed result of the offset is a row index less than 0x00000000 or greater than 0x0000FFFF, the value is adjusted by 0x00010000 so that it will result in a valid row index.

column (2 bytes): A ColRelNegU that specifies information about the row and column. If column.colRelative is 0, then column.col is an unsigned integer that specifies the column coordinate of the cell reference and MUST be less than 256. If column.colRelative is 1, then column.col is a signed integer that specifies the column as an offset from the cell in which the formula is evaluated. If the signed result of the offset is a column index less than 0x0000 or greater than 0x00FF, the value is adjusted by 0x0100 so that it will result in a valid column index.

2.5.198.112 SerAr

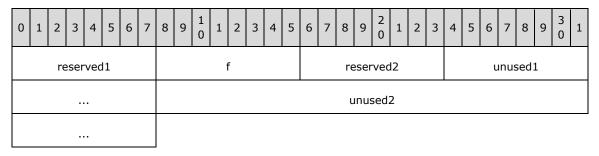

The **SerAr** structure specifies a **cell** value within an array of values.

blob (variable): A structure that specifies a cell value. MUST be one of the following structures: SerNil, SerNum, SerStr, SerBool, or SerErr. The structure is specified by the first byte, which is the reserved byte in each of those structures.

2.5.198.113 SerBool

The **SerBool** structure specifies a Boolean (section 2.5.14) value in an array of values.

reserved1 (1 byte): Reserved. MUST be 0x04.

f (1 byte): A Boolean that specifies the value.

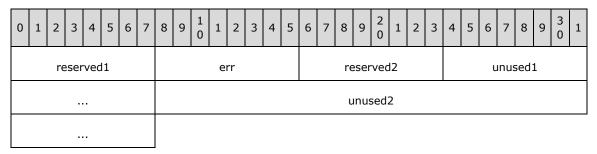

reserved2 (1 byte): MUST be zero, and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

2.5.198.114 SerErr

The **SerErr** structure specifies an error value in an array of values.

reserved1 (1 byte): Reserved. MUST be 0x10.

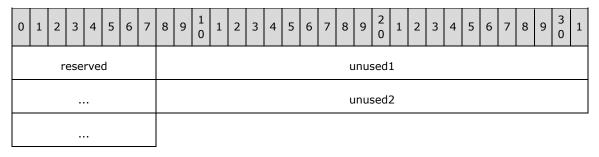

err (1 byte): A BErr that specifies the error code value.

reserved2 (1 byte): MUST be zero, and MUST be ignored.

unused1 (2 bytes): Undefined and MUST be ignored.
unused2 (4 bytes): Undefined and MUST be ignored.

2.5.198.115 SerNil

The **SerNil** structure specifies a null value in an array of values.

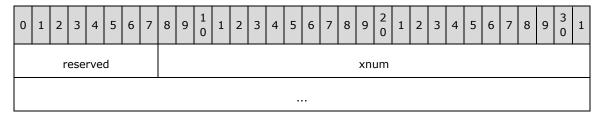

reserved (1 byte): MUST be zero, and MUST be ignored.

unused1 (4 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

2.5.198.116 SerNum

The **SerNum** structure specifies a numeric value in an array of values.

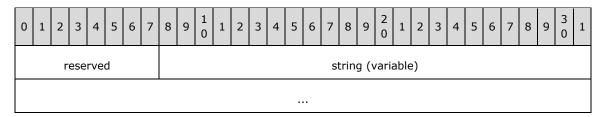

...

reserved (1 byte): Reserved. MUST be 0x01.

xnum (8 bytes): An Xnum (section <u>2.5.342</u>) that specifies the value.

2.5.198.117 SerStr

The **SerStr** structure specifies a string in an array of values.

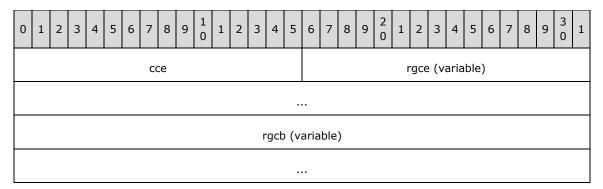

reserved (1 byte): Reserved. MUST be 0x02.

string (variable): An <u>XLUnicodeString</u> that specifies the string. The length of the string MUST be less than 256 characters.

2.5.198.118 SharedParsedFormula

The **SharedParsedFormula** structure specifies the formula (section 2.2.2) for a shared formula.

cce (2 bytes): An unsigned integer that specifies the length of rgce in bytes. MUST be greater than
0.

rgce (variable): An Rgce that specifies the sequence of Ptgs for the formula. MUST NOT contain PtgExp, PtgTbl, PtgSxName, PtgIsect, PtgUnion, PtgRange, PtgArray, PtgElfLel, PtgElfRw, PtgElfCol, PtgElfRwV, PtgElfRolV, PtgElfRadical, PtgElfRadicalS, PtgElfColS, PtgElfColSV, PtgElfRadicalLel, PtgRefErr, PtgRef3d, PtgArea3d, PtgRefErr3d, PtgNameX, PtgMemArea, PtgMemErr, PtgMemNoMem, or PtgMemFunc.

If this field contains a PtgRef, then the loc.column.colRelative and loc.column.rowRelative fields in the PtgRef MUST be 0.

If this field contains a PtqArea, then the area.columnFirst.colRelative, area.columnFirst.rowRelative, area.columnLast.colRelative, and area.columnLast.rowRelative fields in the PtqArea MUST be 0.

If this field contains a PtgFuncVar and the **fCeFunc** field of the PtgFuncVar is 0, then the **tab** field of PtgFuncVar MUST NOT be 0x017B.

The root node of the parse tree of this field MUST be a VALUE_TYPE, as described in Rgce.

rgcb (variable): An RqbExtra that specifies ancillary data for the formula.

2.5.198.119 XtiIndex

XtiIndex is a 2-byte unsigned integer that specifies an <u>XTI</u> record. MUST be a value from the following table:

Value	Meaning
0xFFFF	Specifies an invalid XTI.
Greater than or equal to zero and less than 0xFFFF	Specifies a zero-based index of an XTI structure in the array specified by the rgXTI field of the <u>ExternSheet</u> record. The value MUST be less than the cXTI field of the ExternSheet record.

2.5.199 PBT

The **PBT** structure specifies information about a parameter in a **query** that retrieves **external data** for a <u>PivotTable</u> or a **query table**. The values in this structure provide additional information about the related <u>ParamQry</u> record as specified by the **rgPbt** field in the <u>DBQueryExt</u> record that contains this structure.

pbt (3 bits): An unsigned integer that specifies the location of the parameter value. MUST be the same as the **pbt** field in the related ParamQry record as specified by the **rgPbt** field in the DBQueryExt record that contains this structure. MUST be a value from the following table:

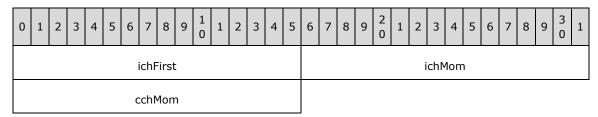

Value	Meaning
0x0	The user is prompted for the value of the parameter.
0x1	The parameter value is specified in the query.
0x2	The parameter value is specified in a cell .

- **A fAutoRefresh (1 bit):** A bit that specifies whether the query refreshes when the parameter value changes. If **pbt** is not equal to 0x2 then this bit MUST be zero, and MUST be ignored.
- **B fNeedRefresh (1 bit):** A bit that specifies that the parameter value changed and the query was not refreshed. MUST be 0 if **pbt** is not equal to 0x2.

reserved (11 bits): MUST be zero, and MUST be ignored.

2.5.200 PhRuns

The **PhRuns** structure specifies a **phonetic text run** that is displayed above a **text run**.

- **ichFirst (2 bytes):** A signed integer that specifies the zero-based index of the first character of the phonetic text run in the **rphssub.st** field of the <u>ExtRst</u> structure that contains this PhRuns structure. MUST be greater than or equal to 0.
- ichMom (2 bytes): A signed integer that specifies the zero-based index of the first character of the text run in the rgb field of the <u>XLUnicodeRichExtendedString</u> that contains the ExtRst that contains this PhRuns that corresponds to the phonetic text run specified in ichFirst. ichMom specifies the location where the text run which phonetic text run specified in ichFirst applies to begins. MUST be greater than or equal to 0.
- **cchMom (2 bytes):** A signed integer that specifies the count of characters in the text run specified in **ichMom**. MUST be greater than or equal to 0.

2.5.201 Phs

The **Phs** structure specifies the formatting information for a **phonetic string**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
							ifı	nt								ļ	4	E	3						unu	sed					

ifnt (2 bytes): A FontIndex structure that specifies the font.

A - phType (2 bits): An unsigned integer that specifies the type of the phonetic information. MUST be a value from the following table:

Value	Meaning
0x0	Use narrow Katakana characters as phonetic string.
0x1	Use wide Katakana characters as phonetic string.
0x2	Use Hiragana characters as phonetic string.
0x3	Use any type of characters as phonetic string.

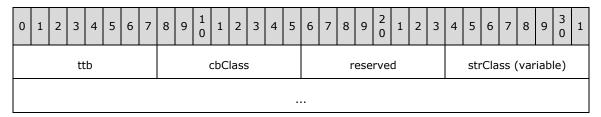

B - alcH (2 bits): An unsigned integer that specifies the alignment of the phonetic string. MUST be a value from the following table:

Value Alignment									
0x0	General alignment								
0x1	Left aligned								
0x2	Center aligned								
0x3	Distributed alignment								

unused (12 bits): Undefined and MUST be ignored.

2.5.202 PictFmlaEmbedInfo

The **PictFmlaEmbedInfo** structure specifies information about the embedded control associated with the <u>Obj</u> record that contains the <u>ObjFmla</u> structure that contains this PictFmlaEmbedInfo. The embedded control can be an **ActiveX control**, an **OLE object** or a **camera picture** control. The **pictFlags** field of this Obj record specifies the type of embedded control.

ttb (1 byte): Reserved. MUST be 0x03.

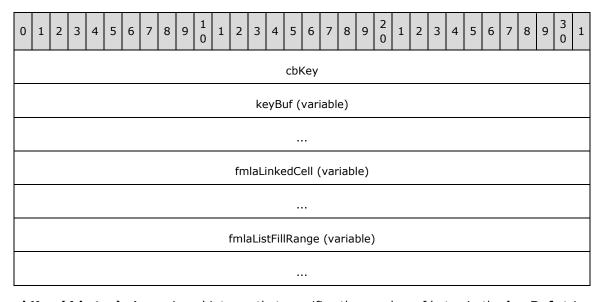

cbClass (1 byte): An unsigned integer that specifies the length in bytes of the strClass field.

reserved (1 byte): MUST be zero, and MUST be ignored.

strClass (variable): An optional <u>XLUnicodeStringNoCch</u> structure that specifies the class name of the embedded control associated with this Obj. This field MUST exist if and only if **cbClass** is nonzero.

2.5.203 PictFmlaKey

The **PictFmlaKey** structure specifies the runtime **license key** of the object and specifies the reference to a **cell** that is linked to the picture <u>Obj</u> that contains this PictFmlaKey.

cbKey (4 bytes): An unsigned integer that specifies the number of bytes in the **keyBuf** string<179>.

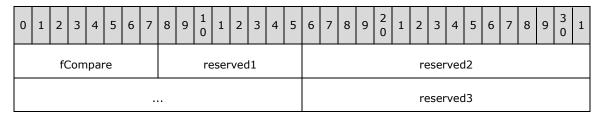

keyBuf (variable): An array of **cbKey** that specifies the license key for the **ActiveX control**. This field is passed to a license-aware object creation method.

fmlaLinkedCell (variable): An <u>ObjFmla</u> that specifies a reference to the **range** where the value of the first cell is linked to the current selection in this picture control. An empty formula, where **fmlaLinkedCell.cbFmla** equals zero, specifies there is no such cell linked to this picture control.

fmlaListFillRange (variable): An ObjFmla that specifies the range used to populate the content of this picture control. The **fmlaListFillRange.cbFmla** field MUST be 0 unless there is a bindable property (as specified in [MS-OAUT] section 2.2.49.5.2) in the typelib of the ActiveX control that equals the GUID {0C733A7C-2A1C-11CE-ADE5-00AA0044773D}.

2.5.204 PivotCompProp

The **PivotCompProp** structure specifies the properties of a <u>PivotTable</u> string comparison.

fCompare (1 byte): A Boolean (section 2.5.14) that specifies the type of string comparison.

Value	Meaning
0x0000	This is a wildcard pattern match. For the purposes of comparisons, the characters "?" and "*" are used as wildcards. A "?" refers to any single character, and a "*" refers to any number of characters.
0x0001	This is a simple string comparison.

reserved1 (1 byte): MUST be zero, and MUST be ignored.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

2.5.205 PositionMode

The **PositionMode** structure specifies positioning mode for position information saved in a <u>Pos</u> record.

Name	Value	Meaning
MDFX	0x0000	Relative position to the chart, in points.
MDABS	0x0001	Absolute width and height in points. It can only be applied to the mdBotRt field of Pos.
MDPARENT	0x0002	Owner of Pos determines how to interpret the position data.
моктн	0x0003	Offset to default position, in 1/1000 th of the plot area size.
MDCHART	0x0005	Relative position to the chart, in <u>SPRC</u> .

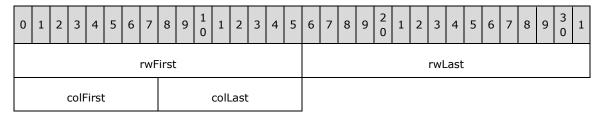

2.5.206 ReadingOrder

The **ReadingOrder** enumeration specifies the **reading order**.

Name	Value	Meaning
READING_ORDER_CONTEXT	0x00	Context reading order
READING_ORDER_LTR	0x01	Left-to-right reading order
READING_ORDER_RTL	0x02	Right-to-left reading order

2.5.207 Ref

The **Ref** structure specifies a **range** of **cells** on a given **sheet**.

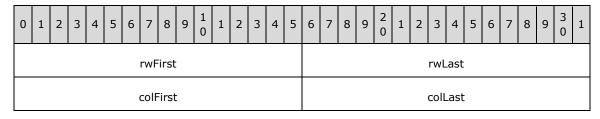

- **rwFirst (2 bytes):** An unsigned integer that specifies the first zero-based row index in the range. MUST be greater than or equal to the **rwMic** field of the <u>Dimensions</u> record and MUST be less than the **rwMac** field of the Dimensions record. MUST be less than or equal to **rwLast**.
- **rwLast (2 bytes):** An unsigned integer that specifies the last zero-based row index in the range.

 MUST be greater than or equal to the **rwMic** field of the Dimensions record and MUST be less than the **rwMac** field of the Dimensions record. MUST be greater than or equal to **rwFirst**.
- **colFirst (1 byte):** A <u>ColByte</u> structure that specifies the first zero-based column index in the range. MUST be less than or equal to **colLast**.
- **colLast (1 byte):** A ColByte structure that specifies the last zero-based column index in the range. MUST be greater than or equal to **colFirst**.

2.5.208 Ref8

The **Ref8** structure specifies a **range** of **cells** on the **sheet**.

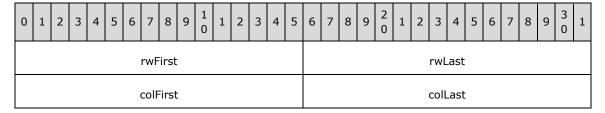

- **rwFirst (2 bytes):** A <u>Rwx</u> structure that specifies the first row in the range. The field **rwFirst.rw** MUST be less than or equal to **rwLast.rw**.
- rwLast (2 bytes): A Rwx structure that specifies the last row in the range. The field rwLast.rw
 MUST be greater than or equal to rwFirst.rw. If rwFirst.rw is 0 and rwLast.rw is 0xFFFF, the
 specified range includes all the rows in the sheet.
- **colFirst (2 bytes):** A <u>Colx</u> structure that specifies the first column in the range. The field **colFirst.col** MUST be less than or equal to **colLast.col**.

colLast (2 bytes): A Colx structure that specifies the last column in the range. The field **colLast.col** MUST be greater than or equal to **colFirst.col**. If **colFirst.col** is 0 and **colLast.col** is 0xFF, the specified range includes all the columns in the sheet.

2.5.209 Ref8U

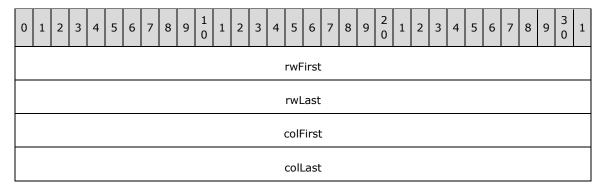

The **Ref8U** structure specifies a **range** of **cells** on the **sheet**.

- **rwFirst (2 bytes):** A <u>RwU</u> structure that specifies the zero-based index of the first row in the range. The value MUST be less than or equal to **rwLast**.
- **rwLast (2 bytes):** A RwU structure that specifies the zero-based index of the last row in the range. The value MUST be greater than or equal to **rwFirst**.
- colFirst (2 bytes): A <u>ColU</u> structure that specifies the zero-based index of the first column in the range. The value MUST be less than or equal to colLast, and MUST be less than or equal to 0x00FF.
- **colLast (2 bytes):** A ColU structure that specifies the zero-based index of the last column in the range. The value MUST be greater than or equal to **colFirst**, and MUST be less than or equal to 0x00FF.

2.5.210 Ref8U2007

The **Ref8U2007** structure specifies a **range** of **cells** on the **sheet**.

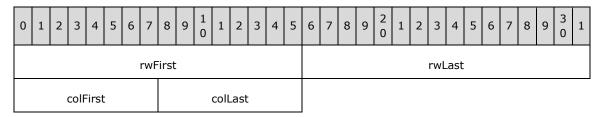

- **rwFirst (4 bytes):** An unsigned integer that specifies the zero-based index of the first row in the range. The value MUST be less than or equal to **rwLast** and MUST be less than or equal to 0xFFFF.
- **rwLast (4 bytes):** An unsigned integer that specifies the zero-based index of the last row in the range. The value MUST be greater than or equal to **rwFirst** and MUST be less than or equal to 0xFFFF.
- **colFirst (4 bytes):** An unsigned integer that specifies the zero-based index of the first column in the range. The value MUST be less than or equal to **colLast** and MUST be less than or equal to 0x00FF.

colLast (4 bytes): An unsigned integer that specifies the zero-based index of the last column in the range. The value MUST be greater than or equal to **colFirst** and MUST be less than or equal to 0x00FF.

2.5.211 RefU

The **RefU** structure specifies a **range** of cells on the **sheet**.

rwFirst (2 bytes): A <u>RwU</u> structure that specifies the first row in the range. The value MUST be less than or equal to **rwLast**.

rwLast (2 bytes): A RwU structure that specifies the last row in the range.

colFirst (1 byte): A <u>ColByteU</u> structure that specifies the first column in the range. The value MUST be less than or equal to **colLast**.

colLast (1 byte): A ColByteU structure that specifies the last column in the range.

2.5.212 RevisionType

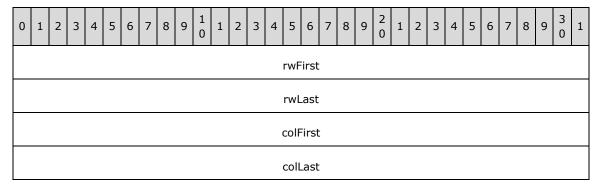

RevisionType is an integer that specifies the type of <u>revision record</u>. The value MUST be one of the following:

Name	Value	Meaning
REVTINSRW	0x0000	Insert Row.
REVTINSCOL	0x0001	Insert Column.
REVTDELRW	0x0002	Delete Row.
REVTDELCOL	0x0003	Delete Column.
REVTMOVE	0x0004	Cell Move.
REVTINSERTSH	0x0005	Insert Sheet .
REVTSORT	0x0007	Sort.
REVTCHANGECELL	0x0008	Cell Change.
REVTRENSHEET	0x0009	Rename Sheet.
REVTDEFNAME	0x000A	Defined name Change.
REVTFORMAT	0x000B	Format Revision.
REVTAUTOFMT	0x000C	AutoFormat Revision.
REVTNOTE	0x000D	Comment Revision.
REVTHEADER	0x0020	Header (meta-data) Revision.

Name	Value	Meaning
REVTCONFLICT	0x0025	Conflict.
REVTADDVIEW	0x002B	Custom view Add.
REVTDELVIEW	0x002C	Custom view Delete.
REVTTRASHQTFIELD	0x002E	Query table field Removal.

2.5.213 RFX

The **RFX** structure specifies a range of cells on the **sheet**.

- **rwFirst (4 bytes):** A <u>Rw12</u> that specifies the first row in the range. The value of **rwFirst.rw** MUST be less than or equal to **rwLast.rw**.
- **rwLast (4 bytes):** A Rw12 that specifies the last row in the range. The value of **rwLast.rw** MUST be greater than or equal to **rwFirst.rw**.
- **colFirst (4 bytes):** A <u>Col12</u> that specifies the first column in the range. The value of **colFirst.col** MUST be less than or equal to **colLast.col**.
- **colLast (4 bytes):** A Col12 that specifies the last column in the range. The value of **colLast.col** MUST be greater than or equal to **colFirst.col**.

2.5.214 RichTextStreamChecksumData

The **RichTextStreamChecksumData** structure specifies the data used to compute the **checksum** of the <u>RichTextStream</u> record. This data can be obtained from <u>Text</u> record, <u>FontX</u> record, <u>Font</u> record, <u>BRAI</u> record, and <u>ObjectLink</u> record associated with the RichTextStream record, as specified in RichTextStream. If no Text record is associated with the RichTextStream record, the Text record associated with the <u>DefaultText</u> record MUST be used. If no Font record is associated with the RichTextStream record, the first Font record specified in the <u>global substream</u> MUST be used.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1
	fibFontInformation (variable)																														
А	В	С		Ł	те	xtR	otat	ion			D	Е	F	=	G	Н	I]		K	L		bs	Seri	iesI	den	ntifie	er	

М	N	0	bTextFormat	StText (variable)									
			fibFontInformatio	nArray (variable)									

- **fibFontInformation (variable):** A <u>RichTextStreamChecksumTextInformation</u> structure that specifies the default **font** information to use for the rich text string.
- A fAutoSize (1 bit): A bit that specifies whether the font size is automatic. MUST be equal to 1 if the value of the iFont field of the related FontX record is 0. Otherwise, MUST be equal to 0. If no FontX record is associated with the RichTextStream record, MUST be equal to 0.
- **B fAutoColor (1 bit):** A bit that specifies whether the foreground text color is determined automatically. MUST be equal to the value of the **fAutoColor** field of the related Text record.
- **C fAutoMode (1 bit):** A bit that specifies if the background color is determined automatically. MUST be equal to the value of the **fAutoMode** field of the related Text record.
- **bTextRotation (8 bits):** An unsigned integer that specifies the text rotation. MUST be equal to the value of the **trot** field of the related Text record.
- D fAutoRot (1 bit): MUST be zero.
- **E reserved1 (1 bit):** MUST be 1, and MUST be ignored.
- **F iReadingOrder (2 bits):** An unsigned integer that specifies the text **reading order**. MUST be equal to the value of the **iReadingOrder** field of the related Text record.
- **G reserved2 (1 bit):** MUST be zero, and MUST be ignored.
- **H fAttached (1 bit):** A bit that specifies whether the text position is absolute or attached. If the RichTextStream record is contained in the sequence of records that conforms to the LD rule, this field MUST be 1. If the RichTextStream is not contained in the LD rule, and the **dlp** field of the associated Text record is set to 0xA, this field MUST be 1. Otherwise, it MUST be 0.
- I fUserPos (1 bit): A bit that specifies whether the text position is automatic. If the value is 0, the text position is automatic. If the dlp field of the associated Text record is set to 0xA, this field MUST be 1. Otherwise, it MUST be 0.
- **J bObjectType (4 bits):** An unsigned integer that specifies the object type. Based on the record the RichTextStream is associated with, the value MUST be from the following table:

Record associated with RichTextStream	Value	Meaning
Chart	0x1	Default text associated with the chart.
Axis where wType is 0x0001	0x2	Attached label of the value axis (or the vertical value axis) in the primary axis group.
Axis where wType is 0x0000	0x3	Attached label of the category (2) axis (or the horizontal value axis) in the primary axis group.
<u>Series</u>	0x4	Attached label of the series.
Legend	0x5	Attached label of the <u>legend</u> .

Record associated with RichTextStream	Value	Meaning
Axis where wType is 0x0003	0x7	Attached label of the series axis.
Second Axis record where wType is 0x0001	0x8	Attached label of the value axis (or the vertical value axis) in the secondary axis group.
Second Axis record where wType is 0x0000	0x9	Attached label of the category (2) axis (or the horizontal value axis) in the secondary axis group.
<u>DataTable</u>	0xB	Attached label of the chart DataTable.
<u>YMult</u>	0xC	Attached label of the axis multiplier.

- K fBuildable (1 bit): A bit that specifies whether the text value of the Text record associated with the RichTextStream is automatically generated and unchanged. MUST be equal to the value of the fAutoText field of the related Text record.
- L reserved3 (1 bit): MUST be zero, and MUST be ignored.
- **bSeriesIdentifier (8 bits):** An unsigned integer that specifies the zero-based index of the Series record of the current chart to which the attached label is attached.
- M reserved4 (2 bits): MUST be 0x3, and MUST be ignored.
- **N fReference (2 bits):** An unsigned integer that specifies the type of data that is being referenced. MUST be equal to the value of the **rt** field of the BRAI record associated with the RichTextStream.
- **O stSource (4 bits):** An unsigned integer that specifies the part of the series, <u>trendline</u>, or <u>error bars</u> the referenced data of the BRAI record associated with the RichTextStream specifies. MUST be equal to the value of the **id** field of the BRAI record associated with the RichTextStream.
- **bTextFormat (8 bits):** An <u>IFmt</u> that specifies the number formatting used for the data. MUST be equal to the value of the **ifmt** field of the BRAI record associated with the RichTextStream.
- **StText (variable):** An array of **Unicode** characters that contains the text content of the rich text. This field only takes the text content into consideration and ignores the size and header fields of the text string. If the RichTextStream is associated with a BRAI record, the text value MUST correspond to the text value identified by the BRAI record. If the RichTextStream record is associated with an ObjectLink record, the text value MUST correspond to the text value identified by the ObjectLink record.
- fibFontInformationArray (variable): An array of

<u>RichTextStreamChecksumFontInformationArrayItem</u> that specifies the formatting of the **StText** field.

2.5.215 RichTextStreamChecksumFontInformation

The **RichTextStreamChecksumFontInformation** structure specifies the data used to compute the **checksum** of the <u>RichTextStream</u> record. This data can be obtained from <u>Text</u> and <u>Font</u> records associated with the RichTextStream record, as specified in RichTextStream. If no Text record is associated with the RichTextStream record, the Text record associated with the <u>DefaultText</u> record MUST be used. If no Font record is associated with the RichTextStream record, the first Font record specified in the <u>global substream</u> MUST be used.

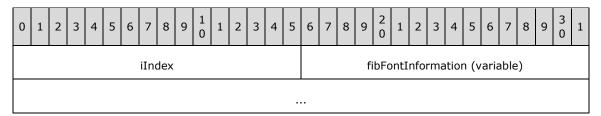

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

						S	ubs	crip	t							bUnderline bFamily															
		b	Cha	arse	ŧt					re	eser	ved	12			rgbFontColor															
									dwDrawingMode																						

- **stFontName (variable):** An array of **Unicode** characters that contains the **font** name. MUST be the font name specified by the **fontName** field of the related Font record.
- **dwFontHeight (4 bytes):** An unsigned integer that specifies the font height. MUST equal the value specified by the **dyHeight** field of the related Font record.
- **A fBold (1 bit):** A bit that specifies whether the font is bold. The value of this field MUST be 1 when the value of the **bls** field of the associated Font record is greater than 400.
- **B fItalic (1 bit):** A bit that specifies whether the font is italic. MUST equal the value specified by the **fItalic** field of the related Font record.
- **C fUnderline (1 bit):** A bit that specifies whether the font is single-underlined. The value of this field MUST be 1 when the value of the **uls** field of the associated Font record is not equal to 0x00.
- **D fOutline (1 bit):** A bit that specifies whether the font has an **outline effect** applied. MUST equal the value specified by the **fOutline** field of the related Font record.
- **E fShadow (1 bit):** A bit that specifies whether the font has a **shadow effect** applied. MUST equal the value specified by the **fShadow** field of the related Font record.
- **F fCondense (1 bit):** A bit that specifies whether the font is condensed. MUST equal the value specified by the **fCondense** field of the related Font record.
- **G fExtend (1 bit):** A bit that specifies whether the font is extended. MUST equal the value specified by the **fExtend** field of the related Font record
- **H fStrikeout (1 bit):** A bit that specifies whether the font has **strikethrough formatting** applied. MUST equal the value specified by the **fStrikeOut** field of the related Font record.
- I fRegular (1 bit): A bit that specifies whether the font is a regular font. MUST equal 1.
- **J fJon (1 bit):** A bit that specifies whether the font is too small to be displayed. MUST equal 1 if the font height in **pixels** is less than 6.
- **K fDialogBox (1 bit):** A bit that specifies whether the font is used in the context of a dialog box. MUST equal 0.

- reserved1 (5 bits): MUST be zero, and MUST be ignored.
- **boldness (2 bytes):** An unsigned integer that specifies the font weight. MUST equal the value specified by the **bls** field of the related Font record.
- **subscript (2 bytes):** An unsigned integer that specifies whether superscript, subscript, or normal script is used. MUST equal the value specified by the **sss** field of the related Font record.
- **bUnderline (1 byte):** An unsigned integer that specifies the underline style. MUST equal the value specified by the **uls** field of the related Font record.
- **bFamily (1 byte):** An unsigned integer that specifies the **font family** of this font. MUST equal the value specified by the **bFamily** field of the related Font record.
- **bCharset (1 byte):** An unsigned integer that specifies the **character set**. MUST equal the value specified by the **bCharSet** field of the related Font record.
- reserved2 (1 byte): MUST be zero, and MUST be ignored.
- **rgbFontColor (4 bytes):** A <u>LongRGB</u> that specifies the font color. MUST equal the color specified by the **icv** field of the related Font record.
- **dwDrawingMode (4 bytes):** An unsigned integer that specifies the display mode of the background of the text. MUST be equal to 0x000010D when the **wBkgMode** field of the related Text record is equal to 0x0001; otherwise, it MUST be equal to 0x000020D.

2.5.216 RichTextStreamChecksumFontInformationArrayItem

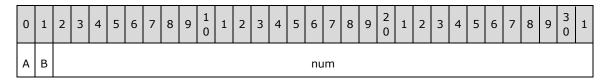

The **RichTextStreamChecksumFontInformationArrayItem** structure specifies data used to compute the checksum of the <u>RichTextStream</u> record.

- **iIndex (2 bytes):** An unsigned integer that specifies a zero-based index of the character within the **StText** field of the containing <u>RichTextStreamChecksumData</u> structure where the text formatting specified in **fibFontInformation** begins.
- **fibFontInformation (variable):** A <u>RichTextStreamChecksumFontInformation</u> that specifies the **font** formatting of the text string starting at the **iIndex** character.

2.5.217 RkNumber

The **RkNumber** structure specifies a numeric value.

A - fX100 (1 bit): A bit that specifies whether **num** is the value of the RkNumber or 100 times the value of the RkNumber. MUST be a value from the following table:

Value	Meaning
0	The value of RkNumber is the value of num .
1	The value of RkNumber is the value of num divided by 100.

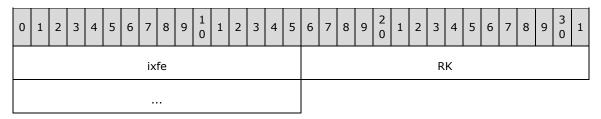

B - fInt (1 bit): A bit that specifies the type of **num**.

num (30 bits): A variable type field whose type and meaning is specified by the value of **fInt**, as defined in the following table:

Value of fInt	Type of num
0	num is the 30 most significant bits of a 64-bit binary floating-point number as defined in [IEEE754] . The remaining 34-bits of the floating-point number MUST be 0.
1	num is a signed integer.

2.5.218 RkRec

The **RkRec** structure contains the numeric data in an application-specific internal type for optimizing disk and memory space along with the corresponding <u>IXFCell</u> to the style record.

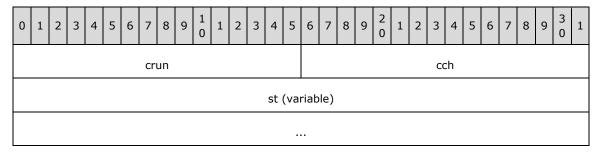

ixfe (2 bytes): An IXFCell that specifies the format of the numeric value.

RK (4 bytes): An RkNumber that specifies the numeric value.

2.5.219 RPHSSub

The RPHSSub structure specifies a phonetic string.

crun (2 bytes): An unsigned integer that specifies the number of **phonetic text runs**. MUST be less than or equal to 32767. If **crun** is zero, there is one phonetic text run.

cch (2 bytes): An unsigned integer that specifies the number of characters in the phonetic string. MUST be less than or equal to 32767.

st (variable): An <u>LPWideString</u> that specifies the phonetic string. The character count in the string MUST be **cch**.

2.5.220 RRD

The **RRD** structure specifies the <u>revision record</u> information used to track changes in a <u>shared</u> <u>workbook</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

	revt									Α	В	С	D					r	ese	rve	d										
tabid																															

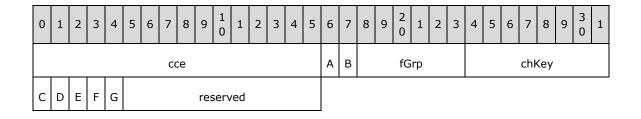

- **cbMemory (4 bytes):** An unsigned integer that specifies the size in bytes of the corresponding revision record structure in memory. This is different from the size of the structure written to the file. The value MUST be greater than or equal to 26. MUST be ignored if the current record is RRDHead.
- **revid (4 bytes):** A signed integer that specifies the revision identifier of the revision records. This identifier is used to keep track of the order of revision records. MUST be greater than or equal to 0.
- **revt (2 bytes):** A RevisionType that specifies the type of revision record.
- A fAccepted (1 bit): A bit that specifies whether this revision was reviewed and accepted.
- **B fUndoAction (1 bit):** A bit that specifies whether the revision occurred because of an undo action.
- C unused (1 bit): Undefined and MUST be ignored.
- **D fDelAtEdgeOfSort (1 bit):** A bit that specifies whether the row or column that is being deleted is at the edge of a sorted **range**. If the value is 1, the current record MUST be **RRDInsDel** and **revt** MUST be equal to **REVTINSRW** or **REVTINSCOL** or **REVTDELRW** or **REVTDELCOL**.

reserved (12 bits): MUST be zero, and MUST be ignored.

tabid (2 bytes): A <u>TabId</u> that specifies the **sheet** where the revision occurred. If the value is 0xFFFF, this revision does not correspond to a specific sheet.

2.5.221 RRDDefNameFlags

The **RRDDefNameFlags** structure specifies additional information for <u>RRDDefName</u>.

- **cce (2 bytes):** An unsigned integer that specifies the length of a formula (section <u>2.2.2</u>) in RRDDefName.
- A fPli (1 bit): A bit that specifies that one or more of the fields stDescription, stHelpTopic, stCustomMenu, stStatusText, stDescriptionOld, stHelpTopicOld, stCustomMenuOld or stStatusTextOld specified in the RRDDefName record MUST NOT be empty.
- **B fFunc (1 bit):** A bit that specifies whether the RRDDefName record specifies a name that refers to a function.

fGrp (6 bits): An unsigned integer that specifies the **function category** for the **defined name**. MUST be a value from the following table:

Value	Category
0	All
1	Financial
2	Date Time
3	Math Trigonometry
4	Statistical
5	Lookup
6	Database
7	Text
8	Logical
9	Info
10	Commands
11	Customize
12	Macro Control
13	DDE External
14	User Defined

- **chKey (8 bits):** An unsigned integer that specifies the shortcut key. MUST have same restrictions as the **chKey** field from the <u>Lbl</u> record.
- C fHidden (1 bit): A bit that specifies whether the defined name is hidden.
- **D fCustomMenu (1 bit):** A bit that specifies whether the **stCustomMenu** field from the RRDDefName record is not empty.
- **E fDescription (1 bit):** A bit that specifies whether the **stDescription** field from the RRDDefName record is not empty.
- **F fHelpTopic (1 bit):** A bit that specifies whether the **stHelpTopic** field from the RRDDefName record is not empty.
- **G fStatusText (1 bit):** A bit that specifies whether the **stStatusText** field from the RRDDefName record is not empty.

reserved (11 bits): MUST be zero, and MUST be ignored.

2.5.222 RRLoc

The **RRLoc** structure specifies the location of a **cell** in the **sheet**.

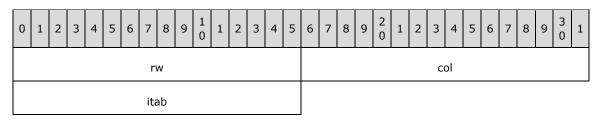

rw (2 bytes): A RwU structure that specifies the zero-based index of the row.

col (2 bytes): A <u>ColElfU</u> structure that specifies the zero-based index of the column and other information about this cell reference.

2.5.223 RTDEItem

The **RTDEItem** structure specifies the **cell** associated with an **RTD topic**.

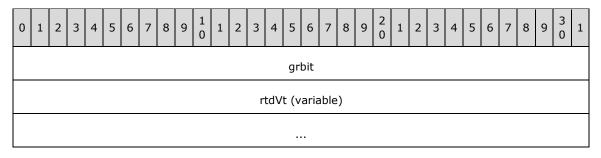

rw (2 bytes): A Rw structure that specifies the row index of the cell.

col (2 bytes): A Col structure that specifies the column index of the cell.

itab (2 bytes): A <u>TabIndex</u> structure that specifies the **sheet** containing the cell.

2.5.224 RTDOper

The **RTDOper** structure specifies the variant data returned from an **RTD server** for **real-time data** (**RTD**).

grbit (4 bytes): An unsigned integer that specifies the type of the variant data stored in **rdtVt**. MUST be a value from the following table:

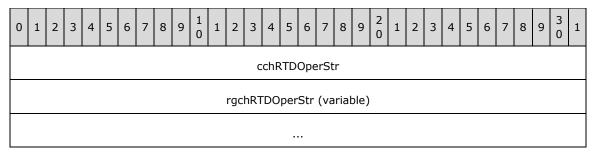

Value	rtdVt Data Type	Meaning
0x0000001	Xnum	The returned variant is an Xnum (section <u>2.5.342</u>).
0x00000002	<u>RTDOperStr</u>	The returned variant is a RTDOperStr. MUST be less than 256 characters long.
0x00000004	Boolean	The returned variant is a 4-byte Boolean (section 2.5.14) value.

Value	rtdVt Data Type	Meaning
0x0000010	Signed integer	The returned variant is a 4-byte signed integer indicating an error code.
0x00000800	Signed integer	The returned variant is a 4-byte signed integer used for purposes other than an error code.
0x00001000	RTDOperStr	The returned variant is a RTDOperStr. MUST be greater than or equal to 256 characters long.

rtdVt (variable): A structure that contains the variant data. The meaning of the data depends on the specific RTD server. The type of the variant data is specified by **grbit**.

2.5.225 RTDOperStr

The RTDOperStr structure specifies a string used in a real-time data (RTD) variant data structure.

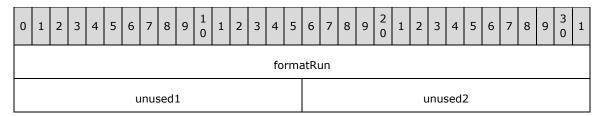

cchRTDOperStr (4 bytes): An unsigned integer that specifies the number of characters in **rgchRTDOperStr**.

rgchRTDOperStr (variable): An <u>XLUnicodeStringNoCch</u> that specifies the string.

2.5.226 Run

The **Run** structure specifies formatting information for a **text run**.

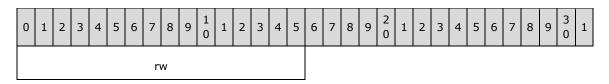

formatRun (4 bytes): A FormatRun. It specifies the formatting information of this run.

unused1 (2 bytes): Undefined and MUST be ignored.unused2 (2 bytes): Undefined and MUST be ignored.

2.5.227 Rw

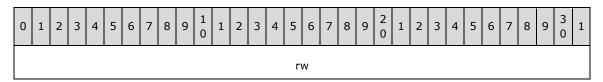

The **Rw** structure specifies the zero-based row index of a row in a **sheet**.

rw (2 bytes): An unsigned integer that specifies the zero-based row index of a row in the sheet that contains this structure. MUST be greater than or equal to the rwMic field of the <u>Dimensions</u> record of the sheet that contains this structure and MUST be less than the rwMac field of the Dimensions record of the sheet that contains this structure.

2.5.228 Rw12

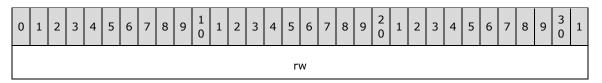

The **Rw12** structure specifies the zero-based row index of a row in a **sheet**.

rw (4 bytes): A signed integer that specifies a zero-based row index of the sheet. MUST be greater than or equal to zero and MUST be less than or equal to 0x0FFFFF.

2.5.229 RwLongU

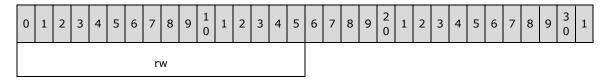

The **RwLongU** structure specifies the zero-based index of a row in a **sheet**.

rw (4 bytes): An unsigned integer that specifies the zero-based index of a row in the sheet that contains this structure. MUST be less than or equal to 0x0000FFFF.

2.5.230 RwU

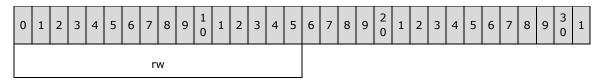

The RwU structure specifies the zero-based index of a row in a sheet.

rw (2 bytes): An unsigned integer that specifies the zero-based index of a row in the sheet that contains this structure.

2.5.231 Rwx

The **Rwx** structure specifies the zero-based row index of a row in a **sheet**.

rw (2 bytes): An unsigned integer that specifies the zero-based row index of a row in the sheet that contains this structure. MUST be 0, 0xFFFF, or greater than or equal to the rwMic field of the Dimensions record of the sheet that contains this structure and less than the rwMac field of the Dimensions record of the sheet that contains this structure.

2.5.232 Script

The **Script** enumeration specifies the superscript or subscript style.

Name	Value	Meaning					
SSSNONE	0x0000	Normal script					
SSSSUPER	0x0001	Superscript					
SSSSUB	0x0002	Subscript					

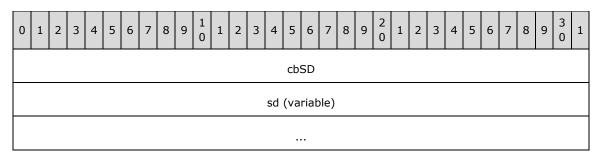

2.5.233 SD_SetSortOrder

The **SD_SetSortOrder** enumeration specifies the types of <u>MDX set metadata</u> sorting orders.

Name	Value	Meaning
SSONONE	0x00	No sorting order
SSOASC	0x01	Ascending order
SSODESC	0x02	Descending order
SSOALPHAASC	0x03	Ascending order by the caption
SSOALPHADESC	0x04	Descending order by the caption
SSONATURALASC	0x05	Ascending order by the natural order of the data, for example, by a key
SSONATURALDESC	0x06	Descending order by the natural order of the data, for example, by a key

2.5.234 SDContainer

The **SDContainer** structure specifies security information for a <u>FeatProtection</u> record.

cbSD (4 bytes): An unsigned integer that specifies the size of the **sd** field in bytes. MUST be greater than 20.

sd (variable): A SecurityDescriptor that specifies the security descriptor data.

2.5.235 SecurityDescriptor

A SECURITY_DESCRIPTOR structure, as defined in [MS-DTYP] section 2.4.6, that specifies a **relative security descriptor** that specifies security information associated with an object. For more information about relative security descriptors see [MSDN-ASRSD].

2.5.236 ShapePropsStreamChecksumData

The **ShapePropsStreamChecksumData** structure specifies the data used to compute the **checksum** of the **ShapePropsStream** record.

linePropertiesForChecksum (8 bytes): A <u>LinePropertiesForShapePropsStreamChecksum</u> that specifies the line properties data used to compute the checksum of the ShapePropsStream record.

This field MUST be present in the following scenarios:

- When the ShapePropsStream record and <u>LineFormat</u> record exist in a <u>chart group</u> but not in a sequence of records that conforms to the <u>LD</u> rule or a sequence of records that conforms to the DROPBAR rule;
- When the ShapePropsStream record and LineFormat record exist in a sequence of records that conforms to the FRAME rule;
- When the ShapePropsStream record and LineFormat record exist in a sequence of records that conforms to the DROPBAR rule;
- When the ShapePropsStream record and LineFormat record exist in a sequence of records that conforms to the AXS rule;
- When the ShapePropsStream record and LineFormat record exist in a sequence of records that conforms to the SS rule and the wObjContext field of the ShapePropsStream record is 0x0000;

This field MUST NOT be present otherwise.

interiorColorPropertiesForChecksum (9 bytes): An

InteriorColorPropertiesForShapePropsStreamChecksum that specifies the interior color data used

to compute the checksum of the ShapePropsStream record. This field MUST be present in the following scenarios:

- When the ShapePropsStream record and <u>AreaFormat</u> record exist in sequence of records that
 conforms to the FRAME rule and the fAuto field of the AreaFormat record is 0x0 and the <u>GelFrame</u>
 record does not exist in the sequence of records;
- When the ShapePropsStream record and AreaFormat record exist in a sequence of records that conforms to the DROPBAR rule and the fAuto field of the AreaFormat record is 0x0 and the GelFrame record does not exist in the sequence of records;
- When the ShapePropsStream record and AreaFormat record exist in a sequence of records that conforms to the AXS rule and the wObjContext field of the ShapePropsStream record is 0x0003 and the fAuto field of the AreaFormat record is 0x0 and the GelFrame record does not exist in the sequence of records;
- When the ShapePropsStream record and AreaFormat record exist in a sequence of records that
 conforms to the SS rule and the fAuto field of the AreaFormat record is 0x0 and the GelFrame
 record does not exist in the sequence of records and the wObjContext field of the
 ShapePropsStream record is 0x0000;
- When the ShapePropsStream record, AreaFormat record, and <u>MarkerFormat</u> record exist in a sequence of records that conforms to the SS rule and the GelFrame record does not exist in the sequence of records and the **wObjContext** field of the ShapePropsStream record is 0x0001.

This field MUST NOT be present otherwise.

fillStylePropertiesForChecksum (variable): A <u>FillStylePropertiesForShapePropsStreamChecksum</u> that specifies the fill-style data used to compute the checksum of the ShapePropsStream record. This field MUST be present in the following scenarios:

- When the ShapePropsStream record, AreaFormat record, and GelFrame record exist in a sequence
 of records that conforms to the FRAME rule and the fAuto field of the AreaFormat record is 0x0;
- When the ShapePropsStream record, AreaFormat record, and GelFrame record exist in a sequence
 of records that conforms to the DROPBAR rule and the fAuto field of the AreaFormat record is 0x0;
- When the ShapePropsStream record, AreaFormat record, and GelFrame record exist in a sequence
 of records that conforms to the AXS rule and the wObjContext field of the ShapePropsStream
 record is 0x0003 and the fAuto field of the AreaFormat record is 0x0;
- When the ShapePropsStream record, AreaFormat record, and GelFrame record exist in a sequence
 of records that conforms to the SS rule and the fAuto field of the AreaFormat record is 0x0 and
 the wObjContext field of the ShapePropsStream record is 0x0000;
- When the ShapePropsStream record, AreaFormat record, MarkerFormat record, and GelFrame record sequence of records that conforms to the SS rule and the fAuto field of the AreaFormat record is 0x0 and the **wObjContext** field of the ShapePropsStream record is 0x0001.

This field MUST NOT be present otherwise.

2.5.237 SharedFeatureType

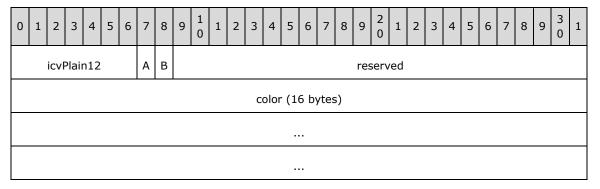

The **SharedFeatureType** enumeration specifies the different types of <u>Shared Features</u>.

Name	Value	Meaning										
ISFPROTECTION	0x0002	Specifies the enhanced protection type. A Shared Feature of this type is used to protect a shared workbook by restricting access to the areas of the workbook and to the available functionality.										

Name	Value	Meaning
ISFFEC2	0x0003	Specifies the ignored formula errors type. A Shared Feature of this type is used to specify the formula errors to be ignored.
ISFFACTOID	0x0004	Specifies the smart tag type. A Shared Feature of this type is used to recognize certain types of entries (for example, proper names, dates/times, financial symbols) and flag them for action.
ISFLIST	0x0005	Specifies the list type. A Shared Feature of this type is used to describe a table within a sheet .

2.5.238 SheetExtOptional

The **SheetExtOptional** structure specifies **sheet** specific data including **sheet tab** color and the **published** state of this sheet.

icvPlain12 (7 bits): An unsigned integer that specifies the tab color of this sheet. If the tab has a color assigned to it, the value of this field MUST be greater than or equal to 0x08 and less than or equal to 0x3F, as specified in the color table for Icv. If this value does not equal to Icv Plain of the associated SheetExt, the value of Icv Plain takes precedence. If the tab has no color assigned to it, the value of this field MUST be 0x7F, and MUST be ignored.

A - fCondFmtCalc (1 bit): A bit that specifies whether conditional formatting formulas are evaluated. MUST be one of the following:

Value	Meaning
0	Conditional formatting formulas in this workbook are not evaluated.
1	Conditional formatting formulas in this workbook are evaluated.

B - fNotPublished (1 bit): A bit that specifies whether this sheet is published. MUST be ignored when this sheet is a <u>chart sheet</u>, <u>dialog sheet</u>, or <u>macro sheet</u>. MUST be a value from the following table:

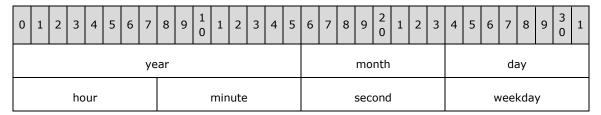

Value	Meaning
0	The sheet is published.
1	The sheet is not published.

reserved (23 bits): MUST be zero, and MUST be ignored.

color (16 bytes): A <u>CFColor</u> that specifies the tab color. Used only when the tab color was not modified by earlier versions of the application.

2.5.239 ShortDTR

The **ShortDTR** structure specifies date and time. The **year**, **month**, and **day** values MUST be consistent with the Gregorian calendar.

- **year (2 bytes):** An unsigned integer that specifies the year. MUST be greater than or equal to 1900 and less than or equal to 9999.
- month (1 byte): An unsigned integer that specifies the month. MUST be greater than or equal to 1 and less than or equal to 12.
- day (1 byte): An unsigned integer that specifies the day. MUST be greater than or equal to 1 and less than or equal to 31.
- **hour (1 byte):** An unsigned integer that specifies the hour. MUST be greater than or equal to 0 and less than or equal to 23.
- **minute (1 byte):** An unsigned integer that specifies the minute. MUST be greater than or equal to 0 and less than or equal to 59.
- **second (1 byte):** An unsigned integer that specifies the second. MUST be greater than or equal to 0 and less than or equal to 59.
- weekday (1 byte): An unsigned integer that specifies the weekday. The value MUST be one of the following:

Value	Meaning
0	The weekday is not specified.
1	Monday
2	Tuesday
3	Wednesday
4	Thursday
5	Friday
6	Saturday
7	Sunday

2.5.240 ShortXLUnicodeString

The **ShortXLUnicodeString** structure specifies a Unicode string.

0	1	 2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
			cc	h				Α			res	serv	ed								ı	rgb	(va	rial	ole)						
																•															

cch (1 bytes): An unsigned integer that specifies the count of characters in the string.

A - fHighByte (1 bit): A bit that specifies whether the characters in **rgb** are double-byte characters. MUST be a value from the following table:

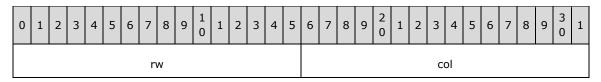

Value	Meaning
0x0	All the characters in the string have a high byte of $0x00$ and only the low bytes are in rgb .
0x1	All the characters in the string are saved as double-byte characters in rgb .

reserved (7 bits): MUST be zero, and MUST be ignored.

rgb (variable): An array of bytes that specifies the characters. If **fHighByte** is 0x0, the size of the array MUST be equal to the value of **cch**. If **fHighByte** is 0x1, the size of the array MUST be equal to the value of **cch***2.

2.5.241 SLC08

The **SLCO8** structure specifies a reference to a **cell** in a <u>SCENARIO</u> record.

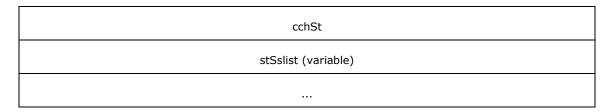

rw (2 bytes): A RWU structure that specifies the zero-based index of the row of the cell.

col (2 bytes): A <u>ColSico8U</u> structure that specifies the zero-based index of the column of the cell and other information about this cell reference.

2.5.242 SortCond12

The **SortCond12** structure specifies the sort conditions.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	sortOn reserved														rfx (16 bytes)																
																					cor	ndDa	ata	(va	riat	ole)					

A - fSortDes (1 bit): A bit that specifies whether to sort in descending order.

sortOn (4 bits): An unsigned integer that specifies the kind of sort to perform. MUST be a value listed in the Sort On Value column in the table for **condData**.

reserved (11 bits): MUST be zero, and MUST be ignored.

rfx (16 bytes): An RFX that specifies the sort range of cells on the **sheet**.

condData (variable): A structure that specifies the conditional data information. The data type of this structure depends on the value of the sortOn field and MUST be a value from the following table:

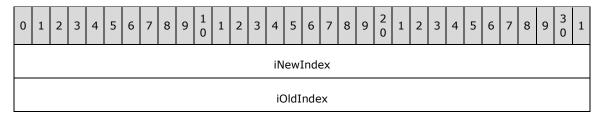

Sort On Value	Data Type
0x0	<u>CondDataValue</u>
0x1	CondDataValue
0x2	CondDataValue
0x3	<u>CFFlag</u>

cchSt (4 bytes): A signed integer that specifies the character count in **stSslist**. MUST be greater than or equal to zero. MUST be zero and ignored if **sortOn** is not equal to zero.

stSslist (variable): An <u>XLUnicodeStringNoCch</u> that specifies the custom sort list string. It exists only if **cchSt** is greater than zero.

2.5.243 SortItem

The **SortItem** structure specifies the sort mapping from the old row/column index (before sort action) to the new row/column index (after sort action). An array of these structures is contained within a RRSort record.

iNewIndex (4 bytes): An unsigned integer that specifies the new zero-based index of row or column. If the fCol field of the RRSort record that contains this structure is zero, then this value is a zero-based row index and MUST be within the range of rows specified in the ref8 field of the RRSort record that contains this structure. If the fCol field of the RRSort record that contains this structure is 1, then this value is a zero-based column index and MUST be within the range of columns specified in the ref8 field of the RRSort record that contains this structure.

iOldIndex (4 bytes): An unsigned integer that specifies the old zero-based index of row or column. If the **fCol** field of the RRSort record that contains this structure is zero, then this value is a zero-

based row index and MUST be within the range of rows specified in the **ref8** field of the RRSort record that contains this structure. If the **fCoI** field of the RRSort record that contains this structure is 1, then this value is a zero-based column index and MUST be within the range of columns specified in the **ref8** field of the RRSort record that contains this structure.

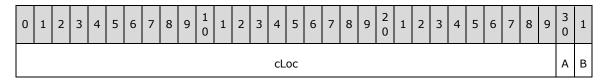

2.5.244 SourceType

The **SourceType** enumeration specifies the source type for a **table**.

Name	Value	Meaning
LTRANGE	0x00000000	Range
LTSHAREPOINT	0x00000001	Read/write Web-based data provider list
LTXML	0x00000002	XML Mapper data
LTEXTERNALDATA	0x00000003	External data source (query table)<180>

2.5.245 SQEIfFlags

The **SQEIFFlags** structure specifies additional undo data associated with a **natural language formula**.

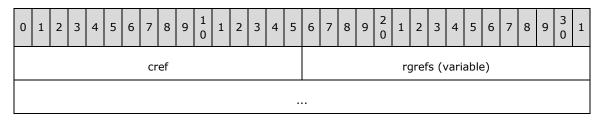

cLoc (30 bits): An unsigned integer that specifies the number of elements in the **rgloc** field of the Duce structure that contains this structure. MUST be greater than or equal to 0x000000002 and less than or equal to 0x3FFFFFFF.

A - reserved (1 bit): MUST be zero, and MUST be ignored.

B - fRel (1 bit): A bit that specifies whether **relative references** are used.

2.5.246 SqRef

The **SqRef** structure specifies a sequence of <u>Ref8</u> structures on the **sheet**.

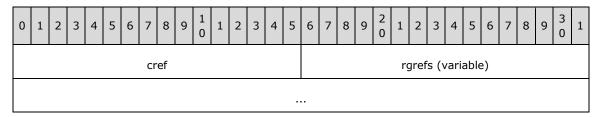

cref (2 bytes): An unsigned integer that specifies the number of elements in **rgrefs**. MUST be less than or equal to 0x2000.

rgrefs (variable): An array of Ref8 structures. The number of elements in the array MUST be equal to **cref**.

2.5.247 SqRefU

The **SqRefU** structure specifies a sequence of Ref8U structures on the **sheet**.

cref (2 bytes): An unsigned integer that specifies the number of elements in **rgrefs**. MUST be less than or equal to 0x2000.

rgrefs (variable): An array of Ref8U structures. The number of elements in the array MUST be equal to **cref**.

2.5.248 Stxp

The **Stxp** structure specifies various formatting attributes of a **font**.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														tv	vpH	eig	ht														
															t	S															
			bls sss																												
			ul	s						ł	oFai	mily	/					b	Cha	arSe	et					ı	unu	ised			

twpHeight (4 bytes): A signed integer that specifies the height of the font in **twips**. This value MUST be -1, 0, or between 20 and 8191. This value SHOULD NOT<181> be 0. A value of -1 specifies that this field is to be ignored.

ts (4 bytes): A Ts that specifies additional formatting attributes.

bls (2 bytes): A signed integer that specifies the font weight. This value MUST be 0, or a value from the following table. The value SHOULD NOT<182> be 0.

Value	Description
0xFFFF	Indicates that this specification is to be ignored
0x0190	Normal font weight
0x02BC	Bold font weight

sss (2 bytes): A signed integer that specifies whether the superscript or subscript or normal style of the font is used. MUST be set to a value from the following table:

Value	Description
0xFFFF	Indicates that this specification is to be ignored

Value	Description
0x0000	Normal script
0x0001	Superscript
0x0002	Subscript

uls (1 byte): An unsigned integer that specifies the underline style. The value MUST be one of the following:

Value	Description
0x00	No underline
0x01	Single
0x02	Double
0x21	single accounting
0x22	double accounting
0xFF	Indicates that this specification is to be ignored

bFamily (1 byte): An unsigned integer that specifies the **font family**, as defined by Windows API LOGFONT structure in [MSDN-FONTS]. MUST be greater than or equal to 0 or less than or equal to 5.

bCharSet (1 byte): An unsigned integer that specifies the **character set**, as defined by Windows API LOGFONT structure in [MSDN-FONTS].

unused (1 byte): Undefined and MUST be ignored.

2.5.249 StyleXF

The **StyleXF** structure specifies formatting properties for a <u>cell style</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1						
	alc		Α		alcV	/	В		trot				(cIndent C D				cIndent C D				cIndent C D				ent C D				Е				unused			
	dgl	Left		(dgR	ight	t		dg٦	Гор		F				icvLeft									icv	vRight				G	ŝ						
		ic	vTc	р					icvE	Bott	om					ic	√Dia	ag				dg[Diag		Н			fl	s								
		ic	vFo	re					ic\	/Ba	ck	I																									

alc (3 bits): A HorizAlign that specifies the horizontal alignment.

A - fWrap (1 bit): A bit that specifies whether cell text is wrapped.

alcV (3 bits): A VertAlign that specifies the vertical alignment.

B - fJustLast (1 bit): A bit that specifies whether the justified or distributed alignment of the cell is used on the last line of text. (Setting this to 1 is typical for East Asian text but not typical in other contexts). If this field equals 1 then **alc** MUST equal 7.

- trot (1 byte): An XFPropTextRotation that specifies the text rotation.
- **cIndent (4 bits):** An unsigned integer that specifies the text **indentation level**. MUST be less than or equal to 15.
- C fShrinkToFit (1 bit): A bit that specifies whether a cell is shrink to fit.
- **D reserved1 (1 bit):** MUST be zero and MUST be ignored.
- E iReadOrder (2 bits): A ReadingOrder that specifies the reading order.
- unused (1 byte): Undefined and MUST be ignored.
- dgLeft (4 bits): A BorderStyle that specifies the logical left border formatting.
- dgRight (4 bits): A BorderStyle that specifies the logical right border formatting.
- dgTop (4 bits): A BorderStyle that specifies the top border formatting.
- **F dgBottom (4 bits):** A BorderStyle that specifies the bottom border formatting.
- **icvLeft (7 bits):** An unsigned integer that specifies the color of the logical left **border**. The value MUST be one of the values specified in the **icv** field in <u>IcvXF</u> or zero. A value of zero means the left border color is not specified. If this value is zero then **dgLeft** MUST also be zero.
- **icvRight (7 bits):** An unsigned integer that specifies the color of the logical right border. The value MUST be one of the values specified in the **icv** field in IcvXF or zero. A value of zero means the right border color is not specified. If this value is zero then **dgRight** MUST also be zero.
- **G grbitDiag (2 bits):** An unsigned integer that specifies which diagonal borders are present (if any). MUST be a value from the following table:

Value	Meaning
0x0	No diagonal border
0x1	Diagonal-down border
0x2	Diagonal-up border
0x3	Both diagonal-down and diagonal-up

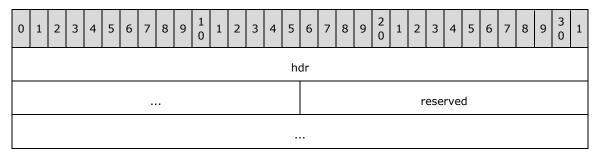

- icvTop (7 bits): An unsigned integer that specifies the color of the top border. The value MUST be one of the values specified in the icv field in IcvXF or zero. A value of zero means the top border color was not specified. If this value is zero then dgTop MUST also be zero.
- **icvBottom (7 bits):** An unsigned integer that specifies the color of the bottom border. The value MUST be one of the values specified in the **icv** field in IcvXF or zero. A value of zero means the bottom border color was not specified. If this value is zero then **dgBottom** MUST also be zero.
- **icvDiag (7 bits):** An unsigned integer that specifies the color of the diagonal border. The value MUST be one of the values specified in the **icv** field in IcvXF or zero. A value of zero means the diagonal border color has not been specified. If this value is zero then **dgDiag** MUST also be zero.
- dgDiag (4 bits): A BorderStyle that specifies the diagonal border formatting.
- H reserved2 (1 bit): MUST be zero and MUST be ignored.
- **fls (6 bits):** A <u>FillPattern</u> that specifies the **fill pattern**. If this value is 1 which specifies a solid fill pattern only **icvFore** is rendered.
- icvFore (7 bits): An IcvXF that specifies the foreground color of the fill pattern.

icvBack (7 bits): An unsigned integer that specifies the background color of the fill pattern. The value MUST be an IcvXF value.

I - reserved3 (2 bits): MUST be zero and MUST be ignored.

2.5.250 SXAddl_SXDEnd

The **SXAddI_SXDEnd** record specifies the end of a sequence of <u>SXAddI</u> records that specify information about a <u>PivotTable</u>.

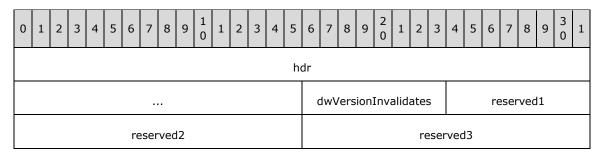

hdr (6 bytes): An SXAddlHdr. The sxd field of SXAddlHdr MUST equal 0xFF.

reserved (6 bytes): MUST be zero, and MUST be ignored.

2.5.251 SXAddl_SXDVerUpdInv

The **SXAddi_SXDVerUpdInv** structure specifies the highest <u>data functionality level</u> for which records following this record are handled.

hdr (6 bytes): An SXAddlHdr. The sxd field of SXAddlHdr MUST equal 0x01.

dwVersionInvalidates (1 byte): An unsigned integer that specifies the highest data functionality level for which records following this record are handled.

MUST be greater than or equal to 0 and less than or equal to 0xFF. If this value is equal to 0xFF, the data functionality level is not set.

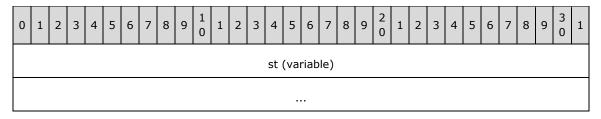

reserved1 (1 byte): MUST be zero, and MUST be ignored.

reserved2 (2 bytes): MUST be zero, and MUST be ignored.

reserved3 (2 bytes): MUST be zero, and MUST be ignored.

2.5.252 SXAddl_SXString

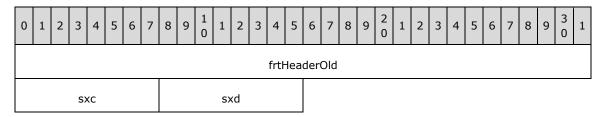

The SXAddl_SXString structure specifies a Unicode string segment.

st (variable): An <u>XLUnicodeStringSegmentedSXADDL</u> that specifies a Unicode string segment. **st.cchTotal** MUST be less than or equal to 65535.

2.5.253 SXAddlHdr

The **SXAddlHdr** structure specifies header information for an <u>SXAddl</u>record.

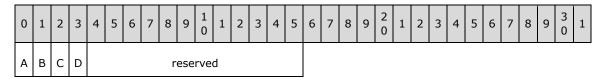

frtHeaderOld (4 bytes): An FrtHeaderOld. The frtHeaderOld.rt field MUST be 0x0864.

sxc (1 byte): An unsigned integer that specifies the current class. See <u>class</u> for details.

sxd (1 byte): An unsigned integer that specifies the type of record contained in the **data** field of the containing SXAddl record. See class for details.

2.5.254 SXAxis

The **SXAxis** structure specifies the <u>PivotTable axis</u> referred to by the containing record.

A - sxaxisRw (1 bit): A bit that specifies whether this structure refers to the <u>row axis</u>.

B - sxaxisCol (1 bit): A bit that specifies whether this structure refers to the column axis.

C - sxaxisPage (1 bit): A bit that specifies whether this structure refers to the page axis.

D - sxaxisData (1 bit): A bit that specifies whether this structure refers to the value axis.

reserved (12 bits): MUST be zero, and MUST be ignored.

2.5.255 SXEZDoper

The **SXEZDoper** structure specifies a <u>PivotTable</u> data operation.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	vts grbitSign									vtValue																					
																									<u>.</u>						

vts (1 byte): An unsigned integer that specifies the type of comparison used in the data operation. MUST be a value in the following table:

Value	Meaning						
0x00	This SXEZDoper record is undefined and MUST be ignored.						
0x04	This SXEZDoper specifies a numeric data operation.						
0x06	This SXEZDoper specifies a string data operation.						
0x0C	This SXEZDoper specifies that all space characters are matched in the data operation.						
0x0E	This SXEZDoper specifies that all non-space characters are matched in the data operation.						

grbitSign (1 byte): An unsigned integer that specifies the comparison operation between a database value and **vtValue**. MUST be one of the following values:

Value	Meaning
0x00	No operation. The vts field MUST be zero.
0x01	Less than
0x02	Equal to
0x03	Less than or equal to
0x04	Greater than
0x05	Not equal to
0x06	Greater than or equal to

vtValue (8 bytes): A field with the type and meaning specified by the value of **vts**, as specified in the following table:

Value of vts	vtValue meaning
0x00	Undefined and MUST be ignored.
0x04	An Xnum (section $2.5.342$) that specifies the numeric value used in the numeric data operation.
0x06	A <u>PivotCompProp</u> that specifies the type of string comparison.
0x0C	Undefined and MUST be ignored.
0x0E	Undefined and MUST be ignored.

2.5.256 SxFT

The **SxFT** structure specifies the pivot filter types.

Name	Value	Meaning
SXFTCOUNT	0x00000001	Specifies the "count" filter. This is a <u>value</u> <u>filter</u> .
SXFTPERCENT	0x00000002	Specifies the "percent" filter. This is a value filter.
SXFTSUM	0x00000003	Specifies the "sum" filter. This is a value filter.
SXFTCAPTIONEQUALS	0x00000004	Specifies the "equals" filter. This is a <u>label</u> <u>filter</u> .
SXFTCAPTIONDOESNOTEQUAL	0x00000005	Specifies the "not equal" filter. This is a label filter.
SXFTCAPTIONBEGINSWITH	0x00000006	Specifies the "begins with" filter. This is a label filter.
SXFTCAPTIONDOESNOTBEGINWITH	0x00000007	Specifies the "does not begin with" filter. This is a label filter.
SXFTCAPTIONENDSWITH	0x00000008	Specifies the "ends with" filter. This is a label filter.
SXFTCAPTIONDOESNOTENDWITH	0x00000009	Specifies the "does not end with" filter. This is a label filter.
SXFTCAPTIONCONTAINS	0x0000000A	Specifies the "contains" filter. This is a label filter.
SXFTCAPTIONDOESNOTCONTAIN	0x0000000B	Specifies the "does not contain" filter. This is a label filter.
SXFTCAPTIONISGREATERTHAN	0x0000000C	Specifies the "is greater than" filter. This is a label filter.
SXFTCAPTIONISGREATERTHANOREQUALTO	0x0000000D	Specifies the "is greater than or equal to" filter. This is a label filter.
SXFTCAPTIONISLESSTHAN	0x0000000E	Specifies the "is less than" filter for field captions. This is a label filter.
SXFTCAPTIONISLESSTHANOREQUALTO	0x0000000F	Specifies the "is less than or equal to" filter. This is a label filter.
SXFTCAPTIONISBETWEEN	0x00000010	Specifies the "is between" filter. This is a label filter.
SXFTCAPTIONISNOTBETWEEN	0x00000011	Specifies the "is not between" filter. This is a label filter.
SXFTVALUEEQUAL	0x00000012	Specifies the "value equal" filter. This is a value filter.
SXFTVALUENOTEQUAL	0x00000013	Specifies the "value not equal" filter. This is a value filter.
SXFTVALUEGREATERTHAN	0x00000014	Specifies the "value greater than" filter. This is a value filter.
SXFTVALUEGREATERTHANOREQUAL	0x00000015	Specifies the "value greater than or equal to" filter. This is a value filter.
SXFTVALUELESSTHAN	0x0000016	Specifies the "value less than" filter. This is a

Name	Value	Meaning
		value filter.
SXFTVALUELESSTHANOREQUAL	0x00000017	Specifies the "value less than or equal to" filter. This is a value filter.
SXFTVALUEBETWEEN	0x00000018	Specifies the "value between" filter. This is a value filter.
SXFTVALUENOTBETWEEN	0x0000019	Specifies the "value not between" filter. This is a value filter.
SXFTDATEEQUALS	0x000001A	Specifies the "equals" filter. This is a <u>date</u> <u>filter</u> .
SXFTDATEOLDERTHAN	0x000001B	Specifies the "older than" filter. This is a date filter.
SXFTDATENEWERTHAN	0x0000001C	Specifies the "newer than" filter. This is a date filter.
SXFTDATEBETWEEN	0x000001D	Specifies the "between" filter. This is a date filter.
SXFTDATETOMORROW	0x0000001E	Specifies the "tomorrow" filter. This is a date filter.
SXFTDATETODAY	0x000001F	Specifies the "today" filter. This is a date filter.
SXFTDATEYESTERDAY	0x00000020	Specifies the "yesterday" filter. This is a date filter.
SXFTDATENEXTWEEK	0x00000021	Specifies the "next week" filter. This is a date filter.
SXFTDATETHISWEEK	0x00000022	Specifies the "this week" filter. This is a date filter.
SXFTDATELASTWEEK	0x00000023	Specifies the "last week" filter. This is a date filter.
SXFTDATENEXTMONTH	0x00000024	Specifies the "next month" filter. This is a date filter.
SXFTDATETHISMONTH	0x00000025	Specifies the "this month" filter. This is a date filter.
SXFTDATELASTMONTH	0x00000026	Specifies the "last month" filter. This is a date filter.
SXFTDATENEXTQUARTER	0x00000027	Specifies the "next quarter" filter. This is a date filter.
SXFTDATETHISQUARTER	0x00000028	Specifies the "this quarter" filter. This is a date filter.
SXFTDATELASTQUARTER	0x00000029	Specifies the "last quarter" filter. This is a date filter.
SXFTDATENEXTYEAR	0x0000002A	Specifies the "next year" filter. This is a date filter.
SXFTDATETHISYEAR	0x0000002B	Specifies the "this year" filter. This is a date filter.

Name	Value	Meaning
SXFTDATELASTYEAR	0x0000002C	Specifies the "last year" filter. This is a date filter.
SXFTDATEYEARTODATE	0x0000002D	Specifies the "year-to-date" filter. This is a date filter.
SXFTDATEALLDATESINPERIODQUARTER1	0x0000002E	Specifies the "first quarter" filter. This is a date filter.
SXFTDATEALLDATESINPERIODQUARTER2	0x0000002F	Specifies the "second quarter" filter. This is a date filter.
SXFTDATEALLDATESINPERIODQUARTER3	0x00000030	Specifies the "third quarter" filter. This is a date filter.
SXFTDATEALLDATESINPERIODQUARTER4	0x00000031	Specifies the "fourth quarter" filter. This is a date filter.
SXFTDATEALLDATESINPERIODJANUARY	0x00000032	Specifies the "January" filter. This is a date filter.
SXFTDATEALLDATESINPERIODFEBRUARY	0x00000033	Specifies the "February" filter. This is a date filter.
SXFTDATEALLDATESINPERIODMARCH	0x00000034	Specifies the "March" filter. This is a date filter.
SXFTDATEALLDATESINPERIODAPRIL	0x00000035	Specifies the "April" filter. This is a date filter.
SXFTDATEALLDATESINPERIODMAY	0x00000036	Specifies the "May" filter. This is a date filter.
SXFTDATEALLDATESINPERIODJUNE	0x00000037	Specifies the "June" filter. This is a date filter.
SXFTDATEALLDATESINPERIODJULY	0x00000038	Specifies the "July" filter. This is a date filter.
SXFTDATEALLDATESINPERIODAUGUST	0x00000039	Specifies the "August" filter. This is a date filter.
SXFTDATEALLDATESINPERIODSEPTEMBER	0x0000003A	Specifies the "September" filter. This is a date filter.
SXFTDATEALLDATESINPERIODOCTOBER	0x0000003B	Specifies the "October" filter. This is a date filter.
SXFTDATEALLDATESINPERIODNOVEMBER	0x0000003C	Specifies the "November" filter. This is a date filter.
SXFTDATEALLDATESINPERIODDECEMBER	0x0000003D	Specifies the "December" filter. This is a date filter.
SXFTDATENOTEQUAL	0x0000003E	Specifies the "not equal" filter. This is a date filter.
SXFTDATEOLDEROREQUAL	0x0000003F	Specifies the "older than or equal to" filter. This is a date filter.
SXFTDATENEWEROREQUAL	0x00000040	Specifies the "newer than or equal to" filter. This is a date filter.
SXFTDATENOTBETWEEN	0x00000041	Specifies the "not between" filter. This is a date filter.

2.5.257 SxIvdCol

The **SxIvdCol** structure specifies a reference to a <u>pivot field</u> or <u>data field</u> on the <u>column axis</u>

col (2 bytes): A signed integer that specifies a pivot field or data field for the column axis of the PivotTable view. MUST be a value from the following table:

Value	Meaning
-2	This value specifies that the data field is on the column axis. The sxaxisCol field of sxaxis4Data of the <u>SxView</u> record of the PivotTable view MUST equal 1 and the sxaxisData field of sxaxis4Data of the SxView record of the PivotTable view MUST equal zero.
0+	This value specifies a pivot field index as specified in Pivot Fields. The pivot field index specifies a pivot field on the column axis of the PivotTable view. MUST be less than the cDim field of the SxView record of the PivotTable view. If the referenced pivot field is not a hidden field in an <u>OLAP PivotTable view</u> then the sxaxisCol field of <u>SXAxis</u> of the <u>Sxvd</u> record of the pivot field MUST equal 1.

A pivot field is a hidden field if an <u>SXAddl_SXCField12_SXDVer12Info</u> record exists for the pivot field, and the **fHiddenLvl** field of the SXAddl_SXCField12_SXDVer12Info record is 1.

2.5.258 SxIvdRw

The **SxIvdRw** structure specifies a reference to a <u>pivot field</u> or <u>data field</u> on the <u>row axis</u>.

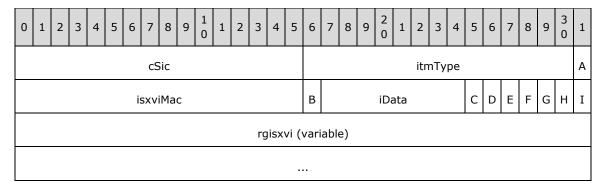

rw (2 bytes): A signed integer that specifies a pivot field or data field for the row axis of the PivotTable view. MUST be a value from the following table:

Value	Meaning
-2	This value specifies that the data field is on the row axis. The sxaxisRw field of sxaxis4Data of <u>SxView</u> record of the PivotTable view MUST equal 1 and the sxaxisData field of sxaxis4Data of the SxView record of the PivotTable view MUST equal zero.
0+	This value specifies a pivot field index as specified in Pivot Fields. The pivot field index specifies a pivot field on the row axis of the PivotTable view. MUST be less than the cDim field of the SxView record of the PivotTable view. If the referenced pivot field is not a hidden field in an <u>OLAP PivotTable view</u> then the sxaxisRw field of <u>SXAxis</u> of the <u>Sxvd</u> record of the pivot field MUST equal 1.

A pivot field is a hidden field if an <u>SXAddl_SXCField12_SXDVer12Info</u> record exists for the pivot field, and the **fHiddenLvl** field of the SXAddl_SXCField12_SXDVer12Info record is 1.

2.5.259 SXLIItem

The **SXLIItem** structure specifies a <u>pivot line</u> in the <u>row area</u> or <u>column area</u> of a <u>PivotTable view</u>.

cSic (2 bytes): A signed integer that specifies the count of <u>pivot item</u> indexes in the beginning of the rgisxvi array that are identical to the same number of pivot item indexes in the beginning of the rgisxvi array of the previous SXLIItem structure in the rgsxli array of the preceding <u>SXLI</u> record. The value MUST be greater than or equal to 0 and less than the isxviMac field. If the fGrand field equals 1, then this value MUST be 0.

itmType (15 bits): An unsigned integer that specifies the type of this pivot line. MUST be a value from the following table:

Name	Value	Meaning
ITMTYPEDATA	0x0000	A value in the data
ITMTYPEDEFAULT	0x0001	Automatic subtotal selection
ITMTYPESUM	0x0002	Sum of values in the data
ITMTYPECOUNTA	0x0003	Count of values in the data
ITMTYPECOUNT	0x0004	Count of numbers in the data
ITMTYPEAVERAGE	0x0005	Average of values in the data
ITMTYPEMAX	0x0006	Maximum value in the data
ITMTYPEMIN	0x0007	Minimum value in the data
ITMTYPEPRODUCT	0x0008	Product of values in the data
ITMTYPESTDEV	0x0009	Statistical standard deviation (estimate)
ITMTYPESTDEVP	0x000A	Statistical standard deviation (entire population)
ITMTYPEVAR	0x000B	Statistical variance (estimate)
ITMTYPEVARP	0x000C	Statistical variance (entire population)
ITMTYPEGRAND	0x000D	Grand total
ITMTYPEBLANK	0x000E	Blank line

A - reserved1 (1 bit): MUST be zero and MUST be ignored.

isxviMac (2 bytes): A signed integer that specifies the number of elements in the rgisxvi array that are displayed in this pivot line. MUST be greater than or equal to 0. If the fGrand field equals 1, then the value of this field MUST be 1. If the fGrand field equals zero and the preceding SXLI record contains row area pivot items, then this value MUST be less than or equal to the cDimRw field of the preceding SxView. If the fGrand field equals zero and the preceding SXLI record contains column area pivot items, then this value MUST be less than or equal to the cDimCol field of the preceding SxView.

B - fMultiDataName (1 bit): A bit that specifies whether the <u>data field</u> name is used for the total or the subtotal. MUST be a value from the following table:

Value	Meaning
0	The data field name is used for the total.

Value	Meaning
1	The data field name is used for the subtotal.

If the **fGrand** field equals 1 or the **fBlock** field equals 1, then this value MUST equal the value in the **fMultiDataOnAxis** field. If the **fGrand** and **fBlock** fields equal zero, the **fSbt** and **fMultiDataOnAxis** fields equal 1, and the **cSic** field is less than *iposData*, then this value MUST equal 1. Otherwise, this value MUST be zero.

iposData is specified as follows:

- If the preceding SXLI record contains row area pivot items, *iposData* equals the index of the SxIvdRw record in the **rgSxivd** array of the SxIvdRw records where the **rw** field equals -2. If there is not an SxIvdRw record with the **rw** field equal to -2, *iposData* equals zero.
- If the preceding SXLI record contains column area pivot items, *iposData* equals the index of the <u>SxIvdCol</u> record in the **rgSxivd** array of the SxIvd containing SxIvdCol records where the **col** field equals -2. If there is not an SxIvdCol record with the **col** field equal to -2, *iposData* equals zero.
- iData (8 bits): An unsigned integer that specifies a data item index as specified in Data Items, for an SXDI record specifying a data item used for a subtotal. This field MUST be 0 if the CDimData field of the preceding SxView record is 0 or if the FGFANA field equals 1. If the CDimData field of the preceding SxView is greater than 0, then this value MUST be greater than or equal to 0 and less than the CDimData field of the preceding SxView record. If the fMultiDataOnAxis field equals 1 and the itmType field does not equal ITMTYPEBLANK and the itmType field is greater than iposData as specified in fMultiDataName, then the value of this field MUST equal the value of the element of the right right array in the position equal to iposData as specified in fMultiDataName.
- **C fSbt (1 bit):** A bit that specifies whether this pivot line is a subtotal. This value MUST equal 1 if the **itmType** field is greater than or equal to ITMTYPEDEFAULT and the **itmType** field is less than or equal to ITMTYPEGRAND and the **fBlock** field equals 0. Otherwise, this value MUST be 0.
- **D fBlock (1 bit):** A bit that specifies whether this pivot line is a block total. A block total is a total of a group of pivot items. For more details see <u>Grouping</u>. If the **fGrand** field equals 0 and the **fBlock** field in the previous SXLIItem record equals 1, this value MUST be 1.
- **E fGrand (1 bit):** A bit that specifies whether this pivot line is a **grand total**. If the **fGrand** field in the previous SXLIItem record is 1, then this value MUST be 1. Otherwise, if the **itmType** field equals ITMTYPEGRAND this field MUST equal 1 and if the **itmType** field does not equal ITMTYPEGRAND this field MUST equal 0.
- **F fMultiDataOnAxis (1 bit):** A bit that specifies whether a <u>pivot line entry</u> in this pivot line is a data item index.

If the preceding SXLI record contains row area pivot items, the **cDimData** field of the preceding SxView record is greater than 1, the **sxaxis4Data.sxaxisRw** field of the preceding SxView equals 1 and **itmType** is not equal to ITMTYPEBLANK, then this value MUST be 1. Otherwise, this value MUST be 0.

If the preceding SXLI record contains column area pivot items, the **cDimData** field of the preceding SxView record is greater than 1, the **sxaxis4Data.sxaxisCol** field of the preceding SxView equals 1 and **itmType** is not equal to ITMTYPEBLANK, then this value MUST be 1. Otherwise, this value MUST be 0.

- **G unused1 (1 bit):** Undefined, and MUST be ignored.
- H unused2 (1 bit): Undefined, and MUST be ignored.
- I reserved2 (1 bit): MUST be zero and MUST be ignored.

rgisxvi (variable): An array of 2-byte signed integers that specifies a pivot line entry.

Each element of this array is either a pivot item index or a data item index.

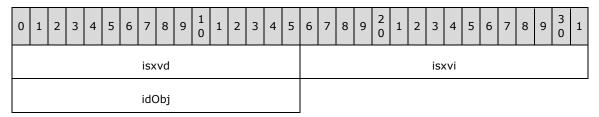

If **fGrand** is 1 or **itmType** is ITMTYPEBLANK then all elements of this field are undefined and MUST be ignored. Otherwise each element MUST be a value from the following table:

Value	Meaning
0x0000 to 0x7EF4	This value specifies a data item index or pivot item index in the associated <u>pivot field</u> as specified in Pivot Items.
0x7FFF	This value specifies that there is no pivot item and that the cell in the pivot line is blank.

For more details see Pivot Line Entries and Pivot Lines.

2.5.260 SXPI_Item

The **SXPI_Item** structure specifies information about a <u>pivot field</u> and its filtering on the <u>page axis</u> of a <u>PivotTable view</u>.

isxvd (2 bytes): A signed integer that specifies a pivot field index as specified by Pivot Fields. The referenced pivot field is specified to be on the page axis. MUST be greater than or equal to zero and less than the **cDim** field of the <u>SxView</u> record of the PivotTable view.

isxvi (2 bytes): A signed integer that specifies the <u>pivot item</u> used for the page axis filtering. MUST be a value from the following table:

Value	Meaning
0x0000 to 0x7FFC	This value specifies a pivot item index that specifies a pivot item in the pivot field specified by isxvd . The referenced pivot item specifies the page axis filtering for the pivot field.
0x7FFD	This value specifies all pivot items, see page axis for filtering that applies.

For a non-<u>OLAP PivotTable view</u> the value MUST be 0x7FFD or greater than or equal to zero and less than the **cItm** field of the <u>Sxvd</u> record of the pivot field. Otherwise the value MUST be 0x7FFD.

idObj (2 bytes): A signed integer that specifies the object identifier of the <u>Obj</u> record with the page item drop-down arrow.

2.5.261 SXVDEx_Opt

The **SXVDEx_Opt** structure specifies an optional string in the <u>SXVDEx</u> record.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	cchSubName														reserved1																
																	re	ser	vec	12											

cchSubName (2 bytes): An unsigned integer that specifies the length, in characters, of the XLUnicodeStringNoCch in the **stSubName** field. If the value is 0xFFFF then **stSubName** does not exist. The value MUST be 0xFFFF or greater than zero and less than or equal to 0x00FF.

reserved1 (4 bytes): MUST be zero, and MUST be ignored.

reserved2 (4 bytes): MUST be zero, and MUST be ignored.

stSubName (variable): An XLUnicodeStringNoCch that specifies the name of the aggregate function used to calculate this <u>pivot field</u>'s subtotals. A "?" character within the string will be replaced by the **stName** field of <u>Sxvd</u> when displayed in the UI. The length is specified in **cchSubName**.

2.5.262 SXView9Save

The **SXView9Save** structure specifies option flags for a <u>PivotTable view</u>.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	С	D	Е		reserved2															re	eser	ved	13							

- **A fNoStencil (1 bit):** A bit that specifies whether to disable the drawing of large drop zones for a PivotTable viewthat has no data fields.
- **B fHideTotAnnotation (1 bit):** A bit that specifies whether, for an <u>OLAP PivotTable view</u> when the **fNotVisualTotals** field of the <u>SXAddl_SXCView_SXDVer12Info</u> record of the PivotTable view is 0 or the SXAddl_SXCView_SXDVer12Info record is not present, an asterisk is not displayed next to the caption for subtotals and grand totals.
- C reserved1 (1 bit): MUST be zero, and MUST be ignored.
- **D fIncludeEmptyRw (1 bit):** A bit that specifies whether empty rows from an **OLAP data source** be shown in the PivotTable view.
- **E fIncludeEmptyCol (1 bit):** A bit that specifies whether empty columns from an OLAP data source is shown in the PivotTable view.

reserved2 (11 bits): MUST be zero, and MUST be ignored.

reserved3 (16 bits): MUST be zero, and MUST be ignored.

2.5.263 SXVIFlags

SXVIFlags is a 2-byte structure which specifies properties for a pivot item.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В	C	D	Е	F		reserved2																								

- **A fDrilledMember (1 bit):** A bit that specifies whether child elements of this node are collapsed, see <u>Collapsing</u> for details. MUST be zero if the pivot items are from **attribute hierarchies**. MUST be zero if the **itmType** field of the SXVI record of the pivot item is not zero.
- **B reserved1 (1 bit):** MUST be zero, and MUST be ignored.
- **C fHasChildren (1 bit):** A bit that specifies whether the pivot item has child **OLAP members**. MUST be zero if the **itmType** field of the SXVI record of the pivot item is not zero.
- **D fCollapsedMember (1 bit):** A bit that specifies whether the subnodes of this node are collapsed, see Collapsing for details. This value applies only to pivot items of attribute hierarchies. MUST be zero if the pivot items are from non-attribute hierarchies.
- E fHasChildrenEst (1 bit): A bit that specifies whether fHasChildren is considered correct.
- **F fOlapFilterSelected (1 bit):** A bit that specifies whether this pivot item is selected for <u>Olap Manual Filtering</u>.

reserved2 (10 bits): MUST be zero, and MUST be ignored.

2.5.264 TabId

The **TabId** structure specifies the unique sheet identifier associated with the **sheet**. A sheet's identifier is specified by the <u>RRTabId</u> record, the order of the sheet identifiers in the RRTabId record matches the order of the <u>BoundSheet8</u> records as they appear in the <u>Globals Substream</u>. If the **workbook** contains more than 4112 sheets then this record is not present and each sheet identifier is specified by the order in which the BoundSheet8 records appear in the Globals Substream, beginning with one.

tabid (2 bytes): An unsigned integer that specifies the unique sheet identifier associated with the sheet. MUST be greater than or equal to 0x0001 and less than or equal to 0xFFFE.

2.5.265 TabIndex

The **TabIndex** structure specifies a **sheet** index in the **workbook**. A sheet index is the zero-based index into the collection of <u>BoundSheet8</u> records as they appear in the <u>Globals Substream</u>

itab (2 bytes): An unsigned integer that specifies the zero-based index into the collection of BoundSheet8 records as they appear in the Globals Substream.

2.5.266 TableFeatureType

The **TableFeatureType** structure specifies the definition of a **table** within a **sheet**.

The table feature supports multiple **data source** types. The data source is specified by the **It** field. If the **It** field is 0x00000001, the table's data source definition is cached within the List Data stream. If

the **It** field is 0x00000002, the table's data source schema is cached within the **XML stream** (section 2.1.7.22).

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1

	fieldData (variable)																														

idDeleted (variable)
idChanged (variable)
cellInvalid (variable)

It (4 bytes): A SourceType that specifies the type of data source for the table.

idList (4 bytes): An unsigned integer that specifies an identifier for the table. MUST be unique within the sheet. SHOULD<183> be unique within the **workbook**.

crwHeader (4 bytes): A Boolean (section 2.5.14) that specifies whether the table has a **header row**. If **fAutoFilter** is 1, the value MUST be 0x00000001. If **fSingleCell** is 1, the value MUST be 0x00000000. MUST be one of the following values:

Value	Meaning
0x00000000	Table has no header row.
0x0000001	Table has a header row.

crwTotals (4 bytes): A Boolean that specifies whether there is a **total row**. If **fSingleCell** is 1, the value MUST be 0x00000000. MUST be one of the following values:

Value	Meaning
0x00000000	Table has no total row.
0x0000001	Table has a total row.

idFieldNext (4 bytes): An unsigned integer that specifies the next unique identifier to use when assigning unique identifiers to the **fieldData.idField** field of the table.

cbFSData (4 bytes): An unsigned integer that specifies the size, in bytes, of the fixed portion of this structure. The fixed portion starts at the **It** field and ends at the **rgbHashParam** field. MUST be equal to 64.

rupBuild (2 bytes): An unsigned integer that specifies the build number of the application that
wrote the structure.

unused1 (2 bytes): Undefined, and MUST be ignored.

A - unused2 (1 bit): Undefined, and MUST be ignored.

- **B fAutoFilter (1 bit):** A bit that specifies whether the table has an **AutoFilter**. MUST be 1 when **fPersistAutoFilter** is 1.
- **C fPersistAutoFilter (1 bit):** A bit that specifies whether the AutoFilter is preserved for this table after data **refresh** operations. <184>
- **D fShowInsertRow (1 bit):** A bit that specifies whether the **insert row** is **visible**. MUST be 1 if **fInsertRowInsCells** is 1.
- **E fInsertRowInsCells (1 bit):** A bit that specifies whether rows below the table are shifted down because of the insert row being visible.
- **F fLoadPldwIdDeleted (1 bit):** A bit that specifies whether the **idDeleted** field is present. MUST be zero if the **It** field is not set to 0x00000001.
- **G fShownTotalRow (1 bit):** A bit that specifies whether the total row was ever visible.
- H reserved1 (1 bit): MUST be zero and MUST be ignored.
- **I fNeedsCommit (1 bit):** A bit that specifies whether table modifications were not synchronized with the data source. MUST be zero if the **It** field is not set to 0x00000001.
- **J fSingleCell (1 bit):** A bit that specifies whether the table is limited to a single **cell**. The table cannot have header rows, total rows, or multiple columns. If **fSingleCell** equals 1, the **It** field MUST be set to 0x00000002.
- **K reserved2 (1 bit):** MUST be zero and MUST be ignored.
- **L fApplyAutoFilter (1 bit):** A bit that specifies whether the AutoFilter is currently applied. MUST be 1 if the AutoFilter is currently applied < 185>.
- **M fForceInsertToBeVis (1 bit):** A bit that specifies whether the insert row is forced to be visible because the table has no data.
- **N fCompressedXml (1 bit):** A bit that specifies whether the cached data for this table in the List Data stream is compressed. MUST be zero if the **It** field is not set to 0x00000001.
- **O fLoadCSPName (1 bit):** A bit that specifies whether the **cSPName** field is present. MUST be zero if the **It** field is not set to 0x00000001.
- **P fLoadPldwIdChanged (1 bit):** A bit that specifies whether **idChanged** field is present. MUST be zero if the **It** field is not set to 0x00000001.
- **verXL (4 bits):** An unsigned integer that specifies the application version under which the table was created. MUST be either 0xB or 0xC < 186 >.
- **Q fLoadEntryId (1 bit):** A bit that specifies whether the **entryId** field is present.
- **R fLoadPlistclInvalid (1 bit):** A bit that specifies whether the **cellInvalid** field is present. MUST be zero if the **It** field is not set to 0x0000001.
- S fGoodRupBld (1 bit): A bit that specifies whether the rupBuild field is valid.
- T unused3 (1 bit): Undefined, and MUST be ignored.
- **U fPublished (1 bit):** A bit that specifies whether the table is **published**. This bit is ignored if the **fPublishedBookItems** field of the <u>BookExt Conditional12</u> structure is zero.

reserved3 (7 bits): Undefined, and MUST be ignored.

IPosStmCache (4 bytes): An unsigned integer that specifies the position of the cached data within the List Data stream. Undefined and MUST be ignored if the **It** field is not set to 0x00000001.

cbStmCache (4 bytes): An unsigned integer that specifies the size, in bytes, of the cached data within the List Data stream. Undefined and MUST be ignored if the **It** field is not set to 0x00000001.

cchStmCache (4 bytes): An unsigned integer that specifies the count of characters of the cached data within the List Data stream when the cached data is uncompressed. Undefined and MUST be ignored if the **It** field is not set to 0x00000001.

lem (4 bytes): A <u>LEMMode</u> enumeration that specifies the table edit mode. If **It** is set to 0x00000000, 0x00000002 or 0x00000003, this field MUST be set to 0x00000000.

rgbHashParam (16 bytes): An array of bytes that specifies round-trip information. SHOULD<187> be ignored and MUST be preserved if the **It** field is set to 0x00000001. Undefined and MUST be ignored if the **It** field is not set to 0x00000001.

rgbName (variable): An <u>XLUnicodeString</u> that specifies the name of the table. MUST be unique per workbook, and case-sensitive in all locales.

cFieldData (2 bytes): An unsigned integer that specifies the number of columns in the table. MUST be greater than or equal to 0x0001 and less than or equal to 0x0100.

cSPName (variable): An XLUnicodeString that specifies the name of the **cryptographic service provider** used to specify **rgbHashParam**. This field is present only if **fLoadCSPName** is set to 1.

entryId (variable): An XLUnicodeString that specifies a unique identifier for the table. The string equals the value of the **idList** field, represented in decimal format, without any leading zeros. It is used when **It** equals 0x00000002 and ignored otherwise. This field is present only if **fLoadEntryId** is set to 1.

fieldData (variable): An array of <u>Feat11FieldDataItem</u> that contains the specification of the columns of the table. The number of items in this array is specified by the **cFieldData** field.

idDeleted (variable): A <u>Feat11RqSharepointIdDel</u> structure that specifies the identifiers of deleted rows. This information is used when synchronizing with the Web based **data provider's** data source. This field is only present if the **fLoadPldwIdDeleted** field is set to 1.

idChanged (variable): A <u>Feat11RqSharepointIdChange</u> structure that specifies the identifiers of the edited rows. This information is used when synchronizing with the Web based data provider's data source. This field is only present if the **fLoadPldwIdChanged** field is set to 1.

cellInvalid (variable): A <u>Feat11RgInvalidCells</u> structure that specifies the location of cells within the table that contain values that are invalid based on validation rules on the Web based data provider. This field is only present if the **fLoadPllstcInvalid** field is set to 1.

2.5.267 Tag_Fn_MDX

The **Tag_Fn_MDX** enumeration specifies **cube function** types.

Name	Value	Meaning
TFNCUBEMEMBER	0x01	CUBEMEMBER
TFNCUBEVALUE	0x02	CUBEVALUE
TFNCUBESET	0x03	CUBESET
TFNCUBESETCOUNT	0x04	CUBESETCOUNT
TFNCUBERANKEDMEMBER	0x05	CUBERANKEDMEMBER
TFNCUBEMEMBERPROPERTY	0x06	CUBEMEMBERPROPERTY

Name	Value	Meaning
TFNCUBEKPIPROPERTY	0x07	CUBEKPIPROPERTY

2.5.268 TextPropsStreamChecksumData

The **TextPropsStreamChecksumData** structure specifies the data used to compute the **checksum** of the <u>TextPropsStream</u> record. This data can be obtained from <u>Font</u> and <u>Text</u> records associated with the TextPropsStream record, as specified in TextPropsStream. If no Font record is associated with the TextPropsStream record, the fields related to the Font record MUST be omitted from this structure and thus not used to compute the checksum. If no Text record is associated with the TextPropsStream record, the Text record associated with the <u>DefaultText</u> record MUST be used instead.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	5 6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3	1

																									(dw∖	/Ali	gnm	nent	t	
														•											t	Re	adiı	ngO	rde	r	

stFontName (variable): An array of **Unicode** characters that specify the **font** name. The size of the array MUST be equal to **fontName.cch***2, where **fontName** is a field of the associated Font record.

The value of this field MUST be equal to value of the **fontName.rgb** field of the associated Font record.

- **dwFontHeight (4 bytes):** An unsigned integer that specifies the font height. The value of this field MUST be equal to the value of the **dyHeight** field of the associated Font record.
- **A fBold (1 bit):** A bit that specifies whether the font is bold. The value of this field MUST be 1 when the value of the **bls** field of the associated Font record is greater than 400.
- **B fItalic (1 bit):** A bit that specifies whether the font is italic. The value of this field MUST be equal to the value of the **fItalic** field of the associated Font record.
- **C fUnderline (1 bit):** A bit that specifies whether the font is single-underlined. The value of this field MUST be 1 when the value of the **uls** field of the associated Font record is not equal to 0x00.

- **D fOutline (1 bit):** A bit that specifies whether the font has an **outline effect** applied. The value of this field MUST be equal to the value of the **fOutline** field of the associated Font record.
- **E fShadow (1 bit):** A bit that specifies whether the font has a **shadow effect** applied. The value of this field MUST be equal to the value of the **fShadow** field of the associated Font record.
- **F fCondense (1 bit):** A bit that specifies whether the font is condensed. The value of this field MUST be equal to the value of the **fCondense** field of the associated Font record.
- **G fExtend (1 bit):** A bit that specifies whether the font is extended. The value of this field MUST be equal to the value of the **fExtend** field of the associated Font record.
- H fStrikeout (1 bit): A bit that specifies whether the font has strike-through effect applied. The value of this field MUST be equal to the value of the fStrikeOut field of the associated Font record.
- I fRegular (1 bit): A bit that specifies whether the font is a regular font. The value of this field MUST be equal to 1.
- **J fJon (1 bit):** A bit that specifies whether the font is too small to be displayed. MUST have a value of 1 if the font height in pixels is less than 6.
- **K fDialogBox (1 bit):** A bit that specifies whether the font is used in the context of a dialog box. The value of this field MUST be equal to 0.
- unused1 (5 bits): MUST be zero, and MUST be ignored.
- **boldness (2 bytes):** An unsigned integer that specifies the font weight. The value of this field MUST be equal to the value of the **bls** field of the associated Font record.
- subscript (2 bytes): An unsigned integer that specifies whether superscript, subscript, or normal script is used. The value of this field MUST be equal to the value of the sss field of the associated Font record.
- **bUnderline (1 byte):** An unsigned integer that specifies the underline style. The value of this field MUST be equal to the value of the **uls** field of the associated Font record.
- **bFamily (1 byte):** An unsigned integer that specifies the **font family** of this font. The value of this field MUST be equal to the value of the **bFamily** field of the associated Font record.
- **bCharset (1 byte):** An unsigned integer that specifies the **character set**. The value of this field MUST be equal to the value of the **bCharSet** field of the associated Font record.
- unused2 (1 byte): MUST be zero, and MUST be ignored.
- **rgbFontColor (4 bytes):** A <u>LongRGB</u> that specifies the font color. The value of this field MUST be equal to the value of the **icv** field of the associated Font record.
- **dwDrawingMode (4 bytes):** An unsigned integer that specifies the display mode of the background of the text. The value of this field MUST be equal to 0x000010D when the **wBkgMode** field of the associated Text record is equal to 0x0001; otherwise, it MUST be equal to 0x0000020D.
- **bRotation (1 byte):** An unsigned integer that specifies the text rotation. The value of this field MUST be equal to the value of the **trot** field of the associated Text record.
- **dwHAlignment (4 bytes):** An unsigned integer that specifies the horizontal alignment of the text. The value of this field MUST equal to the value of the **at** field of the associated Text record.
- **dwVAlignment (4 bytes):** An unsigned integer that specifies the vertical alignment of the text. The value of this field MUST be equal to the value of the **vat** field of the associated Text record.

bReadingOrder (1 byte): An unsigned integer that specifies the reading order of the text. The value of this field MUST be equal to the value of the **iReadingOrder** field of the associated Text record.

2.5.269 Top10FT

The **Top10FT** enumeration specifies the **top N filter** type.

Name	Value	Meaning
TOP10FTUNKNOWN	0x00000000	None
TOP10FTCOUNT	0x00000001	Count
TOP10FTPERCENT	0x00000002	Percent
TOP10FTSUM	0x0000003	Sum

2.5.270 Ts

The **Ts** structure specifies the italic and **strikethrough formatting** of a **font**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
Α	В		un	use	d2		С											u	ınus	sed:	3										

A - unused1 (1 bit): Undefined and MUST be ignored.

B - ftsItalic (1 bit): A bit that specifies whether the text **style** is italic.

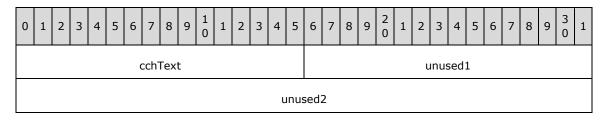

unused2 (5 bits): Undefined and MUST be ignored.

C - ftsStrikeout (1 bit): A bit that specifies whether the font has strikethrough formatting applied.

unused3 (24 bits): Undefined and MUST be ignored.

2.5.271 TxOLastRun

The TxOLastRun structure marks the end of the $formatting\ run$ information in the $\underline{TxORuns}$ structure.

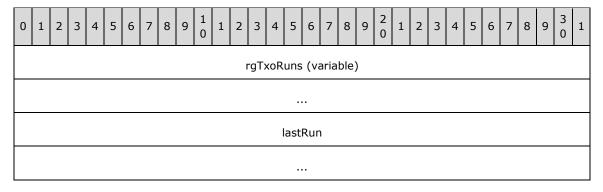

cchText (2 bytes): An unsigned integer that specifies the number of characters in the preceding IxO record. The value MUST be the count of characters specified in the **cchText** field of the preceding IxO record.

unused1 (2 bytes): Undefined and MUST be ignored.

unused2 (4 bytes): Undefined and MUST be ignored.

2.5.272 TxORuns

The **TxORuns** structure specifies the **formatting run** information for the <u>TxO</u> record and zero or more <u>Continue</u> records immediately following.

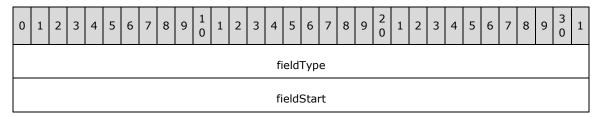

rgTxoRuns (variable): An array of <u>Run</u>. Each Run specifies the formatting information for a **text run**. **formatRun.ich** MUST be less than or equal to **cchText** of the preceding TxO record. The number of elements in this array is as follows:

(cbRuns of the preceding TxO record / 8 - 1).

lastRun (8 bytes): A <u>TxOLastRun</u> that marks the end of the text run. This field is only present in the last Continue record following the TxO record. <188>

2.5.273 TxtWf

The **TxtWf** structure specifies a field in text to column.

fieldType (4 bytes): An unsigned integer that specifies the format of the field. MUST be a value from the following table:

Value	Meaning								
0x00000000	eneral								
0x00000001	ext								
0x00000002	Date in the order month, day, year								
0x00000003	ate in the order day, month, year								
0x00000004	Date in the order year, month, day								
0x00000005	Date in the order month, year, day								
0x00000006	Date in the order day, year, month								
0x00000007	Date in the order year, day, month								
0x00000008	Skip importing field								
0x00000009	Taiwan era dates.								

fieldStart (4 bytes): An unsigned integer that specifies the character position of the field. The offset is zero-based and MUST be greater than or equal to 0.

2.5.274 Underline

The **Underline** enumeration specifies the underline style.

Name	Value	Meaning
ULSNONE	0x0000	No underline
ULSSINGLE	0x0001	Single
ULSDOUBLE	0x0002	Double
ULSSINGLEACCOUNTANT	0x0021	Single accounting
ULSDOUBLEACCOUNTANT	0x0022	Double accounting

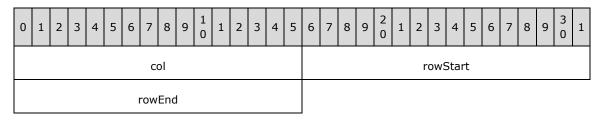

2.5.275 VertAlign

The **VertAlign** enumeration specifies the vertical alignment.

Name	Value	Meaning							
ALCVTOP	0x00	Top alignment							
ALCVCTR	0x01	Center alignment							
ALCVBOT	0x02	Bottom alignment							
ALCVJUST	0x03	Justify alignment							
ALCVDIST	0x04	Distributed alignment							

2.5.276 **VertBrk**

The VertBrk structure specifies one column page break.

col (2 bytes): A <u>ColU</u> that specifies the zero-based index of the first column to the right of the page break.

rowStart (2 bytes): A RwU that specifies the zero-based index of the first row on the page.

rowEnd (2 bytes): A RwU that specifies the zero-based index of the last row on the page. The value MUST be greater than **rowStart**.

2.5.277 VirtualPath

VirtualPath is a XLUnicodeString that specifies a path, a workbook, and optionally a sheet.

MUST be a string in the following grammar:

```
virt-path = volume / unc-volume / rel-volume / transfer-protocol / startup / alt-startup /
library / simple-file-path / ole-link
ole-link = path-string %x0003 path-string
simple-file-path = [%x0001] file-path
startup = %x0001 %x0006 file-path
```

This code specifies that the relative-path is relative to the **startup directory**.

```
alt-startup = %x0001 %x0007 file-path
```

This code specifies that the relative-path is relative to the alternate startup directory.

```
library = %x0001 %x0008 file-path
```

This code specifies that the relative-path is relative to the **library directory**.

```
transfer-protocol = %x0001 %x0005 count transfer-path
```

This code specifies that the path is a **transfer protocol** path. The value of count MUST be equal to the number of characters following count in transfer-path.

```
transfer-path = transfer-base-path / "[" transfer-base-path "]" sheet-name
transfer-base-path = transfer-type "://" file-path
transfer-type = "ftp" / "http" / "https"
rel-volume = %x0001 %x0002 file-path
```

This code specifies that the path is relative to the drive volume of the workbook that contains the path.

```
volume = %x0001 %x0001 volume-character file-path
```

This code specifies that the path is relative to a specific drive volume. The drive volume is specified in volume-character.

```
unc-volume = %x0001 %x0001 %x0040 unc-path
```

This code specifies that the path is relative to a **UNC volume**. The computer name is specified in computer-name and the shared folder is specified in shared-folder.

```
unc-path = unc-base-path / "[" unc-base-path "]" sheet-name
unc-base-path = computer-name %x0003 shared-folder %x0003 relative-path
volume-character = %x0041-%x005A / %x0061-%x007A
```

This code specifies a drive volume.

```
file-path = relative-path / "[" relative-path "]" sheet-name
sheet-name = sheet-start-end-character *sheet-character sheet-start-end-character / sheet-
start-end-character
```

This code specifies the name of the sheet within the workbook.

```
sheet-start-end-character = %x0001-%xFFFF
```

This code specifies a character which is a first or last character of sheet name. Such character MUST NOT include any character that matches invalid-sheet-start-end-character.

```
invalid-sheet-start-end-character = \$x0003 / "*" / "?" / "(" / "]" / "\" / ":" / "/" sheet-character = \$x0001-\$xFFFF
```

This code specifies a sheet character. A sheet character MUST NOT include any character that matches invalid-sheet-character.

```
invalid-sheet-character = %x0003 / "*" / "?" / / "[" / "]" / "\" / ":" / "/"
relative-path = directory *(%x0003 directory)
```

This code specifies a sequence of subdirectories that comprise the path from the volume or directory.

```
directory = path-string
```

This code specifies a directory.

```
computer-name = path-string
```

This code specifies a computer name.

```
shared-folder = path-string
```

This code specifies a shared folder.

```
path-string = 1*path-character path-character = \$x0020-\$x0021 / \$x0023-\$x0029 / \$x002B-\$x002E / \$x0030-\$x0039 / \$x003D / \$x0040-\$x005B / \$x005D-\$x007B / \$x007D-\$xFFFF
```

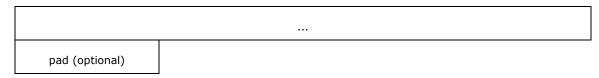

This code specifies a path character.

```
count = %x00-%xFF
```

2.5.278 WebPubString

The **WebPubString** structure specifies a string for Web publishing.

- **cch (2 bytes):** An unsigned integer that specifies the character count in the **str** field. MUST be greater than or equal to zero and less than or equal to 255.
- **str (variable):** An <u>XLUnicodeStringNoCch</u>. The character count in the string MUST be equal to the value of the **cch** field.
- pad (1 byte): Unused and MUST be ignored. This field exists if and only if the total number of bytes in the str field is an odd number.

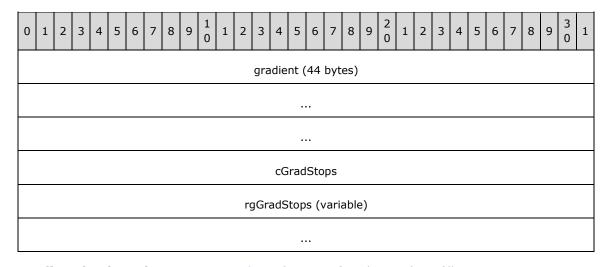

2.5.279 XColorType

The **XColorType** enumeration specifies the color reference types. It MUST be one of the following values:

Name	Value	Meaning							
XCLRAUTO	0x00000000	Automatic color							
XCLRINDEXED	0x00000001	Indexed color							
XCLRRGB	0x00000002	RGB color							
XCLRTHEMED	0x00000003	Theme color							
XCLRNINCHED	0x00000004	Color not set							

2.5.280 XFExtGradient

The **XFExtGradient** structure specifies a gradient fill for a **cell** interior.

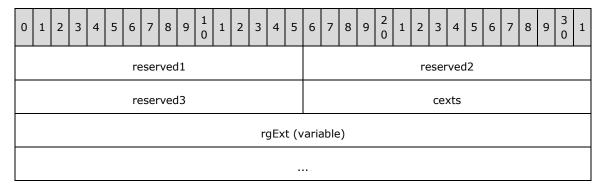

gradient (44 bytes): An XFPropGradient that specifies the gradient fill.

cGradStops (4 bytes): An unsigned integer that specifies the number of items in **rgGradStops**. MUST be greater than or equal to 0 and less than or equal to 256.

rgGradStops (variable): An array of <u>GradStop</u>. Each array element specifies a gradient stop for this gradient fill.

2.5.281 XFExtNoFRT

The **XFExtNoFRT** structure specifies a set of extensions to formatting properties.

reserved1 (2 bytes): MUST be zero and MUST be ignored.

reserved2 (2 bytes): MUST be equal to 0xFFFF and MUST be ignored.

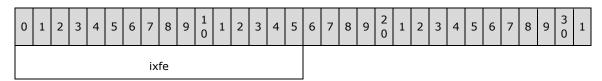

reserved3 (2 bytes): MUST be zero and MUST be ignored.

cexts (2 bytes): An unsigned integer that specifies the number of elements in rgExt.

rgExt (variable): An array of ExtProp. Each array element specifies an extension to a formatting property. The element count of this field MUST be equal to **cexts**.

2.5.282 XFIndex

The **XFIndex** structure specifies the index of a \overline{XF} record.

ixfe (2 bytes): An unsigned integer that specifies a zero-based index of a XF record in the collection of XF records in the <u>Globals Substream</u>.

The XF records in the file refer to both and <u>Cell Style XFs</u> and <u>Cell XFs</u>. For more information, see <u>Styles</u>.

The XF records in the file can be divided into three sections. The first section contains the 16 built-in XF records that MUST exist and MUST be ordered as follows:

Index	XF specifies	fStyle value
0	Normal style	1
1	Row outline level 1	1
2	Row outline level 2	1
3	Row outline level 3	1
4	Row outline level 4	1
5	Row outline level 5	1
6	Row outline level 6	1

Index	XF specifies	fStyle value
7	Row outline level 7	1
8	Column outline level 1	1
9	Column outline level 2	1
10	Column outline level 3	1
11	Column outline level 4	1
12	Column outline level 5	1
13	Column outline level 6	1
14	Column outline level 7	1
15	Default cell format	0

The second section contains XF records for both built-in and user-defined Cell Style XFs. These Cell Style XFs MUST be ordered alphabetically in the file based on their name. The name of the Cell Style XF is specified by the **user** field of the corresponding Style record. The corresponding Style record is the one with an **ixfe** field that specifies the XF record of the Cell Style XF. Note that the ordering depends on the localized name of the style and the language of the application that last saved the file.

For example, in a workbook created by a specific version of the application $\leq 189 >$ with no user-defined <u>cell styles</u> the remainder of the table is:

Index	Name of Style	fStyle value
16	20% - Accent1	1
17	20% - Accent2	1
18	20% - Accent3	1
19	20% - Accent4	1
20	20% - Accent5	1
21	20% - Accent6	1
22	40% - Accent1	1
23	40% - Accent2	1
24	40% - Accent3	1
25	40% - Accent4	1
26	40% - Accent5	1
27	40% - Accent6	1
28	60% - Accent1	1
29	60% - Accent2	1
30	60% - Accent3	1
31	60% - Accent4	1
32	60% - Accent5	1
33	60% - Accent6	1
34	Accent1	1
35	Accent2	1
36	Accent3	1
37	Accent4	1
38	Accent5	1
39	Accent6	1
40	Bad	1
41	Calculation	1
42	Check Cell	1
43	Comma	1

Index	Name of Style	fStyle value
44	Comma[0]	1
45	Currency	1
46	Currency[0]	1
47	Explanatory Text	1
48	Good	1
49	Heading 1	1
50	Heading 2	1
51	Heading 3	1
52	Heading 4	1
53	Input	1
54	Linked Cell	1
55	Neutral	1
56	Note	1
57	Output	1
58	Percent	1
59	Title	1
60	Total	1
61	Warning Text	1

The last section contains unordered XFs for any Cell XFs in the file.

2.5.283 XFProp

The **XFProp** structure specifies a formatting property. Instances of this structure appear as elements in the **xfPropArray** field of an <u>XFProps</u> structure.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	xfPropType												cb																		
	xfPropDataBlob (variable)																														

xfPropType (2 bytes): An unsigned integer that specifies the type of the formatting property. MUST be greater than or equal to 0x0000 and less than or equal to 0x002C, and MUST NOT equal 0x0027 or 0x0028. See the table in **xfPropDataBlob** for more information about the meaning of this field.

cb (2 bytes): An unsigned integer that specifies the size of this XFProp structure.

xfPropDataBlob (variable): A field that specifies the formatting property data. The size and data type of this field varies based on the property type as specified in **xfPropType** as follows:

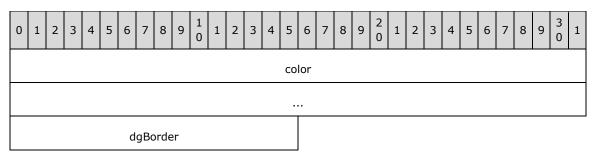

xfPropType value	xfPropDataBlob field Data and Meaning
0x0000	A <u>FillPattern</u> that specifies the fill pattern .
0x0001	An XFPropColor that specifies the foreground color.
0x0002	An XFPropColor that specifies the background color.
0x0003	An XFPropGradient that specifies the gradient fill. This is often followed in the same

xfPropType value	xfPropDataBlob field Data and Meaning
	xfPropArray field of the XFProps structure by one or more XFProp structures with xfPropType equal to 0x0004, which provides additional specifications for the gradient fill.
0x0004	An XFPropGradientStop that specifies a gradient stop for a preceding XFProp with xfPropType equal to 0x0003 in the same xfPropArray field in the XFProps structure.
0x0005	An XFPropColor that specifies the text color.
0x0006	An XFPropBorder that specifies the top border formatting.
0x0007	An XFPropBorder that specifies the bottom border formatting.
0x0008	An XFPropBorder that specifies the left border formatting.
0x0009	An XFPropBorder that specifies the right border formatting.
0x000A	An XFPropBorder that specifies the diagonal border formatting.
0x000B	An XFPropBorder that specifies the vertical border formatting.
0x000C	An XFPropBorder that specifies the horizontal border formatting.
0x000D	A 1-byte unsigned integer that specifies whether a diagonal-up border is used. MUST be 0 or 1. The value of 1 means that a diagonal-up border is used.
0x000E	A 1-byte unsigned integer that specifies whether a diagonal-down border is used. MUST be 0 or 1. The value of 1 means that a diagonal-down border is used.
0x000F	A <u>HorizAlign</u> that specifies the horizontal alignment .
0x0010	A <u>VertAlign</u> that specifies the vertical alignment .
0x0011	An XFPropTextRotation that specifies the text rotation.
0x0012	A 2-byte unsigned integer that specifies the absolute text indentation level . MUST be less than or equal to 15. The absolute indentation level replaces any previous indentation.
0x0013	A ReadingOrder that specifies the reading order.
0x0014	A 1-byte unsigned integer that specifies whether cell text is wrapped. MUST be 0 or 1. The value of 1 means that the text is wrapped.
0x0015	A 1-byte unsigned integer that specifies whether cell text is justify distributed . MUST be 0 or 1. The value of 1 means that the text is justify distributed. If this value is 1 then an XFProp with xfPropType equal to 0x000F MUST exist in this xfPropArray field of the XFProps structure and MUST equal 0x07.
0x0016	A 1-byte unsigned integer that specifies whether a cell is shrink to fit . MUST be 0 or 1. The value of 1 means that the cell is shrink to fit.
0x0017	A 1-byte unsigned integer that specifies whether a cell is merged. MUST be 0 or 1. The value of 1 means that the cell is merged.
0x0018	An <u>LPWideString</u> that specifies the font name used by the cell data. MUST be less than or equal to 32 characters in length.
0x0019	A Bold that specifies the font face weight.
0x001A	An <u>Underline</u> that specifies the underline style.
0x001B	A <u>Script</u> that specifies the superscript or subscript style.
0x001C	A 1-byte unsigned integer that specifies whether text is italicized. MUST be 0 or 1 . The value of 1 means that the text is italic.
0x001D	A 1-byte unsigned integer that specifies whether text has strikethrough formatting applied. MUST be 0 or 1. The value of 1 means that the text has strikethrough formatting applied.
0x001E	A 1-byte unsigned integer that specifies whether text has an outline style. MUST be 0 or 1. The value of 1 means that the text is outline style.
0x001F	A 1-byte unsigned integer that specifies whether text has a shadow style. MUST be 0 or 1. The value of 1 means that the text is shadow style.
0x0020	A 1-byte unsigned integer that specifies whether text is condensed. MUST be 0 or 1. The value of 1 means that the text is condensed.
0x0021	A 1-byte unsigned integer that specifies whether text is extended. MUST be 0 or 1. The value of 1 means that the text is extended.
0x0022	A 1-byte unsigned integer that specifies a character set . For more information about

xfPropType value	xfPropDataBlob field Data and Meaning
	character sets, see the Windows API LOGFONT structure in [MSDN-FONTS].
0x0023	A 1-byte unsigned integer that specifies a font family . For more information about font families, see the Windows API LOGFONT structure in [MSDN-FONTS]. MUST be greater than or equal to 0 and less than or equal to 5.
0x0024	A 4-byte unsigned integer that specifies text size in twips . MUST be greater than or equal to 20 and less than or equal to 8191.
0x0025	A FontScheme that specifies the font scheme of a theme font.
0x0026	A number format as specified by the stFormat field of <u>Format</u> that specifies the number format string .
0x0029	An IFmt that specifies a number format identifier.
0x002A	A 2-byte signed integer that specifies the relative text indentation level. The relative indentation level is added to any previous indentation. The value MUST either be greater than or equal to -15 and less than or equal to 15, or it MUST be 255. Values -15 through 15 specify a relative indentation level, and the value 255 specifies the absence of a relative indentation level.
0x002B	A 1-byte unsigned integer that specifies whether the locked protection property is set to true. MUST be 0 or 1. The value of 1 means that the property is set to true.
0x002C	A 1-byte unsigned integer that specifies whether the hidden protection property is set to true. MUST be 0 or 1. The value of 1 means that the property is set to true.

2.5.284 XFPropBorder

The **XFPropBorder** structure specifies **border formatting**.

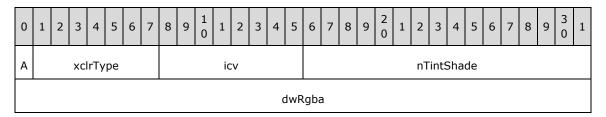

color (8 bytes): An XFPropColor that specifies the border color.

dgBorder (2 bytes): A BorderStyle that specifies the border line style.

2.5.285 XFPropColor

The **XFPropColor** structure specifies a color.

A - fValidRGBA (1 bit): A bit that specifies whether the xclrType, icv and nTintShade fields were used to set the dwRgba field. MUST equal 1.

xclrType (7 bits): An XColorType that specifies how the color information is stored.

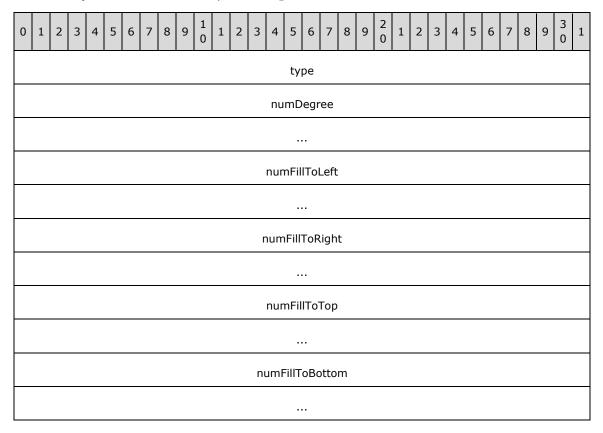

icv (1 byte): An unsigned integer that specifies color information. If xclrType equals 0x01, this field MUST be one of the values specified in <u>IcvXF</u>, or equal 0. If xclrType equals 0x03, this field MUST be one of the values specified in <u>ColorTheme</u>. Otherwise this field is undefined and MUST be ignored.

nTintShade (2 bytes): A signed integer that specifies the tint of the color. This value is mapped to the range -1.0 to 1.0. Positive values lighten the color, and negative values darken the color. MUST NOT equal -32768.

dwRgba (4 bytes): A LongRGBA that specifies the color.

2.5.286 XFPropGradient

The XFPropGradient structure specifies a gradient fill.

type (4 bytes): A Boolean (section 2.5.14) that specifies the gradient type. MUST be a value from the following table:

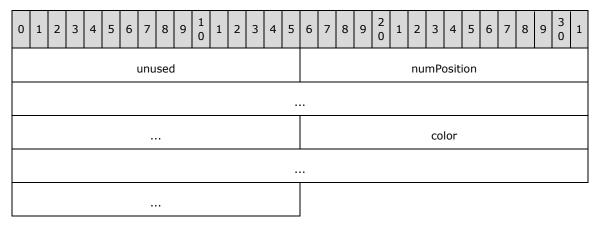

Value	Meaning
0x0000000	Linear gradient
0x00000001	Rectangular gradient

numDegree (8 bytes): An Xnum (section <u>2.5.342</u>) that specifies the gradient angle in degrees for a linear gradient. The gradient angle specifies the angle at which gradient strokes are drawn.

- **numFillToLeft (8 bytes):** An Xnum that specifies the left coordinate of the **inner rectangle** for a rectangular gradient, where (0.0,0.0) is the upper-left hand corner of the inner rectangle. MUST be greater than or equal to 0.0 and less than or equal to 1.0.
- **numFillToRight (8 bytes):** An Xnum that specifies the right coordinate of the inner rectangle for a rectangular gradient, where (0.0,0.0) is the upper-left hand corner of the inner rectangle. MUST be greater than or equal to 0.0 and less than or equal to 1.0.
- **numFillToTop (8 bytes):** An Xnum that specifies the top coordinate of the inner rectangle for a rectangular gradient, where (0.0,0.0) is the upper-left hand corner of the inner rectangle. MUST be greater than or equal to 0.0 and less than or equal to 1.0.
- **numFillToBottom (8 bytes):** An Xnum that specifies the bottom coordinate of the inner rectangle for a rectangular gradient, where (0.0,0.0) is the upper-left hand corner of the inner rectangle. MUST be greater than or equal to 0.0 and less than or equal to 1.0.

2.5.287 XFPropGradientStop

The XFPropGradientStop structure specifies a gradient stop for a gradient fill.

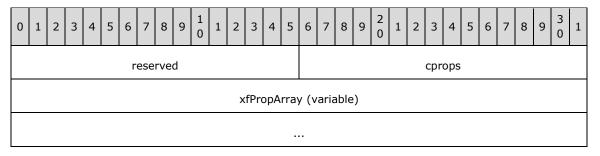

unused (2 bytes): Undefined and MUST be ignored.

numPosition (8 bytes): An Xnum (section <u>2.5.342</u>) that specifies the gradient stop position. The gradient stop position is the position within the gradient range where this gradient stop's color begins. MUST be greater than or equal to 0.0 and less than or equal to 1.0.

color (8 bytes): An XFPropColor that specifies the gradient stop color.

2.5.288 XFProps

This structure specifies an array of formatting properties.

reserved (2 bytes): MUST be zero and MUST be ignored.

cprops (2 bytes): An unsigned integer that specifies the number of <u>XFProp</u> structures in **xfPropArray.**

xfPropArray (variable): An array of XFProp. Each array element specifies a formatting property. The array of properties specifies the full set of formatting properties. If the array contains an XFProp with an xfPropType field equaling 0, the array MUST NOT contain any XFProp elements with xfPropType fields equaling 3 or 4. If the array contains an XFProp with an xfPropType field equaling 3 or 4, the array MUST NOT contain any XFProp elements with an xfPropType field equaling 0.

2.5.289 XFPropTextRotation

The **XFPropTextRotation** structure specifies the text rotation.

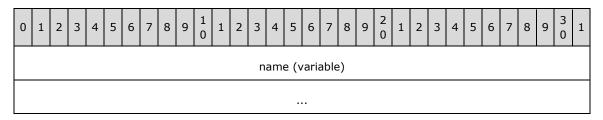

trot (1 byte): An unsigned integer that specifies the text rotation. MUST be a value from the following table:

Value	Meaning
0x00 to 0x5A (0 to 90)	Text rotated counterclockwise 0 to 90 degrees
0x5B to 0xB4 (91 to 180)	Text rotated clockwise 1 to 90 degrees
0xFF (255)	Vertical text

2.5.290 XLNameUnicodeString

The XLNameUnicodeString structure specifies a defined name.

name (variable): An XLUnicodeString that specifies the name. The number of characters in the string, **name.cch**, MUST be greater than or equal to 1 and less than or equal to 255.

This field MUST adhere to the following grammar:

```
name = name-start-character, *name-characters
name-start-character = "_" / "\" / Unicode-character
name-character = name-start-character / "." / "?" / 0x061F / Unicode-digit
```

where:

Unicode-character is any code point which is a character as defined by the Unicode character properties in chapter four of the [RFC2781]

Unicode-digit is any code point which is a digit as defined by the Unicode character properties in chapter four of the [RFC2781].

This field MUST NOT be equal to "TRUE" or "FALSE" using case-insensitive string comparison. This field MUST NOT be an **R1C1** or **A1 cell reference**.

An R1C1 cell reference is defined to be:

```
R1C1-cell-reference= R1C1-row R1C1-column / R1C1-column R1C1-row
R1C1-row = letter-r row-number
letter-r = "R" / "r"
R1C1-column = letter-c column-number
letter-c = "C" / "c"
column-number = 1-256
row-number = 1-65536
```

An A1 cell reference is defined as follows:

```
Al-reference = Al-column Al-Row

Al-row = row-number

; See definition of row-number in R1C1 cell reference grammar specified previously.

Al-column = letter / letter-limited-one letter / letter-i letter-limited-two

letter-limited-one = "A" / "B" / "C" / "D" / "E" / "F" / "G" / "H" / "a" / "b" / "c" / "d" / "e" / "f" / "g" / "h"

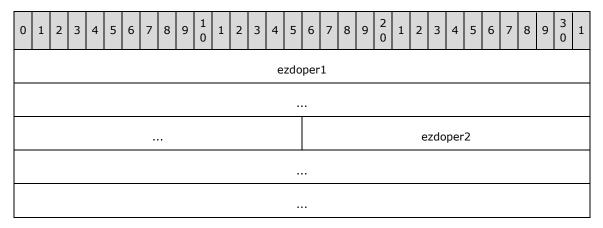

letter-limited-two = letter-limited-one / "I" / "J" / "K" / "L" / "M" / "N" / "O" / "P" / "Q" / "R" / "S" / "T" / "U" / "V" / "i" / "j" / "k" / "l" / "m" / "n" / "o" / "p" / "q" / "r" / "s" / "t" / "u" / "v"

letter-i = "I" / "i"

letter = letter-limited-two / "W" / "X" / "Y" / "Z" / "w" / "x" / "y" / "z"
```

2.5.291 XlsFilter_Criteria

The **XIsFilter_Criteria** structure specifies **filter** criteria.

- **ezdoper1 (10 bytes):** An <u>SXEZDoper</u> structure that specifies the first filter operation. If the **ccriteria** field of the <u>SXAddl SXCSXFilter12 SXDXIsFilter</u> that contains this structure is zero, then **ezdoper1.vts** MUST be zero and **ezdoper1** MUST be ignored. If **ezdoper1.vts** equals 0x6, the following record MUST be <u>SXAddl SXCSXFilter12 SXDXIsFilterValue1</u>.
- ezdoper2 (10 bytes): An SXEZDoper structure that specifies the second filter operation. If the ccriteria field of the SXAddl_SXCSXFilter12_SXDXIsFilter that contains this structure is not equal to 2, then ezdoper2.vts MUST be zero and ezdoper2 MUST be ignored. If ezdoper1.vts is not 0x6 and ezdoper2.vts is 0x6, then the following record is SXAddl_SXCSXFilter12_SXDXIsFilterValue2. If both ezdoper1.vts and ezdoper2.vts are 0x6, then the following record is SXAddl_SXCSXFilter12_SXDXIsFilterValue1, and the next non-Continue SxaddlSxString record after that is SXAddl_SXCSXFilter12_SXDXIsFilterValue2.
- djoin1 (4 bytes): A Doin that specifies the join operation between ezdoper1 and ezdoper2.

MUST be DJOINNULL if the **ccriteria** field of the SXAddl_SXCSXFilter12_SXDXlsFilter record is less than 2.

reserved (4 bytes): MUST be zero, and MUST be ignored.

2.5.292 XlsFilter_Top10

The **XIsFilter_Top10** structure specifies filter information for a **top N filter**.

0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
	top10ft																														
Α	reserved1 numTopN																														
																				1	ese	erve	ed2	(14	by	tes)				

top10ft (4 bytes): A Top10FT that specifies the top N filter type.

A - fTop (1 bit): A bit that specifies whether the filter displays the top or bottom records.

Value	Meaning
0	Display the bottom records.
1	Display the top records.

reserved1 (15 bits): MUST be zero, and MUST be ignored.

numTopN (8 bytes): An Xnum (section <u>2.5.342</u>) that specifies the number or percentage of records to include.

If **top10Ft** is TOP10FTPERCENT, **numTopN** specifies the percentage of records to include; otherwise **numTopN** specifies the number of records to include.

If **top10ft** is TOP10FTPERCENT, **numTopN** MUST be greater than or equal to 0 and less than or equal to 100.

If **top10ft** is TOP10FTSUM, **numTopN** MUST be greater than or equal to 0 and less than or equal to 2147483647.

If **top10ft** is TOP10FTCOUNT, **numTopN** MUST be an integer greater than or equal to 0 and less than or equal to 2147483647.

reserved2 (14 bytes): MUST be zero, and MUST be ignored.

2.5.293 XLUnicodeRichExtendedString

The **XLUnicodeRichExtendedString** structure specifies a Unicode string, which can contain formatting information and **phonetic string** data.

This structure's non-variable fields MUST be specified in the same record.

This structure's variable fields can be extended with <u>Continue</u> records. A value from the table for **fHighByte** MUST be specified in the first byte of the **continue** field of the Continue record followed by the remaining portions of this structure's variable fields.

0 1 2 3 4 5 6 7	8 9 0 1 2	3 4 5 6	7	8 9	2 9 0	1	2 3	4	5 6	7	8	9	3 0 :	1
co	ch	A	В	С	D r	eserv	ed2		cRu	n (o	ptic	nal)	
			cbl	ExtRs	st (op	tiona	al)							
				rgb ((varia	ble)								
rgRun (variable, optional)														
:														
ExtRst (variable, optional)														

cch (2 bytes): An unsigned integer that specifies the count of characters in the string.

A - fHighByte (1 bit): A bit that specifies whether the characters in **rgb** are double-byte characters. MUST be a value from the following table:

Value	Meaning
0x0	All the characters in the string have a high byte of $0x00$ and only the low bytes are in rgb .
0x1	All the characters in the string are saved as double-byte characters in rgb .

B - reserved1 (1 bit): MUST be zero, and MUST be ignored.

C - fExtSt (1 bit): A bit that specifies whether the string contains phonetic string data.

D - fRichSt (1 bit): A bit that specifies whether the string is a rich string and the string has at least two character formats applied.

reserved2 (4 bits): MUST be zero, and MUST be ignored.

cRun (2 bytes): An optional unsigned integer that specifies the number of elements in **rgRun**. MUST exist if and only if **fRichSt** is 0x1.

cbExtRst (4 bytes): An optional signed integer that specifies the byte count of **ExtRst**. MUST exist if and only if **fExtSt** is 0x1. MUST be zero or greater.

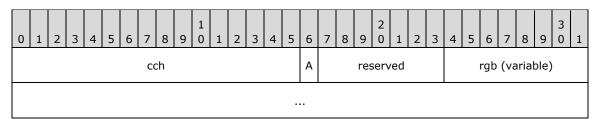

rgb (variable): An array of bytes that specifies the characters in the string. If **fHighByte** is 0x0, the size of the array is **cch**. If **fHighByte** is 0x1, the size of the array is **cch***2. If **fHighByte** is 0x1 and **rgb** is extended with a Continue record the break MUST occur at the double-byte character boundary.

rgRun (variable): An optional array of <u>FormatRun</u> structures that specifies the formatting for each **text run**. The number of elements in the array is **cRun**. MUST exist if and only if **fRichSt** is 0x1.

ExtRst (variable): An optional <u>ExtRst</u> that specifies the phonetic string data. The size of this field is **cbExtRst**. MUST exist if and only if **fExtSt** is 0x1.

2.5.294 XLUnicodeString

The **XLUnicodeString** structure specifies a **Unicode** string.

cch (2 bytes): An unsigned integer that specifies the count of characters in the string.

A - fHighByte (1 bit): A bit that specifies whether the characters in rgb are double-byte characters. MUST be a value from the following table:

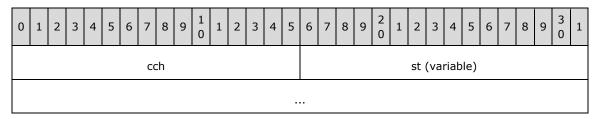

Value	Meaning
0x0	All the characters in the string have a high byte of $0x00$ and only the low bytes are in ${f rgb}$.
0x1	All the characters in the string are saved as double-byte characters in rgb .

reserved (7 bits): MUST be zero, and MUST be ignored.

rgb (variable): An array of bytes that specifies the characters. If **fHighByte** is 0x0, the size of the array MUST be equal to **cch**. If **fHighByte** is 0x1, the size of the array MUST be equal to **cch***2.

2.5.295 XLUnicodeStringMin2

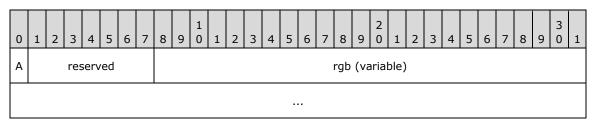

The **XLUnicodeStringMin2** structure specifies a **Unicode** string.

- **cch (2 bytes):** An unsigned integer that specifies the count of characters in the string. MUST be equal to the number of characters in **st**.
- **st (variable):** An optional <u>XLUnicodeStringNoCch</u> that specifies the string. MUST exist if and only if **cch** is greater than zero.

2.5.296 XLUnicodeStringNoCch

The **XLUnicodeStringNoCch** structure specifies a Unicode string. When an XLUnicodeStringNoCch is used, the count of characters in the string MUST be specified in the structure that uses the XLUnicodeStringNoCch.

A - fHighByte (1 bit): A bit that specifies whether the characters in rgb are double-byte characters. MUST be a value from the following table:

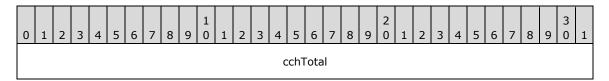

Value	Meaning
0x0	All the characters in the string have a high byte of $0x00$ and only the low bytes are in rgb .
0x1	All the characters in the string are saved as double-byte characters in rgb .

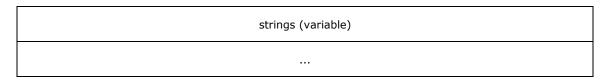

reserved (7 bits): MUST be zero, and MUST be ignored.

rgb (variable): An array of bytes that specifies the characters. If **fHighByte** is 0x0, the size of the array MUST be equal to the count of characters in the string. If **fHighByte** is 0x1, the size of the array MUST be equal to 2 times the count of characters in the string.

2.5.297 XLUnicodeStringSegmented

The **XLUnicodeStringSegmented** structure specifies a **Unicode** string that is split into multiple string segments. If the count of characters in the string is greater than 512, the string is split into multiple string segments, each of which has a character count of 512 or less.

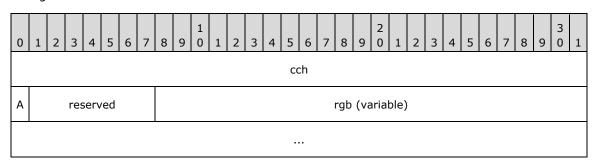

cchTotal (4 bytes): An unsigned integer that specifies the total count of characters in the string. MUST be less than 2147483644.

strings (variable): An array of <u>XLUnicodeString</u>. Each element specifies a string segment. The **cch** field of each XLUnicodeString element MUST be less than or equal to 512 and greater than 0, and the sum of the **cch** fields of all XLUnicodeString elements MUST be equal to **cchTotal**. MUST exist if and only if **cchTotal** is greater than zero.

2.5.298 XLUnicodeStringSegmentedRTD

The **XLUnicodeStringSegmentedRTD** structure specifies a Unicode string that contains a set of substrings.

cch (4 bytes): An unsigned integer that specifies the size of rgb.

A - fHighByte (1 bit): A bit that specifies whether the characters in rgb are double-byte characters. MUST be a value from the following table:

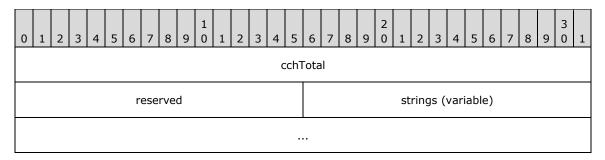

Value	Meaning
0x0	All the characters in the string have a high byte of 0x00 and only the low bytes are in rgb .
0x1	All the characters in the string are saved as double-byte characters in rgb .

reserved (7 bits): MUST be zero, and MUST be ignored.

rgb (variable): An array of bytes that specifies a set of sub-strings. If **fHighByte** is 0x0, the size of the array is **cch**. If **fHighByte** is 0x1, the size of the array is **cch***2. Each sub-string begins with one or two bytes specifying the count of characters in the sub-string. The count is one byte in length if **fHighByte** is zero and two bytes in length if **fHighByte** is 1. The number of the sub-strings MUST be greater than 2 and less than 40.

2.5.299 XLUnicodeStringSegmentedSXAddl

The **XLUnicodeStringSegmentedSXAddI** structure specifies a Unicode string segment. <u>SXAddI</u> records use this structure to represent Unicode strings. If the count of characters in the string is greater than 255, the string is split into multiple segments. Each string segment has a character count of 255 or less, and each segment is stored in an SXAddI record.

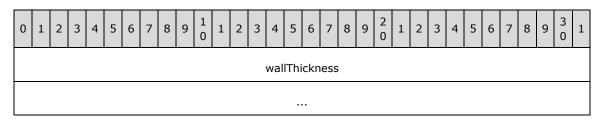

cchTotal (4 bytes): An unsigned integer that specifies the total count of characters in the string. If this is the first segment of a string, **cchTotal** MUST be greater than 0. If this is not the first segment of a string, **cchTotal** MUST be zero.

reserved (2 bytes): MUST be zero, and MUST be ignored.

string (variable): An <u>XLUnicodeString</u> that specifies the string segment. The **cch** field of **string** MUST be less than or equal to 255 and greater than 0.

2.5.300 XmlTkBackWallThicknessFrt

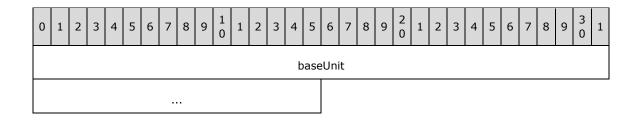

The **XmlTkBackWallThicknessFrt** structure specifies the thickness of the back wall of a <u>chart</u> as a percentage of the depth of the 3-D **plot area**. The back wall is the **wall** that is parallel to the **category (2)** <u>axis</u>. This structure MUST only be present if the back wall thickness is greater than 0. MUST only be specified if the chart contains a <u>Chart3d</u> record.

wallThickness (8 bytes): An <u>XmlTkDWord</u> that specifies the thickness of the back wall of the chart as a percentage of the depth of the 3-D plot area. The wallThickness.dValue MUST be greater than 0, and less than or equal to 100. The wallThickness.xtHeader.xmlTkTag field MUST be equal to 0x0035.

2.5.301 XmlTkBaseTimeUnitFrt

The **XmlTkBaseTimeUnitFrt** structure specifies the value of the smallest unit of time used by the date <u>axis</u>. This structure MUST only be present if the **fAutoBase** field of the corresponding <u>AxcExt</u> record is set to 1 and the **fDateAxis** of the corresponding AxcExt record is equal to 1.

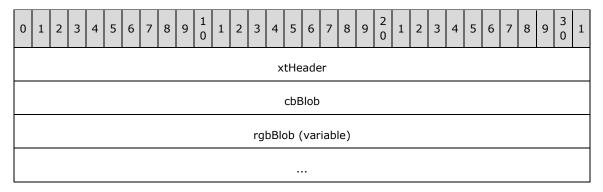

baseUnit (6 bytes): An XmlTkToken that specifies a value that can override the duBase field of the corresponding AxcExt record. The baseUnit.xtHeader.xmlTkTag field MUST be equal to 0x005F. This field overrides the duBase field of the corresponding AxcExt record when the fAutoBase field of the AxcExt record is set to 1. The baseUnit.dValue MUST be a value from the following table:

Value	Meaning
0x0060	Time value is measured in days.
0x0061	Time value is measured in months.
0x0062	Time value is measured in years.

2.5.302 XmlTkBlob

The **XmlTkBlob** structure specifies an array of bytes for the **xmltkChain** field of the **CrtMlFrt** record.

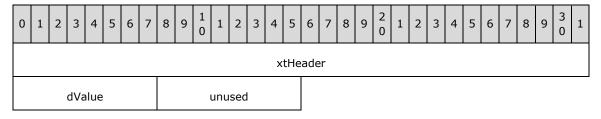

xtHeader (4 bytes): An XmlTkHeader. The **xtHeader.drType** field MUST be equal to 0x07.

cbBlob (4 bytes): An unsigned integer that specifies the count of bytes of the rgbBlob field.

rgbBlob (variable): An array of bytes for the **xmltkChain** field of the CrtMlFrt record. The size of this field, in bytes, is specified by the **cbBlob** field.

2.5.303 XmlTkBool

The **XmlTkBool** structure specifies a Boolean (section 2.5.14) value for the **xmltkChain** field of the <u>CrtMlFrt</u> record.

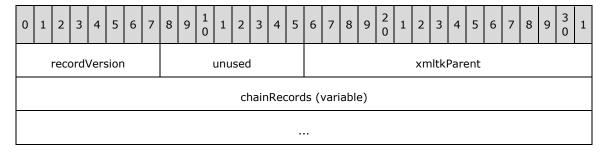

xtHeader (4 bytes): An XmlTkHeader. The **xtHeader.drType** field MUST be equal to 0x02.

dValue (1 byte): A Boolean that specifies the value of this structure.

unused (1 byte): Undefined, and MUST be ignored.

2.5.304 XmlTkChain

The **XmlTkChain** structure specifies a chain of structures that specifies a group of additional properties or property overrides for a given <u>chart</u> element, specified by the **xmltkParent** field. See meanings of the additional properties or property overrides in each token structure.

recordVersion (1 byte): An unsigned integer that specifies the chain version. MUST be 0.

unused (1 byte): Undefined, and MUST be ignored.

xmltkParent (2 bytes): An unsigned integer that specifies the chart element targeted by the token structures in the chain. MUST be a value from the following table:

Value	Meaning
0x0001	The record that contains this structure MUST be in a sequence of records that conforms to the <u>DVAXIS</u> rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify scaling properties and MUST be one of the following: XmlTkMinFrt , XmlTkLogBaseFrt
0x0002	The record that contains this structure MUST be in a sequence of records that conforms to the CHARTSHEET or CHARTSHEETCONTENT rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify chart space properties and MUST be one of the following: XmlTkThemeOverride , XmlTkColorMappingOverride
0x0004	The record that contains this structure MUST be in a sequence of records that conforms to the IVAXIS rule and SERIESAXIS rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify <u>Axis</u> properties and MUST be one of the following: <u>XmlTkNoMultiLvlLbl</u> , <u>XmlTkTickLabelSkipFrt</u> , <u>XmlTkTickMarkSkipFrt</u> , <u>XmlTkMajorUnitFrt</u> , <u>XmlTkMinorUnitFrt</u> , <u>XmlTkTickLabelPositionFrt</u> , <u>XmlTkBaseTimeUnitFrt</u> , <u>XmlTkFormatCodeFrt</u> , <u>XmlTkMajorUnitTypeFrt</u> , <u>XmlTkMinorUnitTypeFrt</u>

Value	Meaning
0×0005	The record that contains this structure MUST be in a sequence of records that conforms to the CHARTFORMATS rule and appears directly before the End record. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify chart properties and MUST be one of the following: XmlTkShowDLblsOverMax , XmlTkShowDLblsOverMax , XmlTkBackWallThicknessFrt , XmlTkBackWallThicknessFrt , XmlTkBloorThicknessFrt , XmlTkDloorThicknessFrt , XmlTkFloorThicknessFrt ,
0x000F	The <u>CrtMIFrt</u> record that contains this structure MUST be in a sequence of records that conforms to the LD rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify <u>Legend</u> properties and MUST be: <u>XmlTkOverlay</u>
0x0013	The record that contains this structure MUST be in a sequence of records that conforms to the SS rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify data marker properties and MUST be: XmlTkSymbolFrt
0x0016	The record that contains this structure MUST be in a sequence of records that conforms to the CHARTFORMATS rule and appears directly before the End record. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify Plot area properties and MUST be: <u>XmlTkPieComboFrom12Frt</u>
0x0019	The record that contains this structure MUST be in a sequence of records that conforms to the ATTACHEDLABEL within the CHARTFORMATS rule. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify Chart title properties and MUST be: XmlTkOverlay
0x0037	The record that contains this structure MUST be in a sequence of records that conformed to the CHARTFORMATS rule and appears directly before the End record. This sequence of records specifies the chart element targeted by the token structures in this chain.
	The token structures in the chain specify View 3-D properties and MUST be one of the following: XmlTkRangAxOffFrt , X

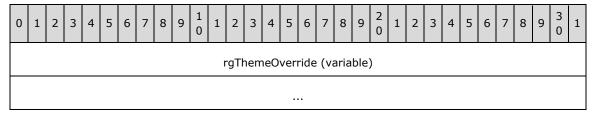

chainRecords (variable): A chain of structures that specifies the additional properties or property overrides for a given chart element, specified by the **xmltkParent** field. The token sequence **ABNF** for each **xmltkParent** is specified according to the following table:

xmltkParent	ABNF
0x0001	chainRecords = [XmlTkMaxFrt] [XmlTkMinFrt] [XmlTkLogBaseFrt]
0x0002	<pre>chainRecords = [XmlTkStyle] [XmlTkThemeOverride] [XmlTkColorMappingOverride]</pre>
0x0004	<pre>chainRecords = [XmlTkNoMultiLvlLbl] [XmlTkTickLabelSkipFrt] [XmlTkTickMarkSkipFrt] [XmlTkMajorUnitFrt] [XmlTkMinorUnitFrt] [XmlTkTickLabelPositionFrt] [XmlTkBaseTimeUnitFrt] [XmlTkFormatCodeFrt] [XmlTkMajorUnitTypeFrt]</pre>

xmltkParent	ABNF
	[XmlTkMinorUnitTypeFrt]
0x0005	<pre>chainRecords = [XmlTkShowDLblsOverMax] [XmlTkBackWallThicknessFrt] [XmlTkFloorThicknessFrt] [XmlTkDispBlanksAsFrt] [SURFACE] SURFACE = XmlTkStartSurface [XmlTkFormatCodeFrt [XmlTkSpb]] [XmlTkTpb] XmlTkEndSurface</pre>
0x000F	chainRecords = [XmlTkOverlay]
0x0013	chainRecords = [XmlTkSymbolFrt]
0x0016	chainRecords = [XmlTkPieComboFrom12Frt]
0x0019	chainRecords = [XmlTkOverlay]
0x0037	<pre>chainRecords = [XmlTkRAngAxOffFrt] [XmlTkPerspectiveFrt] [XmlTkRotYFrt] [XmlTkRotXFrt] [XmlTkHeightPercent]</pre>

2.5.305 XmlTkColorMappingOverride

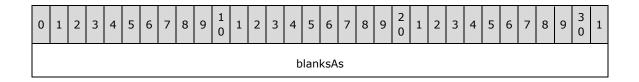

The **XmlTkColorMappingOverride** structure specifies the color mapping override for a <u>chart</u>, stored as an **XML stream** (section <u>2.1.7.22</u>) as specified in [ECMA-376] Part 4, section 4.4.1.7.

rgThemeOverride (variable): An XmlTkBlob that specifies the color mapping override. The **rgThemeOverride.xtHeader.xmlTkTag** MUST be equal to 0x0034. The **XML stream** (section 2.1.7.22) is specified in [ECMA-376] Part 4, section 4.4.1.7, and compressed by the compression algorithm specified in [RFC1951].

2.5.306 XmlTkDispBlanksAsFrt

The **XmlTkDispBlanksAsFrt** structure specifies how blank data entries are represented. This structure MUST only be present if the current <u>chart</u> does not support displaying blank entries. The following <u>chart group</u> types do not support blank entries: area chart group, pie chart group, line chart group with **fStacked** field of the <u>Line</u> record equal to 1, bar of pie chart group, pie of pie chart group and doughnut chart group.

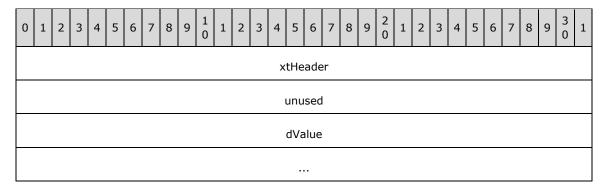

...

blanksAs (6 bytes): An XmlTkToken that specifies how blank data entries are represented on the current chart. The **blanksAs.xtHeader.xmlTkTag** field MUST be equal to 0x0066. This field overrides the **mdBlank** field of the ShtProps record that specifies the current **sheet**. The **blanksAs.dValue** field MUST be a value from the following table:

Value	Meaning
0x0067	Specifies that blank values are shown as a gap.
0x0069	Specifies that blank values are spanned with a line. The current chart group type MUST be area chart group or line chart group with fStacked field of the Line record equal to 1.

2.5.307 XmlTkDouble

The **XmlTkDouble** structure specifies an Xnum (section <u>2.5.342</u>) value for the **xmltkChain** field of the <u>CrtMlFrt</u> record.

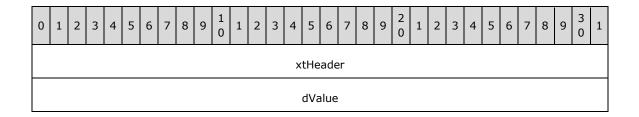

xtHeader (4 bytes): An XmlTkHeader. The **xtHeader.drType** field MUST be equal to 0x03.

unused (4 bytes): Undefined, and MUST be ignored.

dValue (8 bytes): An Xnum that specifies the value of this structure.

2.5.308 XmlTkDWord

The **XmlTkDWord** structure specifies an integer value for the **xmltkChain** field of the <u>CrtMlFrt</u> record.

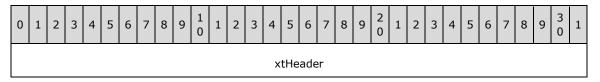

xtHeader (4 bytes): An XmlTkHeader. The **xtHeader.drType** field MUST be equal to 0x04.

dValue (4 bytes): A signed integer that specifies the value of this structure.

2.5.309 XmlTkEnd

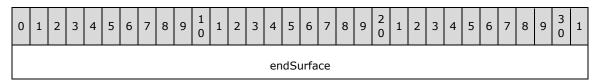

The **XmITkEnd** structure specifies the end of a group of structures for the **xmItkChain** field of the CrtMIFrt record.

xtHeader (4 bytes): An XmlTkHeader. The xtHeader.drType field MUST be equal to 0x01.

2.5.310 XmlTkEndSurface

The **XmlTkEndSurface** structure specifies the end of a back wall definition. The back wall is the **wall** that is parallel to the **category (2)** <u>axis</u>. This structure defines additional properties for the back wall of the current chart. This structure MUST have a corresponding XmlTkStartSurface structure.

endSurface (4 bytes): An XmlTkEnd that specifies the end of a back wall definition. The endSurface.xtHeader.xmlTkTag field MUST be equal to the startSurface.xtHeader.xmlTkTag of the corresponding XmlTkStartSurface structure.

2.5.311 XmlTkFloorThicknessFrt

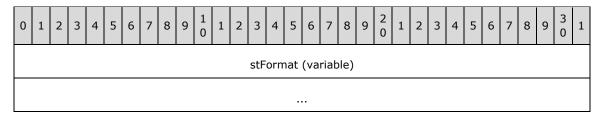

The **XmlTkFloorThicknessFrt** structure specifies the thickness of the **floor** of a <u>chart</u> as a percentage of the height of the 3-D **plot area**. This structure MUST only be present if the floor thickness is greater than 0. MUST only be specified if the chart contains a <u>Chart3d</u> record.

floorThickness (8 bytes): An XmlTkDWord that specifies the thickness of the floor of the chart as a percentage of the height of the 3-D plot area. The **floorThickness.dValue** MUST be greater than 0, and less than or equal to 100. The **floorThickness.xtHeader.xmlTkTag** field MUST be equal to 0x0036.

2.5.312 XmlTkFormatCodeFrt

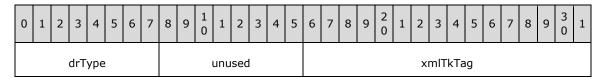

The **XmlTkFormatCodeFrt** structure specifies the number formatting to use for the <u>axis</u> labels on the date axis. This structure MUST only be present if the **fUnlinkedIfmt** field of the <u>BRAI</u> record that corresponds to the axis labels of the date axis is set to 0. This structure MUST only be present if the **fDateAxis** of the corresponding <u>AxcExt</u> record is equal to 1.

stFormat (variable): An xmiTkString that specifies the number formatting to use for the axis labels of the date axis. Details about the structure of **number format** string are specified in [ECMA-376] Part 4: Markup Language Reference, section 3.8.31. This field overrides the **ifmt** field of the corresponding BRAI record when the **fUnlinkedIfmt** field of the BRAI record is set to 0. The **stFormat.xtHeader.xmlTkTag** field MUST be equal to 0x0064.

2.5.313 XmlTkHeader

The XmlTkHeader structure specifies the header of the XML token data types.

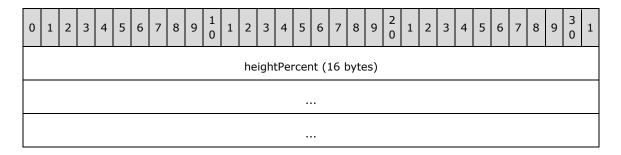

drType (1 byte): An unsigned integer that specifies the data type. MUST be specified by the containing structure.

unused (1 byte): Undefined, and MUST be ignored.

xmlTkTag (2 bytes): An unsigned integer that specifies the token identifier. MUST be specified by the containing structure.

2.5.314 XmlTkHeightPercent

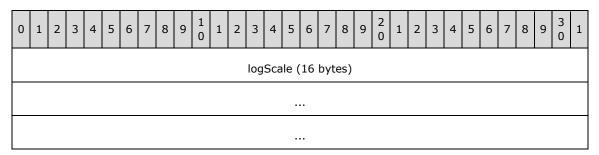

The **XmlTkHeightPercent** structure specifies the height of the **plot area** as a percentage of its width. This record MUST NOT exist for a pie <u>chart group</u>, and MUST only exist when a <u>Chart3d</u> record is present and the **f3DScaling** field of the Chart3d record is equal to 1.

heightPercent (16 bytes): An XmlTkDouble that specifies the height of the plot area as a percentage of its width. heightPercent.dValue MUST be greater than or equal to 5, MUST be less than the maximum value of Xnum, and SHOULD<190> be less than or equal to 500. This field overrides the pcHeight field of the Chart3d record in the chart sheet substream. The heightPercent.xtHeader.xmlTkTag MUST be equal to 0x0065.

2.5.315 XmlTkLogBaseFrt

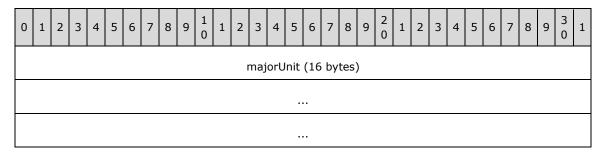

The **XmlTkLogBaseFrt** structure specifies the logarithmic base of a logarithmic value <u>axis</u>. This structure MUST only be present if the **fLog** field of the corresponding <u>ValueRange</u> record is set to 1, and the logarithmic base is not 10.

logScale (16 bytes): An XmlTkDouble that specifies the logarithmic base of a logarithmic value axis. logScale.dValue MUST be greater than or equal to 2, and less than or equal to 1000. The logScale.xtHeader.xmlTkTag field MUST be equal to 0x0000. This field overrides the base, 10, of the logarithmic value axis when the fLog field of the corresponding ValueRange record is set to 1.

2.5.316 XmlTkMajorUnitFrt

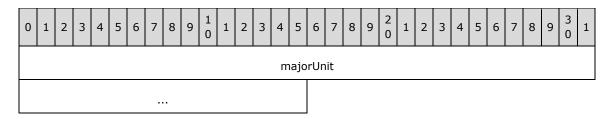

The **XmlTkMajorUnitFrt** structure specifies the value of the interval at which the **major tick marks** are displayed on the date <u>axis</u>. This structure MUST only be present if the **fAutoBase** field of the corresponding <u>AxcExt</u> record is set to 1 and the **fDateAxis** field of the corresponding AxcExt record is equal to 1.

majorUnit (16 bytes): An XmlTkDouble that specifies a value that can override the catMajor field of the corresponding AxcExt record. The majorUnit.xtHeader.xmlTkTag field MUST be equal to 0x0053. This field overrides the catMajor field of the corresponding AxcExt record when the fAutoMajor field of the AxcExt record is set to 1.

2.5.317 XmlTkMajorUnitTypeFrt

The **XmlTkMajorUnitTypeFrt** structure specifies the value of the unit of time used by the interval at which the **major tick marks** are displayed on the date <u>axis</u>. This structure MUST only be present if the **fAutoBase** field of the corresponding <u>AxcExt</u> record is set to 1 and the **fDateAxis** of the corresponding AxcExt record is equal to 1.

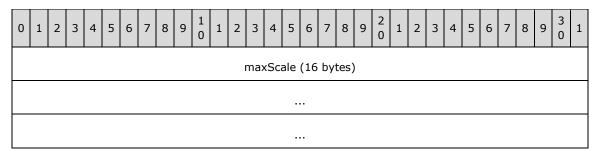

majorUnit (6 bytes): An XmlTkToken that specifies a value that can override the duMajor field of the corresponding AxcExt record. The majorUnit.xtHeader.xmlTkTag field MUST be equal to 0x006A. This field overrides the duMajor field of the corresponding AxcExt record when the fAutoMajor field of the AxcExt record is set to 1. The majorUnit.dValue MUST be a value from the following table:

Value	Meaning
0x0060	Time value is measured in days.
0x0061	Time value is measured in months.
0x0062	Time value is measured in years.

2.5.318 XmlTkMaxFrt

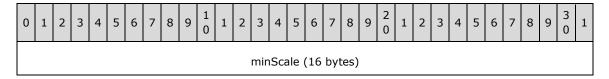

The **XmlTkMaxFrt** structure specifies the maximum value on a logarithmic value <u>axis</u>. This structure MUST only be present if the **fAutoMax** field of the corresponding <u>ValueRange</u> record is set to 0, the **fLog** field of the corresponding ValueRange record is set to 1, and the logarithmic base is not 10.

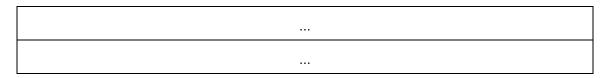

maxScale (16 bytes): An XmlTkDouble that specifies the maximum value on a logarithmic value axis. The maxScale.dValue MUST be greater than the value specified in the minScale.dValue field of the XmlTkMinFrt structure. The maxScale.xtHeader.xmlTkTag field MUST be equal to 0x0055. This field overrides the numMax field of the associated ValueRange record when the fLog field of the ValueRange record is set to 1.

2.5.319 XmlTkMinFrt

The **XmlTkMinFrt** structure specifies the minimum value on a logarithmic value <u>axis</u>. This structure MUST only be present if the **fAutoMin** field of the corresponding <u>ValueRange</u> record is set to 0, the **fLog** field of the corresponding ValueRange record is set to 1, and the logarithmic base is not 10.

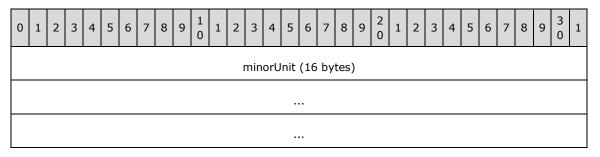

minScale (16 bytes): An XmlTkDouble that specifies the minimum value on a logarithmic value axis. The minScale.dValue MUST be less than the value specified in the maxScale.dValue field of the XmlTkMaxFrt structure. The minScale.xtHeader.xmlTkTag field MUST be equal to 0x0056. This field overrides the numMin field of the associated ValueRange record when the fLog field of the ValueRange record is set to 1.

2.5.320 XmlTkMinorUnitFrt

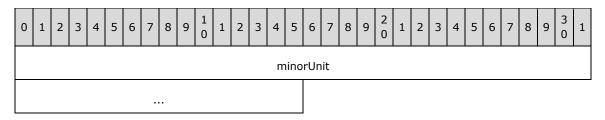

The **XmlTkMinorUnitFrt** structure specifies the value of the interval at which the **minor tick marks** are displayed on the date <u>axis</u>. This structure MUST only be present if the **fAutoBase** field of the corresponding <u>AxcExt</u> record is set to 1 and the **fDateAxis** of the corresponding AxcExt record is equal to 1.

minorUnit (16 bytes): An XmlTkDouble that specifies a value that can override the catMinor field of the corresponding AxcExt record. The minorUnit.xtHeader.xmlTkTag field MUST be equal to 0x0054. This field overrides the catMinor field of the corresponding AxcExt record when the fAutoMinor field of the AxcExt record is set to 1.

2.5.321 XmlTkMinorUnitTypeFrt

The **XmlTkMinorUnitTypeFrt** structure specifies the value of the unit of time used by the interval at which the **major tick marks** are displayed on the date <u>axis</u>. This structure MUST only be present if the **fAutoBase** field of the corresponding <u>AxcExt</u> record is set to 1 and the **fDateAxis** of the corresponding AxcExt record is equal to 1.

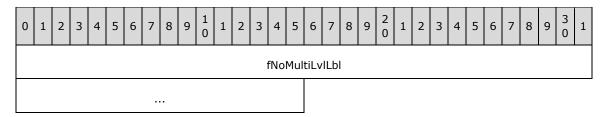

minorUnit (6 bytes): An XmlTkToken that specifies a value that can override the duMinor field of the corresponding AxcExt record. The minorUnit.xtHeader.xmlTkTag field MUST be equal to 0x006B. This field overrides the duMinor field of the corresponding AxcExt record when the fAutoMinor field of the AxcExt record is set to 1. The minorUnit.dValue MUST be a value from the following table:

Value	Meaning
0x0060	Time value is measured in days.

Value	Meaning
0x0061	Time value is measured in months.
0x0062	Time value is measured in years.

2.5.322 XmlTkNoMultiLvlLbl

The **XmlTkNoMultiLvlLbl** structure specifies whether multi-level labeling is enabled for a **category** (2) <u>axis</u>.

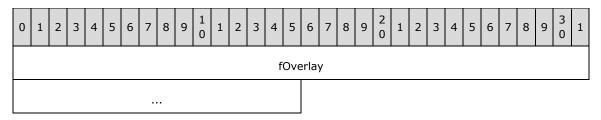

fNoMultiLvILbl (6 bytes): An XmlTkBool that specifies whether single-level labeling is enabled for a category (2) axis. The **fNoMultiLvILbl.xtHeader.xmlTkTag** field MUST be equal to 0x002E. MUST be a value from the following table:

Value	Meaning
0	Multi-level labeling is enabled for a category (2) axis.
1	Single-level labeling is enabled for a category (2) axis.

2.5.323 XmlTkOverlay

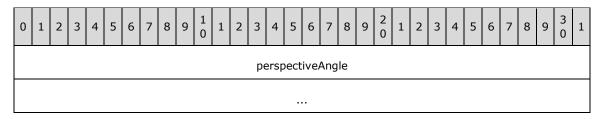

The **XmITkOverlay** structure specifies whether the <u>chart legend</u> and title can overlap or can overlap other chart elements.

fOverlay (6 bytes): An XmlTkBool that specifies whether the chart legend or title can overlap or can overlap other chart elements. **fOverlay.dValue** MUST be 1. The **fOverlay.xtHeader.xmlTkTag** field MUST be equal to 0x002F.

2.5.324 XmlTkPerspectiveFrt

The **XmlTkPerspectiveFrt** structure specifies the angle of the field of view for the **plot area**. This structure MUST exist only for bar <u>chart groups</u> and pie chart groups, and MUST exist only when the <u>chart</u> contains a <u>Chart3d</u> record and the **fPerspective** field of the Chart3d record equal to 1. When the angle of the field of view is the default angle, 20, this structure MUST NOT be present.

perspectiveAngle (8 bytes): An XmlTkDWord that specifies the angle of the field of view. The perspectiveAngle.xtHeader.xmlTkTag field MUST be 0x004D. The value of perspectiveAngle.dValue field MUST equal to two times the view angle and MUST be greater than or equal to 0 and less than or equal to 200. This field overrides the pcDist field of the Chart3d record in the chart sheet substream.

2.5.325 XmlTkPieComboFrom12Frt

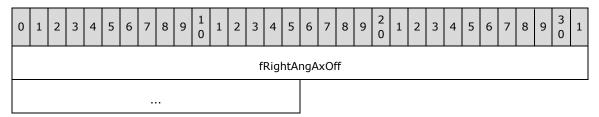

The **XmlTkPieComboFrom12Frt** structure specifies whether the current <u>chart</u> contains multiple <u>chart</u> groups and one of them is a pie chart group.

fPieCombo (6 bytes): An XmlTkBool that specifies whether the current chart contains multiple chart groups and one of them is a pie chart group. **fPieCombo.dValue** MUST be 1. The **fPieCombo.xtHeader.xmlTkTag** field MUST be equal to 0x005E.

2.5.326 XmlTkRAngAxOffFrt

The **XmlTkRAngAxOffFrt** structure specifies whether the **plot area** is rendered with a vanishing point, rather than rendered at right angles. This structure MUST only exist for a bar <u>chart group</u>, and only when the <u>chart</u> contains a <u>Chart3d</u> record is present and the **fPerspective** field of the Chart3d record equal to 1.

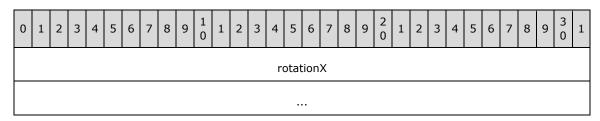

fRightAngAxOff (6 bytes): An XmlTkBool that specifies whether the plot area is rendered with a vanishing point. This field corresponds to the **fPerspective** field of Chart3d record, and it MUST only be present when the **fPerspective** field of the Chart3d record in the chart sheet substream is

equal to 1. The **fRightAngAxOff.dValue** field MUST be equal to 0x01. The **fRightAngAxOff.xtHeader.xmlTkTag** field MUST be equal to 0x0050.

2.5.327 XmlTkRotXFrt

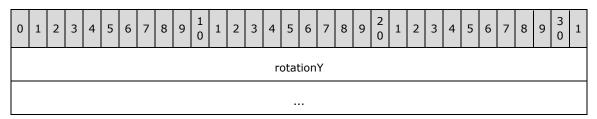

The **XmITkRotXFrt** structure specifies the clockwise rotation, in degrees, of the 3-D **plot area** around a horizontal line through the center of the 3-D plot area. It MUST only be present when the <u>chart</u> contains a <u>Chart3d</u>, and as specified by the **fPerspective** field of the Chart3d record. This structure MUST only exist for a bar <u>chart group</u>, and only when the rotation angle is less than 0 or greater than 44.

rotationX (8 bytes): An XmlTkDWord that specifies the rotation angle. The **rotationX.xtHeader.xmlTkTag** field MUST be 0x004E. The **rotationX.dValue** field MUST be either greater than or equal to -90 and less than 0, or greater than or equal to 45 and less than or equal to 90. It overrides the **anElev** field of the Chart3d record in the chart sheet substream.

2.5.328 XmlTkRotYFrt

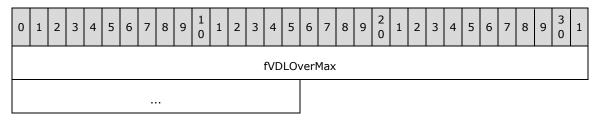

The **XmlTkRotYFrt** structure specifies the clockwise rotation, in degrees, of the 3-D **plot area** around a vertical line through the center of the 3-D plot area. MUST exist only when the <u>chart</u> contains a <u>Chart3d</u> record, and as specified by the **fPerspective** field of the Chart3d record. This record MUST only exist for a bar <u>chart group</u>, and only when the rotation angle is greater than 44.

rotationY (8 bytes): An XmlTkDWord that specifies the rotation angle. The **rotationY.xtHeader.xmlTkTag** field MUST be 0x004F. The **rotationY.dValue** field MUST be greater than or equal to 45, and less than or equal to 359. It overrides the **anRot** field of the Chart3d record chart sheet substream.

2.5.329 XmlTkShowDLblsOverMax

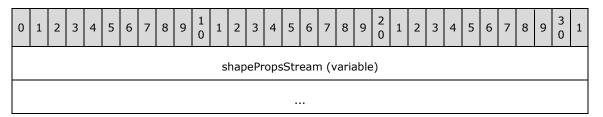

The **XmITkShowDLbIsOverMax** structure specifies whether <u>data labels</u> with values over the maximum value of the value <u>axis</u> of the <u>chart</u> are displayed.

fVDLOverMax (6 bytes): An <u>XmlTkBool</u> that specifies whether data labels with values over the maximum value of the value axis of the chart are displayed. The **fVDLOverMax.xtHeader.xmlTkTag** field MUST be equal to 0x005B.

2.5.330 XmlTkSpb

The **XmITkSpb** structure specifies the shape formatting information of a <u>chart</u> object, stored as an **XML stream** (section 2.1.7.22) as defined in [ECMA-376] Part 4, section 5.7.2.198.

shapePropsStream (variable): An XmlTkBlob that specifies the shape formatting information. The **shapePropsStream.xtHeader.xmlTkTag** MUST be equal to 0x001E. The **XML stream** (section 2.1.7.22) is defined in [ECMA-376] Part 4, section 5.7.2.198, and compressed by the compression algorithm specified in [RFC1951].

2.5.331 XmlTkStart

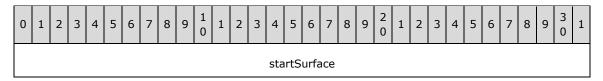

The **XmITkStart** structure specifies the start of a group of structures for the **xmItkChain** field of the CrtMIFrt record.

xtHeader (4 bytes): An XmlTkHeader. The **xtHeader.drType** field MUST be equal to 0x00.

2.5.332 XmlTkStartSurface

The **XmlTkStartSurface** structure specifies the beginning of a back wall. The back wall definition applies to the current <u>chart</u> back wall. The back wall is the **wall** that is parallel to the **category (2)** axis. This structure MUST have a corresponding XmlTkEndSurface structure.

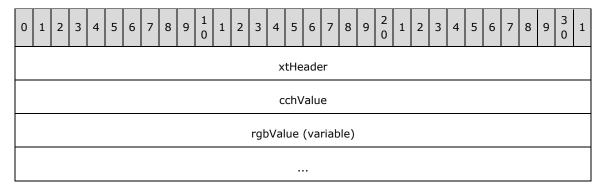

startSurface (4 bytes): An XmlTkStart that specifies which surface is defined. The **startSurface.xtHeader.xmlTkTag** field MUST be equal to a value from the following table:

Value	Meaning
0x0059	The side wall is being defined.

2.5.333 XmlTkString

The **XmlTkString** structure specifies a **Unicode** string value for the **xmltkChain** field of the <u>CrtMlFrt</u> record.

xtHeader (4 bytes): An XmlTkHeader. The xtHeader.drType field MUST be equal to 0x05.

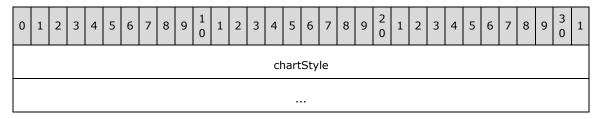

cchValue (4 bytes): An unsigned integer that specifies the count of characters of the rgbValue field.

rgbValue (variable): An array of Unicode characters. The size of the array, in characters, is specified by the cchValue field. The size of the field, in bytes, MUST equal the result of the following formula:

cchValue * 2.

2.5.334 XmlTkStyle

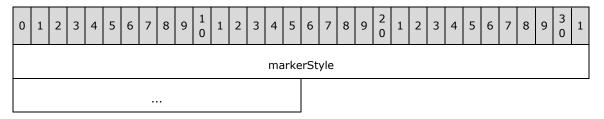

The **XmITkStyle** structure specifies which built-in <u>chart</u> **style** is applied to the chart. This structure MUST only exist when a non-default chart style is used.

chartStyle (8 bytes): An XmlTkDWord that specifies a one-based index into the Style record of the Global substream. MUST be greater than or equal to 1 and less than or equal to 48. MUST NOT be 2. The **chartStyle.xtHeader.xmlTkTag** MUST be equal to 0x0003.

2.5.335 XmlTkSymbolFrt

The **XmlTkSymbolFrt** structure specifies which built-in marker **style** is applied to the **data markers** of the current line, scatter or radar <u>chart group</u>.

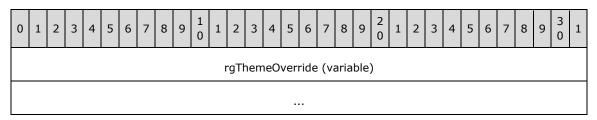

markerStyle (6 bytes): An XmlTkToken that specifies the built-in marker style applied to the data markers of the current line, scatter or radar chart group. The markerStyle.xtHeader.xmlTkTag MUST be equal to 0x0022. It overrides the imk field of the MarkerFormat record when the fauto-image field MUST be equal to a value from the following table:

Value	Meaning
0x0023	Specifies nothing shall be drawn at each data point.
0x0024	Specifies a diamond shall be drawn at each data point.
0x0025	Specifies a square shall be drawn at each data point.
0x0026	Specifies a triangle shall be drawn at each data point.
0x0027	Specifies an X shall be drawn at each data point.
0x0028	Specifies a star shall be drawn at each data point.
0x0029	Specifies a dot shall be drawn at each data point.
0x002A	Specifies a dash shall be drawn at each data point.
0x002B	Specifies a circle shall be drawn at each data point.
0x002C	Specifies a plus shall be drawn at each data point.

2.5.336 XmlTkThemeOverride

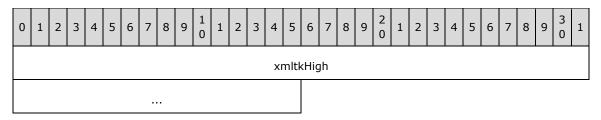

The **XmlTkThemeOverride** structure specifies theme definition override for a <u>chart</u>, stored as an **XML stream** (section <u>2.1.7.22</u>) as defined in <u>[ECMA-376]</u> Part 4, section 5.1.8.12.

rgThemeOverride (variable): An XmlTkBlob that specifies the theme override. The **rgThemeOverride.xtHeader.xmlTkTag** MUST be equal to 0x0033. The **XML stream** (section 2.1.7.22) is defined in [ECMA-376] Part 4, section 5.1.8.12, and compressed by the compression algorithm specified in [RFC1951].

2.5.337 XmlTkTickLabelPositionFrt

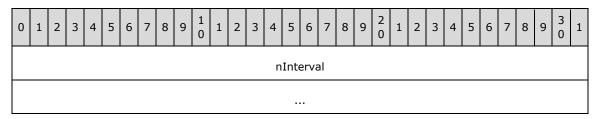

The **XmlTkTickLabelPositionFrt** structure specifies that <u>axis</u> labels on a series axis are centeraligned.

xmltkHigh (6 bytes): An XmlTkToken that specifies that axis labels on a series axis are centeraligned. This is equivalent to the vat field of the corresponding Text record being set to 0x02. The xmltkHigh.dValue MUST be set to 0x005D. The xmltkHigh.xtHeader.xmlTkTag field MUST be equal to 0x005C. This value overrides the vat field of the corresponding Text record when the vat field of the Text record is not set to 0x02.

2.5.338 XmlTkTickLabelSkipFrt

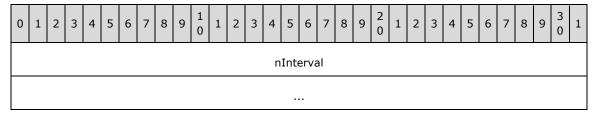

The **XmlTkTickLabelSkipFrt** structure specifies the interval of labels on the **category (2)** <u>axis</u> or series axis. This structure MUST only be present if the **catLabel** field of the corresponding <u>CatSerRange</u> record is not set to 1.

nInterval (8 bytes): An XmlTkDWord that specifies the number of categories (2) between axis labels on a category (2) axis or series axis. The nInterval.xtHeader.xmlTkTag field MUST be equal to 0x0051. It overrides the catLabel field of the corresponding CatSerRange record when the catLabel field of the CatSerRange record is not set to 1.

2.5.339 XmlTkTickMarkSkipFrt

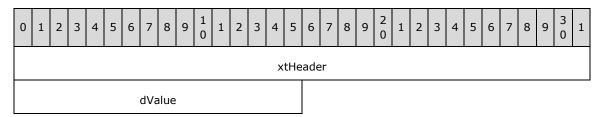

The **XmlTkTickMarkSkipFrt** structure specifies the number of **major tick marks** to skip on a **category (2)** <u>axis</u> or a <u>series</u> axis. This structure MUST only be present if the **catMark** field of the corresponding <u>CatSerRange</u> record is not set to 1.

nInterval (8 bytes): An XmlTkDWord that specifies the number of major tick marks to skip on a category (2) axis or a series axis. The **nInterval.xtHeader.xmlTkTag** field MUST be equal to 0x0052. It overrides the **catMark** field of the corresponding CatSerRange record when the **catMark** field of the CatSerRange record is not set to 1.

2.5.340 XmlTkToken

The XmlTkToken structure specifies a constant value for the xmltkChain field of the CrtMlFrt record.

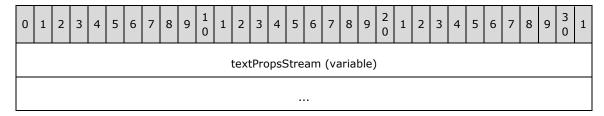

xtHeader (4 bytes): An XmlTkHeader. The xtHeader.drType field MUST be equal to 0x06.

dValue (2 bytes): An unsigned integer that specifies the value of this structure.

2.5.341 XmlTkTpb

The **XmlTkTpb** structure specifies text formatting information for the current chart **XML** element, stored as an **XML stream** (section <u>2.1.7.22</u>), as specified in <u>[ECMA-376]</u> Part 4, section 5.7.2.217.

textPropsStream (variable): An <u>XmlTkBlob</u> that specifies the text formatting information. The **textPropsStream.xtHeader.xmlTkTag** MUST be equal to 0x0020. The **XML stream** (section 2.1.7.22) is specified in [ECMA-376] Part 4, section 5.7.2.217, and compressed by the compression algorithm specified in [RFC1951].

2.5.342 Xnum

Xnum is a 64-bit binary **floating-point number** as specified in [IEEE754]. This value MUST NOT<191> be infinity, denormalized, not-a-number (NaN), nor negative zero.

2.5.343 XORObfuscation

The XORObfuscation structure specifies the XOR obfuscation.

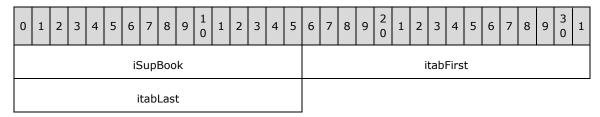

key (2 bytes): An unsigned integer that specifies the **obfuscation key**. See [MS-OFFCRYPTO], 2.3.6.2 section, the first step of initializing XOR array where it describes the generation of 16-bit XorKey value.

verificationBytes (2 bytes): An unsigned integer that specifies the password verification identifier. See Password Verifier Algorithm.

2.5.344 XTI

The **XTI** structure specifies a <u>supporting link</u> and scope information about that supporting link.

iSupBook (2 bytes): An unsigned integer that specifies the zero-based index of a <u>SupBook</u> record in the collection of SupBook records in the <u>Globals Substream ABNF</u>. The referenced SupBook

specifies the supporting link referenced by this structure. This value MUST be less than the number of SupBook records in this file.

itabFirst (2 bytes): A signed integer that specifies the scope of the supporting link, and if a scope is specified, the first sheet in the scope of that supporting link. If the type of supporting link specified by the cch and virtPath fields of the SupBook record is same-sheet referencing, add-in referencing, DDE data source referencing, or OLE data source referencing, then no scope is specified and this value MUST be -2. Otherwise, this field MUST contain a value from the following table:

Value	Meaning
-2	Workbook-level reference that applies to the entire workbook.
-1	Sheet-level reference. The first sheet in the reference could not be found.
>= 0	Sheet-level reference. This specifies the first sheet in the reference. If the supporting link type is unused or external workbook referencing, then this value specifies the zero-based index of an XLUnicodeString in the rgst field of the SupBook record specified in iSupBook . This XLUnicodeString specifies the name of the first sheet within the external workbook that is in scope. This sheet MUST be a worksheet or

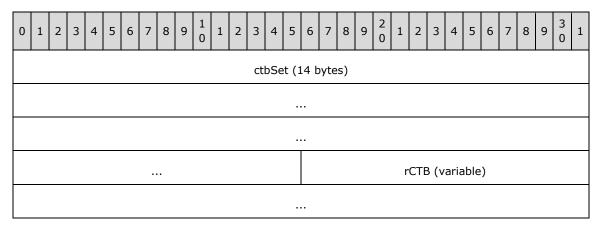

itabLast (2 bytes): A signed integer that specifies the scope of the supporting link, and if a scope is specified, the last sheet in the scope of that supporting link. If the type of supporting link specified by the **cch** and **virtPath** fields of the SupBook record is same-sheet referencing, add-in referencing, **DDE** data source referencing, or OLE data source referencing, then no scope is specified and this value MUST be -2. Otherwise, this field MUST contain a value from the following table:

Value	Meaning
-2	Workbook-level reference that applies to the entire workbook. MUST NOT be used if itabFirst is not equal to -2.
-1	Sheet-level reference. The last sheet in the reference could not be found. SHOULD NOT<192> be used if itabFirst is equal to -2.
>= 0	Sheet-level reference. This specifies the last sheet in the reference. MUST NOT be used if itabFirst is equal to -2.
	If the supporting link type is unused or referring to an external workbook, then this value specifies the zero-based index of an XLUnicodeString in the rgst field of the SupBook record specified in iSupBook . This XLUnicodeString specifies the name of the last sheet within the external workbook that is in scope. This sheet MUST be a worksheet or macro sheet.
	If the supporting link type is self-referencing, then this value specifies the zero-based index of a BoundSheet8 record in the Globals Substream ABNF that specifies the last sheet within the scope of this reference. This sheet MUST be a worksheet or a macro sheet.

2.6 XCB Structures

2.6.1 CTBWRAPPER

The **CTBWRAPPER** structure specifies a custom toolbar wrapper. This is the root record of the XCB binary stream where custom toolbars are stored.

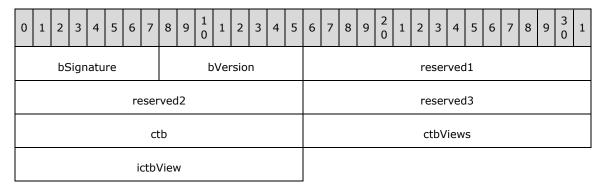

ctbSet (14 bytes): This is a structure of type CTBS.

rCTB (variable): Zero-based index array of <u>CTB</u> structures. The number of elements in the array MUST be equal to **ctbSet.ctb**.

2.6.2 CTBS

The **CTBS** record specifies the number of custom toolbars stored in the file and the number of available **toolbar views**.

bSignature (1 byte): An unsigned integer that specifies the toolbar set signature number. MUST be 0x01.

bVersion (1 byte): An unsigned integer that specifies the toolbar set version number. MUST be 0x01.

reserved1 (2 bytes): MUST be zero and MUST be ignored.

reserved2 (2 bytes): MUST be zero and MUST be ignored.

reserved3 (2 bytes): MUST be zero and MUST be ignored.

ctb (2 bytes): An unsigned integer that specifies the number of elements in the **rCTB** array of the CTBWRAPPER structure that contains this structure. The value MUST be greater than 0x0000.

ctbViews (2 bytes): An unsigned integer that specifies the number of available toolbar views. MUST be 0x0003. There are three view modes and therefore each toolbar has three available views. The view modes are shown in the following table:

View mode number	Meaning
0	Normal view
1	Full screen view
2	Web-only view<193>

ictbView (2 bytes): An unsigned integer that specifies the view mode number that the application was in at the time the file was saved. MUST be equal to 0x0000 or 0x0001.

2.6.3 CTB

The **CTB** record specifies a custom toolbar.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2	1	2	3	4	5	6	7	8	9	3	1
														tb	(va	riab	le)														
											rVi	sua	lDa	ıta ((60	byt	es,	opt	ion	al)											
															ect	bid															
													r	ТВС	(v	aria	ble)													

tb (variable): Structure of type TB, as specified in [MS-OSHARED] section 2.3.1.6, that contains toolbar information.

rVisualData (60 bytes): A zero-based index array of TBVisualData structures, specified in [MS-OSHARED] section 2.3.1.9. The number of elements in this array MUST be equal to the value of the **ctbViews** field of the <u>CTBS</u> structure contained by the <u>CTBWRAPPER</u> structure that contains this structure. The index of each structure in the array corresponds to a view mode number. Refer to the following table for the meaning of each TBVisualData, specified in [MS-OSHARED] section 2.3.1.9, structure according to its position in this array:

Index of structure in array	Meaning of TBVisualData, specified in [MS-OSHARED] section 2.3.1.9, structure
0	Contains the visual information for this toolbar to be used when the application is in Normal view .
1	Contains the visual information for this toolbar to be used when the application is in Full screen view .
2	Contains the visual information for this toolbar to be used when the application is

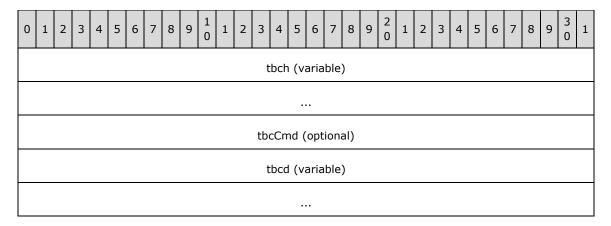

Index of structure in array	Meaning of TBVisualData, specified in [MS-OSHARED] section 2.3.1.9, structure
	in Web-only view.

ectbid (4 bytes): A signed integer that specifies the application's specific custom toolbar identifier. Value MUST be 0x00000FFF.

rTBC (variable): Number of elements in the array MUST be equal to tb.cCL.

2.6.4 TBC

The TBC record specifies a toolbar control.

tbch (variable): Structure of type TBCHeader, as specified in [MS-OSHARED] section 2.3.1.10, that specifies toolbar control header information.

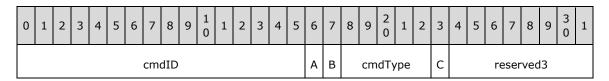

tbcCmd (4 bytes): Structure of type <u>TBCCmd</u>. This field MUST only exist when **tbch.tcid** is not equal to 0x0001, 0x06CC (1740), 0x03D8 (984), 0x03EC (1004), or 0x1051 (4177), and the value of **tbch.tct** equals one of the values in the following table:

Value of tbch.tct	Meaning
0x01	Button control
0x02	Edit control
0x03	Dropdown control
0x04	ComboBox control
0x06	SplitDropDown control
0x07	OCXDropDown control
0x08	GraphicDropDown control
0x0A	Popup control
0x0C	ButtonPopup control
0x0D	SplitButtonPopup control
0x0E	SplitButtonMRUPopup control
0x0F	Label control
0x15	Pane control

tbcd (variable): Structure of type TBCData, as specified in [MS-OSHARED] section 2.3.1.13, that specifies toolbar control data. MUST exist if **tbch.tct** is not equal to 0x16. MUST NOT exist if **tbch.tct** equals 0x16.

2.6.5 TBCCmd

The **TBCCmd** record specifies a command identifier for a **toolbar control**.

cmdID (2 bytes): A signed integer that specifies the command identifier for this toolbar control. Value MUST be in one of the tables specified in sections 2.3, 2.4, 2.5, 2.6, 2.7, and 2.8 of [MS-CTXLS].

- A fHideDrawing (1 bit): A bit that specifies whether the toolbar control is visible if it is disabled. A value of 1 specifies that the toolbar control is not visible if it is disabled. MUST only be used if cmdType equals 0x10 or 0x14. MUST be 0 if cmdType is not equal to 0x10 and is not equal to 0x14.
- **B reserved1 (1 bit):** MUST be zero and MUST be ignored.

cmdType (5 bits): An unsigned integer that specifies the command type for this toolbar control. Value MUST be in the following table:

Value	Meaning
0x00	Toolbar control uses a toolbar control grid command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.8.
0x01	Toolbar control uses a toolbar control command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.4.
0x02	Toolbar control uses a general command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.3.
0x03	Toolbar control uses a menu toolbar control command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.5.
l l	Toolbar control uses a toolbar command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.7. The value of the tbch.tct field of the <u>TBC</u> structure that contains this structure MUST be equal to one of the following values: 0x0A, 0x0C, 0x0D, or 0x0E.
0x07	Toolbar control uses a menu toolbar command identifier. Value of cmdType MUST be one of the values listed in [MS-CTXLS] section 2.6. The value of the tbch.tct field of the TBC structure that contains this structure MUST be equal to one of the following values: 0x0A, 0x0C, 0x0D, or 0x0E.
0x08	Toolbar control command is determined by using the value of the tbch.tcid field of the TBC structure that contains this structure.

0x10	Toolbar control uses an MSODGCID specifying a drawing command, as specified in [MS-ODRAW].
0x14	Toolbar control uses an MSODGCID specifying a drawing command, as specified in [MS-ODRAW].

C - reserved2 (1 bit): MUST be zero and MUST be ignored.

reserved3 (8 bits): MUST be zero and MUST be ignored.

2.7 Algorithms

2.7.1 Application Data For VtHyperlink

The following algorithm specifies how hyperlink properties ([MS-OSHARED] section 2.3.3.1.18) that are associated with a **range** of cells or shapes in a document construct their **dwApp** structure **member (1)** value.

- 1. If the hyperlink is associated with a shape [MS-ODRAW] section 2.2.31, the **dwApp** value MUST be 0xFFFFFFF.
- 2. Otherwise the hyperlink MUST be associated with a range of cells on a **sheet**, and the **dwApp** value is computed as follows:
- 3. Set an unsigned 2-byte integer (wHLIndex) equal to the zero-based index of the <u>HLink</u> structure or <u>HLinkTooltip</u> structure in the sheet that the hyperlink is associated with.
- 4. Set an unsigned 2-byte integer (wWSIndex) equal to the zero-based index of the sheet in the document on which this range of cells that the hyperlink is associated with is defined.
- 5. The value of **dwApp** MUST be equal to the bitwise OR of wWSIndex shifted 16 bits to the high order and wHLIndex.

Example: dwApp = (wWSIndex << 16) | wHLIndex;</pre>

3 Structure Examples

This section contains examples of some of the most commonly used data structures in MS-XLS files. The examples are meant to be a starting point for an implementer learning the file format. They are not meant to cover all records in the file format.

The following conventions are followed for all of the examples, unless noted otherwise:

- The order of the records, structures, and fields within the example match their corresponding order in the file format.
- The examples begin with the first record relevant to the example and end with the last record relevant to the example. An example cannot be used as a complete and standalone MS-XLS file.
- The examples are self-contained and contiguous; no records or structures are omitted in the middle of an example.
- Undefined and ignored fields are not included in the field explanations.
- Offsets for records and structures are omitted because these values can vary depending on how the files are created and what optional records applications choose to include in files.
- In the structure diagrams for the examples, the types of arrays are meant for illustration only and can be disregarded.

3.1 Conditional Formatting

This example shows conditional formatting applied to **cell** A2 with a "between" condition to make the text red when the value is greater than or equal to 1.5, and less than or equal to 2.5.

The first record in this example is a <u>CondFmt</u> record, which specifies beginning of a collection of <u>CF</u> records and defines the **range** of cells to which the conditional formatting rule applies. The CF record follows next in this example, defining that conditional formatting rule.

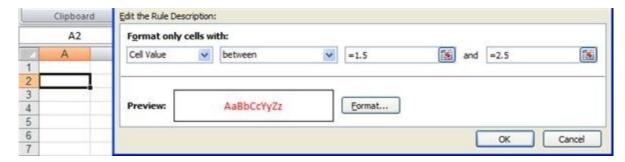

Figure 19: Conditional formatting in this example within a sheet

3.1.1 Conditional Formatting: CondFmt

The first record in this example, <u>CondFmt</u>, specifies beginning of a collection of <u>CF</u> records and defines the <u>range</u> of <u>cells</u> to which the conditional formatting rule applies.

Size	Structure	Value
0016	CondFmt - CondFmt	
0002	USHORT - ccf	0x0001

Size	Structure	Value
1 bit	USHORT - fToughRecalc	0x0
15 bits	USHORT - nID	0x0000
0008	Ref8U - refBound	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0001
0002	RwU - rwLast	
0002	USHORT - rw	0x0001
0002	ColU - colFirst	
0002	USHORT - col	0x0000
0002	ColU - colLast	
0002	USHORT - col	0x0000
000A	SqRefU - sqref	
0002	USHORT - cref	0x0001
0008	RgRef8U - rgrefs	
0008	Ref8U - ref[0]	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0001
0002	RwU - rwLast	
0002	USHORT - rw	0x0001
0002	ColU - colFirst	
0002	USHORT - col	0x0000
0002	ColU - colLast	
0002	USHORT - col	0×0000

Figure 20: Structure of CondFmt

ccf: 0x0001 specifies that there is one CF record in the collection that follows this record.

fToughRecalc: 0x0 specifies that the appearance of the cell does not require significant processing.

nID: 0x0000 specifies the identifier for this record.

refBound: A Ref8U structure specifies the bounds of the set of cells to which the rules are applied.

refBound.rwFirst: An RwU structure that specifies the index of the first row in the range.

refBound.rwFirst.rw: 0x0001 specifies that the range starts in row two of the worksheet.

refBound.rwLast: A RwU structure that specifies index of the last row in the range.

refBound.rwLast.rw: 0x0001 specifies that the range ends in row two of the worksheet.
refBound.colFirst: A ColU structure that specifies the index of the first column in the range.
refBound.colFirst.col: 0x0000 specifies that the range starts in column A of the worksheet.
refBound.colLast: A ColU structure that specifies the index of the last column in the range.
refBound.colLast.col: 0x0000 specifies that the range ends in column A of the worksheet.
sqref: An SqRefU structure that specifies the cells to which the conditional formatting rules apply.

sqref.rgrefs.ref[0]: This is the first Ref8U structure that specifies the range of cells on the sheet
 where the conditional formatting rules apply.

sqref.rgrefs.ref[0].rwFirst.rw: 0x0001 specifies the range starts in row two of the worksheet. sqref.rgrefs.ref[0].rwLast.rw: 0x0001 specifies the range ends in row two of the worksheet.

sqref.rgrefs.ref[0].colFirst.col: 0x0000 specifies the range starts in column A of the worksheet. **sqref.rgrefs.ref[0].colLast.col:** 0x0000 specifies the range ends in column A of the worksheet.

3.1.2 Conditional Formatting: CF

The next record in this example, CF, specifies a conditional formatting rule.

sqref.cref: 0x0001 specifies that there is one Ref8U structure in rgrefs.

Figure 21: Structure of Cf

ct: 0x01 specifies that the **conditional formatting** rule requires two inputs. The inputs, **rgce1** and **rgce2**, are evaluated with the comparison function specified in the **cp** field. If the result of the evaluation is TRUE, the conditional formatting rule is applied.

cp: 0x01 specifies that the comparison function evaluates to TRUE if the **cell** value is greater than or equal to the value of the **rgce1** field and less than or equal to the value of the **rgce2** field.

cce1: 0x0009 specifies that the size of the rgce1 field is 9 bytes.

cce2: 0x0009 specifies that the size of the rgce2 field is 9 bytes.

rgbdxf: A DXFN structure that specifies the formatting that is applied if the defined condition evaluates to TRUE.

rgbdxf.alchNinch: 0x1 specifies that rgbdxf.dxfalc.alc is ignored.

rgbdxf.alcvNinch: 0x1 specifies that **rgbdxf.dxfalc.alcv** is ignored.

rgbdxf.wrapNinch: 0x1 specifies that **rgbdxf.dxfalc.fWrap** is ignored.

rgbdxf.trotNinch: 0x1 specifies that **rgbdxf.dxfalc.trot** is ignored.

rgbdxf.kintoNinch: 0x1 specifies that rgbdxf.dxfalc.fJustLast is ignored.

 $\textbf{rgbdxf.cIndentNinch:}\ 0x1\ \text{specifies that}\ \textbf{rgbdxf.dxfalc.cIndent}\ \text{and}\ \textbf{rgbdxf.dxfalc.iIndent}\ \text{are}$

ignored.

rgbdxf.fShrinkNinch: 0x1 specifies that rgbdxf.dxfalc.fShrinkToFit is ignored.

rgbdxf.fMergeCellNinch: 0x1 specifies that rgbdxf.dxfalc.fMergeCell is ignored.

rgbdxf.lockedNinch: 0x1 specifies that **rgbdxf.dxfprot.fLocked** is ignored.

rgbdxf.hiddenNinch: 0x1 specifies that **rgbdxf.dxfprot.fHidden** is ignored.

rgbdxf.glLeftNinch: 0x1 specifies that rgbdxf.dxfbdr.dgLeft and rgbdxf.dxfbdr.icvLeft are

ignored.

 $\textbf{rgbdxf.glRightNinch:}\ 0x1\ specifies\ that\ \textbf{rgbdxf.dxfbdr.dgRight}\ and\ \textbf{rgbdxf.dxfbdr.icvRight}\ are$

ignored.

 $\textbf{rgbdxf.glTopNinch:} \ 0x1 \ \text{specifies that the properties for the top } \textbf{border} \ \text{of the cell can be updated}$

and that **rgbdxf.dxfbdr.dgTop** and **rgbdxf.dxfbdr.icvTop** are ignored.

 $\mbox{\bf rgbdxf.glBottomNinch: } 0\mbox{\bf x1 specifies that } \mbox{\bf rgbdxf.dxfbdr.dgBottom and}$

rgbdxf.dxfbdr.icvBottom are ignored.

rgbdxf.glDiagDownNinch: 0x1 specifies that rgbdxf.dxfbdr.bitDiagDown is ignored.

rgbdxf.glDiagUpNinch: 0x1 specifies that rgbdxf.dxfbdr.bitDiagUp is ignored. Because

rgbdxf.glDiagDownNinch is also set to 0x1, rgbdxf.dxfbdr.dgDiag and

rgbdxf.dxfbdr.icvDiag are ignored.

rgbdxf.flsNinch: 0x1 specifies that **rgbdxf.dxfpat.fls** is ignored.

rgbdxf.icvFNinch: 0x1 specifies that **rgbdxf.dxfpat.icvForeground** is ignored.

rgbdxf.icvBNinch: 0x1 specifies that rgbdxf.dxfpat.icvBackground is ignored.

rgbdxf.ifmtNinch: 0x1 specifies that **rgbdxf.dxfnum.ifmt** is ignored.

rgbdxf.fIfntNinch: 0x1 specifies that **rgbdxf.dxffntd.ifnt** is ignored.

rqbdxf.ibitAtrNum: 0x0 specifies that the number format is not part of this structure.

rgbdxf.ibitAtrFnt: 0x1 specifies that **font** information is a part of this structure.

 $\textbf{rgbdxf.ibitAtrAlc:} \ 0x0 \ specifies \ that \ alignment \ information \ is \ not \ a \ part \ of \ this \ structure.$

rgbdxf.ibitAtrBdr: 0x0 specifies that border formatting information is not a part of this structure.

 $\textbf{rgbdxf.ibitAtrPat:} \ 0 x 0 \ \text{specifies that pattern information is not a part of this structure}.$

rgbdxf.ibitAtrProt: 0x0 specifies that rotation information is not a part of this structure.

```
rgbdxf.iReadingOrderNinch: 0x1 specifies that rgbdxf.dxfalc.iReadingOrder is ignored.
```

rgbdxf.fIfmtUser: 0x0 specifies that the number format is not a user-defined format string.

rgbdxf.fNewBorder: 0x0 specifies that the border formats apply to all cells in the **range**.

 $\textbf{rgbdxf.fZeroInited:}\ 0x0\ specifies\ that\ \textbf{rgbdxf.dxfalc.iReadingOrder}\ is\ undefined\ and\ not\ taken$

into account.

rgbdxf.dxffntd: A DXFFntD structure that specifies the font information used for formatting.

rgbdxf.dxffntd.cchFont: 0x00 specifies the number of characters in the font name string.

rgbdxf.dxffntd.stxp: This specifies the formatting attributes of the font.

rgbdxf.dxffntd.stxp.twpHeight: 0xFFFFFFF specifies that this value is ignored.

rgbdxf.dxffntd.stxp.ts: A Ts structure that specifies additional formatting attributes.

rgbdxf.dxffntd.stxp.ts.ftsItalic: 0x1 is ignored because rgbdxf.dxffntd.tsNinch.ftsItalic is 0x1.

rgbdxf.dxffntd.stxp.ts.ftsStrikeout: 0x0 is ignored because **rgbdxf.dxffntd.tsNinch.ftsStrikeout** is 0x1.

rgbdxf.dxffntd.stxp.bls: 0x0000 specifies that the font is normal weight.

rgbdxf.dxffntd.stxp.sss: 0x0000 specifies that the font is normal script.

rgbdxf.dxffntd.stxp.uls: 0x00 specifies that the font is not underlined.

rgbdxf.dxffntd.stxp.bFamily: 0x00 specifies the font family.

rgbdxf.dxffntd.stxp.bCharSet: 0x00 specifies the font **character set**.

rgbdxf.dxffntd.icvFore: 0x0000000A specifies that the font color is red.

rgbdxf.dxffntd.tsNinch: A Ts structure that specifies how the value of rgbdxf.dxffntd.stxp.ts is interpreted.

rgbdxf.dxffntd.tsNinch.ftsItalic: 0x1 specifies that the value of rgbdxf.dxffntd.stxp.ts.ftsItalic
is ignored.

rgbdxf.dxffntd.tsNinch.ftsStrikeout: 0x1 specifies that the value of **rgbdxf.dxffntd.stxp.ts. ftsStrikeout** is ignored.

rgbdxf.dxffntd.fSssNinch: 0x00000001 specifies that rgbdxf.dxffntd.stxp.sss is ignored.

rgbdxf.dxffntd.fUlsNinch: 0x00000001 specifies that rgbdxf.dxffntd.stxp.uls is ignored.

rgbdxf.dxffntd.fBlsNinch: 0x00000001 specifies that rgbdxf.dxffntd.stxp.bls is ignored.

rgbdxf.dxffntd.ich: 0x00000000 specifies that the font formatting is applied starting from the first character.

rgbdxf.dxffntd.cch: 0x7FFFFFF specifies that the font formatting applies to 2147483647 characters.

rgbdxf.dxffntd.iFnt: 0x0001 is ignored because **rgbdxf.fIfntNinch** is 0x1.

rgce1: A CFParsedFormulaNoCCE structure that specifies the first operand of the comparison.

rgce1.rgce: An Rgce that specifies an array of Ptgs.

rgce1.rgce.Ptg[0]: A Ptg that specifies a formula element.

rgce1.rgce.Ptg[0].PtgNum.ptg: 0x1F specifies that this Ptg is a floating point value.

rgce1.rgce.Ptg[0].PtgNum.value: 0x3FF800000000000 specifies a numeric value of 1.5.

rgce2: A CFParsedFormulaNoCCE structure that specifies the second operand of the comparison.

rgce2.rgce: A Rgce structure that specifies an array of Ptgs.

rgce2.rgce.Ptg[0]: A Ptg that specifies a formula element.

rgce2.rgce.Ptg[0].PtgNum.ptg: 0x1F specifies that this Ptg is a floating point value.

rgce2.rgce.Ptg[0].PtgNum.value: 0x400400000000000 specifies a numeric value of 2.5.

3.2 Defined Name

This example shows a **workbook**-level **defined name**, *MyName*, that points to the **cell** E4 on the second **sheet**. A defined name is specified by a <u>Lbl</u> record, which is a part of the <u>Globals Substream</u> (not included in this example for brevity). This example includes the <u>ExternSheet</u> record referenced by the Lbl record, and the <u>SupBook</u> record referenced by the ExternSheet record.

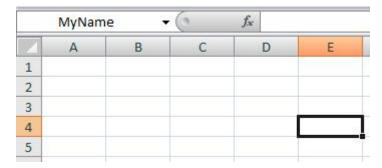

Figure 22: Defined name in this example within a sheet

3.2.1 Defined Name: Lbl

The first record in this example, Lbl, stores the **defined name**.

Size	Structure	Value
001C	Lbl - Lbl	
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fFunc	0x0
1 bit	USHORT - fOB	0x0
1 bit	USHORT - fProc	0x0
1 bit	USHORT - fCalcExp	0x0
1 bit	USHORT - fBuiltin	0x0
6 bits	USHORT - fGrp	0x00
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fPublished	0x0

Size	Structure	Value
1 bit	USHORT - fWorkbookParam	0x0
1 bit	USHORT - reserved2	0x0
0001	BYTE - chKey	0x00
0001	BYTE - cch	0x06
0002	SHORT - cce	0x0007
0002	SHORT - reserved3	0x0000
0002	USHORT - itab	0x0000
0001	BYTE - reserved4	0x00
0001	BYTE - reserved5	0x00
0001	BYTE - reserved6	0x00
0001	BYTE - reserved7	0x00
0007	XLUnicodeStringNoCch - Name	MyName
0007	NameParsedFormula - rgce	
0007	Ptg - Ptg[0]	
0007	PtgRef3d - PtgRef3d	
5 bits	BYTE - ptg	0x1A
2 bits	PtgDataType - type	0x1
1 bit	BYTE - reserved	0x0
0002	USHORT - ixti	0x0000
0004	RgceLoc - loc	
0002	RwU - row	
0002	USHORT - rw	0x0003
0002	ColRelU - column	
0002	USHORT - col	0x0004

Figure 23: Structure of Lbl

fHidden: 0x0 specifies that the defined name is visible in the list of defined names.

fFunc: 0x0 specifies that the defined name does not represent an **XLM**.

fOB: 0x0 specifies that the defined name does not represent a **VBA macro**.

fProc: 0x0 specifies that the defined name does not represent a macro.

fCalcExp: 0x0 specifies that the defined name does not represent a function that could return an

array.

fBuiltin: 0x0 specifies that the defined name does not represent a built-in name.

fGrp: 0x00 specifies the **function category** for the defined name is "All".

fPublished: 0x0 specifies that this defined name is not **published**.

fWorkbookParam: 0x0 specifies that this defined name is not a workbook parameter.

chKey: 0x00 specifies there is no shortcut key for the macro represented by the defined name.

cch: 0x06 specifies that there are six characters in the **Name** field.

cce: 0x0007 specifies that the length of the rgce field is 7 bytes.

itab: 0x0000 specifies that the defined name is not local to a **sheet**.

Name: MyName specifies the name of the defined name.

rgce: A NameParsedFormula that specifies the formula (section <u>2.2.2</u>) that represents the defined name.

rgce.Ptg[0].PtgRef3d.ptg: 0x1A specifies that this Ptg is of type PtgRef3d.

rgce.Ptg[0].PtgRef3d.type: 0x1 specifies that this Ptg is a reference to a range.

rgce.Ptg[0].PtgRef3d.ixti: 0x0000 specifies that this range refers to the sheet specified by the first XTI element in the ExternSheet record.

rgce.Ptg[0].PtgRef3d.loc.row.rw: 0x0003 specifies that the referenced **cell** is in row four of the **worksheet**.

rgce.Ptg[0].PtgRef3d.loc.column.col: 0x0004 specifies that the referenced cell is in column E of the worksheet.

3.2.2 Defined Name: ExternSheet

The next record in this example is an <u>ExternSheet</u> record. This record defines the set of **sheets** that are referenced by this **workbook**. It is included in this example because the **ixti** field in the <u>Lbl</u> record points to the <u>XTI</u> structure within this record.

Size	Structure	Value	
0008	ExternSheet - ExternSheet		
0002	USHORT - cXTI	0x0001	
0006	RgXTI - rgXTI		
0006	XTI - xti[0]		
0002	USHORT - iSupBook	0x0000	
0002	SHORT - itabFirst	0x0001	
0002	SHORT - itabLast	0x0001	

Figure 24: Structure of ExternSheet

cXTI: 0x0001 specifies that there is one XTI record in the **rgXTI** array.

rgXTI.xti[0].iSupBook: 0x0000 specifies the reference to the first <u>SupBook</u> record in the <u>global</u> <u>substream</u>.

rgXTI.xti[0].itabFirst: 0x0001 specifies that the first sheet referenced by the **defined name** is the second sheet in the workbook (Sheet2). The related BoundSheet8 record is omitted for brevity.

rgXTI.xti[0].itabLast: 0x0001 specifies that the last sheet referenced by the defined name is the second sheet in the workbook (Sheet2).

3.2.3 Defined Name: SupBook

The next record in this example, <u>SupBook</u>, stores information about a **workbook** that is referenced by this workbook.

Size	Structure	Value
0004	SupBook - SupBook	
0002	USHORT - ctab	0x0003
0002	USHORT - cch	0x0401

Figure 25: Structure of SupBook

ctab: 0x0003 specifies that there are three sheets in the referenced workbook.

cch: 0x0401 specifies that this record defines a self-referencing supporting link.

3.3 Table

This example shows the records that make up a **table**. The following figure shows a possible implementation of the table discussed in this example:

	Α	В	С		D		E	F
1								
2								
3								
4			Item	*	Price	-	Sales Tax	
5			Bicycle	е		50	4	
6			Backp	ack		24	1.92	
7			Shoes			60	4.8	
8								
9								

Figure 26: Table in this example within a sheet

3.3.1 Table: Feathdr11

The first record in this example is a FeatHdr11 record that appears in the worksheet substream (the worksheet substream is not included in this example for brevity). This record stores common information about all the tables on this **sheet**.

Size	Structure	Value
001D	FeatHdr11 - Feathdr11	
000C	<u>FrtHeader</u> - frt	
0002	USHORT - rt	0x0871

Size	Structure	Value
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0008	RESERVED - reserved	0x000000000000000
0002	<u>SharedFeatureType</u> - isf	0x0005
0001	BYTE - reserved1	0x01
0004	DWORD - reserved2	0xFFFFFFF
0004	DWORD - reserved3	0xFFFFFFF
0004	DWORD - idListNext	0x00000002
0002	USHORT - reserved4	0x0000

Figure 27: Structure of Feathdr11

frt: This structure specifies a future version record type FrtHeader.

frt.rt: 0x0871 specifies that this record belongs to a record of type FeatHdr11.

frt.grbitFrt: Stores attributes for this record.

frt.grbitFrt.fFrtRef: 0x0000 specifies that this record does not specify a range of cells.

frt.grbitFrt.fFrtAlert: 0x0000 specifies not to alert the user of possible problems when saving the file as an earlier version of the file format.

isf: 0x0005 specifies type Table.

idListNext: 0x00000002 specifies the next identifier to try when assigning a unique identifier to a new **table**.

3.3.2 Table: Feature11

The next record in this example, <u>Feature11</u>, specifies information about this **table** on this **sheet**.

Size	Structure	Value
0116	Feature11 - Feature11	
000C	<u>FrtRefHeaderU</u> - frtRefHeaderU	
0002	USHORT - rt	0x0872
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x1
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000

Size	Structure	Value
8000	Ref8U - ref8	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0003
0002	RwU - rwLast	
0002	USHORT - rw	0x0006
0002	ColU - colFirst	
0002	USHORT - col	0x0002
0002	ColU - colLast	
0002	USHORT - col	0x0004
0002	USHORT - isf	0x0005
0001	BYTE - reserved1	0x00
0004	DWORD - reserved2	0x0000000
0002	USHORT - cref2	0x0001
0004	DWORD - cbFeatData	0x00000000
0002	USHORT - reserved3	0x0000
0008	REFS2 - refs2	
0008	Ref8U - ref[0]	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0003
0002	RwU - rwLast	
0002	USHORT - rw	0x0006
0002	ColU - colFirst	
0002	USHORT - col	0x0002
0002	ColU - colLast	
0002	USHORT - col	0x0004
00F3	FeatUnion5 - rgbFeat	
00F3	<u>TableFeatureType</u> - TableFeature	
0004	SourceType - It	0x00000000
0004	DWORD - idList	0x0000001
0004	DWORD - crwHeader	0x00000001
0004	DWORD - crwTotals	0x0000000

Size	Structure	Value

Figure 28: Structure of Feature11

frtRefHeaderU: This structure specifies a future version record type header.

frtRefHeaderU.rt: 0x0872 specifies that this record belongs to a record of type Feature11.

frtRefHeaderU.grbitFrt: Specifies attributes for this record.

frtRefHeaderU.grbitFrt.fFrtRef: 0x1 specifies that the containing record specifies a range of cells.

frtRefHeaderU.grbitFrt.fFrtAlert: 0x0 specifies not to alert the user of possible problems when saving as an earlier version of the file format.

frtRefHeaderU.ref8: Specifies a range of cells on the sheet. This refers to the range C4:E7. Because frt.rt is equal to 0x0872, this field is ignored.

frtRefHeaderU.ref8.rwFirst: Specifies the first row in the Table range.

frtRefHeaderU.ref8.rwFirst.rw: 0x0003 specifies the first row in the table on the sheet. This refers to row four of the sheet.

frtRefHeaderU.ref8.rwLast: Specifies the last row in the table range.

frtRefHeaderU.ref8.rwLast.rw: 0x0006 specifies the last row in the table on the sheet. This refers to row seven of the sheet.

frtRefHeaderU.ref8.colFirst: Specifies the first column in the table range.

frtRefHeaderU.ref8.colFirst.col: 0x0002 specifies the first column in the table on the sheet. This refers to column C of the sheet.

frtRefHeaderU.ref8.colLast: Specifies the last column in the table range.

frtRefHeaderU.ref8.colLast.col: 0x0004 specifies the last column in the table on the sheet. This refers to column E of the sheet.

isf: 0x0005 specifies that the shared feature type is a table feature.

cref2: 0x0001 specifies the count of Ref8U records within the refs2 field. refs2 contains one Ref8U record.

cbFeatData: 0x00000000 specifies that the size of the **rgbFeat** field is calculated using the following formula:

Size of rgbFeat = record total size in bytes - size of refs2 in bytes - 27 bytes

Size of rgbFeat = 278 bytes - 8 bytes - 27 bytes

Size of rgbFeat = 243 bytes

refs2: Specifies the references to the ranges of cells within the sheet that are affected by the feature.

refs2.ref[0]: The first Ref8U record in the array. It specifies the range C4:E7. This specifies the range of cells for the table.

refs2.ref[0].rwFirst.rw: 0x0003 specifies that the first row of the range is row four.

refs2.ref[0].rwLast.rw: 0x0006 specifies that the last row of the range is row seven.

refs2.ref[0].colFirst.col: 0x0002 specifies that the first column of the range is column C.

refs2.ref[0].colLast.col: 0x0004 specifies that the last column of the range is column E.

rgbFeat: Specifies any of the possible features for this record. Contains a TableFeatureType record, as indicated by isf.

rgbFeat.TableFeature: Specifies the definition of this table.

rgbFeat.TableFeature.It: 0x00000000 specifies the type of **data source** for the table is a range.

rgbFeat.TableFeature.idList: 0x00000001 specifies the identifier for the table.

rgbFeat.TableFeature.crwHeader: 0x00000001 specifies there is a row at the top of the table that is used as a **header row**.

rgbFeat.TableFeature.crwTotals: 0x00000000 specifies there is not a row at the bottom of the table that is used as a **total row**.

rgbFeat.TableFeature.idFieldNext: 0x00000004 specifies the next unique identifier to try when assigning unique identifiers to columns of the table.

rgbFeat.TableFeature.cbFSData: 0x00000040 specifies the size, in bytes, of the fixed portion of this TableFeatureType structure.

- rgbFeat.TableFeature.rupBuild: This value is not valid, as specified by rgbFeat.TableFeature.fGoodRupBld.
- rgbFeat.TableFeature.fAutoFilter: 0x1 specifies the table has AutoFilters.
- **rgbFeat.TableFeature.fPersistAutoFilter:** 0x1 specifies that the AutoFilter information is preserved for this table across data refresh operations.
- rgbFeat.TableFeature.fShowInsertRow: 0x0 specifies the insert row is not visible.
- **rgbFeat.TableFeature.fInsertRowInsCells:** 0x0 specifies rows are not shifted down because the insert row is not visible.
- rgbFeat.TableFeature.fLoadPldwIdDeleted: 0x0 specifies the idDeleted field is not present.
- **rgbFeat.TableFeature.fShownTotalRow:** 0x0 specifies the total row is not displayed at the bottom of the table.
- **rgbFeat.TableFeature.fNeedsCommit:** 0x0 specifies that only table modifications that are synchronized with the data source exist.
- rgbFeat.TableFeature.fSingleCell: 0x0 specifies the table is not limited to a single cell.
- rgbFeat.TableFeature.fApplyAutoFilter: 0x1 specifies that the AutoFilter is currently applied.
- rgbFeat.TableFeature.fForceInsertToBeVis: 0x0 specifies the insert row is not forced to be visible.
- **rgbFeat.TableFeature.fCompressedXml:** 0x0 specifies the XML data linked to the table is to be compressed. No XML data link is present.
- rgbFeat.TableFeature.fLoadCSPName: 0x0 specifies that the CSPName field is not present.
- **rgbFeat.TableFeature.fLoadPldwIdChanged:** 0x0 specifies that the **IdChanged** field is not present.
- rgbFeat.TableFeature.verXL: 0xB specifies the table was created using Microsoft Office Excel 2003.
- rgbFeat.TableFeature.fLoadEntryId: 0x1 specifies the EntryId field is present
- rgbFeat.TableFeature.fLoadPllstclInvalid: 0x0 specifies the CellInvalid field is not present
- rgbFeat.TableFeature.fGoodRupBld: 0x0 specifies the rupBuild field is not valid.
- rgbFeat.TableFeature.fPublished: 0x0 specifies the table was not published.
- **rgbFeat.TableFeature.IPosStmCache:** 0x00000000 specifies the cached data begins at position 0 in the <u>List Data stream</u>.
- **rgbFeat.TableFeature.cbStmCache:** 0x00000000 specifies the size, in bytes, of the cached data within the List Data stream is 0.
- **rgbFeat.TableFeature.cchStmCache:** 0x00000000 specifies the count of characters of the cached data within the List Data stream when uncompressed is 0.
- **rgbFeat.TableFeature.lem:** 0x00000000 specifies the table can be directly edited inline.
- **rgbFeat.TableFeature.rgbHashParam:** The value of this field is required to be zeros because the **It** field is not equal to 0x00000001.
- rgbFeat.TableFeature.rgbName: List1 specifies the unique name of the table.
- rqbFeat.TableFeature.cFieldData: 0x0003 specifies the number of columns in the table.

- **rgbFeat.TableFeature.entryId:** 1 specifies the unique identifier for the table. This is ignored because the **It** field is not equal to 0x00000002.
- **rgbFeat.TableFeature.fieldData:** An array of Feat11FieldDataItem that contains the definition of the columns of the table. The array contains three items as specified by the **cFieldData** field.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0]: Specifies the definition of the first column of the table.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].idField:** 0x00000001 specifies the identifier of the column.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].lfdt:** 0x00000000 specifies that the table column is of the Web-based data provider data type. This value specifies that the field is unused.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].lfxidt: 0x00000000 specifies the table column XML data type. This value specifies the field is unused.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].ilta:** 0x00000000 specifies the aggregation function to use for the column. This value specifies that no formula is used.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].cbFmtAgg: 0x00000000 specifies that the dxfFmtAgg field does not exist.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].istnAgg:** 0xFFFFFFFF specifies the total row of the column uses the default style of the table.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fAutoFilter: 0x1 specifies that this
 column has AutoFilters.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fAutoFilterHidden:** 0x0 specifies that this column has AutoFilters displayed.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fLoadXmapi:** 0x0 specifies the **rgXmap** field is not present.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fLoadFmla:** 0x0 specifies that the **fmla** field is not present.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fLoadTotalFmla: 0x0 specifies that the totalFmla field is not present.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fLoadTotalArray: 0x0 specifies that the formula specified by totalFmla is not an array formula.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fSaveStyleName:** 0x0 specifies that the **dskHdrCache.strStyleName** field is not present.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fLoadTotalStr: 0x0 specifies the
 strTotal field is not present.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].fAutoCreateCalcCol: 0x0 specifies the column does not have a calculated column formula.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].cbFmtInsertRow: 0x00000000 specifies that the dxfFmtInsertRow field does not exist.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].istnInsertRow:** 0xFFFFFFFF specifies the insert row of the column uses the default style of the table.

- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].strFieldName: Specifies the name of the column, as provided by the data source.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].strCaption: Item specifies the caption
 of the column.
- **rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].AutoFilter.cbAutoFilter:** 0x00000000 specifies that the **recAutoFilter** field does not exist.
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[1]: Specifies the definition of the second column of the table. The details of most of the fields within this structure are omitted here because they are the same as the fields in the first column rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].
- rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[2]: Specifies the definition of the third column of the table. The details of most of the fields within this structure are omitted here because they are the same as the fields in the first column rgbFeat.TableFeature.fieldData.Feat11FieldDataItem[0].

3.4 Filters

This example shows how filters are applied to a **range** of **cells** (C4:C8) on a **sheet** when the **AutoFilter** is set to display items that are greater than 70.

The first record in this example is the <u>FilterMode</u> record that appears in a <u>worksheet substream</u> (the worksheet substream is not included in this example for brevity). This record specifies that the data in the containing sheet is filtered.

Other records mentioned in this example are the <u>AutoFilterInfo</u> record and <u>AutoFilter</u> record. They specify the properties of the AutoFilter and define the conditions that are used to filter the data.

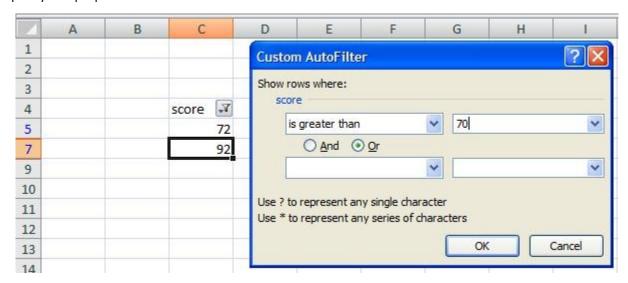

Figure 29: AutoFilter in this example within a sheet

3.4.1 Filters: FilterMode

The first record in this example, FilterMode, specifies that the data in the containing **sheet** is filtered.

Size	Structure
0000	FilterMode - FilterMode

Figure 30: Structure of FilterMode

3.4.2 Filters: AutoFilterInfo

The <u>AutoFilterInfo</u> record specifies the number of columns that have **AutoFilter** enabled and indicates the beginning of the collection of <u>AutoFilter</u> records.

Size	Structure	Value
0002	AutoFilterInfo - AutoFilterInfo	
0002	USHORT - cEntries	0x0001

Figure 31: Structure of AutoFilterInfo

cEntries: 0x0001 specifies the number of filtered columns.

3.4.3 Filters: AutoFilter

Next, the AutoFilter record specifies the criteria that are used to filter the data.

Size	Structure	Value
0018	AutoFilter - AutoFilter	
0002	USHORT - iEntry	0x0000
2 bits	USHORT - wJoin	0x0
1 bit	USHORT - fSimple1	0x0
1 bit	USHORT - fSimple2	0x0
1 bit	USHORT - fTopN	0x0
1 bit	USHORT - fTop	0x0
1 bit	USHORT - fPercent	0x0
9 bits	USHORT - wTopN	0x000
000A	AFDOper - doper1	
0001	BYTE - vt	0x02
0001	BYTE - grbitSign	0x04
0008	AFDOperRk - vtValue	
0004	<u>RkNumber</u> - rk	
1 bit	ULONG - fX100	0x0
1 bit	ULONG - fInt	0x0
30 bits	ULONG - num	0x10146000
0004	DWORD - unused1	0x00000000

Size	Structure	Value
000A	AFDOper - doper2	
0001	BYTE - vt	0x00
0001	BYTE - grbitSign	0x00
0008	BLOB - vtValue	0x000000000000000

Figure 32: Structure of AutoFilter

iEntry: 0x0000 specifies that this **AutoFilter** applies to the first column in this **sheet**.

wJoin: 0x0 specifies that filtering conditions specified in **doper1** and **doper2** conditions are joined by a logical AND operation when applying the AutoFilter.

fSimple1: 0x0 specifies that an application-specific performance optimization cannot be used.

fSimple2: 0x0 specifies that an application-specific performance optimization cannot be used.

fTopN: 0x0 specifies that this AutoFilter is not a **Top N filter**.

fTop: 0x0 is ignored because fTopN is 0.

fPercent: 0x0 is ignored because **fTopN** is 0.

wTopN: 0x000 is ignored because fTopN is 0.

doper1: An AFDOper that specifies the first AutoFilter condition.

doper1.vt: 0x02 specifies that the type of comparison is numeric.

doper1.grbitSign: 0x04 specifies that the comparison operation is GREATER THAN.

doper1.vtValue: An AFDOperRk that specifies a numeric value.

doper1.vtValue.rk: An RkNumber specifies a numeric value.

doper1.vtValue.rk.fX100: 0x0 specifies that the value in the **doper1.vtValue.rk.num** field was not multiplied by 100 when it was saved.

doper1.vtValue.rk.fInt: 0x0 specifies that the value in the **doper1.vtValue.rk.num** field is 30 most significant bits of a 64-bit binary floating-point number.

doper1.vtValue.rk.num: 0x10146000 specifies the 30 most significant bits of a 64-bit binary floating-point number whose remaining bits are 0. That number is 70.

doper2: An AFDOper that specifies the second AutoFilter condition.

doper2.vt: 0x00 specifies that there is no second AutoFilter defined.

doper2.grbitSign: 0x00 specifies that there is no second filter.

3.5 External References

This example shows a workbook where the cell F5 contains an external reference to [Book1.xls]Sheet1!B3. The example workbook and Book1.xls are in the same folder, and the cell contents of Sheet1!B3 in the external workbook contains the string "External Cell". The following figure shows a possible implementation of the external reference discussed in this example:

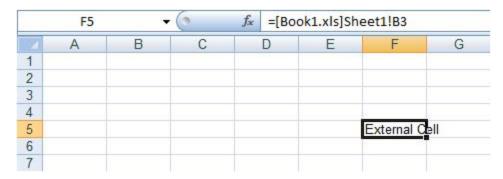

Figure 33: External reference in this example a sheet

3.5.1 External References: Formula

The first record in this example is the <u>Formula</u> record that appears in the <u>global substream</u> (the global substream is not included in this example for brevity). This record specifies the formula for the cell F5. The formula is a reference to a **cell** in an external **worksheet**.

Other records mentioned in this example are <u>String</u>, <u>SupBook</u>, <u>XCT</u>, <u>CRN</u> and <u>ExternSheet</u> records. These records specify the external referenced cell as well as the <u>external cell cache</u> that stores the cached value of the cell.

Size	Structure	Value
001D	Formula - Formula	
0006	Cell - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0004
0002	Col - col	
0002	USHORT - col	0x0005
0002	IXFCell - ixfe	
0002	USHORT - ixfe	0x000F
8000	FormulaValue - val	
0001	BYTE - byte1	0x00
0001	BYTE - byte2	0x00
0001	BYTE - byte3	0xA0
0001	BYTE - byte4	0x00
0001	BYTE - byte5	0x9C
0001	BYTE - byte6	0x01
0002	USHORT - fExprO	0xFFFF
1 bit	USHORT - fAlwaysCalc	0x0
1 bit	USHORT - reserved1	0x0

Size	Structure	Value
1 bit	USHORT - fFill	0x0
1 bit	USHORT - fShrFmla	0x0
1 bit	USHORT - reserved2	0x0
1 bit	USHORT - fClearErrors	0x0
10 bits	USHORT - reserved3	0x000
0004	ULONG - unused	0xFCC412C8
0009	CellParsedFormula - formula	
0002	WORD - cce	0x0007
0007	Rgce - rgce	
0007	Ptg - Ptg[0]	
0007	PtgRef3d - PtgRef3d	
5 bits	BYTE - ptg	0x1A
2 bits	<u>PtqDataType</u> - type	0x2
1 bit	BYTE - reserved	0x0
0002	USHORT - ixti	0x0000
0004	RgceLoc - loc	
0002	<u>RwU</u> - row	
0002	USHORT - rw	0x0002
0002	<u>ColRelU</u> - column	
14 bits	USHORT - col	0x0001
1 bit	USHORT - colRelative	0x1
1 bit	USHORT - rowRelative	0x1

Figure 34: Structure of Formula

cell: Specifies a cell in this **sheet** that contains the external reference. The specified cell is F5.

cell.rw: Specifies the row of this cell in this sheet.

cell.rw.rw: 0x0004 specifies that the row of this cell is row 5.

cell.col: Specifies the column of this cell in this sheet.

cell.col.col: 0x0005 specifies that the column of this cell is column F.

cell.ixfe: Specifies the formatting properties for this cell.

cell.ixfe.ixfe: 0x000F specifies that the cell has the default cell format.

val: Specifies the value to which the formula evaluated. This specifies the value stored in cell F5.

- **val.byte1:** 0x00 specifies that the value to which this formula is evaluated is a string value. The string value is stored in the String record following this record.
- val.fExprO: 0xFFFF specifies that the value to which this formula evaluated is a Boolean value, an error value, a string value, or a blank string value and that val.byte2, val.byte3, val.byte4, val.byte5, and val.byte6 are ignored. val.byte2, val.byte3, val.byte4, val.byte5, and val.byte6 are omitted from this example for brevity.

fAlwaysCalc: 0x0 specifies that this cell value is not to be calculated during the next recalculation.

fFill: 0x0 specifies that this cell has either a **fill alignment** or a **center-across-selection alignment**.

fShrFmla: 0x0 specifies that the formula (section 2.2.2) is not part of a shared formula.

fClearErrors: 0x0 specifies that the formula is not excluded from formula error checking.

formula: Specifies the formula contained in the cell F5 in this sheet.

formula.cce: 0x0007 specifies that the following **formula.rgce** field is 7 bytes.

formula.rgce: Specifies the sequence of Ptgs structures. The sequence of Ptgs specify the formula.

formula.rgce.Ptg[0]: The first and only Ptg structure in the sequence. Specifies that there is only one element in the formula.

formula.rgce.Ptg[0].PtgRef3d: Specifies the PtgRef3d structure. Specifies that the formula is a reference to a single cell in a sheet.

formula.rgce.Ptg[0].PtgRef3d.ptg: 0x1A specifies that this Ptg is a PtgRef3d structure.

formula.rgce.Ptg[0].PtgRef3d.type: 0x2 specifies that the PtgRef3d data type is a single value.

- **formula.rgce.Ptg[0].PtgRef3d.ixti:** 0x0000 specifies the first XTI structure of the **rgXTI** array in the ExternSheet record. The first XTI of the **rgXTI** array specifies the Supbook record that specifies the target sheet that contains the referenced cell. This Supbook record is the third record in this example. The ExternSheet record is the seventh record in this example.
- **formula.rgce.Ptg[0].PtgRef3d.loc:** Specifies the coordinates of the referenced cell. This field is a RgceLoc value because PtgRef3d is not part of a NameParsedFormula structure.

formula.rgce.Ptg[0].PtgRef3d.loc.row: Specifies the row of the referenced cell.

formula.rgce.Ptg[0].PtgRef3d.loc.row.rw: 0x0002 specifies that the row of the referenced cell is row 3.

formula.rgce.Ptg[0].PtgRef3d.loc.column: Specifies the column of the referenced cell.

- **formula.rgce.Ptg[0].PtgRef3d.loc.column.col:** 0x0001 specifies that the column of the referenced cell is column B.
- **formula.rgce.Ptg[0].PtgRef3d.loc.column.colRelative:** 0x1 specifies that the column is a **relative reference**.
- **formula.rgce.Ptg[0].PtgRef3d.loc.column.rowRelative:** 0x1 specifies that the row is a relative reference.

3.5.2 External References: String

The next record in this example, <u>String</u>, specifies the Unicode string value to which the formula evaluated.

Size	Structure	Value
0010	String - String	
0010	XLUnicodeString - string	External Cell

Figure 35: Structure of String

string: External Cell is the Unicode string value.

3.5.3 External References: SupBook 1

The next record in this example, <u>Supbook</u>, specifies an external workbook referencing <u>supporting link</u> and specifies the beginning of a collection of records that specifies the referenced cell (B3) in the <u>External Workbook</u> (*Book1.xls*). This record is the first SupBook record in the <u>global substream</u>.

The **workbook** of the referenced cell (*Book1.xls*) is specified in the Supbook record. The **sheet** of the referenced cell (*Sheet1*) is specified in the <u>XCT</u> record following this record. The referenced cell (B3) is specified in the <u>CRN</u> record following the XCT record.

Size	Structure	Value
002A	SupBook - SupBook	
0002	USHORT - ctab	0x0003
0002	USHORT - cch	0x000A
000B	XLUnicodeStringNoCch - virtPath	Book1.xls
001B	XLUnicodeString - rgst	
0009	XLUnicodeString - rgst[0]	Sheet1
0009	XLUnicodeString - rgst[1]	Sheet2
0009	XLUnicodeString - rgst[2]	Sheet3

Figure 36: Structure of SupBook

ctab: 0x0003 specifies that there are three sheets in the referenced workbook.

cch: 0x000A specifies that there are 10 characters in **virtPath**.

virtPath: Book1.xls specifies the encoded path of the referenced workbook. The length of the string is 10 characters, but the first character is an unprintable Unicode character with a value of 0x01.

rgst: Specifies an array of three sheets contained within the referenced workbook.

rgst.rgst[0]: Sheet1 specifies the name of the first sheet in the referenced workbook.

rgst.rgst[1]: Sheet2 specifies the name of the second sheet in the referenced workbook.

rgst.rgst[2]: Sheet3 specifies the name of the third sheet in the referenced workbook.

3.5.4 External References: XCT

The next record in this example, <u>XCT</u>, specifies the beginning of an <u>external cell cache</u> and specifies the beginning of a collection of <u>CRN</u> records. The collection of <u>CRN</u> records specifies the value of the **cell** (B3) in a **sheet** (*Sheet1*) in the external cell cache.

Size	Structure	Value
0004	XCT - Xct	
0002	SHORT - ccrn	0x0001
0002	USHORT - itab	0x0000

Figure 37: Structure of Xct

ccrn: 0x0001 specifies that there is one CRN record immediately following this record.

itab: 0x0000 specifies the first element in the **rgst** field of the <u>SupBook</u> that specifies that the referenced cell is in the *Sheet1* sheet.

3.5.5 External References: CRN

The next record in this example, <u>CRN</u>, specifies the value of the referenced <u>cell</u> in the <u>external cell</u> <u>cache</u>.

Size	Structure	Value
0015	CRN - Crn	
0001	ColByteU - colLast	
0001	BYTE - col	0x01
0001	ColByteU - colFirst	
0001	BYTE - col	0x01
0002	RwU - row	
0002	USHORT - rw	0x0002
0011	CRNOper - crnOper	
0011	SerAr - crnOper[0]	
0001	BYTE - reserved	0x02
0010	<u>SerStr</u> - string	External Cell

Figure 38: Structure of Crn

colLast: Specifies the column of the last cell that has a value in the external cell cache.

colLast.col: 0x01 specifies that the column of the last cell is column B.

colFirst: Specifies the column of the first cell that has a value in the external cell cache.

colFirst.col: 0x01 specifies that the column of the first cell is column B.

row: Specifies the row index of the cell that has a value in the external cell cache.

row.rw: 0x0002 specifies that the row of the cell is row 3.

crnOper: Specifies an array of cell values in the range specified by colLast, colFirst and row, which is B3.

13 05.

crnOper.crnOper[0].string: External Cell specifies the text referenced in cell B3.

3.5.6 External References: SupBook 2

The next record in this example, <u>SupBook</u>, specifies a self-referencing <u>supporting link</u>. The self-referencing supporting link is used when a cell in this **workbook** refers to a cell in a different **sheet** in the same workbook. In this example this record is not used. This is the second SupBook record in the <u>global substream</u>.

Size	Structure	Value
0004	SupBook - SupBook	
0002	USHORT - ctab	0x0003
0002	USHORT - cch	0x0401

Figure 39: Structure of SupBook

The **VirtPath** field and **rgst** field of this record are similar to the corresponding fields of the third record (SupBook) in this example and are omitted for brevity.

ctab: 0x0003 specifies that there are three sheets in the referenced workbook.

cch: 0x0401 specifies that this is self-referencing supporting link.

3.5.7 External References: ExternSheet

The next record in this example, <u>ExternSheet</u>, specifies a collection of <u>XTI</u> records that specify the supporting link information.

Size	Structure	Value
000E	ExternSheet - ExtSheet	
0002	USHORT - cXTI	0x0002
000C	XTI - rgXTI	
0006	XTI - xti[0]	
0002	USHORT - iSupBook	0x0000
0002	SHORT - itabFirst	0x0000
0002	SHORT - itabLast	0x0000
0006	XTI - xti[1]	
0002	USHORT - iSupBook	0x0001
0002	SHORT - itabFirst	0x0000
0002	SHORT - itabLast	0x0000

Figure 40: Structure of ExtSheet

cXTI: 0x0002 specifies that there are two elements in the **rgXTI** array.

rgXTI: An array of XTI elements. The number of elements in the array is specified by the cXTI field.

rgXTI.xti[0]: This is the first XTI element in the array.

- **rgXTI.xti[0].iSupBook:** 0x0000 specifies the reference to the first <u>SupBook</u> record in the <u>global</u> <u>substream</u>.
- **rgXTI.xti[0].itabFirst:** 0x0000 specifies that the supporting link has a sheet-level scope and specifies the first sheet, within the referenced **workbook**, that is in scope. The first sheet in scope is *Sheet1*.
- **rgXTI.xti[0].itabLast:** 0x0000 specifies that the supporting link has a sheet-level scope and specifies the last sheet, within the referenced workbook, that is in scope. The last sheet in scope is *Sheet1*.
- rgXTI.xti[1]: This is the second XTI element in the array. (The details of the referenced XTI record
 are omitted for brevity.)
- **rgXTI.xti[1].iSupBook:** 0x0001 specifies the reference to the second SupBook record in the global substream.

3.6 Column Chart Object

This example shows a column chart object on a **sheet**. The set of records that specify the column chart exist in the <u>chart sheet substream</u> of the file (the chart sheet substream is not included in this example for brevity). The column chart specified in this example has a single series with three control points. The following figure shows a possible implementation of the column chart discussed in this example:

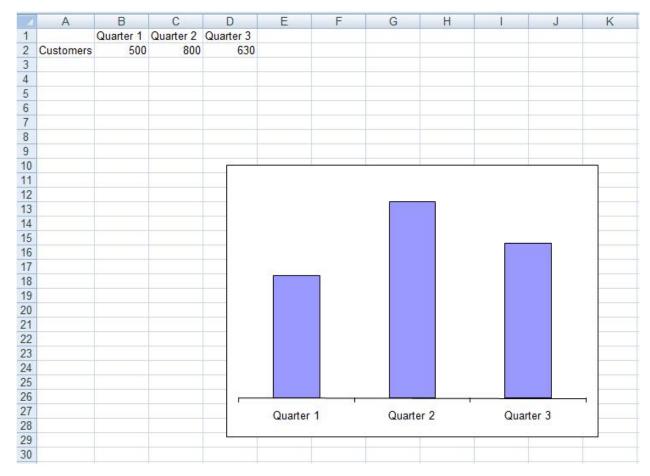

Figure 41: Column chart in this example within a sheet

3.6.1 Column Chart Object: Chart

The first record in this example is the <u>Chart</u> record. This record specifies the position and dimensions of the **chart area** (section 2.2.3.17). The position of the chart area is automatically calculated by the application and the dimension of the chart is specified by the **dx** and **dy** fields.

Size	Structure	Value
0010	Chart - Chart	
0004	FixedPoint - x	0x00000000
0004	FixedPoint - y	0x00000000
0004	FixedPoint - dx	0x01493FD0
0004	FixedPoint - dy	0x00F0C000

Figure 42: Structure of Chart

- **x:** The value of this field is ignored because the **fAutoPosition** field of the **Frame** record that follows this record equals 1.
- **y:** The value of this field is ignored because the **fAutoPosition** field of the **Frame** record that follows this record equals 1.
- **dx:** 0x01493FD0 specifies the width of the chart in **points**. This field is a fixed point and the width is calculated using the following formula:

```
width of chart = 0149 + (3FD0 / 65536.0) = 329 + (16336 / 65536)
```

dy: 0x00F0C000 specifies the height of the chart in points. This field is a fixed point and the height is calculated using the following formula:

```
height of chart = 00F0 + (C000 / 65536.0) = 240 + (49152 / 65536)
```

The next record in this example, <u>Begin</u>, specifies the beginning of a collection of records that specifies the chart area (section 2.2.3.17) of the <u>chart</u>.

The next record in this example, <u>Scl</u>, specifies the **zoom level** of the current view in the window used to display the **sheet**. The zoom level of the current view is equal to 1.

The next record in this example, <u>PlotGrowth</u>, specifies the scale factors for **font scaling** in the **plot area**.

(The details of the Begin record, the Scl record, and the PlotGrowth record are omitted from the example for brevity.)

3.6.2 Column Chart Object: Frame

The next record in this example, <u>Frame</u>, specifies the type, size, and position of the frame around the column chart. The size of the frame is stored in the <u>Chart</u> record and the position of the frame is automatically calculated by the application.

Size	Structure	Value
0004	Frame - Frame	
0002	USHORT - frt	0x0000
1 bit	USHORT - fAutoSize	0x0

Size	Structure	Value
1 bit	USHORT - fAutoPosition	0x1
14 bits	USHORT - reserved	0x0000

Figure 43: Structure of Frame

frt: 0x0000 specifies that the frame surrounding the chart element does not have a shadow.

fAutoSize: 0x0000 specifies that the size of the frame is not automatically calculated. The width (**dx** field) and height (**dy** field) of the Chart record are used as the size of the frame.

fAutoPosition: 0x0001 specifies that the position of the frame is automatically calculated by the application and the **x** and **y** fields of the Chart record are ignored.

3.6.3 Column Chart Object: LineFormat

The next record in this example, <u>LineFormat</u>, specifies the appearance of the lines of the frame.

Size	Structure	Value
000C	LineFormat - LineFormat	
0004	LongRGB - rgb	
0001	BYTE - red	0x00
0001	BYTE - green	0x00
0001	BYTE - blue	0x00
0001	BYTE - reserved	0x00
0002	USHORT - Ins	0x0000
0002	SHORT - we	0x0000
1 bit	USHORT - fAuto	0x1
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fAxisOn	0x0
1 bit	USHORT - fAutoCo	0x1
12 bits	USHORT - reserved2	0x000
0002	<u>IcvChart</u> - icv	
0002	USHORT - icv	0x004D

Figure 44: Structure of LineFormat

(Fields in this record that are ignored because **fAuto** is 0x1 are omitted for brevity.)

fAuto: 0x1 specifies that the contents of the **Ins**, **we**, **icv**, and **rgb** field are ignored and the defaults specified in the following table are used instead:

Attribute	Default Value
Line pattern (Ins)	0xFFFF (Hairline)
Line weight (we)	0x0000 (Narrow)

Attribute	Default Value
Line color (icv)	0x004D
Line color (rgb)	0x004D

fAxisOn: 0x0000 specifies this field is ignored because the previous record is not an <u>AxisLine</u> record with an **id** field equal to 0X0000, specifying the frame does not have any <u>axis</u> lines.

3.6.4 Column Chart Object: AreaFormat

The next record in this example, <u>AreaFormat</u>, specifies the patterns and colors used in the filled area of the column chart.

Size	Structure	Value
0010	AreaFormat - AreaFormat	
0004	<u>LongRGB</u> - rgbFore	
0001	BYTE - red	0xFF
0001	BYTE - green	0xFF
0001	BYTE - blue	0xFF
0001	BYTE - reserved	0x00
0004	LongRGB - rgbBack	
0001	BYTE - red	0x00
0001	BYTE - green	0x00
0001	BYTE - blue	0x00
0001	BYTE - reserved	0x00
0002	SHORT - fls	0x0001
1 bit	WORD - fAuto	0x1
1 bit	WORD - fInvertNeg	0x0
14 bits	WORD - reserved	0x0000
0002	<u>IcvChart</u> - icvFore	
0002	USHORT - icv	0x004E
0002	IcvChart - icvBack	
0002	USHORT - icv	0x004D

Figure 45: Structure of AreaFormat

(Fields in this record that are ignored because **fAuto** is 0x1 are omitted for brevity.)

fls: 0x0001 specifies that the fill pattern is solid.

fAuto: 0x1 specifies that the fill colors are automatically set by the application.

The next record in this example, <u>End</u>, specifies the end of a collection of records that specifies the **chart area** (section <u>2.2.3.17</u>) of the <u>chart</u>. The details of End record are omitted from the example for brevity.

3.6.5 Column Chart Object: Series

The next record in this example, <u>Series</u>, specifies a Series of this chart, the type of data it contains and the number of data fields that make up this series. The series of this column chart contains three textual **categories** (2) and three numerical values. In this example the series of this column chart is specified by the first Series record in the collection of Series records in the current <u>chart sheet substream</u>.

Size	Structure	Value
000C	Series - Series	
0002	USHORT - sdtX	0x0003
0002	USHORT - sdtY	0x0001
0002	USHORT - cValx	0x0003
0002	USHORT - cValy	0x0003
0002	USHORT - sdtBSize	0x0001
0002	USHORT - cValBSize	0x0000

Figure 46: Structure of Series

Fields in this record that are ignored because this <u>chart group</u> is not of the type bubble chart group, are omitted for brevity.

sdtX: 0x0003 specifies that the categories (2) contain text information.

sdtY: 0x0001 specifies that the values contain numeric information.

cValx: 0x0003 specifies that the count of categories (2) is 3.

cValy: 0x0003 specifies that the count of values is 3.

Records following this record, and before the next BRAI record, are omitted for brevity.

3.6.6 Column Chart Object: BRAI 1

The next record in this example, <u>BRAI</u>, specifies a reference to **cells** in a **sheet** that have values that specify the name of the series.

Size	Structure	Value
000F	BRAI - BRAI	
0001	BYTE - id	0x00
0001	BYTE - rt	0x02
1 bit	USHORT - fUnlinkedIfmt	0x0
15 bits	USHORT - reserved	0x0000
0002	IFmt - ifmt	0x0000

Size	Structure	Value
0009	<u>ChartParsedFormula</u> - formula	
0002	WORD - cce	0x0007
0007	Rgce - rgce	
0007	<u>Ptg</u> - Ptg [0]	
0007	PtgRef3d - PtgRef3d	
5 bits	BYTE - ptg	0x1A
2 bits	<u>PtgDataType</u> - type	0x1
1 bit	BYTE - reserved	0x0
0002	USHORT - ixti	0x0000
0004	RgceLoc - loc	
0002	<u>RwU</u> - row	
0002	USHORT - rw	0x0001
0002	<u>ColRelU</u> - column	
14 bits	USHORT - col	0x0000
1 bit	USHORT - colRelative	0x0
1 bit	USHORT - rowRelative	0x0

Figure 47: Structure of BRAI

id: 0x00 specifies that the values of the referenced cells specify the name of the series.

rt: 0x02 specifies that the **data source** is values from a range of cells in a sheet specified by the **rgce** field.

fUnlinkedIfmt: 0x0 specifies that the series name maintains the number formatting of the referenced data.

ifmt: 0x0000 specifies that the **number format** for the name of the series is automatically determined by the application.

formula.cce: 0x0007 specifies that the length of **rgce** is 7 bytes.

formula.rgce.Ptg[0].PtgRef3d: This operand specifies a reference to a specific cell on one or more sheets.

formula.rgce.Ptg[0].PtgRef3d.ptg: 0x1A specifies that this Ptg is of type PtgRef3d.

formula.rgce.Ptg[0].PtgRef3d.type: 0x1 specifies that the value of the **ptg** field is a reference to a **range**.

formula.rgce.Ptg[0].PtgRef3d.ixti: 0x0000 specifies that the name of the series is found on the sheets referenced by the first <u>XTI</u> in the <u>ExternSheet</u> record.

formula.rgce.Ptg[0].PtgRef3d.loc: Specifies that the coordinates of the referenced cell for the name of the series refers to cell A2.

formula.rgce.Ptg[0].PtgRef3d.loc.row.rw: 0x0001 specifies that the referenced cell is in row two.

formula.rgce.Ptg[0].PtgRef3d.loc.column.col: 0x0000 specifies that the referenced cell is in column A.

formula.rgce.Ptg[0].PtgRef3d.loc.column.colRelative: 0x0 specifies that the **col** field is an **absolute reference**.

formula.rgce.Ptg[0].PtgRef3d.loc.column.rowRelative: 0x0 specifies that the **rw** field is an absolute reference.

3.6.7 Column Chart Object: SeriesText

The next record in this example, <u>SeriesText</u>, specifies the name of this <u>Series</u>. The name of this Series is *Customers*.

Size	Structure	Value
0016	SeriesText - SeriesText	
0002	USHORT - reserved	0x0000
0014	ShortXLUnicodeString - stText	Customers

Figure 48: Structure of SeriesText

stText: Customers specifies name of the series.

3.6.8 Column Chart Object: BRAI 2

The next record in this example, <u>BRAI</u>, specifies a reference to data in a **sheet** that specifies the values of this series. The values for this series are stored in the range B2:D2.

Size	Structure	Value
0013	BRAI - BRAI	
0001	BYTE - id	0x01
0001	BYTE - rt	0x02
1 bit	USHORT - fUnlinkedIfmt	0x0
15 bits	USHORT - reserved	0x0000
0002	IFmt - ifmt	0x0000
000D	<u>ChartParsedFormula</u> - formula	
0002	WORD - cce	0x000B
000B	Rgce - rgce	
000B	Ptg - Ptg[0]	
000B	<u>PtgArea3d</u> - PtgArea3d	
5 bits	BYTE - ptg	0x1B
2 bits	PtgDataType - type	0x1

Size	Structure	Value
1 bit	BYTE - reserved	0x0
0002	USHORT - ixti	0x0000
0008	RgceArea - area	
0002	RwU - rowFirst	
0002	USHORT - rw	0x0001
0002	RwU - rowLast	
0002	USHORT - rw	0x0001
0002	ColReIU - columnFirst	
14 bits	USHORT - col	0x0001
1 bit	USHORT - colRelative	0x0
1 bit	USHORT - rowRelative	0x0
0002	ColReIU - columnLast	
14 bits	USHORT - col	0x0003
1 bit	USHORT - colRelative	0x0
1 bit	USHORT - rowRelative	0x0

Figure 49: Structure of BRAI

id: 0x01 specifies that the referenced data specifies the values of the series.

rt: 0x02 specifies that the **data source** is values from a range of cells in a sheet specified by the **rgce** field.

fUnlinkedIfmt: 0x0 specifies that the series maintains the number formatting of the referenced data.

ifmt: 0x0000 specifies that the **number format** for the values of the series is automatically determined by the application.

formula.cce: 0x000B specifies that the length of the **rgce** field is 11 bytes.

formula.rgce.Ptg[0].PtgArea3d: This operand specifies a reference to the rectangular range of cells on the sheet.

formula.rgce.Ptg[0].PtgArea3d.ptg: 0x1B specifies that this Ptg structure is of type PtgArea3d.

formula.rgce.Ptg[0].PtgArea3d.type: 0x01 specifies that the value of the **ptg** field is a reference to a range.

formula.rgce.Ptg[0].PtgArea3d.ixti: 0x0000 specifies the values of the series are found on the sheet referenced by the first XTI structure in the <u>ExternSheet</u> record.

formula.rgce.Ptg[0].PtgArea3d.area: Specifies that the coordinates of the referenced rectangular range of cells for values of the series are in the range B2:D2.

formula.rgce.Ptg[0].PtgArea3d.area.rowFirst.rw: 0x0001 specifies that row two of the sheet is the first row of the rectangular range of cells.

formula.rgce.Ptg[0].PtgArea3d.area.rowLast.rw: 0x0001 specifies that row two of the sheet is the last row of the rectangular range of cells.

formula.rgce.Ptg[0].PtgArea3d.area.columnFirst.col: 0x0001 specifies that column B of the sheet is the first column of the rectangular range of cells. The details of this ColRelU are not included in this example for brevity.

formula.rgce.Ptg[0].PtgArea3d.area.columnLast.col: 0x0003 specifies that column D of the sheet is the last column of the rectangular range of cells. The details of this ColRelU are not included in this example for brevity.

3.6.9 Column Chart Object: BRAI 3

The next record in this example, <u>BRAI</u>, specifies a reference to data in a **sheet** that specifies the **category (2)** names of this series. The category (2) names are stored in the range B1:D1.

Size	Structure	Value
0013	BRAI - BRAI	
0001	BYTE - id	0x02
0001	BYTE - rt	0x02
0002	USHORT - fUnlinkedIfmt	0x0000
0002	USHORT - reserved	0x0000
0002	IFmt - ifmt	0x0000
000D	<u>ChartParsedFormula</u> - formula	
0002	WORD - cce	0x000B
000B	Rgce - rgce	
000B	Ptg - Ptg[0]	
000B	PtgArea3d - PtgArea3d	
0001	BYTE - ptg	0x1B
0001	<u>PtgDataType</u> - type	0x01
0001	BYTE - reserved	0x00
0002	USHORT - ixti	0x0000
0008	RgceArea - area	
0002	<u>RwU</u> - rowFirst	
0002	USHORT - rw	0x0000
0002	RwU - rowLast	
0002	USHORT - rw	0x0000
0002	ColReIU - columnFirst	
14 bits	USHORT - col	0x0001

Size	Structure	Value
1 bit	USHORT - colRelative	0x0
1 bit	USHORT - rowRelative	0x0
0002	ColReIU - columnLast	
14 bits	USHORT - col	0x0003
1 bit	USHORT - colRelative	0x0
1 bit	USHORT - rowRelative	0x0

Figure 50: Structure of BRAI

id: 0x02 specifies that the referenced data specifies the category (2) name of the series.

rt: 0x02 specifies that the **data source** is values from a range of cells in a sheet specified by the **rgce** field.

fUnlinkedIfmt: 0x0000 specifies that the series maintains the number formatting of the referenced data.

ifmt: 0x0000 specifies that the **number format** for the category (2) names of the series is automatically determined by the application.

formula.cce: 0x000B specifies that the length of the **rgce** field is 11 bytes.

formula.rgce.Ptg[0].PtgArea3d: This operand specifies a reference to the rectangular range of cells on the sheet.

formula.rgce.Ptg[0].PtgArea3d.ptg: 0x1B specifies that this Ptg structure is of type PtgArea3d.

formula.rgce.Ptg[0].PtgArea3d.type: 0x01 specifies that the data type for the value of the **ptg** field is a reference to a range.

formula.rgce.Ptg[0].PtgArea3d.ixti: 0x0000 specifies that the name of the category (2) is found on the sheet referenced by the first <u>XTI</u> structure in the <u>ExternSheet</u> record.

formula.rgce.Ptg[0].PtgArea3d.area: Specifies that the coordinates of the referenced rectangular range of cells for the names of categories (2) are in the range B1:D1.

formula.rgce.Ptg[0].PtgArea3d.area.rowFirst.rw: 0x0000 specifies that the first row of the sheet is the first row of the rectangular range of cells.

formula.rgce.Ptg[0].PtgArea3d.area.rowLast.rw: 0x0000 specifies that the first row of the sheet is the last row of the rectangular range of cells.

formula.rgce.Ptg[0].PtgArea3d.area.columnFirst.col: 0x0001 specifies that the second column of the sheet is the first column of the rectangular range of cells. The details of this ColRelU structure are not included in this example for brevity.

formula.rgce.Ptg[0].PtgArea3d.area.columnLast.col: 0x0003 specifies that the fourth column of the sheet is the last column of the rectangular range of cells. The details of this ColRelU are not included in this example for brevity.

(Records following this record, and before the next <u>DataFormat</u> record, are omitted for brevity.)

3.6.10 Column Chart Object: DataFormat

The next record in this example, <u>DataFormat</u>, specifies the series of this chart to which the formatting information applies. The formatting information is specified by the <u>Lineformat</u> record and <u>AreaFormat</u> record following this record. (The Lineformat and AreaFormat records are not included in this example for brevity.)

Size	Structure	Value
0008	DataFormat - DataFormat	
0002	USHORT - xi	0xFFFF
0002	USHORT - yi	0x0000
0002	SHORT - iss	0x0000
15 bits	SHORT - reserved	0x0000

Figure 51: Structure of DataFormat

xi: 0xFFFF specifies that the LineFormat record and AreaFormat record following this record specify the format of the series.

yi: 0x0000 specifies that the series of this chart is specified by the first <u>Series</u> record in the collection of Series records in the current <u>chart sheet substream</u>.

iss: 0x0000 specifies the number of the series based on the ordering in the legend, which is zero.

The next two records in this example, LineFormat and AreaFormat, specify the formatting information for the series. (The LineFormat record and AreaFormat record are similar to the LineFormat record and AreaFormat record defined earlier in the example and are omitted for brevity.)

3.6.11 Column Chart Object: SerToCrt

The next record in this example, <u>SerToCrt</u>, specifies the chart that contains the series specified in this example. The <u>ChartFormat</u> record that specifies this chart is the first ChartFormat record in the <u>chart sheet subsream</u>.

Size	Structure	Value
0002	SerToCrt - SerToCrt	
0002	USHORT - id	0x0000

Figure 52: Structure of SerToCrt

id: 0x0000 specifies that the chart that contains the series in this example is specified by the first ChartFormat record in the collection of ChartFormat records in the current chart sheet substream.

(Records following this record, and before the next ShtProps record, are omitted for brevity.)

3.6.12 Column Chart Object: ShtProps

The next record in this example, ShtProps, specifies the properties of this chart.

Size	Structure	Value
0004	ShtProps - ShtProps	

Size	Structure	Value
1 bit	USHORT - fManSerAlloc	0x0
1 bit	USHORT - fPlotVisOnly	0x1
1 bit	USHORT - fNotSizeWith	0x0
1 bit	USHORT - fManPlotArea	0x1
1 bit	USHORT - fAlwaysAutoPlotArea	0x0
11 bits	USHORT - reserved1	0x000
0001	BYTE - mdBlank	0x00
0001	BYTE - reserved2	0x00

Figure 53: Structure of ShtProps

fManSerAlloc: 0x0 specifies that the series is not automatically allocated for this chart.

fPlotVisOnly: 0x1 specifies to plot only **visible** cells on this chart.

fNotSizeWith: 0x0 specifies not to size this chart with the window.

fAlwaysAutoPlotArea: 0x0 specifies that the default plot area dimension is used for this chart.

mdBlank: 0x00 specifies that empty cells are not plotted on this chart.

3.6.13 Column Chart Object: DefaultText

The next record in this example, <u>DefaultText</u>, specifies the text elements that are formatted using the information specified in the <u>Text</u> record that follows this record.

Size	Structure	Value
0002	DefaultText - DefaultText	
0002	USHORT - id	0x0002

Figure 54: Structure of DefaultText

id: 0x0002 specifies that the default formatting of all text in the chart that does not use scalable fonts is to be set by the Text record following this record.

3.6.14 Column Chart Object: Text

The next record in this example, <u>Text</u>, specifies the position and appearance of text fields specified in the preceding <u>DefaultText</u> record.

Size	Structure	Value
0020	Text - Text	
0001	BYTE - at	0x02
0001	BYTE - vat	0x02
0002	WORD - wBkgMode	0x0001

Size	Structure	Value
0004	LongRGB - rgbText	
0001	BYTE - red	0x00
0001	BYTE - green	0x00
0001	BYTE - blue	0x00
0001	BYTE - reserved	0x00
0004	LONG - x	0xFFFFFD1
0004	LONG - y	0xFFFFFC0
0004	LONG - dx	0x0000000
0004	LONG - dy	0x0000000
1 bit	USHORT - fAutoColor	0x1
1 bit	USHORT - fShowKey	0x0
1 bit	USHORT - fShowValue	0x0
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fAutoText	0x1
1 bit	USHORT - fGenerated	0x1
1 bit	USHORT - fDeleted	0x0
1 bit	USHORT - fAutoMode	0x1
3 bits	USHORT - unused2	0x0
1 bit	USHORT - fShowLabelAndPerc	0x0
1 bit	USHORT - fShowPercent	0x0
1 bit	USHORT - fShowBubbleSizes	0x0
1 bit	USHORT - fShowLabel	0x0
1 bit	USHORT - reserved	0x0
0002	<u>Icv</u> - icvText	
0002	USHORT - icv	0x004D
4 bits	USHORT - dlp	0x0
10 bits	USHORT - unused3	0x317
2 bits	USHORT - iReadingOrder	0x0
0002	USHORT - trot	0x0000

Figure 55: Structure of Text

The position and size specified by the **x** field, **y** field, **dx** field, and **dy** field is ignored because this record is followed by a <u>Pos</u> record. The **fShowLabelAndPerc** field, **fShowPercent** field, **fShowBubbleSizes** field, **fShowLabel** field, and **dlp** field are ignored because this is a column chart.

at: 0x02 specifies that the horizontal alignment of the text is center-alignment.

vat: 0x02 specifies that the vertical alignment of the text is center-alignment.

wBkgMode: 0x0001 specifies that the background of the text is transparent.

rgbText: Specifies the color of the text.

fAutoColor: 0x0001 specifies that the foreground color is determined automatically.

fAutoText: 0x0001 specifies that the text value of the text field is automatically generated and has

not been changed.

fGenerated: 0x0001 specifies that the properties of the text field are automatically generated and

was not changed.

fAutoMode: 0x0001 specifies that the background color is determined automatically.

icvText: Specifies a color in the color table.

icvText.icv: 0x004D specifies that the default chart foreground color is used.

iReadingOrder: 0x0000 specifies that the reading order is based on the context.

trot: 0x0000 specifies that the text is not rotated.

(Records following this record, and before the next FontX record, are omitted for brevity.)

3.6.15 Column Chart Object: FontX

The next record in this example, FontX, specifies the font used for text of this chart.

Size	Structure	Value
0002	FontX - FontX	
0002	USHORT - iFont	0x0005

Figure 56: Structure of FontX

iFont: 0x0005 specifies that the referenced font is the fifth Font record in the chart sheet substream.

(Records following this record, and before the next AxesUsed record, are omitted for brevity.)

3.6.16 Column Chart Object: AxesUsed

The next record in this example, <u>AxesUsed</u>, specifies the number of <u>axis groups</u> on the <u>chart</u>.

Size	Structure	Value
0002	AxesUsed - AxesUsed	
0002	USHORT - cAxes	0x0001

Figure 57: Structure of AxesUsed

cAxes: 0x0001 specifies that this chart contains a single primary axis group.

3.6.17 Column Chart Object: AxisParent

The next record in this example, <u>AxisParent</u>, specifies the properties of an <u>axis group</u> and specifies the beginning of a collection of records as defined by the <u>chart sheet substream</u> that specifies an Axis Group.

Size	Structure	Value
0012	AxisParent - AxisParent	
0002	SHORT - iax	0x0000
0010	Unused - unused	5D 00 00 00 81 00 00 00 E6 0E 00 00 10 0D 00 00

Figure 58: Structure of AxisParent

iax: 0x0000 specifies that the Axis Group specified by the records following this record is primary.

Records following this record, and before the next Axis record, are omitted for brevity.

3.6.18 Column Chart Object: Axis

The next record in this example, Axis, specifies properties of an axis and specifies the beginning of a collection of records as defined by the chart sheet substream that specifies the category (2) axis.

Size	Structure	Value
0012	Axis - Axis	
0002	WORD - wType	0x0000
0004	ULONG - reserved1	0x00000000
0004	ULONG - reserved2	0x00000000
0004	ULONG - reserved3	0x00000000
0004	ULONG - reserved4	0x00000000

Figure 59: Structure of Axis

wType: 0x0000 specifies that the axis type is category (2) axis.

(Records following this record, and before the next <u>CatSerRange</u> record, are omitted for brevity.)

3.6.19 Column Chart Object: CatSerRange

The next record in this example, CatSerRange, specifies the properties of the category (2) axis.

Size	Structure	Value
0008	CatSerRange - CatSerRange	
0002	SHORT - catCross	0x0001
0002	SHORT - catLabel	0x0001
0002	SHORT - catMark	0x0001
1 bit	USHORT - fBetween	0x1

Size	Structure	Value
1 bit	USHORT - fMaxCross	0x0
1 bit	USHORT - fReverse	0x0
13 bits	USHORT - reserved	0x0000

Figure 60: Structure of CatSerRange

catCross: 0x0001 specifies the category (2) axis is crossed by the value axis at the first category (2).

catLabel: 0x0001 specifies that the number of categories (2) between major tick mark labels is 1.

catMark: 0x0001 specifies that the number of categories (2) between major tick marks is 1.

fBetween: 0x0001 specifies that the value axis crosses the category (2) axis between two major tick marks.

fMaxCross: 0x0000 specifies that the value axis crosses the category (2) axis at the category specified by the **catCross** field.

fReverse: 0x0000 specifies that categories (2) are displayed in order.

3.6.20 Column Chart Object: Tick

The next record in this example, <u>Tick</u>, specifies the properties of the **major tick marks** and **minor tick marks** associated with the **category (2)** <u>axis</u>.

Size	Structure	Value
001E	Tick - Tick	
0001	BYTE - tktMajor	0x02
0001	BYTE - tktMinor	0x00
0001	BYTE - tlt	0x03
0001	BYTE - wBkgMode	0x01
0004	LongRGB - rgb	
0001	BYTE - red	0x00
0001	BYTE - green	0x00
0001	BYTE - blue	0x00
0001	BYTE - reserved	0x00
0004	LONG - reserved1	0x00000000
0004	LONG - reserved2	0x00000000
0004	LONG - reserved3	0x00000000
0004	LONG - reserved4	0x00000000
1 bit	USHORT - fAutoCo	0x1
1 bit	USHORT - fAutoMode	0x1

Size	Structure	Value
3 bits	USHORT - rot	0x0
1 bit	USHORT - fAutoRot	0x1
8 bits	USHORT - unused	0x00
2 bits	USHORT - iReadingOrder	0x0
0002	<u>IcvChart</u> - icv	
0002	USHORT - icv	0x004D
0002	SHORT - trot	0x0000

Figure 61: Structure of Tick

The **rgb** field is ignored because the **fAUtoCo** field is equal to 0x0001. The **wBkgMode** field is ignored because the **fAutoMode** field is equal to 0x0001. The **rot** field is ignored because the **fAutoRot** field is equal to 0x0001.

tktMajor: 0x02 specifies that the location of the major tick marks is outside, which indicates that the major tick marks are drawn away from the **plot area**.

tktMinor: 0x00 specifies that no minor tick marks are present on the axis.

tlt: 0x03 specifies to place axis labels next to the axis.

fAutoCo: 0x0001 specifies that the text uses an automatically selected foreground color, based on the display settings of the computer.

fAutoMode: 0x0001 specifies that the background mode is set according to the <u>DefaultText</u> settings of the chart

fAutoRot: 0x0001 specifies that the text rotation of axis labels is determined automatically.

iReadingOrder: 0x0000 specifies that the **reading order** of the axis label is determined by the application.

icv.icv: 0x004D specifies that the foreground color is the default chart foreground color. This is the window text color in the chart display.

trot: 0x0000 specifies that the axis label is not rotated.

(Records following this record, and before the next <u>ChartFormat</u> record, are omitted for brevity.) The collection of records includes a collection of record beginning with the <u>Axis</u> record that specifies the value axis for this chart.

3.6.21 Column Chart Object: ChartFormat

The next record in this example, <u>ChartFormat</u>, specifies properties of this <u>chart group</u> and specifies the beginning of a collection of records as defined by the <u>chart sheet substream</u>. The collection of records specifies this chart group. In this example this record is the first ChartFormat record in the collection of ChartFormat records in the current chart sheet substream.

Size	Structure	Value
0014	ChartFormat - ChartFormat	
0004	LONG - Reserved1	0x00000000

Size	Structure	Value	
0004	LONG - Reserved2	0x00000000	
0004	LONG - Reserved3	0x00000000	
0004	LONG - Reserved4	0x00000000	
1 bit	WORD - fVaried	0x0	
15 bits	WORD - Reserved5	0x0000	
0002	SHORT - icrt	0x0000	

Figure 62: Structure of ChartFormat

fVaried: 0x0000 specifies that the color of each data point does not vary.

icrt: 0x0000 specifies that this chart group is at the bottom of the z-order.

3.6.22 Column Chart Object: Bar

The next record in this example, Bar, specifies the attributes of this chart group.

Size	Structure	Value
0006	Bar - Bar	
0002	SHORT - pcOverlap	0x0000
0002	USHORT - pcGap	0x0096
1 bit	USHORT - fTranspose	0x0
1 bit	USHORT - fStacked	0x0
1 bit	USHORT - f100	0x0
1 bit	USHORT - fHasShadow	0x0
12 bits	USHORT - reserved	0x000

Figure 63: Structure of Bar

pcOverlap: 0x0000 specifies that there is no overlap between data points.

pcGap: 0x0096 specifies that the width of the gap between adjacent **categories (2)** is 150% of the data point width. It also specifies that the width of the gap between the categories (2) and the left and right edges of the **plot area** is 75% of the data point width.

fTranspose: 0x0000 specifies that the data points and the value axis are vertical.

fStacked: 0x0000 specifies that data points in the same chart group are not stacked.

f100: 0x0000 specifies that data points in the chart group are not displayed as a percentage of the sum of all data points in the chart group that share the same category (2).

fHasShadow: 0x0000 specifies that none of the data points in the chart group has shadows.

The remaining records following this record, are omitted for brevity.

3.7 Pie Chart Sheet

This is an example of a 2D Pie <u>Chart Sheet</u>. This example omits records previously covered in the <u>column chart object example</u>.

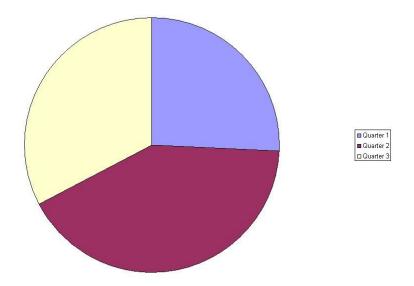

Figure 64: Pie Chart Sheet in this example within a sheet.

3.7.1 Pie Chart Sheet: PrintSize

The first record in this example, PrintSize, specifies the printed size of the chart.

Size	Structure	Value
0002	PrintSize - PrintSize	
0002	WORD - printSize	0x0003

Figure 65: Structure of PrintSize

printSize: 0x0003 specifies that the printed size of the chart is defined in the <u>Chart</u> record that follows this record.

3.7.2 Pie Chart Sheet: Chart

The next record in this example, <u>Chart</u>, specifies the beginning of the collection of records for the <u>chart</u>, and specifies the position and size of the <u>chart area</u> (section 2.2.3.17).

Size	Structure	Value
0010	Chart - Chart	
0004	FixedPoint - x	0x00000000
0004	FixedPoint - y	0x00000000
0004	FixedPoint - dx	0x02AB0A30
0004	FixedPoint - dy	0x01D30A30

Figure 66: Structure of Chart

x: 0x00000000 specifies that the horizontal position of the upper-left corner of the chart is 0 **points**.

y: 0x00000000 specifies that the vertical position of the upper-left corner of the chart is 0 points.

dx: 0x02AB0A30 specifies that the chart is 44763696 points wide.

dy: 0x01D30A30 specifies that the chart is 30607920 points high.

3.7.3 Pie Chart Sheet: ShtProps

The next record in this example, **ShtProps**, specifies the **chart sheet** properties.

Size	Structure	Value
0004	ShtProps - ShtProps	
1 bit	USHORT - fManSerAlloc	0x0
1 bit	USHORT - fPlotVisOnly	0x1
1 bit	USHORT - fNotSizeWith	0x1
1 bit	USHORT - fManPlotArea	0x1
1 bit	USHORT - fAlwaysAutoPlotArea	0x0
11 bits	USHORT - reserved1	0x000
0001	BYTE - mdBlank	0x00
0001	BYTE - reserved2	0x00

Figure 67: Structure of ShtProps

fManSerAlloc: 0x0 specifies that the data <u>series</u> are not automatically allocated to the series of the <u>chart</u>.

fPlotVisOnly: 0x1 specifies to plot **visible cells** only.

fNotSizeWith: 0x1 specifies not to size the chart with the window.

fManPlotArea: This field is ignored because the **fAlwaysAutoPlotArea** value is 0x0.

fAlwaysAutoPlotArea: 0x0 specifies that the default **plot area** size is used regardless of the <u>Pos</u> record information.

mdBlank: 0x00 specifies that empty cells are not plotted.

3.7.4 Pie Chart Sheet: AxesUsed

The next record in this example, AxesUsed, specifies the value axes used on the chart.

Size	Structure	Value
0002	AxesUsed - AxesUsed	
0002	USHORT - cAxes	0x0001

Figure 68: Structure of AxesUsed

cAxes: 0x0001 specifies that a single primary value axis is present and used on the chart.

3.7.5 Pie Chart Sheet: AxisParent

The next record in this example, <u>AxisParent</u>, specifies properties of the one <u>axis group</u> on the <u>chart</u> and specifies the beginning of the collection of records that specifies an axis group.

Size	Structure	Value
0012	AxisParent - AxisParent	
0002	SHORT - iax	0x0000
0010	unused - unused	

Figure 69: Structure of AxisParent

iax: 0x0000 specifies that this axis group is a primary axis group.

3.7.6 Pie Chart Sheet: ChartFormat

The next record, <u>ChartFormat</u>, specifies properties of a <u>chart group</u> and specifies the beginning of the collection of records that specifies further properties of that chart group.

Size	Structure	Value
0014	ChartFormat - ChartFormat	
0004	LONG - reserved1	0x00000000
0004	LONG - reserved2	0x00000000
0004	LONG - reserved3	0x00000000
0004	LONG - reserved4	0x00000000
1 bit	WORD - fVaried	0x1
15 bits	WORD - reserved5	0x0000
0002	SHORT - icrt	0x0000

Figure 70: Structure of ChartFormat

fVaried: 0x0001 specifies that the color for each <u>data point</u>, or the color or type for each **data marker** varies.

icrt: 0x0000 specifies that the drawing order of the chart group relative to the other chart groups is the bottom of the **z-order**.

3.7.7 Pie Chart Sheet: Pie

The next record in this example, $\underline{\text{Pie}}$, specifies that this is a pie $\underline{\text{chart group}}$, and specifies attributes of the chart group.

Size	Structure	Value
0006	Pie - Pie	
0002	USHORT - anStart	0x0000

Size	Structure	Value
0002	USHORT - pcDonut	0x0000
1 bit	USHORT - fHasShadow	0x0
1 bit	USHORT - fShowLdrLines	0x1
14 bits	USHORT - reserved	0x0000

Figure 71: Structure of Pie

anStart: 0x0000 specifies that the starting angle, calculated clockwise from the top of the circle, of the first <u>data point</u> is 0 degrees.

pcDonut: 0x0000 specifies that the chart group is a pie chart group.

fHasShadow: 0x0 specifies that zero data points in the chart group have shadows.

fShowLdrLines: 0x1 specifies that the **leader lines** to the <u>data labels</u> are shown. This value is ignored because zero data labels are present in this example.

3.7.8 Pie Chart Sheet: Legend

The next record in this example, <u>Legend</u>, specifies the location of the <u>legend</u> on the display and its overall size. The displayed legend contains all the <u>series</u> on the <u>chart</u>. The position and size information specified in this record is ignored, and the position and size information specified in the following <u>Pos</u> record is used.

Size	Structure	Value
0014	Legend - Legend	
0004	ULONG - x	0x00000E47
0004	ULONG - y	0x00000703
0004	ULONG - dx	0x00000147
0004	ULONG - dy	0x00000199
0001	BYTE - unused	0x03
0001	BYTE - wSpace	0x01
1 bit	WORD - fAutoPosition	0x1
1 bit	WORD - reserved1	0x1
1 bit	WORD - fAutoPosX	0x1
1 bit	WORD - fAutoPosY	0x1
1 bit	WORD - fVert	0x1
1 bit	WORD - fWasDataTable	0x0
10 bits	WORD - reserved2	0x000

Figure 72: Structure of Legend

wSpace: 0x01 specifies that there are 40 **twips** between **legend entries**.

fAutoPosition: 0x1 specifies that the legend is automatically positioned.

fAutoPosX: 0x1 specifies that the x-positioning of the legend is automatic.

fAutoPosY: 0x1 specifies that the y-positioning of the legend is automatic.

fVert: 0x1 specifies that the layout of the legend entries contain a single column of entries.

fWasDataTable: 0x0 specifies that the chart is not displaying the chart data table.

The next record in this example, <u>Begin</u>, specifies the beginning of the collection of records that specifies the properties of the legend.

The details of the Begin record have been omitted from the example for brevity.

3.7.9 Pie Chart Sheet: Pos

The next record in this example, Pos, specifies the size and position for the Legend of the plot area.

Size	Structure	Value
0014	Pos - Pos	
0002	PositionMode - mdTopLt	0x0005
0002	PositionMode - mdBotRt	0x0002
0002	SHORT - x1	0x0E47
0002	SHORT - unused1	0x0000
0002	SHORT - y1	0x0703
0002	SHORT - unused2	0x0000
0002	SHORT - x2	0x0000
0002	SHORT - unused3	0x0000
0002	SHORT - y2	0x0000
0002	SHORT - unused4	0x0000

Figure 73: Structure of Pos

Fields in this record that are ignored because mdTopLt is 0x0005 and mdBotRt is 0x0002 are omitted for brevity.

mdTopLt: 0x0005 specifies that the horizontal offset of the upper-left corner for this Legend is relative to the upper-left corner of the **chart area** (section <u>2.2.3.17</u>), measured in <u>SPRC</u>.

mdBotRt: 0x0002, when combined with the **mdTopLt** value of 0x0005, specifies that the values of **x1** and **y1** specify the horizontal and vertical offsets of the upper-left corner of the Legend, relative to the upper-left corner of the chart area (section 2.2.3.17).

- **x1:** 0x0E47 specifies that the upper-left corner of the Legend is horizontally offset by 3655 SPRC from the upper-left corner of the chart area (section 2.2.3.17).
- **y1:** 0x0703 specifies that the upper-left corner of the Legend is vertically offset by 1795 SPRC from the upper-left corner of the chart area (section 2.2.3.17).

3.7.10 Pie Chart Sheet: Text

The next record in this example, <u>Text</u>, specifies the position and appearance of text fields that appear on the <u>chart</u>. The position and size information specified in this record are ignored because this record is followed by a <u>Pos</u> record.

Size	Structure	Value
0020	Text - Text	
0001	BYTE - at	0x02
0001	BYTE - vat	0x02
0002	WORD - wBkgMode	0x0001
0004	LongRGB - rgbText	
0001	BYTE - red	0x00
0001	BYTE - green	0x00
0001	BYTE - blue	0x00
0001	BYTE - reserved	0x00
0004	LONG - x	0xFFFFFFEA
0004	LONG - y	0xFFFFFF75
0004	LONG - dx	0x00000000
0004	LONG - dy	0x00000000
1 bit	USHORT - fAutoColor	0x1
1 bit	USHORT - fShowKey	0x0
1 bit	USHORT - fShowValue	0x0
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fAutoText	0x1
1 bit	USHORT - fGenerated	0x1
1 bit	USHORT - fDeleted	0x0
1 bit	USHORT - fAutoMode	0x1
3 bits	USHORT - unused2	0x0
1 bit	USHORT - fShowLabelAndPerc	0x0
1 bit	USHORT - fShowPercent	0x0
1 bit	USHORT - fShowBubbleSizes	0x0
1 bit	USHORT - fShowLabel	0x0
1 bit	USHORT - reserved	0x0
0002	<u>Icv</u> - icvText	

Size	Structure	Value
0002	USHORT - icv	0x004D
4 bits	USHORT - dlp	0x0
10 bits	USHORT - unused3	0x069
2 bits	USHORT - iReadingOrder	0x0
0002	USHORT - trot	0x0000

Figure 74: Structure of Text

at: 0x02 specifies that the horizontal alignment of the text fields that appear in the <u>Legend</u> record is center-aligned.

vat: 0x02 specifies that the vertical alignment of the text fields that appear in the Legend record is center-aligned.

wBkgMode: 0x0001 specifies that the background of the text is transparent.

rgbText: A LongRGB structure that specifies the color of the text.

rgbText.red: 0x00 specifies that the relative intensity of red is 0.

rgbText.green: 0x00 specifies that the relative intensity of green is 0.

rgbText.blue: 0x00 specifies that the relative intensity of blue is 0.

fAutoColor: 0x0001 specifies that the foreground text color is determined automatically.

fShowKey: This field is ignored because this <u>AttachedLabel</u> is not a <u>data label</u>.

fShowValue: This field is ignored because this AttachedLabel is not a data label.

fAutoText: 0x0001 specifies that the text value of the text field is automatically generated and has not been changed.

fGenerated: 0x0001 specifies that the properties of the text field are automatically generated and have not been changed.

fDeleted: 0x0000 specifies that this text field, which is displayed by default, has been deleted by the user.

fAutoMode: 0x0001 specifies that the background color is determined automatically.

fShowLabelAndPerc: This field is ignored because this AttachedLabel is not a data label.

fShowPercent: This field is ignored because this AttachedLabel is not a data label.

fShowBubbleSizes: This field is ignored because this AttachedLabel is not a data label.

fShowLabel: This field is ignored because this AttachedLabel is not a data label.

icvText: An Icv structure that specifies the color of the text.

icvText.icv: 0x004D specifies that the default chart foreground color is used.

dlp: This field is ignored because this AttachedLabel is not a data label.

iReadingOrder: 0x0000 specifies that the **reading order** of the text is determined by the application.

trot: This field is ignored because this AttachedLabel is not a data label.

The next record in this example, <u>Begin</u>, specifies the beginning of the collection of records that specifies data labels on a **graph object**.

The details of the Begin record have been omitted from the example for brevity.

3.7.11 Pie Chart Sheet: BRAI

The next record in this example, <u>BRAI</u>, specifies a reference to data in a **sheet** that is used by a **legend entry**.

Size	Structure	Value
0008	BRAI - BRAI	
0001	BYTE - id	0x00
0001	BYTE - rt	0x01
1 bit	USHORT - fUnlinkedIfmt	0x0
15 bits	USHORT - reserved	0x0000
0002	IFmt - ifmt	0x0000
0002	ChartParsedFormula - formula	
0002	WORD - cce	0x0000

Figure 75: Structure of BRAI

id: 0x00 specifies that the referenced data is used for the text of a legend entry.

rt: 0x01 specifies that the data source is text or the value contained by the rgce field.

fUnlinkedIfmt: 0x0 specifies that the data uses the same number formatting as the referenced data.

ifmt: 0x0000 specifies that the identifier for number format information is general (automatic).

formula: A ChartParsedFormula that specifies the formula (section <u>2.2.2</u>) that specifies the referenced data.

formula.cce: 0x0000 specifies that the length of **rgce** is 0 bytes.

The next two records in this example are both <u>End</u> records. The first End record specifies the end of the collection of records that specifies <u>data labels</u> on a **graph object**. The second End record specifies the end of the collection of records that specifies the <u>legend</u>.

The details of the End records have been omitted from the example for brevity.

3.7.12 Pie Chart Sheet: Window2

The next record in this example, <u>Window2</u>, specifies attributes of the window used to display a **sheet** in a **workbook**.

Size	Structure	Value
000A	WINDOW2 - Window2	
1 bit	USHORT - fDspFmlaRt	0x0

Size	Structure	Value
1 bit	USHORT - fDspGridRt	0x1
1 bit	USHORT - fDspRwColRt	0x0
1 bit	USHORT - fFrozenRt	0x0
1 bit	USHORT - fDspZerosRt	0x0
1 bit	USHORT - fDefaultHdr	0x0
1 bit	USHORT - fRightToLeft	0x0
1 bit	USHORT - fDspGuts	0x0
1 bit	USHORT - fFrozenNoSplit	0x0
1 bit	USHORT - fSelected	0x1
1 bit	USHORT - fPaged	0x1
1 bit	USHORT - fSLV	0x0
4 bits	USHORT - reserved1	0x0
0002	RwU - rwTop	0x0000
0002	<u>ColU</u> - colLeft	0x0000
0002	<u>Icv</u> - icvHdr	0x0000
0002	USHORT - reserved2	0x0000

Figure 76: Structure of Window2

Fields in this record that are ignored because this Window2 record is contained in a <u>chart sheet</u> substream are omitted for brevity.

fSelected: 0x1 specifies that the sheet tab of the chart sheet is selected.

3.8 Formatting

In this example, cell formatting and number formats are applied to three cells in the sheet:

Cell B3, containing 1.2345, is formatted with the built-in "0.00" number format.

Cell B4, containing 1.2345, is formatted with the custom number format "0.00000".

Cell B5, containing "1.2345", is formatted with a blue **foreground color**, yellow **background color**, and is bold.

The following screenshot shows a possible implementation of the cells discussed in this example:

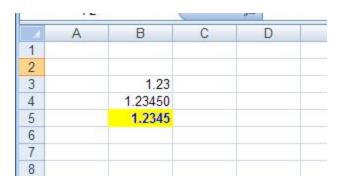

Figure 77: The formatting in this example within a sheet

This example starts at the first Font record in the Workbook stream related to these cells and ends at the Number record containing the value for the last cell. Other records in the Workbook stream or related substreams which are not related to this example are omitted for brevity. The substream of the workbook related to this example contains five Font records, nine Format records, 24 XF records, and three Number records. Of these, the example highlights the first and fifth Font record, the last Format record, the first, sixteenth, seventeenth, and eighteenth XF records, and all three Number records. Any other records in the substream are skipped in this example.

Each Number record that specifies a cell with a **floating-point number** corresponds to one of the three cells in this example. The Number record contains a <u>Cell</u> structure, which in turn contains an <u>IXFCell</u> structure with an **ixfe** field containing the index to an XF record in the <u>Globals Substream</u>. The XF record that specifies formatting properties for a cell contains a <u>FontIndex</u> structure and an <u>IFmt</u> structure. Those records contain indexes for a Font record and a Format record, respectively. The Font record specifies **font** and font formatting information, and the Format record specifies a number format.

3.8.1 Formatting: Font 1

The first record in the example, <u>Font</u>, specifies the **font** and font formatting information which is used by **cells** B3 and B4.

Size	Structure	Value
001A	Font - Font	
0002	USHORT - dyHeight	0x00C8
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fItalic	0x0
1 bit	USHORT - unused2	0x0
1 bit	USHORT - fStrikeOut	0x0
1 bit	USHORT - fOutline	0x0
1 bit	USHORT - fShadow	0x0
1 bit	USHORT - fCondense	0x0
1 bit	USHORT - fExtend	0x0
8 bits	USHORT - reserved	0x00
0002	USHORT - icv	0x7FFF

Size	Structure	Value
0002	USHORT - bls	0x0190
0002	USHORT - sss	0x0000
0001	BYTE - uls	0x00
0001	BYTE - bFamily	0x00
0001	BYTE - bCharSet	0x00
0001	BYTE - unused3	0xDF
000C	ShortXLUnicodeString - fontName	Arial

Figure 78: Structure of Font

dyHeight: 0x00C8 specifies the height of the font is 200 **twips**.

fItalic: 0x0 specifies that the font is not italicized.

fStrikeOut: 0x0 specifies that the font does not have strikethrough formatting applied.

fOutline: 0x0 specifies that the font is not an outline.

fShadow: 0x0 specifies that the font does not have a shadow applied.

fCondense: 0x0 specifies that the font is not condensed by compressing spacing between characters.

fExtend: 0x0 specifies that the font is not extended by stretching spacing between characters.

icv: 0x7FFF is an Icv value that specifies that the color of the font is the default foreground color.

bls: 0x0190 specifies that the font is normal weight.

sss: 0x0000 specifies that the font is normal script.

uls: 0x00 specifies that the font has no underline.

bFamily: 0x00 specifies that the **font family** of the font is not applicable as detailed in the Windows API LOGFONT structure in [MSDN-FONTS].

bCharSet: 0x00 specifies that that this font belongs to the **ANSI character set**.

fontName: Arial specifies the name of the font.

Records following this record, and before the fifth Font record, are omitted for brevity.

3.8.2 Formatting: Font 2

The next record in this example, <u>Font</u>, specifies the **font** and font formatting information which is used by **cell** B5.

Size	Structure	Value
001A	Font - Font	
0002	USHORT - dyHeight	0x00C8
1 bit	USHORT - unused1	0x0

Size	Structure	Value
1 bit	USHORT - fItalic	0x0
1 bit	USHORT - unused2	0x0
1 bit	USHORT - fStrikeOut	0x0
1 bit	USHORT - fOutline	0x0
1 bit	USHORT - fShadow	0x0
1 bit	USHORT - fCondense	0x0
1 bit	USHORT - fExtend	0x0
8 bits	USHORT - reserved	0x00
0002	USHORT - icv	0x000C
0002	USHORT - bls	0x02BC
0002	USHORT - sss	0x0000
0001	BYTE - uls	0x00
0001	BYTE - bFamily	0x00
0001	BYTE - bCharSet	0x00
0001	BYTE - unused3	0xDF
000C	ShortXLUnicodeString - fontName	Arial

Figure 79: Structure of Font

icv: 0x000C is an <u>Icv</u> value that specifies that the color of the font is composed of an RGB value with a red value of 0, a green value of 0, and a blue value of 255, representing the color blue.

bls: 0x02BC specifies that the font is bold.

Records following this record, and before the ninth Format record, are omitted for brevity.

3.8.3 Formatting: Format

The next record in this example, Format, specifies the number format which is used by cell B4.

Size	Structure	Value
000C	Format - Format	
0002	<u>IFmt</u> - ifmt	0x00A4
000A	XLUnicodeString - stFormat	0.00000

Figure 80: Structure of Format

ifmt: 0x00A4 specifies the identifier of the format string.

stFormat: "0.00000" specifies the custom **number format** string to be applied.

3.8.4 Formatting: XF 1

The next record in this example, $\underline{\mathsf{XF}}$, specifies default formatting properties for a **cell** and is always written out. It is not referenced in this example.

Size	Structure	Value
0014	XF - XF	
0002	FontIndex - ifnt	
0002	USHORT - ifnt	0x0000
0002	<u>IFmt</u> - ifmt	
0002	USHORT - ifmt	0x0000
1 bit	USHORT - fLocked	0x1
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fStyle	0x1
1 bit	USHORT - f123Prefix	0x0
12 bits	USHORT - ixfParent	0xFFF
000E	StyleXF - Data	
3 bits	BYTE - alc	0x0
1 bit	BYTE - fWrap	0x0

Figure 81: Structure of XF

ifnt: Specifies formatting properties for the cell.

ifnt.ifnt: 0x0000 specifies the FontIndex that specifies the cell uses the default font.

ifmt: Specifies the number format and text formatting for the cell.

ifmt.ifmt: 0x0000 specifies an IFmt that specifies general (automatic) formatting for the cell.

fLocked: 0x1 specifies that the cell is set to be **locked** for user editing when the worksheet is **protected**.

fHidden: 0x0 specifies that the cell formula is not **hidden** when the worksheet is protected.

fStyle: 0x1 specifies that this record specifies a <u>cell style</u>.

f123Prefix: 0x0 specifies that the text in the cell is not prefixed by a single quote mark.

ixfParent: 0xFFF is the required value as **fStyle** is 0x1.

Data: Specifies additional properties of this cell style.

Data.alc: 0x0 specifies that the horizontal alignment of the cell is **general alignment**.

Data.fWrap: 0x0 specifies that the cell text is not line-wrapped within the cell.

Data.alcV: 0x2 specifies that the cell has a bottom **vertical alignment**.

Data.fJustLast: 0x0 specifies that the cell text is not **justify distributed**.

Data.trot: Specifies the text rotation.

Data.trot.trot: 0x00 specifies that the cell text is rotated counterclockwise 0 degrees.

Data.cIndent: 0x0 specifies that the cell text is not indented.

Data.fShrinkToFit: 0x0 specifies that the cell is not **shrink to fit**.

Data.iReadOrder: 0x0 specifies that the **reading order** of the cell is context reading order.

Data.dgLeft: 0x0 specifies that the **logical left border formatting** of the cell is no **border**.

Data.dgRight: 0x0 specifies that the **logical right** border formatting of the cell is no border.

Data.dgTop: 0x0 specifies that the top border formatting of the cell is no border.

Data.dgBottom: 0x0 specifies that the bottom border formatting of the cell is no border.

Data.icvLeft: 0x00 specifies that the color of the logical left border is not specified.

Data.icvRight: 0x00 specifies that the color of the logical right border is not specified.

Data.grbitDiag: 0x0 specifies that the cell does not have a diagonal border.

Data.icvTop: 0x00 specifies that the color of the top border is not specified.

Data.icvBottom: 0x00 specifies that the color of the bottom border is not specified.

Data.icvDiag: 0x00 specifies that the color of the diagonal border is not specified.

Data.dgDiag: 0x0 specifies that the diagonal border formatting of the cell is no border.

Data.fls: 0x00 specifies that there is no **fill pattern** for the cell.

Data.icvFore: 0x40 specifies that the **foreground color** of the fill pattern is the default foreground

Data.icvBack: 0x41 specifies that the **background color** of the fill pattern is the default background color.

Records following this record, and before the sixteenth XF record, are omitted for brevity.

3.8.5 Formatting: XF 2

The next record in this example, \underline{XF} , specifies formatting properties for a **cell** and is referenced by the Number record for cell B3.

Figure 82: Structure of XF

ifmt: Specifies the **number format** and text formatting for the cell.

ifmt.ifmt: 0x0002 specifies an IFmt value that specifies a number format with two decimals and no 1000s comma.

fStyle: 0x0 specifies that the cell uses a cell format.

ixfParent: 0x000 specifies that the cell inherits formatting properties from the first <u>cell style XF</u> record in the <u>Globals Substream</u>.

Data: Specifies additional properties of the cell format.

Data.fAtrNum: 0x1 specifies that the **ifmt** field of this XF record is not updated when the corresponding field of the XF record specified by the **ixfParent** field of this XF record is changed.

Data.fAtrFnt: 0x0 specifies that the **ifnt** field of this XF record is updated when the corresponding field of the XF record specified by the **ixfParent** field of this XF record is changed.

Data.fAtrAlc: 0x0 specifies that the alc, fWrap, alcV, fJustLast, trot, cIndent, fShrinkToFit, and iReadOrder fields are updated when the corresponding fields of the XF record specified by the ixfParent field of this XF record are changed.

Data.fAtrBdr: 0x0 specifies that the dgLeft, dgRight, dgTop, dgBottom, dgDiag, icvLeft, icvRight, grbitDiag, icvTop, icvBottom, and icvDiag fields are updated when the corresponding fields of the XF record specified by the ixfParent field of this XF record are changed.

Data.fAtrPat: 0x0 specifies that the **fls**, **icvFore**, and **icvBack** fields are updated when the corresponding fields of the XF record specified by the **ixfParent** field of this XF record are changed.

Data.fAtrProt: 0x0 specifies that the **fLocked** and **fHidden** fields are updated when the corresponding fields of the XF record specified by the **ixfParent** field of this XF record are changed.

Data.fHasXFExt: 0x0 specifies that the information in this XF will not be extended by an $\frac{XFExt}{record}$.

Data.fsxButton: 0x0 specifies that the XF record is not attached to a pivot field drop-down button.

3.8.6 Formatting: XF 3

The next record in this example, <u>XF</u>, specifies formatting properties for a <u>cell</u> or a <u>cell style</u> and is referenced by the <u>Number</u> record for cell B4.

Size	Structure	Value
0014	XF - XF

Figure 84: Structure of XF

ifnt: Specifies formatting properties for the cell.

ifnt.ifnt: 0x0005 specifies a <u>FontIndex</u> which specifies the first <u>Font</u> record in the collection of Font records in the <u>Globals Substream</u>. This Font record is illustrated previously.

Data: Specifies additional properties of the cell format.

Data.fAtrNum: 0x0 specifies that the **ifmt** field of this XF record is updated when the corresponding field of the XF record specified by the **ixfParent** field of this XF record is changed.

Data.fAtrFnt: 0x1 specifies that the **ifnt** field of this XF record is not updated when the corresponding field of the XF record specified by the **ixfParent** field of the containing XF record is changed.

Data.fAtrPat: 0x1 specifies that the **fls**, **icvFore**, and **icvBack** fields are not updated when the corresponding fields of the XF record specified by the **ixfParent** field of this XF record are changed.

Data.fls: 0x01 specifies a solid **fill pattern**. Only **icvFore** is rendered.

Data.icvFore: 0x0D specifies that the **foreground color** of the fill pattern is field **rgColor**[5] of the <u>Palette</u> record in the file. If no Palette record exists, the default value is an RGB value with a red value of 255, a green value of 255, and a blue value of 0, representing the color yellow.

Data.icvBack: 0x40 specifies that the **background color** of the fill pattern is the default foreground color.

Records following this record, and before the next Number record, are omitted for brevity.

3.8.8 Formatting: Number 1

The next record in this example, <u>Number</u>, specifies the **cell** B3, which contains a **floating-point number**. This record is the first in the set of Number records in the **workbook**.

Size	Structure	Value
000E	Number - Number	
0006	<u>Cell</u> - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0002

0002	USHORT - ixfe	0x0015
0008	Double - num	3FF3C083126E978D

Figure 85: Structure of Number

cell: Specifies a cell in the current sheet containing a floating-point number.

cell.rw: Specifies the row index of the cell.

cell.rw.rw: 0x0002 specifies that the cell is in row 3.

cell.col: Specifies the column index of the cell.

cell.col.col: 0x0001 specifies that the cell is in column B.

cell.ixfe: Specifies the <u>cell XF</u> record in the collection of <u>XF</u> records in the <u>Globals Substream</u>.

cell.ixfe.ixfe: 0x0015 specifies that the cell is formatted according to the first user-defined XF record in the Globals Substream. This XF is the second XF record in this example.

num: 0x3FF3C083126E978D specifies a 64-bit IEEE-754 floating-point value of 1.2345 as the value of the cell.

3.8.9 Formatting: Number 2

The next record in this example, <u>Number</u>, specifies the **cell** B4, which contains a **floating-point number**.

Size	Structure	Value
000E	Number - Number	
0006	<u>Cell</u> - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0003
0002	<u>Col</u> - col	
0002	USHORT - col	0x0001
0002	<u>IXFCell</u> - ixfe	
0002	USHORT - ixfe	0x0016
0008	Double - num	3FF3C083126E978D

Figure 86: Structure of Number

Fields in this record that are explained in previous records in this example have been omitted for brevity.

cell: Specifies a cell in the current **sheet** containing a floating-point number.

cell.rw: Specifies the row index of the cell.

cell.rw.rw: 0x0003 specifies that the cell is in row 4.

cell.col: Specifies the column index of the cell.

cell.col.col: 0x0001 specifies that the cell is in column B.

cell.ixfe: Specifies the <u>cell XF</u> record in the collection of <u>XF</u> records in the <u>Globals Substream</u>.

cell.ixfe.ixfe: 0x0016 specifies that the cell is formatted according to the second user-defined XF record in the <u>Globals Substream</u>. This XF is the third XF record in this example.

3.8.10 Formatting: Number 3

The next record in this example, <u>Number</u>, specifies the **cell** B5, which contains a **floating-point number**.

Size	Structure	Value
000E	Number - Number	
0006	<u>Cell</u> - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0004
0002	<u>Col</u> - col	
0002	USHORT - col	0x0001
0002	IXFCell - ixfe	
0002	USHORT - ixfe	0x0017
0008	Double - num	3FF3C083126E978D

Figure 87: Structure of Number

Fields in this record that are explained in previous records in this example have been omitted for brevity.

cell: Specifies a cell in the current sheet containing a floating-point number.

cell.rw: Specifies the row index of the cell.

cell.rw.rw: 0x0004 specifies that the cell is in row 5.

cell.col: Specifies the column index of the cell.

cell.col.col: 0x0001 specifies that the cell is in column B.

cell.ixfe: Specifies the <u>cell XF</u> record in the collection of <u>XF</u> records in the <u>Globals Substream</u>.

cell.ixfe.ixfe: 0x0017 specifies that the cell is formatted according to the third user-defined XF record in the <u>Globals Substream</u>. This XF is the fourth XF record in this example.

3.9 Workbook

This example shows a **workbook** containing three **sheets**, named "Sheet1", "Sheet2" and "Sheet3". "Sheet1" contains the following cell content:

- Cell B4 contains the string "Number".
- Cell B5 contains the number 1.
- Cell B6 contains the string "Formula".
- Cell B7 contains the formula "=SQRT(B5*2)".

The workbook example can be broken into two parts. The first part of the example includes records found in the <u>Globals Substream</u>. These records contain details about the entire workbook through examples of the following parent records: <u>BOF</u>, <u>RRTabId</u>, <u>BuiltInFnGroupCount</u>, <u>Window1</u>, <u>HideObj</u>, <u>Date1904</u>, <u>CalcPrecision</u>, <u>BookBool</u>, <u>Font</u>, <u>Format</u>, <u>XF</u>, <u>Style</u>, <u>BoundSheet8</u>, <u>Country</u>, <u>RecalcId</u>, <u>SST</u>, <u>ExtSST</u>, <u>BookExt</u>, and <u>EOF</u>.

The second part of this example contains the <u>Worksheet</u> substream. These records contain details about the first sheet through examples of the following parent records: BOF, <u>Index</u>, <u>DefaultRowHeight</u>, <u>WsBool</u>, <u>Setup</u>, <u>DefColWidth</u>, <u>Dimensions</u>, <u>Row</u>, <u>LabelSst</u>, <u>RK</u>, <u>Formula</u>, <u>DBCell</u>, <u>Window2</u>, <u>Selection</u>, <u>PhoneticInfo</u>, and EOF.

"Sheet2" and "Sheet3" are empty sheets and their record details are not documented in this example.

Figure 88: A sheet within a workbook

3.9.1 Workbook: BOF 1

This first <u>BOF</u> record begins the <u>Globals Substream</u> and <u>Workbook</u> stream and specifies global properties and data for a **workbook**, as well as the **sheets** in this example workbook.

Size	Structure	Value
0014	BOF - BOF	
0002	USHORT - vers	0x0600
0002	USHORT - dt	0x0005
0002	USHORT - rupBuild	0x2013
0002	USHORT - rupYear	0x07CD
1 bit	DWORD - fWin	0x1
1 bit	DWORD - fRisc	0x0
1 bit	DWORD - fBeta	0x0
1 bit	DWORD - fWinAny	0x0
1 bit	DWORD - fMacAny	0x0
1 bit	DWORD - fBetaAny	0x0
2 bits	DWORD - unused1	0x3
1 bit	DWORD - fRiscAny	0x0
1 bit	DWORD - fOOM	0x0

Size	Structure	Value
1 bit	DWORD - fGlJmp	0x0
2 bits	DWORD - unused2	0x0
1 bit	DWORD - fFontLimit	0x0
4 bits	DWORD - verXLHigh	0x3
1 bit	DWORD - unused3	0x0
13 bits	DWORD - reserved1	0x0000
8 bits	DWORD - verLowestBiff	0x06
4 bits	DWORD - verLastXLSaved	0x3
20 bits	DWORD - reserved2	0x00000

Figure 89: Structure of BOF

vers: 0x0600 specifies that the BIFF version of the file is 1536.

dt: 0x0005 specifies that the substream of records following this BOF record are part of the workbook stream.

rupBuild: 0x2013 specifies that the version of the build is 8211.

rupYear: 0x07CD specifies 1997 as the year when the file format version was first created.

fWin: 0x1 specifies that the file was last edited on a Windows platform.

fRisc: 0x0 specifies that the file was not last edited on a RISC platform.

fBeta: 0x0 specifies that the file was not last edited by a **beta** version of the application.

fWinAny: 0x0 specifies that the file has not been subsequently saved.

fMacAny: 0x0 specifies that the file has never been edited on a Macintosh platform.

fBetaAny: 0x0 specifies that the file has never been edited on a beta version of the application.

fRiscAny: 0x0 specifies that the file has never been edited on a RISC platform.

fOOM: 0x0 specifies that the file has never had an **out-of-memory** failure.

fGIJmp: 0x0 specifies that the file has never had an out-of-memory failure during rendering.

fFontLimit: 0x0 specifies that the file has never reached the 255 **font** limit.

verXLHigh: 0x3 specifies that the file was not edited in any applications after Office Excel 2003.

verLowestBiff: 0x06 specifies that the files are saved in BIFF version 6.

verLastXLSaved: 0x3 specifies that the file was last saved by Office Excel 2003.

Records following this record, and before the next RRTabId record, are omitted for brevity.

3.9.2 Workbook: RRTabId

This <u>RRTabId</u> record specifies unique **sheet** identifiers, each of which is associated with a sheet in the **workbook**.

Size	Structure	Value
0006	RRTabId - RRTabId	
0006	RgTabId - rgtabid	
0002	USHORT - rgtabid[0]	0x0001
0002	USHORT - rgtabid[1]	0x0002
0002	USHORT - rgtabid[2]	0x0003

Figure 90: Structure of RRTabId

rgtabid: An array of elements of unique sheet identifiers.

rgtabid.rgtabid[0]: 0x0001 specifies the first sheet identifier.

rgtabid.rgtabid[1]: 0x0002 specifies the second sheet identifier.

rgtabid.rgtabid[2]: 0x0003 specifies the third sheet identifier.

3.9.3 Workbook: BuiltInFnGroupCount

This <u>BuiltInFnGroupCount</u> record specifies information about the built-in **function categories** in the **workbook**.

Size	Structure	Value
0002	BuiltInFnGroupCount - BuiltinFnGroupCount	
0002	USHORT - count	0x000E

Figure 91: Structure of BuiltinFnGroupCount

count: 0x000E specifies there are 14 built-in function categories in the workbook.

Records following this record, and before the next Window1 record, are omitted for brevity.

3.9.4 Workbook: Window1

This <u>Window1</u> record specifies attributes of the window used to display the **sheet**.

Size	Structure	Value
0012	Window1 - Window1	
0002	SHORT - xWn	0x01E0
0002	SHORT - yWn	0x0069
0002	SHORT - dxWn	0x4E1B
0002	SHORT - dyWn	0x3CE1
1 bit	USHORT - fHidden	0x0

0002	<u>TabIndex</u> - itabCur	
0002	USHORT - itab	0x0000
0002	TabIndex - itabFirst	
0002	USHORT - itab	0x0000
0002	USHORT - ctabSel	0x0001
0002	USHORT - wTabRatio	0x0258

Figure 92: Structure of Window1

xWn: 0x01E0 specifies that the horizontal position of the window is 480 **twips** from the logical left edge of the **client area** of the window.

yWn: 0x0069 specifies that the vertical position of the window is 105 twips from the top edge of the client area of the window.

dxWn: 0x4E1B specifies that the width of the window is 19995 twips.

dyWn: 0x3CE1 specifies that the height of the window 15585 twips.

fHidden: 0x0000 specifies that the window is not **hidden**.

fIconic: 0x0000 specifies that the window is not minimized.

fVeryHidden: 0x0000 specifies that the window is not hidden.

fDspHScroll: 0x0001 specifies that the horizontal scroll bar is displayed

fDspVScroll: 0x0001 specifies that the vertical scroll bar is displayed.

fBotAdornment: 0x0001 specifies that the **sheet tabs** are displayed.

fNoAFDateGroup: 0x0000 specifies that dates are grouped by year, month, and day in the

AutoFilter menu.

itabCur: Specifies which sheet tab is selected.

itabCur.itab: 0x0000 specifies that the first sheet tab is selected.

itabFirst: Specifies which is the first displayed sheet tab.

itabFirst.itab: 0x0000 specifies that the first tab is the displayed sheet tab.

ctabSel: 0x0001 specifies that one sheet tab is selected in the **workbook**.

 ${\bf wTabRatio:}\ 0 \times 0258$ specifies that the ratio of the width of the sheet tabs to the width of the

horizontal scroll bar is 0.6.

Records following this record, and before the next HideObj record, are omitted for brevity.

3.9.5 Workbook: HideObj

This <u>HideObj</u> record specifies how **drawing objects** appear in a window that contains the **workbook**.

Size	Structure	Value
0002	HideObj - HideObj	
0002	<u>HideObjEnum</u> - hideObj	0x0000

Figure 93: Structure of HideObj

hideObj: 0x0000 specifies that all drawing objects in the window are shown.

3.9.6 Workbook: Date1904

This <u>Date1904</u> record specifies whether the **workbook** uses the 1904-based or the 1900-based **date system**.

Size	Structure	Value
0002	Date1904 - Date1904	
0002	SHORT - f1904DateSystem	0x0000

Figure 94: Structure of Date1904

f1904DateSystem: 0x0000 specifies that the workbook uses the 1900 date system.

3.9.7 Workbook: CalcPrecision

This <u>CalcPrecision</u> record specifies the calculation precision mode for the **workbook**.

Size	Structure	Value
0002	CalcPrecision - CalcPrec	
0002	SHORT - fFullPrec	0x0001

Figure 95: Structure of CalcPrec

fFullPrec: 0x0001 specifies that **precision as displayed** mode is not **selected**.

Records following this record, and before the next **BookBool** record, are omitted for brevity.

3.9.8 Workbook: BookBool

This **BookBool** record specifies some properties associated with the **workbook**.

Size	Structure	Value
0002	BookBool - BookBool	
1 bit	USHORT - fNoSaveSup	0x0
1 bit	USHORT - reserved1	0x0

Size	Structure	Value
1 bit	USHORT - fHasEnvelope	0x0
1 bit	USHORT - fEnvelopeVisible	0x0
1 bit	USHORT - fEnvelopeInitDone	0x0
2 bits	USHORT - grUpdateLinks	0x0
1 bit	USHORT - unused	0x0
1 bit	USHORT - fHideBorderUnselLists	0x0
7 bits	USHORT - reserved2	0x00

Figure 96: Structure of BookBool

fNoSaveSup: 0x0000 specifies that **external link** values are saved in the workbook.

fHasEnvelope: 0x0000 specifies the workbook does not have an envelope.

fEnvelopeVisible: 0x0000 specifies the envelope is not visible.

fEnvelopeInitDone: 0x0000 specifies the envelope has not been initialized.

grUpdateLinks: 0x0000 specifies the application prompts users to update external links in the workbook.

fHideBorderUnselLists: 0x0000 specifies that borders of **tables** that do not contain the active **cell** are not **hidden**.

3.9.9 Workbook: Font

This Font record specifies font formatting information and is the first of four in the workbook.

Size	Structure	Value
001A	Font - Font	
0002	USHORT - dyHeight	0x00C8
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fItalic	0x0
1 bit	USHORT - unused2	0x0
1 bit	USHORT - fStrikeOut	0x0
1 bit	USHORT - fOutline	0x0
1 bit	USHORT - fShadow	0x0
1 bit	USHORT - fCondense	0x0
1 bit	USHORT - fExtend	0x0
8 bits	USHORT - reserved	0x00
0002	USHORT - icv	0x7FFF

Size	Structure	Value
0002	USHORT - bls	0x0190
0002	USHORT - sss	0x0000
0001	BYTE - uls	0x00
0001	BYTE - bFamily	0x00
0001	BYTE - bCharSet	0x00
0001	BYTE - unused3	0x57
000C	ShortXLUnicodeString - fontName	Arial

Figure 97: Structure of Font

dyHeight: 0x00C8 specifies that the height of the font is 200 **twips**.

fItalic: 0x0 specifies that the font is not italic.

fStrikeOut: 0x0 specifies that the font does not have strikethrough formatting applied.

fOutline: 0x0 specifies that the font does not have an **outline effect**.

fShadow: 0x0 specifies that the font does not have a **shadow effect**.

fCondense: 0x0 specifies that the font is not condensed

fExtend: 0x0 specifies that the font is not extended.

icv: 0x7FFF specifies that the color of the font is automatic and matches the window text color.

bls: 0x0190 specifies that the font weight is normal.

sss: 0x0000 specifies that no superscript or subscript is used.

uls: 0x00 specifies that the font does not have underlining.

bFamily: 0x00 specifies that the **font family** of the font is not applicable as detailed in the Windows API LOGFONT structure in [MSDN-FONTS].

bCharSet: 0x00 specifies that this font belongs to the **ANSI character set**.

fontName: "Arial" specifies the name of the font.

The three Font records following this record, and before the next <u>Format</u> record, are omitted for brevity.

3.9.10 Workbook: Format

This <u>Format</u> record specifies the **number format** applied to a number and is the first of eight in the **workbook**.

Size	Structure	Value
001C	Format - Format	
0002	<u>IFmt</u> - ifmt	0x0005
001A	XLUnicodeString - stFormat	0.00000

Figure 98: Structure of Format

ifmt: 0x0005 specifies the identifier for the formatting string.

stFormat: "0.00000" specifies the custom number format string to be applied.

The seven Format records following this record, and before the next XF record, are omitted for brevity.

3.9.11 Workbook: XF

This $\underline{\mathsf{XF}}$ record specifies formatting properties for a **cell** and is the first of 21 XF records in the **workbook**.

Size	Structure	Value
0014	XF - Xf	
0002	FontIndex - ifnt	
0002	USHORT - ifnt	0x0000
0002	<u>IFmt</u> - ifmt	
0002	USHORT - ifmt	0x0000
1 bit	USHORT - fLocked	0x1
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fStyle	0x1
1 bit	USHORT - f123Prefix	0x0
12 bits	USHORT - ixfParent	0xFFF
0003	StyleXF - Data	
3 bits	BYTE - alc	0x0
1 bit	BYTE - fWrap	0x0
3 bits	BYTE - alcV	0x2
1 bit	BYTE - fJustLast	0x0
0001	XFPropTextRotation - trot	
0001	BYTE - trot	0x00
4 bits	BYTE - cIndent	0x0
1 bit	BYTE - fShrinkToFit	0x0
1 bit	BYTE - reserved1	0x0
2 bits	BYTE - iReadOrder	0x0
0001	BYTE - unused	0x00
4 bits	USHORT - dgLeft	0x0
4 bits	USHORT - dgRight	0x0

Size	Structure	Value
4 bits	USHORT - dgTop	0x0
4 bits	USHORT - dgBottom	0x0
7 bits	USHORT - icvLeft	0x00
7 bits	USHORT - ivcRight	0x00
2 bits	USHORT - grbitDiag	0x0
7 bits	ULONG - icvTop	0x00
7 bits	ULONG - icvBottom	0x00
7 bits	ULONG - icvDiag	0x00
4 bits	ULONG - dgDiag	0x0
1 bit	ULONG - reserved2	0x0
6 bits	ULONG - fls	0x00
7 bits	USHORT - icvFore	0x40
7 bits	USHORT - icvBack	0x41
2 bits	USHORT - reserved3	0x0

Figure 99: Structure of Xf

ifnt: A FontIndex that specifies a <u>Font</u> record.

ifnt.ifnt: 0x0000 specifies that the default **font** is used.

ifmt: Specifies the identifier of a number format.

ifmt.ifmt: 0x0000 specifies that general (automatic) formatting is applied for the cell.

fLocked: 0x1 specifies that this cell has **locked protection**. Because this workbook example has no

Protect record, this setting does not apply.

fHidden: 0x0 specifies that this cell is not **hidden**.

fStyle: 0x1 specifies that this record specifies a <u>cell style XF</u>.

f123Prefix: 0x0 specifies that prefix characters are not present in the cell.

ixfParent: 0xFFF specifies that there is no inheritance from a cell style XF.

Data: This structure specifies formatting properties for a <u>cell style</u>.

Data.alc: 0x0 specifies that horizontal alignment for the cell is general alignment.

Data.fWrap: 0x0 specifies that cell text is not wrapped.

Data.alcV: 0x2 specifies that vertical alignment for the cell is bottom alignment.

Data.fJustLast: 0x0 specifies that the cell text is not justified.

Data.trot: This structure specifies rotation for the cell text.

Data.trot.trot: 0x00 specifies zero degrees of rotation.

Data.cIndent: 0x0 specifies that the text indent level is zero.

Data.fShrinkToFit: 0x0 specifies that text is not shrink to fit.

Data.iReadOrder: 0x0 specifies that context **reading order** is set.

Data.dgLeft: 0x0 specifies that there is no **logical left** border.

Data.dgRight: 0x0 specifies that there is no **logical right** border.

Data.dgTop: 0x0 specifies that there is no top border.

Data.dgBottom: 0x0 specifies that there is no bottom border.

Data.icvLeft: 0x00 specifies that the logical left border color has not been set.

Data.ivcRight: 0x00 specifies that the logical right border color has not been set.

Data.grbitDiag: 0x0 specifies that there is no diagonal border.

Data.icvTop: 0x00 specifies that the top border color has not been set.

Data.icvBottom: 0x00 specifies that the bottom border color has not been set.

Data.icvDiag: 0x00 specifies that the diagonal border color has not been set.

Data.dgDiag: 0x0 specifies the line style for the diagonal border is set to no border.

Data.fls: 0x00 specifies that there is no **fill pattern**.

Data.icvFore: 0x40 specifies that the fill pattern uses the default **foreground color** which is the window text color.

Data.icvBack: 0x41 specifies that fill pattern uses the default background color which is the default

background color for a cell.

The 20 XF records following this record, and before the next Style record, are omitted for brevity.

3.9.12 Workbook: Style

This Style record specifies a cell style and is the first of six Style records in the workbook example .

Size	Structure	Value
0004	Style - Style	
12 bits	USHORT - ixfe	0x010
3 bits	USHORT - unused	0×0
1 bit	USHORT - fBuiltIn	0x1
0002	BuiltInStyle - builtInData	
0001	BYTE - istyBuiltIn	0x03
0001	BYTE - iLevel	0xFF

Figure 100: Structure of Style

Fields in this record that are ignored are omitted for brevity.

ixfe: 0x010 specifies the index to the 16th XF record for which these properties apply; this XF record is omitted from this workbook example for brevity.

fBuiltIn: 0x0001 specifies that this cell uses the built-in cell style.

builtInData: Specifies an optional built-in cell style.

builtInData.istyBuiltIn: 0x03 specifies that the comma cell style is applied.

The records following this record, and before the next BoundSheet8 record, are omitted for brevity.

3.9.13 Workbook: BoundSheet8 1

This <u>BoundSheet8</u> record specifies basic information about the first **sheet** in the **workbook** example, including the sheet name, **hidden** state, and type of sheet.

Size	Structure	Value
000E	BoundSheet8 - BoundSheet8	
0004	FilePointer - IbPlyPos	0x000005CA
2 bits	USHORT - hsState	0x0
6 bits	USHORT - unused	0x00
8 bits	USHORT - dt	0x00
0008	ShortXLUnicodeString - stName	Sheet1

Figure 101: Structure of BoundSheet8

IbPlyPos: 0x000005CA specifies the stream position of the start of the <u>BOF</u> record for the sheet associated with this BoundSheet8 record. This stream position is the start of the binary record, which begins with the two-byte record type and two-byte record size information. See the <u>record</u> overview for more details. The <u>worksheet</u> substream for this sheet is shown later in this workbook example.

hsState: 0x0 specifies that the sheet is **visible**.

dt: 0x00 specifies that the sheet type is a **Worksheet**.

stName: "Sheet1" specifies the case-insensitive name of the sheet.

3.9.14 Workbook: BoundSheet8 2

This record is the same as the previous <u>BoundSheet8</u> record example and specifies basic information about the second **sheet** in the **workbook** example. The fields that contain the same values as the previous record are omitted for brevity.

Size	Structure	Value
000E	BoundSheet8 - BoundSheet8	
0004	FilePointer - IbPlyPos	0x00000785
2 bits	USHORT - hsState	0x0
6 bits	USHORT - unused	0x00

Size	Structure	Value
8 bits	USHORT - dt	0x00
0008	ShortXLUnicodeString - stName	Sheet2

Figure 102: Structure of BoundSheet8

IbPlyPos: 0x00000785 specifies the stream position of the start of the <u>BOF</u> record for the sheet associated with this BoundSheet8 record. The <u>worksheet</u> substream for this sheet is omitted for brevity from the workbook example.

stName: "Sheet2" specifies the unique name of the sheet, which is not case sensitive.

3.9.15 Workbook: BoundSheet8 3

This record is the same as the first <u>BoundSheet8</u> record example and specifies basic information about the third **sheet** in the **workbook** example. The fields that contain the same values as the first BoundSheet8 record are omitted for brevity.

Size	Structure	Value
000E	BoundSheet8 - BoundSheet8	
0004	FilePointer - IbPlyPos	0x0000088C
2 bits	USHORT - hsState	0x0
6 bits	USHORT - unused	0x00
8 bits	USHORT - dt	0x00
0008	ShortXLUnicodeString - stName	Sheet3

Figure 103: Structure of BoundSheet8

IbPlyPos: 0x0000088C specifies the stream position of the start of the <u>BOF</u> record for the sheet associated with this BoundSheet8 record. The <u>worksheet</u> substream for this sheet is omitted for brevity from the workbook example.

stName: "Sheet3" specifies the name of the sheet, which is not case sensitive.

3.9.16 Workbook: Country

This **Country** record specifies the **locale** information for a **workbook**.

Size	Structure	Value
0004	Country - Country	
0002	USHORT - iCountryDef	0x0001
0002	USHORT - iCountryWinIni	0×0001

Figure 104: Structure of Country

iCountryDef: 0x0001 specifies that the locale for the workbook is the United States.

iCountryWinIni: 0x0001 specifies that the system regional setting is United States.

3.9.17 Workbook: RecalcId

This <u>RecalcId</u> record specifies the recalculation engine identifier of the recalculation engine that last performed a recalculation.

Size	Structure	Value
0008	RecalcId - RecalcID	
0002	USHORT - rt	0x01C1
0002	USHORT - reserved	0x0000
0004	DWORD - dwBuild	0x0001BE22

Figure 105: Structure of RecalcID

rt: 0x01C1 specifies that the record identifier for this record is 449.

dwBuild: 0x0001BE22 specifies the recalculation engine identifier of the recalculation engine that performed the last recalculation, which is 114210.

3.9.18 Workbook: SST

This **SST** record specifies string constants.

Size	Structure	Value
001B	SST - Sst	
0004	LONG - cstTotal	0x00000002
0004	LONG - cstUnique	0x00000002
0013	XLUnicodeRichExtendedString[] - rgb	
0009	XLUnicodeRichExtendedString - rgb[0]	Number
000A	XLUnicodeRichExtendedString - rgb[1]	Formula

Figure 106: Structure of Sst

Fields in this record that are ignored because they are optional are omitted for brevity.

cstTotal: 0x00000002 specifies that there are two references in the **workbook** to the strings in the shared string table.

cstUnique: 0x00000002 specifies that there are two unique strings in the shared string table.

rgb: Specifies an array of Unicode strings.

rgb.rgb[0]: "Number" is the first string in the shared string table.

rgb.rgb[1]: "Formula" is the second string in the shared string table.

3.9.19 Workbook: ExtSST

This <u>ExtSST</u> record specifies the location of strings within the shared string table, specified in the previous <u>SST</u> record.

Size	Structure	Value
000A	ExtSST - ExtSst	
0002	USHORT - dsst	0x0008
0008	ISSTInf[] - rgISSTInf	
0008	ISSTInf - rgISSTInf[0]	
0004	FilePointer - ib	0x0000058C
0002	UINT - cbOffset	0x000C
0002	reserved - reserved	0x0000

Figure 107: Structure of ExtSst

dsst: 0x0008 specifies the default value for this field as specified by the formula in the ExtSST record.

rgISSTInf: Specifies the location of a set of strings within the SST record.

rgISSTInf.rgISSTInf[0].ib: 0x0000058C specifies that the FilePointer as specified in [MS-OSHARED] section 2.2.1.5 that specifies the zero-based offset into the Workbook stream is 1420.

rgISSTInf.rgISSTInf[0].cbOffset: 0x000C specifies that the zero-based offset into the SST record is 12.

3.9.20 Workbook: BookExt

This **BookExt** record specifies properties of the **workbook**.

Size	Structure	Value
0015	BookExt - BookExt	
000C	<u>FrtHeader</u> - FrtHeader	
0002	USHORT - rt	0x0863
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0008	reserved - reserved	0x000000000000000
0004	DWORD - cb	0x00000015
1 bit	DWORD - fDontAutoRecover	0x0
1 bit	DWORD - fHidePivotList	0x0
1 bit	DWORD - fFilterPrivacy	0x0
1 bit	DWORD - fEmbedFactoids	0x0
2 bits	DWORD - mdFactoidDisplay	0x0

Size	Structure	Value
1 bit	DWORD - fSavedDuringRecovery	0x0
1 bit	DWORD - fCreatedViaMinimalSave	0x0
1 bit	DWORD - fOpenedViaDataRecovery	0x0
1 bit	DWORD - fOpenedViaSafeLoad	0x0
22 bits	DWORD - reserved	0x000000
0001	BookExt Conditional11 - grbit1	
1 bit	BYTE - fBuggedUserAboutSolution	0x0
1 bit	BYTE - fShowInkAnnotation	0x1
6 bits	BYTE - unused	0x00

Figure 108: Structure of BookExt

Fields in this record that are ignored because they have zero values are omitted for brevity.

FrtHeader: This structure specifies a future record header.

FrtHeader.rt: 0x0863 is the required value for this field and specifies that this record is contained in a BookExt record.

FrtHeader.grbitFrt: This structure specifies flags used in the future record header.

FrtHeader.grbitFrt.fFrtRef: 0x0000 specifies that this FrtHeader does not specify a range of cells.

FrtHeader.grbitFrt.fFrtAlert: 0x0000 specifies that the user is not alerted of possible problems when saving this file without having recognized this record.

cb: 0x00000015 specifies that the size of the record is 21 bytes.

fDontAutoRecover: 0x0 specifies that **AutoRecover** is enabled for the workbook.

fHidePivotList: 0x0 specifies that the <u>PivotTable</u> field list is not **hidden** for this workbook.

fFilterPrivacy: 0x0 specifies that personal information is not removed from the workbook on save.

fEmbedFactoids: 0x0 specifies that smart tags are not embedded in this workbook on save.

mdFactoidDisplay: 0x0 specifies that the workbook displays smart tags as **smart tag actions buttons** and **smart tag indicators**.

fSavedDuringRecovery: 0x0 specifies that the workbook was not saved during AutoRecover.

fCreatedViaMinimalSave: 0x0 specifies the workbook was not created by a **minimal save** during **data recovery**.

fOpenedViaDataRecovery: 0x0 specifies that the workbook was not opened as a result of data recovery.

fOpenedViaSafeLoad: 0x0 specifies that the workbook was not opened in safe load mode.

grbit1: Specifies additional workbook information.

grbit1.fBuggedUserAboutSolution: 0x0 specifies that no warning is requested before loading a **manifest** that is a **smart document**.

grbit1.fShowInkAnnotation: 0x1 specifies that ink comments for the workbook are not displayed.

3.9.21 Workbook: EOF 1

This <u>EOF</u> record specifies the end of a collection of records as defined by <u>Globals Substream</u> **ABNF**.

Size	Structure
0000	EOF - EOF

Figure 109: Structure of EOF

3.9.22 Workbook: BOF 2

This $\underline{\mathsf{BOF}}$ record specifies the beginning of the $\underline{\mathsf{worksheet}}$ substream and specifies information about "Sheet1".

Size	Structure	Value
0014	BOF - BOF	
0002	USHORT - vers	0x0600
0002	USHORT - dt	0x0010
0002	USHORT - rupBuild	0x2013
0002	USHORT - rupYear	0x07CD
1 bit	DWORD - fWin	0x1
1 bit	DWORD - fRisc	0x0
1 bit	DWORD - fBeta	0x0
1 bit	DWORD - fWinAny	0x0
1 bit	DWORD - fMacAny	0x0
1 bit	DWORD - fBetaAny	0x0
2 bits	DWORD - unused1	0x3
1 bit	DWORD - fRiscAny	0x0
1 bit	DWORD - fOOM	0x0
1 bit	DWORD - fGlJmp	0x0
2 bits	DWORD - unused2	0x0
1 bit	DWORD - fFontLimit	0x0
4 bits	DWORD - verXLHigh	0x3
1 bit	DWORD - unused3	0x0
13 bits	DWORD - reserved1	0x0000
8 bits	DWORD - verLowestBiff	0x06
4 bits	DWORD - verLastXLSaved	0x3

Size	Structure	Value
20 bits	DWORD - reserved2	0x00000

Figure 110: Structure of BOF

vers: 0x0600 specifies that the file uses BIFF version 6.

dt: 0x0010 specifies that the records following this BOF record are part of the worksheet substream.

rupBuild: 0x2013 specifies that the version of the build is 8211.

rupYear: 0x07CD specifies that 1997 was the year when the file format version was first created.

fWin: 0x1 specifies that the file was last edited on a Windows platform.

fRisc: 0x0 specifies that the file was not lasted edited on a RISC platform.

fBeta: 0x0 specifies that the file was not last edited by a **beta** version of the application.

fWinAny: 0x0 specifies that the file has not been subsequently saved.

fMacAny: 0x0 specifies that the file has never been edited on a Macintosh platform.

fBetaAny: 0x0 specifies that the file has never edited on a beta version of the application.

fRiscAny: 0x0 specifies that the file has never been edited on a RISC platform.

fOOM: 0x0 specifies that the file never had an **out-of-memory** failure.

fGlJmp: 0x0 specifies that this file has never had an out-of-memory failure during rendering.

fFontLimit: 0x0 specifies that the file has never reached the 255 **font** limit.

verXLHigh: 0x3 specifies that the file was not edited in any applications after Office Excel 2003.

verLowestBiff: 0x06 specifies that the file is saved in BIFF version 6.

verLastXLSaved: 0x3 specifies that the file was last saved on Office Excel 2003.

3.9.23 Workbook: Index

The next record is an <u>Index</u> record that specifies row information and the file locations for all <u>DBCell</u> records corresponding to each row block in the **sheet**. This record, combined with the DBCell records, is used to optimize the <u>lookup of cells</u> in a <u>cell table</u>.

Size	Structure	Value
0014	Index - Index	
0004	ULONG - reserved	0x00000000
0004	RwLongU - rwMic	
0004	ULONG - rw	0x00000003
0004	ULONG - rwMac	0x00000007
0004	FilePointer - ibXF	0x00000686
0004	RgibRw - rgibRw	

Size	Structure	Value
0004	FilePointer - rgibRw[0]	0x0000073E

Figure 111: Structure of Index

rwMic: Specifies the first row that has a cell with data.

rwMic.rw: 0x00000003 specifies that row 4 is the first row with data or formatting.

rwMac: 0x00000007 specifies that row 7 is the last row with data or formatting. This field value specifies the row after the last row that has data or formatting.

ibXF: 0x00000686 specifies a FilePointer as specified in [MS-OSHARED] section 2.2.1.5 that specifies the file position of the DefColWidth record in this sheet.

rgibRw.rgibRw[0]: 0x0000073E specifies the file position of the DBCell record. This stream position is the start of the binary record, which begins with the two-byte record type and two-byte record size information. See the <u>record</u> overview for more details.

The records following this record, and before the next <u>DefaultRowHeight</u> record, are omitted for brevity.

3.9.24 Workbook: DefaultRowHeight

The next record is a <u>DefaultRowHeight</u> record that specifies the height of all empty rows in the current **sheet**.

Size	Structure	Value
0004	DefaultRowHeight - DefaultRowHeight	
1 bit	USHORT - fUnsynced	0x0
1 bit	USHORT - fDyZero	0x0
1 bit	USHORT - fExAsc	0x0
1 bit	USHORT - fExDsc	0x0
12 bits	USHORT - reserved	0x000
0002	SHORT - miyRw	0x00FF

Figure 112: Structure of DefaultRowHeight

fUnsynced: 0x0 specifies that default settings for the row height have not changed.

fDyZero: 0x0 specifies that empty rows do not have a height of zero.

fExAsc: 0x0 specifies that empty rows do not have a thick **border style** applied to the top **border**.

fExDsc: 0x0 specifies that empty rows do not have a thick border style applied to the bottom border.

miyRw: 0x00FF specifies 255 twips as the default row height for empty rows.

3.9.25 Workbook: WsBool

The next record is a WsBool record that specifies information about a **sheet**.

Size	Structure	Value
0002	WsBool - WsBool	
1 bit	USHORT - fShowAutoBreaks	0x1
3 bits	USHORT - reserved1	0x0
1 bit	USHORT - fDialog	0x0
1 bit	USHORT - fApplyStyles	0x0
1 bit	USHORT - fRowSumsBelow	0x1
1 bit	USHORT - fColSumsRight	0x1
1 bit	USHORT - fFitToPage	0x0
1 bit	USHORT - reserved2	0x0
2 bits	USHORT - unused	0x1
1 bit	USHORT - fSyncHoriz	0x0
1 bit	USHORT - fSyncVert	0x0
1 bit	USHORT - fAltExprEval	0x0
1 bit	USHORT - fAltFormulaEntry	0x0

Figure 113: Structure of WsBool

fShowAutoBreaks: 0x0001 specifies that **page breaks** inserted automatically on the sheet are **visible**.

fDialog: 0x0000 specifies that the sheet is not a **dialog sheet**.

fApplyStyles: 0x0000 specifies not to apply styles in an **outline** when an outline is applied.

fRowSumsBelow: 0x0001 specifies that summary rows appear below an outline's detail rows.

fColSumsRight: 0x0001 specifies that summary columns appear on the left if the sheet is displayed **left-to-right** or appear on the right if the sheet is displayed **right-to-left**.

fFitToPage: 0x0000 specifies that printable contents do not have to fit to a single page when the sheet is printed.

fSyncHoriz: 0x0000 specifies that horizontal scrolling is not synchronized across multiple windows displaying this sheet.

fSyncVert: 0x0000 specifies that vertical scrolling is not synchronized across multiple windows displaying this sheet.

fAltExprEval: 0x0000 specifies that the sheet does not use **transition formula evaluation**.

fAltFormulaEntry: 0x0000 specifies that the sheet does not use **transition formula entry**.

The records following this record, and before the next <u>Setup</u> record, are omitted for brevity.

3.9.26 Workbook: Setup

The next record is a <u>Setup</u> record that specifies the page-format settings used to print the current **sheet**.

Size	Structure	Value
0022	Setup - Setup	
0002	USHORT - iPaperSize	0x0000
0002	USHORT - iScale	0x00FF
0002	SHORT - iPageStart	0x0001
0002	USHORT - iFitWidth	0x0001
0002	USHORT - iFitHeight	0x0001
1 bit	BYTE - fLeftToRight	0x0
1 bit	BYTE - fPortrait	0x0
1 bit	BYTE - fNoPls	0x1
1 bit	BYTE - fNoColor	0x0
1 bit	BYTE - fDraft	0x0
1 bit	BYTE - fNotes	0x0
1 bit	BYTE - fNoOrient	0x0
1 bit	BYTE - fUsePage	0x0
1 bit	BYTE - unused1	0x0
1 bit	BYTE - fEndNotes	0x0
2 bits	BYTE - iErrors	0x0
4 bits	BYTE - unused2	0x0
0002	USHORT - iRes	0x0015
0002	USHORT - iVRes	0x0000
0008	Double - numHdr	0x3FE000000000000
0008	Double - numFtr	0x3FE000000000000
0002	USHORT - iCopies	0x3030

Figure 114: Structure of Setup

Fields in this record that are ignored because **fNoPls** is 1 are omitted for brevity.

iFitWidth: 0x0001 specifies that the sheet width is fit to one page.

iFitHeight: 0x0001 specifies that the sheet height is fit to one page.

fLeftToRight: 0x00 specifies that the pages are printed in columns.

fNoPls: 0x01 specifies that fields iPaperSize, iScale, iRes, iVRes, iCopies, fNoOrient, and

fPortrait data are undefined and ignored.

fNoColor: 0x00 specifies that the workbook is not printed in black and white.

fDraft: 0x00 specifies that the workbook is not printed using draft quality.

fNotes: 0x00 specifies that cell notes are not printed. The **fEndNotes** field is not included in this example for brevity.

fUsePage: 0x00 specifies that no custom starting page number is being used to print. The **iPageStart** field is not included in this example for brevity.

iErrors: 0x00 specifies that errors in the cell data are printed as displayed on the sheet.

numHdr: 0x3FE000000000000 specifies that the header margin is .5 inches.

numFtr: 0x3FE0000000000000 specifies that the footer margin is .5 inches.

3.9.27 Workbook: DefColWidth

The next record is a **DefColWidth** record that specifies the default column width of a **sheet**.

Size	Structure	Value
0002	DefColWidth - DefColWidth	
0002	USHORT - cchdefColWidth	0x0008

Figure 115: Structure of DefColWidth

cchdefColWidth: 0x0008 specifies that the default width of the columns in the sheet is 8 characters.

3.9.28 Workbook: Dimensions

The next record is a <u>Dimensions</u> record that specifies the minimum and maximum bounds of all **cells** on the sheet that contain data or formatting.

Size	Structure	Value
000E	Dimensions - Dimensions	
0004	RwLongU - rwMic	
0004	ULONG - rw	0x00000003
0004	ULONG - rwMac	0x00000007
0002	ColU - colMic	
0002	USHORT - col	0x0001
0002	USHORT - colMac	0x0002
0002	USHORT - reserved	0x0000

Figure 116: Structure of Dimensions

rwMic: Specifies the first row in the **sheet** that contains a cell with data or formatting.

rwMic.rw: 0x00000003 specifies that the first row with data or formatting is row 4.

rwMac: 0x00000007 specifies that that row 7 is the last row with data or formatting. This field value specifies the row after the last row that has data or formatting.

colMic: Specifies the first column in the sheet that contains a cell with data or formatting.

colMic.col: 0x0001 specifies that column B is the first column with data or formatting.

colMac: 0x0002 specifies that column B is the last column with data or formatting. This field value specifies the column after the last column that has data or formatting.

3.9.29 Workbook: Row 1

This record is a **Row** record that specifies a single row on a **sheet**.

Size	Structure	Value
0010	Row - Row	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0003
0002	USHORT - colMic	0x0001
0002	USHORT - colMac	0x0002
0002	USHORT - miyRw	0x00FF
0002	SHORT - reserved1	0x0000
0002	SHORT - unused1	0x0000
3 bits	BYTE - iOutLevel	0x0
1 bit	BYTE - reserved2	0x0
1 bit	BYTE - fCollapsed	0x0
1 bit	BYTE - fDyZero	0x0
1 bit	BYTE - fUnsynced	0x0
1 bit	BYTE - fGhostDirty	0x0
0001	BYTE - reserved3	0x01
12 bits	SHORT - ixfe_val	0x00F
1 bit	SHORT - fExAsc	0x0
1 bit	SHORT - fExDes	0x0
1 bit	SHORT - fPhonetic	0x0
1 bit	SHORT - unused2	0x0

Figure 117: Structure of Row

rw: Specifies the row index.

rw.rw: 0x0003 specifies that this record is for row 4.

colMic: 0×0001 specifies that column B is the first column that contains a **cell** populated with data or formatting.

colMac: 0x0002 specifies that column B is the last column that contains a cell populated with data or formatting.

miyRw: 0x00FF specifies the row height as 255 **twips**.

iOutLevel: 0x00 specifies the row has no **outline level**.

fDyZero: 0x00 specifies that the row is not hidden.

fUnsynced: 0x00 specifies that the row height has not been manually set.

fGhostDirty: 0x00 specifies that the row has not been formatted.

ixfe_val: 0x000F specifies that this row uses the default formatting.

fExAsc: 0x0000 specifies that no cell in the row has a thick top **border**.

fExDes: 0x0000 specifies that no cell in the row has a thick bottom border.

fPhonetic: 0x0000 specifies that **phonetic guide** is not enabled for any cell in this row.

3.9.30 Workbook: Row 2

This record is another **Row** record that specifies a single row on a **sheet**.

Size	Structure	Value
0010	Row - Row	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0004
0002	USHORT - colMic	0x0001
0002	USHORT - colMac	0x0002
0002	USHORT - miyRw	0x00FF
0002	SHORT - reserved1	0x0000
0002	SHORT - unused1	0x0000
3 bits	BYTE - iOutLevel	0x0
1 bit	BYTE - reserved2	0x0
1 bit	BYTE - fCollapsed	0x0
1 bit	BYTE - fDyZero	0x0
1 bit	BYTE - fUnsynced	0x0
1 bit	BYTE - fGhostDirty	0x0
0001	BYTE - reserved3	0x01
12 bits	SHORT - ixfe_val	0x00F
1 bit	SHORT - fExAsc	0x0
1 bit	SHORT - fExDes	0x0
1 bit	SHORT - fPhonetic	0x0
1 bit	SHORT - unused2	0x0

Figure 118: Structure of Row

Fields in this record that are explained in previous records in this example are omitted for brevity.

rw.rw: 0x0004 specifies that this record is for row 5.

3.9.31 Workbook: Row 3

This record is another **Row** record that specifies a single row on a **sheet**.

Size	Structure	Value
0010	Row - Row	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0005
0002	USHORT - colMic	0x0001
0002	USHORT - colMac	0x0002

1 bit	SHORT - fExAsc	0x0
1 bit	SHORT - fExDes	0x0
1 bit	SHORT - fPhonetic	0x0
1 bit	SHORT - unused2	0x0

Figure 119: Structure of Row

Fields in this record that are explained in previous records in this example are omitted for brevity.

rw.rw: 0x0005 specifies that this record is for row 6.

3.9.32 Workbook: Row 4

This record is another **Row** record that specifies a single row on a **sheet**.

Size	Structure	Value
0010	Row - Row	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0006
0002	USHORT - colMic	0x0001
0002	USHORT - colMac	0x0002
0002	USHORT - miyRw	0x00FF

12 bits	SHORT - ixfe_val	0x00F
1 bit	SHORT - fExAsc	0x0
1 bit	SHORT - fExDes	0x0
1 bit	SHORT - fPhonetic	0x0
1 bit	SHORT - unused2	0x0

Figure 120: Structure of Row

Fields in this record that are explained in previous records in this example are omitted for brevity.

rw.rw: 0x0006 specifies that this record is for row 7.

3.9.33 Workbook: LabelSst 1

This record is a <u>LabelSst</u> record that specifies a string that is stored in a **cell** as a reference to the shared string table.

Size	Structure	Value
000A	LabelSst - LabelSst	
0006	<u>Cell</u> - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0003

Size	Structure	Value
0002	<u>Col</u> - col	
0002	USHORT - col	0x0001
0002	IXFCell - ixfe	
0002	USHORT - ixfe	0x000F
0004	ULONG - isst	0x00000000

Figure 121: Structure of LabelSst

cell: Specifies a cell in a **sheet**.

cell.rw: Specifies a row in the sheet. **cell.rw:rw:** 0x0003 specifies row 4.

cell.col: Specifies a column in the sheet. **cell.col.col:** 0x0001 specifies column B.

cell.ixfe: Specifies the index of a <u>cell XF</u> record that describes the formatting properties for the cell.

cell.ixfe.ixfe: 0x000F specifies that this cell uses the default cell format.

isst: 0x00000000 specifies that 0 is the zero-based index into the **rgb** field of <u>SST</u>, which specifies that the text for this cell is "Number".

3.9.34 Workbook: RK

This record is an RK record that specifies the numeric data contained in a single cell.

Size	Structure	Value
000A	RK - Rk	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0004
0002	Col - col	
0002	USHORT - col	0x0001
0006	RkRec - rkrec	
0002	IXFCell - ixfe	
0002	USHORT - ixfe	0x000F
0004	<u>RkNumber</u> - RK	
1 bit	ULONG - FX100	0x0
1 bit	ULONG - FInt	0x0
30 bits	ULONG - num	0x0FFC0000

Figure 122: Structure of Rk

rw: Specifies a row in the sheet.

rw.rw: 0x0004 specifies row 5.

col: Specifies a column in the sheet.

col.col: 0x0001 specifies column B.

rkrec: Specifies the numeric data for this cell.

rkrec.ixfe: Specifies the index of a <u>cell XF</u> record that describes the formatting properties for the cell.

rkrec.ixfe.ixfe: 0x000F specifies that this cell uses the default cell format.

rkrec.RK: An RkNumber that specifies a numeric value.

rkrec.RK.FX100: 0x0 specifies that the value in the **rkrec.RK.num** field was not multiplied by 100 when it was saved.

rkrec.RK.FInt: 0x0 specifies that the value in the **rkrec.RK.num** field is the 30 most significant bits of a 64-bit binary floating-point number as defined in [IEEE754].

rkrec.RK.num: 0x0FFC0000 specifies the 30 most significant bits of a 64-bit binary floating-point number as defined in [IEEE754]. The remaining 34 bits are 0, which evaluates to a numeric value of 1.

3.9.35 Workbook: LabelSst 2

This record is a <u>LabelSst</u> record that specifies a string that is stored in a **cell** as a reference to the shared string table.

Size	Structure	Value
000A	LabelSst - LabelSst	
0006	<u>Cell</u> - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0005
0002	<u>Col</u> - col	
0002	USHORT - col	0x0001
0002	IXFCell - ixfe	
0002	USHORT - ixfe	0x000F
0004	ULONG - isst	0x00000001

Figure 123: Structure of LabelSst

Fields in this record that are explained in previous records in this example are omitted for brevity.

cell.rw.rw: 0x0005 specifies row 6.

isst: 0x00000001 specifies that 1 is the zero-based index into the **rgb** field of <u>SST</u>, which specifies that the text for this cell is "Formula".

3.9.36 Workbook: Formula

This record is a Formula record that specifies a formula (section 2.2.2) for a **cell**.

Size	Structure	Value
0022	Formula - Formula	
0006	Cell - cell	
0002	<u>Rw</u> - rw	
0002	USHORT - rw	0x0006
0002	Col - col	
0002	USHORT - col	0x0001
0002	IXFCell - ixfe

1 bit	BYTE - reserved	0x0
0002	<u>Ftab</u> - iftab	
0002	WORD - iftab	0x0014

Figure 124: Structure of Formula

cell: Specifies a cell on the sheet.

cell.rw: Specifies the row of the cell.

cell.rw.rw: 0x0006 specifies row 7.

cell.col: Specifies the column of the cell.

cell.col.col: 0x0001 specifies column B.

cell.ixfe: Specifies the index of a cell XF record that describes the formatting properties for the cell.

cell.ixfe.ixfe: 0x000F specifies that this cell uses the default cell format.

val: 0x3FF6A09E667F3BCD specifies the floating-point value of 1.4142135623731, which is the value in the cell as a result of the last calculation.

fAlwaysCalc: 0x0 specifies that the formula does not need to be recalculated.

fFill: 0x0 specifies this cell does not have a fill alignment or a center-across-selection alignment.

fShrFmla: 0x0 specifies that the formula is not part of a shared formula.

fClearErrors: 0x0 specifies that the formula is not excluded from formula error checking.

chn: Specifies an application-specific cache. This is optionally used and can be ignored.

formula: Specifies a formula.

formula.cce: 0x000C specifies the length of **rgce** in bytes.

formula.rgce: Specifies the sequence of Ptgs for the formula SQRT(B5*2).

formula.rgce.Ptg[0]: Specifies a single element of a formula.

formula.rgce.Ptg[0].PtgRef: Specifies a reference to a single cell on the current sheet.

formula.rgce.Ptg[0].PtgRef.ptg: 0x04 specifies that this Ptg is a PtgRef.

formula.rgce.Ptg[0].PtgRef.type: 0x2 specifies that this PtgRef uses a value data type.

formula.rgce.Ptg[0].PtgRef.loc: Specifies the cell referenced by this Ptg.

formula.rgce.Ptg[0].PtgRef.loc.row: Specifies the row of the referenced cell.

formula.rgce.Ptg[0].PtgRef.loc.row.rw: 0x0004 specifies that the referenced cell is in row 5.

formula.rgce.Ptg[0].PtgRef.loc.column: Specifies the column of the referenced cell.

formula.rgce.Ptg[0].PtgRef.loc.column.col: 0x0001 specifies that the referenced cell is in column B.

formula.rgce.Ptg[0].PtgRef.loc.column.colRelative: 0x1 specifies that the column reference is a **relative reference**.

formula.rgce.Ptg[0].PtgRef.loc.column.rowRelative: 0x1 specifies that the row reference is a relative reference.

formula.rgce.Ptg[1]: Specifies a single element of a formula.

formula.rgce.Ptg[1].PtgInt: Specifies an integer value.

formula.rgce.Ptg[1].PtgInt.ptg: 0x1E specifies that this is a PtgInt.

formula.rgce.Ptg[1].PtgInt.integer: 0x0002 specifies that the value is 2.

formula.rgce.Ptg[2]: Specifies a single element of a formula.

formula.rgce.Ptg[2].PtgMul: Specifies a binary-value-operator that multiplies the first and second expressions in a binary-value-expression.

formula.rgce.Ptg[2].PtgMul.ptg: 0x05 specifies that this Ptg is a PtgMul.

formula.rgce.Ptg[3]: Specifies a single element of a formula.

formula.rgce.Ptg[3].PtgFunc: Specifies a mathematical function.

formula.rgce.Ptg[3].PtgFunc.ptg: 0x01 specifies that this is a PtgFunc.

formula.rgce.Ptg[3].PtgFunc.type: 0x2 specifies that this Ptg uses a value data type.

formula.rgce.Ptg[3].PtgFunc.iftab: Specifies the function to be called for this Ptg.

formula.rgce.Ptg[3].PtgFunc.iftab: 0x0014 specifies that SQRT is the function to be called.

3.9.37 Workbook: DBCell

This record is a <u>DBCell</u> record that specifies the location of the first row and the first cell record in each row of the current row block in the <u>workbook stream</u>.

Size	Structure	Value
000C	DBCell - DbCell	
0004	ULONG - dbRtrw	0x000000A0
0008	Rgdb - rgdb	
0002	USHORT - rgdb[0]	0x003C
0002	USHORT - rgdb[1]	0x000E
0002	USHORT - rgdb[2]	0x000E
0002	USHORT - rgdb[3]	0x000E

Figure 125: Structure of DbCell

dbRtrw: 0x000000A0 specifies the offset from the file position of this record to the file position of the first row record.

rgdb: Specifies the file offset to the first cell record in each row.

rgdb.rgdb[0]: 0x003C specifies the file offset in bytes to the first record that specifies a <u>CELL</u> in each row that is a part of this row block. The starting position of this offset is specified relative to the file position of the end of the first <u>Row</u> record in the row block

rgdb.rgdb[1]: 0x000E specifies the file offset in bytes to the first record that specifies a CELL in each row that is a part of this row block. The offset is specified relative to the file position of the CELL record specified by the previous element in this array.

rgdb.rgdb[2]: 0x000E specifies the file offset in bytes to the first record that specifies a CELL in each row that is a part of this row block. The offset is specified relative to the file position of the CELL record specified by the previous element in this array.

rgdb.rgdb[3]: 0x000E specifies the file offset in bytes to the first record that specifies a CELL in each row that is a part of this row block. The offset is specified relative to the file position of the CELL record specified by the previous element in this array.

3.9.38 Workbook: Window2

This record is a Window2 record that specifies attributes of the window used to display the **sheet**.

Size	Structure	Value
0012	Window2 - Window2	
1 bit	USHORT - fDspFmlaRt	0x0
1 bit	USHORT - fDspGridRt	0x1
1 bit	USHORT - fDspRwColRt	0x1
1 bit	USHORT - fFrozenRt	0x0
1 bit	USHORT - fDspZerosRt	0x1

Size	Structure	Value
1 bit	USHORT - fDefaultHdr	0x1
1 bit	USHORT - fRightToLeft	0x0
1 bit	USHORT - fDspGuts	0x1
1 bit	USHORT - fFrozenNoSplit	0x0
1 bit	USHORT - fSelected	0x1
1 bit	USHORT - fPaged	0x1
1 bit	USHORT - fSLV	0x0
4 bits	USHORT - reserved1	0x0
0002	RwU - rwTop	
0002	USHORT - rw	0x0000
0002	ColU - colLeft	
0002	USHORT - col	0x0000
0002	<u>Icv</u> - icvHdr	
0002	USHORT - icv	0x0040
0002	USHORT - reserved2	0x0000
0002	USHORT - wScaleSLV	0x0000
0002	USHORT - wScaleNormal	0x0000
0002	USHORT - unused	0x0000
0002	USHORT - reserved3	0x0000

Figure 126: Structure of Window2

fDspFmlaRt: 0x0 specifies that this window displays values.

fDspGridRt: 0x1 specifies that this window displays gridlines.

fDspRwColRt: 0x1 specifies that this window displays row headings and column headings.

fFrozenRt: 0x0 specifies that the panes in the window are not **frozen**. The **fFrozenNoSplit** field is not included in this example for brevity.

fDspZerosRt: 0x1 specifies that this window displays each cell that has a value of zero as a zero.

fDefaultHdr: 0x1 specifies that the gridlines of this window are drawn in the default **foreground color** of the window.

fRightToLeft: 0x0 specifies that the text is displayed **left-to-right**.

fDspGuts: 0x1 specifies that this window displays the **outline state**.

fSelected: 0x1 specifies that the **sheet tab** is **selected**.

fPaged: 0x1 specifies that the sheet is currently being displayed in the window.

fSLV: 0x0 specifies that the sheet is not in **Page Break Preview view**.

rwTop.rw: 0x0000 specifies row 1 as the first visible row on the sheet.

colLeft.col: 0x0000 specifies column 1 as the first visible column on the sheet.

icvHdr.icv: 0x0040 specifies that the gridlines of this window are drawn in the default foreground

color of the window.

 $\textbf{wScaleSLV:} \ 0 \times 00000 \ \text{specifies that the } \textbf{zoom level} \ \text{in the Page Break Preview view is the default}$

zoom level.

wScaleNormal: 0x0000 specifies that the zoom level in the Normal view is the default zoom level.

3.9.39 Workbook: Selection

This record is a <u>Selection</u> record that specifies the **selected cells** within a **sheet**.

Size	Structure	Value
000F	Selection - Selection	
0001	PaneType - pnn	0x03
0002	RwU - rwAct	
0002	USHORT - rw	0x0007
0002	ColU - colAct	
0002	USHORT - col	0x0001
0002	USHORT - irefAct	0x0000
0002	USHORT - cref	0x0001
0006	<u>SqRefU</u> - rgref	
0006	RefU - rgref[0]	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0007
0002	RwU - rwLast	
0002	USHORT - rw	0x0007
0001	ColByteU - colFirst	
0001	BYTE - col	0x01
0001	ColByteU - colLast	
0001	BYTE - col	0x01

Figure 127: Structure of Selection

pnn: 0x03 specifies that a top left pane is the **active pane**.

rwAct: An RwU that specifies the row number of the active cell.

rwAct.rw: 0x0007 specifies that row 8 contains the active cell.

colAct: A ColU that specifies the column number of the active cell.

colAct.col: 0x0001 specifies that column B contains the active cell.

irefAct: 0x0000 specifies an index into the rgref array that specifies the range of cells that contain

the active cell.

cref: 0x0001 specifies that there is 1 range of cells in the **rgref** array of this record.

rgref: An array of RefU that specifies ranges of selected cells in the sheet.

rgref.rgref[0]: Specifies a range of cells on the sheet.

rgref.rgref[0].rwFirst: An RwU that specifies the first row in the range.

rgref.rgref[0].rwFirst.rw: 0x0007 specifies that row 8 is the first row in the range.

rgref.rgref[0].rwLast: Specifies the last row in the range.

rgref.rgref[0].rwLast.rw: 0x0007 specifies that row 8 is the last row in the range.

rgref.rgref[0].colFirst: A ColByteU that specifies the first column in the range.

rgref.rgref[0].colFirst.col: 0x01 specifies that column B is the first column in the range.

rgref.rgref[0].colLast: A ColByteU that specifies the last column in the range.

rgref.rgref[0].colLast.col: 0x01 specifies that column B is the last column in the range.

3.9.40 Workbook: PhoneticInfo

This record is a <u>PhoneticInfo</u> record that specifies the default format for **phonetic strings** and the **ranges** of **cells** on the **sheet** that have **visible** phonetic strings.

Size	Structure	Value
0006	PhoneticInfo - PhoneticInfo	
0004	Phs - phs	
0002	FontIndex - ifnt	
0002	USHORT - ifnt	0x0000
2 bits	USHORT - phType	0x3
2 bits	USHORT - alcH	0x1
12 bits	USHORT - unused	0x003
0002	SqRef - sqref	
0002	USHORT - cref	0x0000

Figure 128: Structure of PhoneticInfo

phs: A Phs structure that specifies the default format for phonetic string on the sheet.

phs.ifnt: A FontIndex structure that specifies the **font** for the string.

phs.ifnt.ifnt: 0x0000 specifies that the default font is used.

phs.phType: 0x0003 specifies that phonetic string can use any type of characters.

phs.alcH: 0x0001 specifies that left alignment is used in the phonetic string.

sqref: A SqRef structure that specifies the ranges of cells on the sheet that have visible phonetic strings.

sqref.cref: 0x0000 specifies the number of elements in **rgrefs**. The **rgrefs** field is not included in this example for brevity.

3.9.41 Workbook: EOF 2

This record is an <u>EOF</u> record which specifies the end of a collection of records for this <u>worksheet</u> substream.

Size	Structure
0000	EOF - EOF

Figure 129: Structure of EOF

The remaining records in this **workbook** example, two Worksheet substreams, are omitted for brevity.

3.10 PivotTable

This example shows a <u>PivotTable</u> and associated <u>PivotCache</u> within a **workbook**. The PivotTable uses a range of cells (A1:E45) in the "Source Data" **sheet** as its **data source**. A CustomerName field and ProductName field are added to the <u>row area</u>, a Quantity field to the <u>data area</u>, and an OrderDate field to the <u>page area</u> of this PivotTable. Two dates are selected in the **filter** for the OrderDate field; the other dates are filtered out from page area. This example addresses important PivotTable records, and those records that are relevant to different parts of the PivotTable from the <u>Workbook stream</u> and <u>Pivot Cache Storage stream</u>.

The following figure shows a possible implementation of the PivotTable discussed in this example.

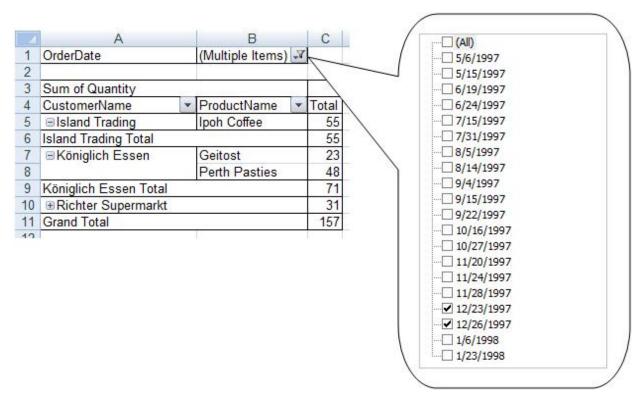

Figure 130: Example PivotTable within a sheet

3.10.1 PivotTable: SXStreamID

The first record, an <u>SXStreamID</u>, specifies the stream in the <u>PivotCache storage</u> that contains the <u>PivotCache for this PivotTable</u>.

Size	Structure	Value
0002	SXStreamID - SxStreamID	
0002	USHORT - idstm	0x0001

Figure 131: Structure of SxStreamID

idstm: 0x0001 specifies the identifier of the stream in the PivotCache storage that contains the PivotCache for this PivotTable. The stream identifier is a four-character string representation of the hexadecimal value. In this case the stream identifier is "0001".

3.10.2 PivotTable: SXVS

The next record, an <u>SXVS</u>, specifies that the type of <u>source data</u> used for this <u>PivotCache</u> is a **range**.

Size	Structure	Value
0002	SXVS - SXVS	
0002	USHORT - sxvs	0x0001

Figure 132: Structure of SXVS

sxvs: 0x0001 specifies that the source data for this PivotTable is a range. The <u>DConRef</u> record that follows this record specifies the range.

3.10.3 PivotTable: DConRef

The next record, a <u>DConRef</u>, specifies the **range** in this **workbook** that is the <u>source data</u> for this <u>PivotTable</u>.

Size	Structure	Value
0016	DConRef - DConRef	
0006	<u>RefU</u> - ref	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0000
0002	RwU - rwLast	
0002	USHORT - rw	0x002C
0001	ColByteU - colFirst	
0001	BYTE - col	0x00
0001	ColByteU - colLast	
0001	BYTE - col	0x04
0002	USHORT - cchFile	0x000C
000D	DConFile - stFile	
000D	XLUnicodeStringNoCch - stFile	Source Data
0001	unused - unused	0x00

Figure 133: Structure of DConRef

ref: A RefU structure that specifies the range of the source data for this PivotTable in the **sheet** specified by **stFile**.

- **ref.rwFirst:** An RwU structure that specifies the first row in the range of the source data for this PivotTable.
- **ref.rwFirst.rw:** 0x0000 specifies that the range of the source data for this PivotTable begins in row 1 of the sheet specified by **stFile**.
- **ref.rwLast:** An RwU structure that specifies the last row in the range of the source data for this PivotTable.
- **ref.rwLast.rw:** 0x002C specifies that the range of the source data for this PivotTable ends in row 45 of the sheet specified by **stFile.**
- **ref.colFirst:** A ColByteU structure that specifies the first column in the range of the source data for this PivotTable.
- **ref.colFirst.col:** 0x00 specifies that the range of the source data for this PivotTable begins in the column A of the sheet specified by **stFile.**

- **ref.colLast:** A ColByteU structure that specifies the last column in the range of the source data for this PivotTable.
- **ref.colLast.col:** 0x04 specifies that the range of the source data for this PivotTable ends in column E of the sheet specified by **stFile**.

cchFile: 0x000C specifies that stFile is 12 characters in length.

stFile: A DConFile structure that specifies the name of the worksheet that contains the range of the source data for this PivotTable.

stFile.stFile: A string, "Source Data", that specifies the name of the worksheet that contains the range of the source data for this PivotTable.

3.10.4 PivotTable: SXAddl 1

The next record, <u>SXAddl</u>, specifies additional information for this <u>PivotTable view</u>.

Size	Structure	Value
000C	SXAddl SXCCache SXDId - SXAddl	
0006	SXAddlHdr - hdr	
0004	FrtHeaderOld - frtHeaderOld	
0002	USHORT - rt	0x0864
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0001	BYTE - sxc	0x03
0001	BYTE - sxd	0x00
0004	ULONG - idCache	0x0000001
0002	USHORT - reserved	0x0000

Figure 134: Structure of SXAddl

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.frtHeaderOld: A structure that specifies a future record type header.

hdr.frtHeaderOld.rt: 0x0864 specifies the record type identifier for this record.

hdr.frtHeaderOld.grbitFrt: A structure that specifies flags for hdr.FrtHeaderOld.

hdr.frtHeaderOld.grbitFrt.fFrtRef: 0x0 specifies that this record does not specify a range of cells.

hdr.frtHeaderOld.grbitFrt.fFrtAlert: 0x0 specifies that the application does not alert the user about possible problems if the file is saved without the record being recognized.

hdr.sxc: 0x03 specifies the current class as an SxcCache class.

hdr.sxd: 0x00 specifies the type of record contained in the **data** field of the containing SXAddl record. This value specifies that the type of this SXAddl record is SXAddl_SXCCache_SXDId.

idCache: 0x00000001 specifies the PivotCache stream that is associated with this SxcCache class.

3.10.5 PivotTable: SXAddl 2

The next record, SXAddl, specifies additional information for this PivotTable view.

Size	Structure	Value
001C	SXAddl SXCCache SXDVer10Info - SXAddl	
0006	SXAddlHdr - hdr	
0004	<u>FrtHeaderOld</u> - frtHeaderOld	
0002	USHORT - rt	0x0864
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0001	BYTE - sxc	0x03
0001	BYTE - sxd	0x02
0006	reserved - reserved1	0x00000000000
0004	LONG - citmGhostMax	0xFFFFFFF
0001	BYTE - bVerCacheLastRefresh	0x02
0001	BYTE - bVerCacheRefreshableMin	0x00
0008	<u>DateAsNum</u> - numDateCopy	
0008	Double - dateNum	0x40E355907CBEB8CE
0002	USHORT - reserved2	0x0000

Figure 135: Structure of SXAddl

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.sxc: 0x03 specifies the current class as an SxcCache class.

hdr.sxd: 0x02 specifies the type of record contained in the **data** field of the containing SXAddl record. See class for more information. This value specifies that the type of this SXAddl record is SXAddl_SXCCache_SXDVer10Info.

citmGhostMax: 0xFFFFFFF specifies that the number of unused <u>cache items</u> to allow before discarding those that are unused is not determined by the file; instead, the application optimizes the number of unused cache items at run time.

bVerCacheLastRefresh: 0x02 specifies the <u>data functionality level</u> with which the <u>PivotCache</u> was last refreshed.

bVerCacheRefreshableMin: 0x00 specifies the lowest data functionality level with which the application is allowed to **refresh** the PivotCache.

numDateCopy: Specifies the date and time when the PivotCache was last refreshed.

numDateCopy.dateNum: 0x40E355907CBEB8CE specifies a DateAsNum structure which indicates that this PivotCache was last refreshed on May 28th, 2008 at 12:21PM.

3.10.6 PivotTable: SXAddl 3

The next record in this example, <u>SXAddl</u>, specifies additional information for this <u>PivotTable view</u>.

Size	Structure	Value
000C	SXAddl SXCCache SXDEnd - SXAddl	
0006	SXAddlHdr - hdr	
0004	FrtHeaderOld - frtHeaderOld	
0002	USHORT - rt	0x0864
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0001	BYTE - sxc	0x03
0001	BYTE - sxd	0xFF
0006	reserved - reserved	0x00000000000

Figure 136: Structure of SXAddl

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.sxc: 0x03 specifies the current <u>class</u> as an <u>SxcCache class</u>.

hdr.sxd: 0xFF specifies the type of record contained in the **data** field of the containing SXAddl record. See class for more information. This value specifies that the type of this SXAddl record is SXAddl_SXCCache_SXDEnd.

3.10.7 PivotTable: SxView

The next record in this example, \underline{SxView} , specifies the top-level $\underline{PivotTable}$ information for this $\underline{PivotTable}$.

Size	Structure	Value
0042	SxView - SxView	

Size	Structure	Value
0008	Ref8U - ref	
0002	RwU - rwFirst	
0002	USHORT - rw	0x0002
0002	RwU - rwLast	
0002	USHORT - rw	0x000A
0002	ColU - colFirst	
0002	USHORT - col	0x0000
0002	ColU - colLast	
0002	USHORT - col	0x0002
0002	RwU - rwFirstHead	
0002	USHORT - rw	0x0004
0002	RwU - rwFirstData	
0002	USHORT - rw	0x0004
0002	ColU - colFirstData	
0002	USHORT - col	0x0002
0002	SHORT - iCache	0x0000
0002	SHORT - reserved	0x0000

1 bit	USHORT - fAtrPat	0x0
1 bit	USHORT - fAtrProc	0x1
6 bits	USHORT - unused2	0x00
0002	<u>AutoFmt8</u> - itblAutoFmt	0x0001
0002	USHORT - cchTableName	0x0010
0002	USHORT - cchDataName	0x0004
0011	XLUnicodeStringNoCch - stTable	OrdersPivotTable
0005	XLUnicodeStringNoCch - stData	Data

Figure 137: Structure of SxView

ref: A structure that specifies the range (A2:C11) that specifies the location of the PivotTable view.

ref.rwFirst: A structure that specifies the first row in the range.

ref.rwFirst.rw: 0x0002 specifies the third row (row 3) in the **sheet**.

ref.rwLast: A structure that specifies the last row in the range.

ref.rwLast.rw: 0x000A specifies the eleventh row (row 11) in the sheet.

ref.colFirst: A structure that specifies the first column in the range.

ref.colFirst.col: 0x0000 specifies the first column (column A) in the sheet.

ref.colLast: A structure that specifies the last column in the range.

ref.colLast.col: 0x0002 specifies the third column (column C) in the sheet.

rwFirstHead: A structure that specifies the first PivotTable **header row**.

rwFirstHead.rw: 0x0004 specifies the fifth row (row 5) in the sheet.

rwFirstData: A structure that specifies the first row that contains PivotTable data.

rwFirstData.rw: 0x0004 specifies the fifth row (row 5) in the sheet.

colFirstData: A structure that specifies the first column that contains PivotTable data.

colFirstData.col: 0x0002 specifies the third column (column C) in the sheet.

iCache: 0x0000 specifies the index of the <u>PivotCache</u> for this PivotTable, which is the first stream in the _SX_DB_CUR storage.

sxaxis4Data: A structure that specifies the default axis for data fields. Only the **sxaxisRow** and **sxaxisCol** bits of the structure are shown, as the rest of the bits are always 0.

sxaxis4Data.sxaxisRw: 0x0001 specifies that the row axis is the default axis for data fields.

sxaxis4Data.sxaxisCol: 0x0000 is required in this field because sxaxisRw is 0x0001.

sxaxis4Data.sxaxisPage: 0x0000 is required in this field because sxaxisRw is 0x0001.

sxaxis4Data.sxaxisData: 0x0000 is required in this field because sxaxisRw is 0x0001.

ipos4Data: 0xFFFF (-1) specifies that the data field is in the default position.

cDim: 0x0005 specifies that there are five fields in the database.

cDimRw: 0x0002 specifies that there are two fields on the row axis.

cDimCol: 0x0000 specifies that there are no fields on the <u>column axis</u>.

cDimPg: 0x0001 specifies that there is one field on the <u>page axis</u>.

cDimData: 0x0001 specifies that there is one field on the <u>data axis</u>.

cRw: 0x0007 specifies that there are seven pivot lines in the row area of this PivotTable view.

cCol: 0x0001 specifies that there is one pivot line in the column area of this PivotTable view.

fRwGrand: 0x0001 specifies that this PivotTable view contains **grand totals** for rows.

fColGrand: 0x0001 specifies that this PivotTable view contains grand totals for columns.

fAutoFormat: 0x0001 specifies that this PivotTable has **AutoFormat** applied.

fAtrNum: 0x0000 specifies that this PivotTable does not have AutoFormat applied for numbers.

fAtrFnt: 0x0000 specifies that this PivotTable does not have AutoFormat applied for fonts.

fAtrAlc: 0x0000 specifies that this PivotTable does not have AutoFormat applied for alignment.

fAtrBdr: 0x0000 specifies that this PivotTable does not have AutoFormat applied for **borders**.

fAtrPat: 0x0000 specifies that this PivotTable does not have AutoFormat applied for patterns.

fAtrProc: 0x0000 specifies that this PivotTable has AutoFormat applied for width and height.

itblAutoFmt: XL8_ITBLCLASSIC1 specifies that this PivotTable is using the "Classic" style of AutoFormat.

cchTableName: 0x0010 specifies that the string in **stTable** has 16 characters.

cchDataName: 0x0004 specifies that the string in **stData** has four characters.

stTable: Specifies that the name of this PivotTable view is "OrdersPivotTable".

stData: Specifies that the name of the data <u>pivot field</u> is "Data".

3.10.8 PivotTable: Sxvd 1

The next record in this example, <u>Sxvd</u>, specifies the first <u>pivot field</u> ("CustomerName") in the <u>row axis</u>.

Size	Structure	Value
000A	Sxvd - Sxvd	
0002	<u>SXAxis</u> - sxaxis	
1 bit	USHORT - sxaxisRw	0x1
1 bit	USHORT - sxaxisCol	0x0
1 bit	USHORT - sxaxisPage	0x0
1 bit	USHORT - sxaxisData	0x0
12 bits	USHORT - reserved	0x000
0002	USHORT - cSub	0x0001
1 bit	USHORT - fDefault	0x1
1 bit	USHORT - fSum	0x0
1 bit	USHORT - fCounta	0x0
1 bit	USHORT - fAverage	0x0
1 bit	USHORT - fMax	0x0
1 bit	USHORT - fMin	0x0
1 bit	USHORT - fProduct	0x0
1 bit	USHORT - fCount	0x0
1 bit	USHORT - fStdev	0x0
1 bit	USHORT - fStdevp	0x0
1 bit	USHORT - fVariance	0x0
1 bit	USHORT - fVariancep	0x0
4 bits	USHORT - reserved	0x0
0002	SHORT - cItm	0x0006
0002	USHORT - cchName	0xFFFF

Figure 138: Structure of Sxvd

sxaxis: Specifies the <u>PivotTable axis</u> to which this pivot field belongs.

sxaxis.sxaxisRw: 0x1 specifies that this pivot field refers to the row axis.

sxaxis.sxaxisCol: 0x0 specifies that this pivot field does not refer to the column axis.

sxaxis.sxaxisPage: 0x0 specifies that this pivot field does not refer to the <u>page axis</u>.

sxaxis.sxaxisData: 0x0 specifies that this pivot field does not refer to the <u>value axis</u>.

cSub: 0x0001 specifies that one subtotal **function** is used for this pivot field.

fDefault: 0x1 specifies that the default subtotal function is applied.

fSum: 0x0 specifies that the **sum** subtotal function is not displayed.

fCounta: 0x0 specifies that the **count** subtotal function is not displayed.

fAverage: 0x0 specifies that the **average** subtotal function is not displayed.

fMax: 0x0 specifies that the **max** subtotal function is not displayed.

fMin: 0x0 specifies that the **min** subtotal function is not displayed.

fProduct: 0x0 specifies that the **sum** subtotal function is not displayed.

fCount: 0x0 specifies that the **count numbers** subtotal function is not displayed.

fStdev: 0x0 specifies that the standard deviation subtotal function is not displayed.

fStdevp: 0x0 specifies that the standard deviation population subtotal function is not displayed.

fVariance: 0x0 specifies that the **variance** subtotal function is not displayed.

fVariancep: 0x0 specifies that the **variance population** subtotal function is not displayed.

cItm: 0x0006 specifies that there are six pivot items for this pivot field.

cchName: 0xFFFF specifies that the caption of this pivot field is NULL, which means that the name is inherited from the associated cache field instead.

3.10.9 PivotTable: SXVI 1

The next record in this example, <u>SXVI</u>, specifies the first <u>pivot item</u> ("Antonio Moreno Taquería") of this <u>pivot field</u> ("CustomerName"). This item is filtered out and not visible in the PivotTable report.

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0x0001
0002	USHORT - cchName	0xFFFF

Figure 139: Structure of SXVI

itmType: 0x0000 specifies that the pivot item is a regular data value.

fHidden: 0x0 specifies that the pivot item is not hidden.

fHideDetail: 0x0 specifies that the pivot item is not collapsed (see Collapsing).

fFormula: 0x0 specifies that the pivot item is not a <u>calculated item</u>.

fMissing: 0x0 specifies that the pivot item exists in the **data source**.

iCache: This field specifies a <u>cache item</u> in the <u>cache field</u> that is associated with this pivot field ("CustomerName"). The index 0x01 specifies the second <u>SXString</u> ("Antonio Moreno Taquería") in the collection following the <u>SXFDB</u> with **stFieldName**="CustomerName".

cchName: 0xFFFF specifies that this pivot item does not have a caption.

3.10.10 PivotTable: SXVI 2

The next record in this example, <u>SXVI</u>, specifies the <u>pivot item</u> "Island Trading" in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0x0003
0002	USHORT - cchName	0xFFFF

Figure 140: Structure of SXVI

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

itmType: 0x0000 specifies that this pivot item is a regular data value.

fHidden: 0x0 specifies that this pivot item is not hidden.

fHideDetail: 0x0 specifies that this pivot item is not collapsed (see Collapsing).

fFormula: 0x0 specifies that this pivot item is not a <u>calculated item</u>.

fMissing: 0x0 specifies that this pivot item exists in the **data source**.

iCache: The index 0x03 specifies the fourth <u>SXString</u> ("Island Trading") in the collection following the <u>SXFDB</u> with **stFieldName**="CustomerName".

3.10.11 PivotTable: SXVI 3

The next record in this example, <u>SXVI</u>, specifies the <u>pivot item</u> "Richter Supermarkt" in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fHideDetail	0x1
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0x0002
0002	USHORT - cchName	0xFFFF

Figure 141: Structure of SXVI

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

fHideDetail: 0x1 specifies that the pivot item is collapsed (see Collapsing).

3.10.12 PivotTable: SXVI 4

The next record in this example, <u>SXVI</u>, specifies the Total row in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0001
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0xFFFF
0002	USHORT - cchName	0xFFFF

Figure 142: Structure of SXVI

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

itmType: 0x0001 specifies that the <u>pivot item</u> is a subtotal.

iCache: 0xFFFF specifies that the pivot item does not refer to any cache item.

3.10.13 PivotTable: SXVDEx 1

The next record in this example, <u>SXVDEx</u>, specifies the extended information about this ("CustomerName") <u>pivot field</u>.

Size	Structure	Value
0014	SXVDEx - SXVDEx	
1 bit	USHORT - fShowAllItems	0x0
1 bit	USHORT - fDragToRow	0x1
1 bit	USHORT - fDragToColumn	0x1
1 bit	USHORT - fDragToPage	0x1
1 bit	USHORT - fDragToHide	0x1
1 bit	USHORT - fNotDragToData	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fServerBased	0x0
1 bit	USHORT - reserved2	0x0
1 bit	USHORT - fAutoSort	0x0
1 bit	USHORT - fAscendSort	0x1
1 bit	USHORT - fAutoShow	0x0
1 bit	USHORT - fTopAutoShow	0x1
1 bit	USHORT - fCalculatedField	0x0
1 bit	USHORT - fPageBreaksBetweenItems	0x0
1 bit	USHORT - fHideNewItems	0x0
5 bits	USHORT - reserved3	0x00
1 bit	USHORT - fOutline	0x0
1 bit	USHORT - fInsertBlankRow	0x0
1 bit	USHORT - fSubtotalAtTop	0x0
8 bits	USHORT - citmAutoShow	0x0A
0002	SHORT - isxdiAutoSort	0xFFFF
0002	SHORT - isxdiAutoShow	0xFFFF
0002	<u>IFmt</u> - ifmt	
0002	USHORT - ifmt	0x0000
000A	SXVDEx Opt - subName	
0002	USHORT - cchSubName	0xFFFF
0004	ULONG - reserved1	0x0000000

Size	Structure	Value
0004	ULONG - reserved2	0x00000000

Figure 143: Structure of SXVDEx

fShowAllItems: 0x0 specifies that all <u>pivot items</u> in the <u>PivotTable view</u> are not displayed.

fDragToRow: 0x1 specifies that the pivot field can be dragged to the <u>row axis</u>.

fDragToColumn: 0x1 specifies that the pivot field can be placed on the column axis.

fDragToPage: 0x1 specifies that the pivot field can be dragged to the page axis.

fDragToHide: 0x1 specifies that the pivot field can be removed from the PivotTable view.

fNotDragToData: 0x0 specifies that the pivot field can be dragged to the data axis.

fServerBased: 0x0 is required because the corresponding <u>cache field</u> is not server-based.

fAutoSort: 0x0 specifies that AutoSort is not enabled for this pivot field.

fAscendSort: 0x1 specifies that AutoSort order is set to ascending, and if AutoSort is enabled, this pivot field is sorted in ascending order.

fAutoShow: 0x0 specifies that **AutoShow** is not enabled on this pivot field.

fTopAutoShow: 0x1 specifies that AutoShow is set to show top 10 values rather than bottom 10 values. If AutoShow is enabled, this PivotTable view uses top 10 values for AutoShow (filter).

fCalculatedField: 0x0 specifies that this pivot field is not a calculated field.

fPageBreaksBetweenItems: 0x0 specifies that a **page break** is not set between different pivot items in the PivotTable view during printing.

fHideNewItems: 0x0 specifies that new pivot items that are added to the **data source** are displayed automatically in the PivotTable view when the <u>PivotTable</u> is refreshed.

fOutline: 0x0 specifies that this pivot field is not displayed in **outline** format.

fInsertBlankRow: 0x0 specifies that a blank line is not inserted between different pivot items in the PivotTable view.

fSubtotalAtTop: 0x0 specifies that subtotals are displayed at the bottom of the list of pivot items for this pivot field.

citmAutoShow: 0x0A specifies that 10 pivot items are set to display for the top n AutoShow (filter).

isxdiAutoSort: 0xFFFF specifies that AutoSort uses current <u>data item</u>.

isxdiAutoShow: 0xFFFF specifies that AutoShow is not enabled for this pivot field.

subName: Specifies the name of the aggregate **function** used to calculate this pivot field's subtotals.

subName.cchSubName: 0xFFFF specifies that there is no aggregate function to use.

3.10.14 PivotTable: Sxvd 2

The next record in this example, <u>Sxvd</u>, specifies the pageField ("OrderDate") of this <u>PivotTable view</u>.

Size	Structure	Value
000A	Sxvd - Sxvd	
0002	SXAxis - sxaxis	
1 bit	USHORT - sxaxisRw	0x0
1 bit	USHORT - sxaxisCol	0x0
1 bit	USHORT - sxaxisPage	0x1
1 bit	USHORT - sxaxisData	0x0
12 bits	USHORT - reserved	0x000
0002	USHORT - cSub	0x0001
1 bit	USHORT - fDefault	0x1
1 bit	USHORT - fSum	0x0
1 bit	USHORT - fCounta	0x0
1 bit	USHORT - fAverage	0x0
1 bit	USHORT - fMax	0x0
1 bit	USHORT - fMin	0x0
1 bit	USHORT - fProduct	0x0
1 bit	USHORT - fCount	0x0
1 bit	USHORT - fStdev	0x0
1 bit	USHORT - fStdevp	0x0
1 bit	USHORT - fVariance	0x0
1 bit	USHORT - fVariancep	0x0
4 bits	USHORT - reserved	0x0
0002	SHORT - cItm	0x0015
0002	USHORT - cchName	0xFFFF

Figure 144: Structure of Sxvd

sxaxis: This field specifies the <u>PivotTable axis</u> upon which this <u>pivot field</u> exists.

sxaxis.sxaxisRw: 0x0 specifies that this pivot field does not refer to the <u>row axis</u>.

sxaxis.sxaxisCol: 0x0 specifies that this pivot field does not refer to the column axis.

sxaxis.sxaxisPage: 0x1 specifies that this pivot field refers to the <u>page axis</u>.

sxaxis.sxaxisData: 0x0 specifies that this pivot field does not refer to the data axis.

cItm: 0x0015 specifies that this pivot field contains 21 pivot items.

3.10.15 PivotTable: SXVI 5

The next record in this example, <u>SXVI</u>, specifies the first <u>pivot item</u> (5/6/1997) of this page field ("OrderDate"). This pivot item is filtered out and not displayed in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x1
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0×0000
0002	USHORT - cchName	0xFFFF

Figure 145: Structure of SXVI

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

fHidden: 0x1 specifies that this pivot item is hidden (filtered out).

3.10.16 PivotTable: SXVI 6

The next record in this example, \underline{SXVI} , specifies the second \underline{pivot} item (11/28/1997) of this page field ("OrderDate").

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x1
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0x000F
0002	USHORT - cchName	0xFFFF

Figure 146: Structure of SXVI

fHidden: 0x1 specifies that the pivot item is hidden. Because this pivot item is one of the items showing in the filter in the <u>page area</u> but is not actually displayed in the report, it is marked as hidden.

3.10.17 PivotTable: SXVI 7

The next record in this example, <u>SXVI</u>, specifies the third <u>pivot item</u> (12/23/1997) of this page field ("OrderDate").

Size	Structure	Value
0008	SXVI - SXVI	
0002	SHORT - itmType	0x0000
1 bit	USHORT - fHidden	0x0
1 bit	USHORT - fHideDetail	0x0
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFormula	0x0
1 bit	USHORT - fMissing	0x0
11 bits	USHORT - reserved2	0x000
0002	SHORT - iCache	0x0010
0002	USHORT - cchName	0xFFFF

Figure 147: Structure of SXVI

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

fHidden: 0x0 specifies that the pivot item is not hidden.

3.10.18 PivotTable: SXVDEx 2

The next record in this example, <u>SXVDEx</u>, specifies extended information about this <u>pivot field</u> ("OrderDate").

Size	Structure	Value
0014	SXVDEx - SXVDEx	
1 bit	USHORT - fShowAllItems	0x0
1 bit	USHORT - fDragToRow	0x1
1 bit	USHORT - fDragToColumn	0x1
1 bit	USHORT - fDragToPage	0x1
1 bit	USHORT - fDragToHide	0x1
1 bit	USHORT - fNotDragToData	0x0

Size	Structure	Value
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fServerBased	0x0
1 bit	USHORT - reserved2	0x0
1 bit	USHORT - fAutoSort	0x0
1 bit	USHORT - fAscendSort	0x1
1 bit	USHORT - fAutoShow	0x0
1 bit	USHORT - fTopAutoShow	0x1
1 bit	USHORT - fCalculatedField	0x0
1 bit	USHORT - fPageBreaksBetweenItems	0x0
1 bit	USHORT - fHideNewItems	0x0
5 bits	USHORT - reserved3	0x00
1 bit	USHORT - fOutline	0x0
1 bit	USHORT - fInsertBlankRow	0x0
1 bit	USHORT - fSubtotalAtTop	0x0
8 bits	USHORT - citmAutoShow	0x0A
0002	SHORT - isxdiAutoSort	0xFFFF
0002	SHORT - isxdiAutoShow	0xFFFF
0002	<u>IFmt</u> - ifmt	
0002	USHORT - ifmt	0x000E
000A	SXVDEx Opt - subName	
0002	USHORT - cchSubName	0xFFFF
0004	ULONG - reserved1	0x00000000
0004	ULONG - reserved2	0x0000000

Figure 148: Structure of SXVDEx

ifmt: Specifies the number format of this pivot field.

ifmt.ifmt: 0x000E specifies that the format of this pivot item is the built-in format mm-dd-yy.

3.10.19 PivotTable: Sxvd 3

The next record in this example, <u>Sxvd</u>, specifies the second field in the <u>row axis</u>, "ProductName".

Size	Structure	Value
000A	Sxvd - Sxvd	
0002	SXAxis - sxaxis	
1 bit	USHORT - sxaxisRw	0x1
1 bit	USHORT - sxaxisCol	0x0
1 bit	USHORT - sxaxisPage	0x0
1 bit	USHORT - sxaxisData	0x0
12 bits	USHORT - reserved	0x000
0002	USHORT - cSub	0x0001
1 bit	USHORT - fDefault	0x1

1 bit	USHORT - fStdev	0x0
1 bit	USHORT - fStdevp	0x0
1 bit	USHORT - fVariance	0x0
1 bit	USHORT - fVariancep	0x0
4 bits	USHORT - reserved	0x0
0002	SHORT - cItm	0×0000
0002	USHORT - cchName	0xFFFF

Figure 150: Structure of Sxvd

sxaxis: Specifies the <u>PivotTable</u> axis that this pivot field belongs to.

sxaxis.sxaxisRw: 0x0 specifies that this pivot field does not refer to the row axis.

sxaxis.sxaxisCol: 0x0 specifies that this pivot field does not refer to the <u>column axis</u>.

sxaxis.sxaxisPage: 0x0 specifies that this pivot field does not refer to the page axis.

sxaxis.sxaxisData: 0x0 specifies that this pivot field does not refer to the <u>data axis</u>.

fDefault: 0x1 specifies that the default subtotal is applied.

cItm: cItm: 0x0000 specifies that there are no <u>pivot items</u> for this pivot field. This is because this pivot field is a numeric field, and cache items do not need to be stored for numeric fields.

Records following this record, and before the next <u>SXVDEx</u> record, are omitted for brevity.

3.10.21 PivotTable: SXVDEx 3

The next record in this example, <u>SXVDEx</u>, specifies extended information about this <u>pivot field</u> ("UnitPrice").

Size	Structure	Value
0014	SXVDEx - SXVDEx	
1 bit	USHORT - fShowAllItems	0x0
1 bit	USHORT - fDragToRow	0x1
1 bit	USHORT - fDragToColumn	0x1

0004	ULONG - reserved2	0x00000000

Figure 151: Structure of SXVDEx

fShowAllItems: 0x0 specifies that <u>pivot items</u> that do not currently exist in the <u>source data</u> are not displayed.

fDragToRow: 0x1 specifies that this pivot field can be placed on the row axis of this PivotTable view.

fDragToColumn: 0x1 specifies that this pivot field can be placed on the <u>column axis</u> of this PivotTable view.

fDragToPage: 0x1 specifies that this pivot field can be dragged to the <u>page axis</u> of this PivotTable view.

fDragToHide: 0x1 specifies that this pivot field can be removed from the PivotTable view.

fNotDragToData: 0x0 specifies that this pivot field can be placed on the <u>data axis</u> of this PivotTable view.

fCalculatedField: 0x0 specifies that this pivot field is not a calculated field.

fOutline: 0x0 specifies that this pivot field is not displayed in **outline** format.

ifmt: Specifies the number format of this pivot field.

ifmt.ifmt: 0x002C specifies that this field has the _(\$* #,##0.00_);_(\$* (#,##0.00);_(\$* "-"??_);_(@_) number format applied.

3.10.22 PivotTable: Sxvd 5

The next record in this example, <u>Sxvd</u>, specifies the data field ("Quantity") in the <u>PivotTable view</u>.

Size	Structure	Value
000A	Sxvd - Sxvd	
0002	SXAxis - sxaxis	
1 bit	USHORT - sxaxisRw	0x0
1 bit	USHORT - sxaxisCol	0x0
1 bit	USHORT - sxaxisPage	0x0

0004	ULONG - reserved1	0x0000000
0004	ULONG - reserved2	0x00000000

Figure 153: Structure of SXVDEx

ifmt: A field that specifies the **number format** of this pivot field.

ifmt.ifmt: 0x0000 specifies that the General number format is applied.

3.10.24 PivotTable: SxIvd

The next record in this example, <u>SxIvd</u>, specifies an array of references to <u>pivot fields</u> on the <u>row axis</u>. Because **cDimRw** is 2 and **cDimCol** is 0 for the parent <u>SxView</u>, this contains an array of rows.

Size	Structure	Value
0004	SxIvd - Sxivd	
0004	rgSxivd - rgSxivd	
0002	SxIvdRw - SxIvdRw[0]	
0002	SHORT - rw	0x0000
0002	SxIvdRw - SxIvdRw[1]	
0002	SHORT - rw	0x0002

Figure 154: Structure of Sxivd

rgSxivd: A field that specifies an array of references to pivot fields.

rgSxivd.SxIvdRw[0]: A field that specifies a reference to a pivot field on the row axis.

rgSxivd.SxIvdRw[0].rw: 0x0000 specifies the first pivot field.

rgSxivd.SxIvdRw[1]: A field that specifies a reference to a pivot field on the row axis.

rgSxivd.SxIvdRw[1].rw: 0x0002 specifies the third pivot field.

3.10.25 PivotTable: SXPI

The next record in this example, <u>SXPI</u>, specifies an array of <u>SXPI Item</u> (information about the <u>PivotTable</u> page item) structures that specify the <u>pivot items</u> on the <u>page axis</u> of this PivotTable. There is one item in the array because the **cDimPg** field of the <u>SxView</u> record for the <u>PivotTable view</u> is 1.

Size	Structure	Value
0006	SXPI - SXPI	
0006	SXPI_Item - rgsxpi	
0006	SXPI_Item - SXPI_Item[0]	
0002	SHORT - isxvd	0x0001
0002	SHORT - isxvi	0x7FFD
0002	SHORT - idObj	0x0001

Figure 155: Structure of SXPI

rgsxpi: Specifies an array of page item information or SXPI_Item Structures.

rgsxpi.SXPI_Item[0]: Specifies the first item in the page area.

rgsxpi.SXPI_Item[0].isxvd: 0x0001 specifies the second pivot field, "OrderDate".

rgsxpi.SXPI_Item[0].isxvi: 0x7FFD specifies that all pivot items are used by the "OrderDate" pivot field.

rgsxpi.SXPI_Item[0].idObj: 0x001 which specifies the object identifier of the <u>Obj</u> record with the page item drop-down arrow.

3.10.26 PivotTable: SXDI

The next record in this example, <u>SXDI</u>, specifies the <u>data item</u> "Quantity" for this <u>PivotTable view</u>.

Size	Structure	Value
001E	SXDI - SXDI	
0002	SHORT - isxvdData	0x0004
0002	SHORT - iiftab	0x0000
0002	SHORT - df	0x0000
0002	SHORT - isxvd	0x0000
0002	SHORT - isxvi	0x0000
0002	<u>IFmt</u> - ifmt	
0002	USHORT - ifmt	0x0000
0002	USHORT - cchName	0x000F
0010	XLUnicodeStringNoCch - stName	Sum Of Quantity

Figure 156: Structure of SXDI

isxvdData: A field that specifies a <u>pivot field</u> in the form of an index in the collection of pivot fields specified by <u>SXFDB</u>. The value 0x04 specifies the fifth pivot field, "Quantity".

iiftab: 0x0000 specifies the "Sum of values" **aggregation function**.

df: 0x0000 specifies that this data item is to be displayed as its raw value with no calculation applied.

isxvd: 0x0000 is required because **df** is 0x0000.

isxvi: 0x0000 is required because df is 0x0000.

cchName: 0x000F specifies that the length of this data item is 15 characters.

stName: "Sum Of Quantity" specifies the name of this data item.

3.10.27 PivotTable: SXLI 1

Because the **cRw** and **cCol** fields of the <u>SxView</u> record are greater than zero, this example contains two <u>SXLI</u> records. This first SXLI specifies the <u>pivot lines</u> for the <u>row area</u>.

Size	Structure	Value
0054	SXLI - SXLI	
0054	SXLIItem - rgsxli	
000C	SXLIItem - SXLIItem[0]	
0002	SHORT - cSic	0x0000

Size	Structure	Value
15 bits	USHORT - itmType	0x0000
1 bit	USHORT - reserved1	0x0

Figure 157: Structure of SXLI

Fields that appear in several SXLIItem structures with the same values are omitted for brevity.

rgsxli: A field that contains an array of SXLIItem structures, which specify the pivot lines present in this <u>PivotTable</u>.

rgsxli.SXLIItem[0]: Specifies the first pivot line and its <u>pivot items</u> in the <u>row axis</u>.

rgsxli.SXLIItem[0].cSic: 0x0000 specifies that no pivot items in the **rgisxvi** array are identical to the first pivot items in the previous pivot line item in this record.

rgsxli.SXLIItem[0].itmType: 0x0000 specifies that the pivot item is a regular data value.

- rgsxli.SXLIItem[0].isxviMac: 0x0002 specifies that this pivot line contains two pivot items.
- rgsxli.SXLIItem[0].fMultiDataName: 0x0 specifies that the data field name is used for the total.
- **rgsxli.SXLIItem[0].iData:** 0x00 specifies that the data item for this line item is "Quantity" (the only data item in this PivotTable).
- rgsxli.SXLIItem[0].fSbt: 0x0 specifies that this pivot item does not represent a subtotal.
- rgsxli.SXLIItem[0].fBlock: 0x0 specifies that this pivot item is not a block total.
- rgsxli.SXLIItem[0].fGrand: 0x0 specifies that this pivot item is not a grand total.
- **rgsxli.SXLIItem[0].fMultiDataOnAxis:** 0x0 specifies that this pivot line does not contain multiple data fields.
- rgsxli.SXLIItem[0].rgisxvi: Specifies pivot line entries for this pivot line.
- rgsxli.SXLIItem[0].rgisxvi.isxvi[0]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[0], specifies a pivot item index. 0x0002 specifies the third pivot item (SXVI) within this Sxvd ("CustomerName") record. The referenced pivot item contains an index which refers to the fourth cache item (SXString) of the corresponding cache field ("CustomerName"). The fourth cache item within this cache field is "Island Trading".
- rgsxli.SXLIItem[0].rgisxvi.isxvi[1]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[1], specifies a pivot item index. 0x0002 specifies the third pivot item (SXVI) within this Sxvd ("ProductName"). The referenced pivot item contains an index which refers to the fourth cache item (SXString) of the corresponding cache field ("ProductName"). The fourth cache item within this cache field is "Ipoh Coffee".
- rgsxli.SXLIItem[1]: Specifies the second pivot line and its pivot items in the row axis.
- rgsxli.SXLIItem[1].itmType: 0x0001 specifies that the pivot item is a subtotal.
- rgsxli.SXLIItem[1].isxviMac: 0x0001 specifies that this pivot line contains one item.
- rgsxli.SXLIItem[1].fSbt: 0x1 specifies that this item is a subtotal.
- rgsxli.SXLIItem[2]: Specifies the third pivot line and its pivot items in the row axis.
- rgsxli.SXLIItem[2].rgisxvi: Specifies pivot line entries for this pivot line.
- rgsxli.SXLIItem[2].rgisxvi.isxvi[0]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[0], specifies a pivot item index. 0x0003 specifies the fourth pivot item (SXVI) within this Sxvd ("CustomerName"). The referenced pivot item contains an index which refers to the fifth cache item (SXString) of the corresponding cache field ("CustomerName"). The first cache item within this cache field is "Königlich Essen".
- rgsxli.SXLIItem[2].rgisxvi.isxvi[1]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[1], specifies a pivot item index. 0x0000 specifies the first pivot item (SXVI) within this Sxvd ("ProductName") record. The referenced pivot item contains an index which refers to the first cache item (SXString) of the corresponding cache field ("ProductName"). The first cache item within this cache field is "Geitost".
- rgsxli.SXLIItem[3]: Specifies the fourth pivot line and its pivot items in the row axis.
- **rgsxli.SXLIItem[3].cSic:** 0x0001 specifies that one pivot item in the **rgisxvi** array is identical to the first pivot item in the previous pivot line item in this record.
- rgsxli.SXLIItem[3].rgisxvi: Specifies pivot line entries for this pivot line.

- rgsxli.SXLIItem[3].rgisxvi.isxvi[0]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[0], specifies a pivot item index. 0x0003 specifies the fourth pivot item (SXVI) within this Sxvd ("CustomerName") record. The referenced pivot item contains an index which refers to the fifth cache item (SXString) of the corresponding cache field ("CustomerName"). The fifth cache item within this cache field is "Königlich Essen".
- rgsxli.SXLIItem[3].rgisxvi.isxvi[1]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[1], specifies a pivot item index. 0x0003 specifies the fourth pivot item (SXVI) within this Sxvd ("ProductName") record. The referenced pivot item contains an index which refers to the third cache item (SXString) of the corresponding cache field ("ProductName"). The third cache item within this cache field is "Perth Pasties".

The next pivot line is similar to the earlier subtotal pivot line and is not described here.

rgsxli.SXLIItem[5]: Specifies the sixth pivot line and its pivot items in the row axis.

rgsxli.SXLIItem[5].rgisxvi: Specifies pivot line entries for this pivot line.

rgsxli.SXLIItem[5].rgisxvi.isxvi[0]: A field that specifies a pivot item index, because the SxIvd record with the same index, rgSxivd.SxIvdRw[0], specifies a pivot item index. 0x0004 specifies the fourth pivot item (SXVI) within this Sxvd ("CustomerName") record. The referenced pivot item contains an index which refers to the third cache item (SXString) of the corresponding cache field ("ProductName"). The third cache item within this cache field is "Richter Supermarkt".

rgsxli.SXLIItem[5].rgisxvi.isxvi[1]: 0x7FFF specifies that there is no pivot item in this position and the cell is blank.

rgsxli.SXLIItem[6]: Specifies the seventh pivot line and its pivot items in the row axis.

rgsxli.SXLIItem[6].itmType: 0x000D specifies that the pivot item is a grand total.

rgsxli.SXLIItem[6].fGrand: 0x1 specifies that this pivot item is a grand total.

rgsxli.SXLIItem[6].rgisxvi: Specifies pivot line entries for this pivot line.

rgsxli.SXLIItem[6].rgisxvi.isxvi[0]: This field has the value 0x0000 because this pivot item is a grand total (**fGrand**=1).

rgsxli.SXLIItem[6].rgisxvi.isxvi[1]: This field has the value 0x0000 because this pivot item is a grand total (**fGrand**=1).

3.10.28 PivotTable: SXLI 2

This second \underline{SXLI} record specifies the <u>pivot line</u> item structures for the <u>column axis</u>. The size of this array (one item) is determined by the **cCol** field of the \underline{SxView} record.

Size	Structure	Value
0008	SXLI - SXLI	
0008	SXLIItem - rgsxli	
0008	SXLIItem - SXLI_Item[0]	
0002	SHORT - cSic	0x0000
15 bits	USHORT - itmType	0x0000
1 bit	USHORT - reserved1	0x0

Size	Structure	Value
0002	SHORT - isxviMac	0x0000
1 bit	USHORT - fMultiDataName	0x0
8 bits	USHORT - iData	0x00
1 bit	USHORT - fSbt	0x0
1 bit	USHORT - fBlock	0x0
1 bit	USHORT - fGrand	0x0
1 bit	USHORT - fMultiDataOnAxis	0x0
1 bit	USHORT - unused1	0x0
1 bit	USHORT - unused2	0x0
1 bit	USHORT - reserved2	0x0

Figure 158: Structure of SXLI

All values of this record are 0 because there is no field or any item in column axis. Because of this, none of the fields are described in this section.

3.10.29 PivotTable: SXEx

The next record in this example, <u>SXEx</u>, specifies additional properties of this <u>PivotTable view</u>.

Size	Structure	Value
0018	SXEx - Sxex	
0002	USHORT - csxformat	0x0000
0002	USHORT - cchErrorString	0xFFFF
0002	USHORT - cchNullString	0xFFFF
0002	USHORT - cchTag	0xFFFF
0002	USHORT - csxselect	0×0000
0002	DRw - crwPage	
0002	USHORT - drw	0x0001
0002	DCol - ccolPage	
0002	USHORT - dcol	0x0001
1 bit	USHORT - fAcrossPageLay	0x0
8 bits	USHORT - cWrapPage	0x00
1 bit	USHORT - unused	0x1
1 bit	USHORT - reserved1	0x0
5 bits	USHORT - reserved2	0×00

Size	Structure	Value
1 bit	USHORT - fEnableWizard	0x1
1 bit	USHORT - fEnableDrilldown	0x1
1 bit	USHORT - fEnableFieldDialog	0x1
1 bit	USHORT - fPreserveFormatting	0x1
1 bit	USHORT - fMergeLabels	0x0
1 bit	USHORT - fDisplayErrorString	0x0
1 bit	USHORT - fDisplayNullString	0x1
1 bit	USHORT - fSubtotalHiddenPageItems	0x0
8 bits	USHORT - reserved3	0x00
0002	USHORT - cchPageFieldStyle	0xFFFF
0002	USHORT - cchTableStyle	0xFFFF
0002	USHORT - cchVacateStyle	0xFFFF

Figure 159: Structure of Sxex

csxformat: 0x0000 specifies that no <u>SxFormat</u> records follow this record.

cchErrorString: 0xFFFF specifies that a custom string displayed in **cells** that contain errors does not exist.

cchNullString: 0xFFFF specifies that a custom string displayed in cells that contain NULL values does not exist.

cchTag: 0xFFFF specifies that a custom string saved with this PivotTable view does not exist.

csxselect: 0x0000 specifies that no <u>SxSelect</u> records follow this record.

crwPage: Specifies the number of rows in the <u>page area</u> of the PivotTable view.

crwPage.drw: 0x0001 specifies that this PivotTable view contains one row on the page axis.

ccolPage: Specifies the number of columns in the page area in the PivotTable view.

ccolPage.dcol: 0x0001 specifies that this PivotTable view contains one column on the page axis.

fAcrossPageLay: 0x0 specifies that multiple <u>pivot fields</u> on the page axis will be displayed in the page area from the top to the bottom first, as fields are added, before moving to another column.

cWrapPage: 0x00 specifies that pivot fields in the page area do not wrap, as specified by **fAcrossPageLay**.

fEnableWizard: 0x1 specifies that the application displays a user interface to interact with the PivotTable view.

fEnableDrilldown: 0x1 specifies that details can be shown for cells in the <u>data area</u>.

fEnableFieldDialog: 0x1 specifies that a user interface for setting properties of a pivot field can be displayed.

- **fPreserveFormatting:** 0x1 specifies that formatting is preserved when the PivotTable view is recalculated.
- **fMergeLabels:** 0x0 specifies that empty cells adjacent to the cells displaying <u>pivot item</u> captions of pivot fields on the <u>row axis</u> and <u>column axis</u> of this PivotTable view are not merged into a single cell.
- **fDisplayErrorString:** 0x0 specifies that the PivotTable view does not display a custom error string in cells that contain errors.
- **fDisplayNullString:** 0x1 specifies that the PivotTable view displays a custom string in cells that contain NULL values.
- **fSubtotalHiddenPageItems:** 0x0 specifies that hidden pivot items, as specified by <u>SXVI</u> records with the **fHidden** field equal to 1, of a pivot field on the page axis with the **isxvi** field of the corresponding <u>SXPI Item</u> structure equal to 0x7FFD, are filtered out when calculating the PivotTable view.
- cchPageFieldStyle: 0xFFFF specifies that no style is applied in the page area of the PivotTable view.
- cchTableStyle: 0xFFFF specifies that no style is applied in the body of the PivotTable view.
- **cchVacateStyle:** 0xFFFF specifies that no style is applied to cells that become empty when the PivotTable view is recalculated.

3.10.30 PivotTable: QsiSXTag

The next record in this example, <u>OsiSXTag</u>, specifies the name and **refresh** information for this <u>PivotTable</u>.

Size	Structure	Value
0025	QsiSXTag - QsiSxTag	
0004	FrtHeaderOld - frtHeader	
0002	USHORT - rt	0x0802
0002	<u>FrtFlags</u> - grbitFrt	
1 bit	USHORT - fFrtRef	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved	0x0000
0002	SHORT - fSx	0x0001
1 bit	USHORT - fEnableRefresh	0x1
1 bit	USHORT - fInvalid	0x0
1 bit	USHORT - fTensorEx	0x0
13 bits	USHORT - reserved1	0x0000
0004	SXView9Save - dwQsiFuture	
1 bit	USHORT - fNoStencil	0x0
1 bit	USHORT - fHideTotAnnotation	0x1

Size	Structure	Value
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fIncludeEmptyRw	0x0
1 bit	USHORT - fIncludeEmptyCol	0x0
11 bits	USHORT - reserved2	0x000
16 bits	USHORT - reserved3	0x0000
0001	BYTE - verSxLastUpdated	0x02
0001	BYTE - verSxUpdatableMin	0x00
0001	BYTE - obCchName	0x10
0001	BYTE - reserved2	0x00
0013	XLUnicodeString - stName	OrdersPivotTable
0002	USHORT - unused	0x0100

Figure 160: Structure of QsiSxTag

frtHeader: A structure that specifies a <u>future record</u> type header.

frtHeader.rt: 0x0802 specifies the record type identifier and is required.

frtHeader.grbitFrt: 0x00 specifies a constant value of 0x00.

fSx: 0x0001 specifies that this record relates to a PivotTable.

 $\textbf{fEnableRefresh:} \ 0x1 \ \text{specifies that the PivotTable is to be refreshed with data from an external } \\ \textbf{data}$

source.

fInvalid: 0x0 specifies that the PivotTable needs to be refreshed.

fTensorEx: 0x0 specifies that the PivotTable is not an **OLAP** report.

dwQsiFuture: Specifies additional option flags for a PivotTable.

dwQsiFuture.fNoStencil: 0x0 specifies that the drawing of large drop zones is enabled for this PivotTable viewthat has no data fields.

dwQsiFuture.fHideTotAnnotation: 0x1 specifies that annotation for the total in this <u>OLAP PivotTable view</u> is hidden.

dwQsiFuture.fIncludeEmptyRw: 0x0 specifies that empty rows from an OLAP data source are not shown in this PivotTable view.

dwQsiFuture.fIncludeEmptyCol: 0x0 specifies that empty columns from an OLAP data source are not shown in this PivotTable view.

verSxLastUpdated: 0x02 specifies the <u>data functionality level</u> that this PivotTable was last refreshed with.

verSxUpdatableMin: 0x00 specifies the minimum version of the application that can refresh this PivotTable.

stName: "OrdersPivotTable" specifies the name of this PivotTable.

3.10.31 PivotTable: SXViewEx9

QsiSXTag The next record in this example, <u>SXViewEx9</u>, specifies extensions to the <u>PivotTable view</u>.

Size	Structure	Value
0011	SXViewEx9 - Sxviewex9	
0002	USHORT - rt	0x0810
1 bit	USHORT - reserved1	0x0
1 bit	USHORT - fFrtAlert	0x0
14 bits	USHORT - reserved2	0x0000
0004	ULONG - reserved3	0x00000000
1 bit	ULONG - reserved4	0x0
1 bit	ULONG - fPrintTitles	0x0
1 bit	ULONG - fLineMode	0x0
2 bits	ULONG - reserved5	0x0
1 bit	ULONG - fRepeatItemsOnEachPrintedPage	0x1
26 bits	ULONG - reserved6	0x0000000
0002	AutoFmt8 - itblAutoFmt	0x0001
0003	XLUnicodeString - chGrand	empty string

Figure 161: Structure of Sxviewex9

rt: 0x0810 specifies a constant record type identifier.

fFrtAlert: 0x0000 specifies that features of this <u>PivotTable</u> are supported in earlier versions of the **BIFF**.

fPrintTitles: 0x00000000 specifies that print titles for the **worksheet** are not set based on the PivotTable report.

fLineMode: 0x00000000 specifies that no <u>pivot field</u> is in outline mode. See <u>subtotaling</u> for more information.

fRepeatItemsOnEachPrintedPage: 0x00000001 specifies that <u>pivot item</u> captions on the <u>row axis</u> will be repeated at the top of each printed page for pivot fields in tabular form.

itblAutoFmt: 0x0001 specifies the PivotTable **AutoFormat**. A value of 0x001 specifies XL8_ITBLCLASSIC1 or the **Classic 1** AutoFormat style.

3.10.32 PivotTable: SxAddl 4

The next record in this example, \underline{SxAddl} , specifies additional information for a $\underline{PivotTable\ view}$ and $\underline{PivotCache}$.

Size	Structure	Value
001F	SXAddl SXCView SXDId - SXAddl	

Size	Structure	Value
0006	SXAddlHdr - hdr	
0004	FrtHeaderOld - frtHeaderOld

0001	BYTE - sxd	0x00
0019	SXAddl_SXString - stName	
0019	XLUnicodeStringSegmentedSXAddl - stName	OrdersPivotTable

Figure 162: Structure of SXAddl

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.sxc: 0x00 specifies the current class as an SxcView class.

hdr.sxd: 0x00 specifies the type of record contained in the **data** field of the containing SXAddl record. This value specifies that the type of this SXAddl record is <u>SXAddl SXCCache SXDId</u>.

stName.stName: "OrdersPivotTable" specifies the name of the PivotTable View.

3.10.33 PivotTable: SxAddl 5

The next record in this example, \underline{SxAddl} , specifies additional information for a $\underline{PivotTable\ view}$ and $\underline{PivotCache}$.

Size	Structure	Value
000C	SXAddl SXCView SXDVer10Info - SXAddl	
0006	SXAddlHdr - hdr	
0004	<u>FrtHeaderOld</u> - frtHeaderOld	
0002	USHORT - rt	0x0864

1 bit	ULONG - fHideDDData	0x0
3 bits	ULONG - reserved1	0x0
12 bits	ULONG - unused	0x000
0002	USHORT - reserved2	0x0000

Figure 163: Structure of SXAddl

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.sxc: 0x00 specifies the current class as an SxcView class.

hdr.sxd: 0x02 specifies the type of record contained in the data field of the containing SXAddl record. See class for more information. This value specifies that the type of this SXAddl record is SXAddl_SXCView_SXDVer10Info.

bVerSxMacro: 0x01 specifies the <u>data functionality level</u> with which this <u>PivotTable</u> was created.

fDisplayImmediateItems: 0x1 specifies that <u>pivot items</u> are displayed in the PivotTable view even when there is no <u>pivot field</u> on the <u>data axis</u>.

fEnableDataEd: 0x0 specifies the user is not allowed to change values in the data axis of the PivotTable view.

fDisableFList: 0x0 specifies the **PivotTable field list** is enabled.

fReenterOnLoadOnce: 0x0 specifies that this PivotTable view will not **refresh** the next time the **workbook** is opened.

fPageMultipleItemLabel: 0x1 specifies that <u>OLAP calculated members</u> are **hidden** in the PivotTable view.

3.10.34 PivotTable: SxAddl 6

The next record in this example, <u>SxAddl</u>, specifies additional information for a <u>PivotTable view</u> and <u>PivotCache</u>. In this record, the **data.hdr.sxd** field specifies that this is the last record of an **SxAddl** record collection.

Size	Structure	Value
000C	SXAddl SXCView SXDEnd - SXAddl	
0006	SXAddlHdr - hdr	
0004	FrtHeaderOld - frtHeaderOld

0006	reserved - reserved	0x00000000000

Figure 164: Structure of SXAddl

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

hdr: An SXAddlHdr structure that specifies header information for this SXAddl record.

hdr.sxc: 0x00 specifies the current class as an SxcView class.

hdr.sxd: 0xFF specifies the type of record contained in the data field of the containing SXAddl record. See class for more information. This value specifies that the type of this SXAddl record is SXAddl SXCView SXDEnd.

3.10.35 PivotTable: SXDB

The next record in this example, <u>SXDB</u>, specifies some of the <u>PivotCache</u> properties for the <u>PivotTable</u> in this example. This SXDB record marks the beginning of the set of records in the stream associated with this PivotTable that appear in the <u>Pivot Cache storage</u> (_SX_DB_CUR).

Size	Structure	Value
001F	SXDB - SXDB	
0004	LONG - crdbdb	0x0000002C
0002	USHORT - idstm	0x0001
1 bit	USHORT - fSaveData	0x1
1 bit	USHORT - fInvalid	0x0

Size	Structure	Value
1 bit	USHORT - fRefreshOnLoad	0x0
1 bit	USHORT - fOptimizeCache	0x0
1 bit	USHORT - fBackgroundQuery	0x0
1 bit	USHORT - fEnableRefresh	0x1
10 bits	USHORT - unused1	0x000
0002	SHORT - unused2	0x0666
0002	SHORT - cfdbdb	0x0005
0002	SHORT - cfdbTot	0x0005
0002	SHORT - crdbUsed	0x0006
0002	USHORT - vsType	0x0001
0002	USHORT - cchWho	0x000A
000B	XLUnicodeStringNoCch - rgb	John Smith

Figure 165: Structure of SXDB

crdbdb: 0x0000002C specifies that there are a total of 44 records in the <u>source data</u> of this PivotCache.

idstm: 0x0001 specifies the identifier of the stream in the PivotCache storage that contains the PivotCache for this PivotTable. The stream identifier is a four-character string representation of the hexadecimal value. In this case the stream identifier is "0001". This field is equal to the idstm field of SXStreamID.

fSaveData: 0x1 specifies that <u>cache records</u> exist for this PivotCache.

fInvalid: 0x0 specifies that the cache does not need to be refreshed before the next recalculation.

fRefreshOnLoad: 0x0 specifies that the PivotCache is not refreshed on load.

fOptimizeCache: 0x0 specifies that the cache is not optimized for reduced memory usage.

fBackgroundQuery: 0x0 specifies that a **refresh** of the PivotCache is performed synchronously.

fEnableRefresh: 0x1 specifies that the PivotCache refresh is enabled.

cfdbdb: 0x0005 specifies that there are five base cache fields in the source data.

cfdbTot: 0x0005 specifies that there are a sum total of five base, grouped, and calculated fields in the cache. The value of this field is the same as the **cfdbdb** field because there are no grouped or calculated fields.

crdbUsed: 0x0006 specifies that there are six records in use from the source data in the <u>PivotTable</u> view as a result of the filtering in the page area.

vsType: 0x0001 specifies that the **data source** is a **sheet** range.

cchWho: 0x000A specifies the length (10) of the following **rgb** string.

rgb: "John Smith" specifies the name of the user who last refreshed the PivotTable.

3.10.36 PivotTable: SXDBEx

The next record in this example, <u>SXDBEx</u>, specifies additional <u>PivotCache</u> properties.

Size	Structure	Value
000C	SXDBEx - SXDBEx	
0008	<u>DateAsNum</u> - numDate	
0008	Xnum - dateNum	0x40E355907CBEB8CE
0004	DWORD - cSxFormula	0x0000000

Figure 166: Structure of SXDBEx

numDate: A DateAsNum structure that specifies the PivotCache was last refreshed on 5/28/2008.

numDate.dateNum: 0x40E355907CBEB8CE specifies the numeric value 39596.515227662035, which represents the date (5/28/2008 12:21:56 PM) that the PivotCache was last refreshed.

cSxFormula: 0x00000000 specifies that there are no <u>SXFormula</u> records for this PivotCache.

3.10.37 PivotTable: SXFDB 1

The next records in this example are a series of <u>SXFDB</u> and related records that specify the <u>cache</u> <u>fields</u> and their contents. This first SXFDB record specifies details of the CustomerName cache field in the <u>PivotCache</u>. In this example, this cache field is displayed in the <u>row axis</u> of the <u>PivotTable</u>.

Size	Structure	Value
001D	SXFDB - SXFDB	
1 bit	USHORT - fAllAtoms	0x1
1 bit	USHORT - fSomeUnhashed	0x0
1 bit	USHORT - fUsed	0x0
1 bit	USHORT - fHasParent	0x0
1 bit	USHORT - fRangeGroup	0x0
1 bit	USHORT - fNumField	0x0
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fTextEtcField	0x1
1 bit	USHORT - fnumMinMaxValid	0x0
1 bit	USHORT - fShortIitms	0x0
1 bit	USHORT - fNonDates	0x1
1 bit	USHORT - fDateInField	0x0
1 bit	USHORT - unused2	0x0
1 bit	USHORT - fServerBased	0x0
1 bit	USHORT - fCantGetUniqueItems	0x0

Size	Structure	Value
1 bit	USHORT - fCalculatedField	0x0
0002	SHORT - ifdbParent	0x0000
0002	SHORT - ifdbBase	0x0000
0002	SHORT - citmUnq	0x0005
0002	SHORT - csxoper	0x0000
0002	SHORT - cisxoper	0x0000
0002	SHORT - catm	0x0005
000F	XLUnicodeString - stFieldName	CustomerName

Figure 167: Structure of SXFDB

Fields in this record that are ignored because **fHasParent** is 0 are omitted for brevity.

fAllAtoms: 0x1 specifies that the <u>source data</u> for this cache field is cached. It is cached because the CustomerName cache field is displayed in the PivotTable as the first row field.

fSomeUnhashed: 0x0 specifies that all source data is cached in the PivotCache.

fUsed: 0x0 specifies that no calculated cache fields are used in the PivotTable.

fHasParent: 0x0 specifies that this cache field does not have a parent cache field.

fRangeGroup: 0x0 specifies that this cache field is not grouped by range grouping, as specified in Grouping.

fNumField: 0x0 specifies that the cache items in this cache field do not contain numeric data.

fTextEtcField: 0x1 specifies that the cache items in this cache field contain text values.

fnumMinMaxValid: 0x0 specifies that a valid minimum or maximum value is not computed for this cache field.

fShortIitms: 0x0 specifies that this cache field does not contain more than 255 cache items.

fNonDates: 0x1 specifies that the cache items in this cache field contain values that are neither time nor date values.

fDateInField: 0x0 specifies that none of the cache items in this cache field contain a time or date value.

fServerBased: 0x0 specifies that this cache field is not a server-based field, as specified in Source Data.

fCantGetUniqueItems: 0x0 specifies that it is possible to retrieve a list of unique items for this cache field.

fCalculatedField: 0x0 specifies that this record is not a <u>calculated field</u>.

csxoper: 0x0000 specifies that there are zero cache item values in this cache field that are based on **child** cache fields.

cisxoper: 0x0000 specifies that there are zero values in the child cache fields of this cache field.

catm: 0x0005 specifies that there are five items in the cache item collection for this cache field.

stFieldName: "CustomerName" specifies the name of this cache field.

The following record, <u>SXFDBType</u>, is not included in this example because the **sxvs** field of the <u>SXVS</u> record in this example is 1.

3.10.38 PivotTable: SXString 1

After the <u>cache field</u> is specified, a series of records follow it that specify the <u>cache items</u> in the CustomerName cache field. In this example, the next record is an <u>SXString</u> record, which specifies a string cache item. This cache item is not displayed in the <u>PivotTable view</u>.

Size	Structure	Value
001A	SXString - SXString	
0002	USHORT - cch	0x0017
0018	XLUnicodeStringNoCch - segment	Great Lakes Food Market

Figure 168: Structure of SXString

cch: 0x0017 specifies the length (23) of the cache item string.

segment: "Great Lakes Food Market" specifies the value of the cache item.

3.10.39 PivotTable: SXString 2

The next record in this example, <u>SXString</u>, specifies a string <u>cache item</u> in the CustomerName <u>cache</u> <u>field</u>. This cache item does not appear in the <u>PivotTable view</u>.

Size	Structure	Value
001A	SXString - SxString	
0002	USHORT - cch	0x0017
0018	XLUnicodeStringNoCch - segment	Antonio Moreno Taquería

Figure 169: Structure of SxString

cch: 0x0017 specifies the length (23) of the cache item string.

segment: "Antonio Moreno Taquería" specifies the value of the cache item.

This record is followed by 1 additional SXString record that is omitted for brevity.

3.10.40 PivotTable: SXString 3

The next record in this example, <u>SXString</u>, specifies a string <u>cache item</u> in the CustomerName <u>cache field</u>. This record is included in this example because it is displayed in the <u>PivotTable view</u>.

Size	Structure	Value
0011	SXString - SXString	
0002	USHORT - cch	0x000E
000F	XLUnicodeStringNoCch - segment	Island Trading

Figure 170: Structure of SXString

cch: 0x000E specifies the length (14) of the cache item string.

segment: "Island Trading" specifies the value of the cache item.

Records following this record, and before the next <u>SXFDB</u> record, are omitted for brevity.

3.10.41 PivotTable: SXFDB 2

The next record in this example, $\underline{\mathsf{SXFDB}}$, specifies the OrderDate $\underline{\mathsf{cache}}$ in the $\underline{\mathsf{PivotCache}}$. This cache field is displayed in the $\underline{\mathsf{page}}$ axis of the $\underline{\mathsf{PivotTable}}$.

Size	Structure	Value
001A	SXFDB - SXFDB	
1 bit	USHORT - fAllAtoms	0x1
1 bit	USHORT - fSomeUnhashed	0x0
1 bit	USHORT - fUsed	0x0
1 bit	USHORT - fHasParent	0x0
1 bit	USHORT - fRangeGroup	0x0
1 bit	USHORT - fNumField	0x0
1 bit	USHORT - unused1	0x0
1 bit	USHORT - fTextEtcField	0x0
1 bit	USHORT - fnumMinMaxValid	0x1
1 bit	USHORT - fShortIitms	0x0
1 bit	USHORT - fNonDates	0x0
1 bit	USHORT - fDateInField	0x1
1 bit	USHORT - unused2	0x0
1 bit	USHORT - fServerBased	0x0
1 bit	USHORT - fCantGetUniqueItems	0x0
1 bit	USHORT - fCalculatedField	0x0
0002	SHORT - ifdbParent	0x0000
0002	SHORT - ifdbBase	0x0000
0002	SHORT - citmUnq	0x0014
0002	SHORT - csxoper	0x0000
0002	SHORT - cisxoper	0x0000
0002	SHORT - catm	0x0014
000C	XLUnicodeString - stFieldName	OrderDate

Figure 171: Structure of SXFDB

fAllAtoms: 0x1 specifies that the <u>source data</u> for this cache field is cached. It is cached because the OrderDate cache field is displayed in the PivotTable as the first page field.

fNonDates: 0x0 specifies that the <u>cache items</u> in this cache field are date or time values.

fDateInField: 0x1 specifies that at least one cache item in this cache field is a date or time value.

catm: 0x0014 specifies that there are 20 items in the cache item collection for this cache field.

stFieldName: "OrderDate" specifies the name of the cache field.

Records following this record, and before the next <u>SXDtr</u> record, are omitted for brevity.

3.10.42 PivotTable: SXDtr 1

The next record in this example, <u>SXDtr</u>, specifies a date <u>cache item</u> in the OrderDate <u>cache field</u>. This cache item is filtered out in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXDtr - SXDtr	
0002	USHORT - yr	0x07CD
0002	USHORT - mon	0x0005
0001	BYTE - dom	0x06
0001	BYTE - hr	0x00
0001	BYTE - min	0x00
0001	BYTE - sec	0x00

Figure 172: Structure of SXDtr

yr: 0x07CD specifies the year value (1997) of the cache item.

mon: 0x0005 specifies the month value (5) of the cache item.

dom: 0x06 specifies the day of the month value (6) of the cache item.

hr: 0x00 specifies the hour value (0) of the cache item.

min: 0x00 specifies the minute value (0) of the cache item.

sec: 0x00 specifies the second value (0) of the cache item.

This record is followed by 15 additional SXDtr records that are omitted for brevity.

3.10.43 PivotTable: SXDtr 2

The next record in this example, <u>SXDtr</u>, specifies a date <u>cache item</u> in the OrderDate page field that is not filtered in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXDtr - SXDtr	

Size	Structure	Value
0002	USHORT - yr	0x07CD
0002	USHORT - mon	0x000C
0001	BYTE - dom	0x17
0001	BYTE - hr	0x00
0001	BYTE - min	0x00
0001	BYTE - sec	0x00

Figure 173: Structure of SXDtr

yr: 0x07CD specifies the year value (1997) of the cache item.

mon: 0x000C specifies the month value (12) of the cache item.

dom: 0x17 specifies the day of the month value (23) of the cache item.

Records following this record, and before the next <u>SXFDB</u> record, are omitted for brevity.

3.10.44 PivotTable: SXFDB 3

The next record in this example, <u>SXFDB</u>, specifies the ProductName <u>cache field</u> in the <u>PivotCache</u>. This cache field is displayed in the <u>row axis</u> of the <u>PivotTable</u>.

Size	Structure	Value
001C	SXFDB - SXFDB	
1 bit	USHORT - fAllAtoms	0x1
1 bit	USHORT - fSomeUnhashed	0x0
1 bit	USHORT - fUsed	0x0

0002	SHORT - catm	0x0006
000E	XLUnicodeString - stFieldName	ProductName

Figure 174: Structure of SXFDB

fAllAtoms: 0x1 specifies that the <u>source data</u> for this cache field is cached. It is cached because the ProductName cache field is displayed in the PivotTable as the first row field.

fNumField: 0x0 specifies that the cache items in this cache field do not contain numeric data.

fTextEtcField: 0x1 specifies that the cache items in this cache field contain text values.

catm: 0x0006 specifies that there are six items in the cache item collection for this cache field. The number of items in the cache field was affected in this case by the filtering on the page field.

stFieldName: "ProductName" specifies the name of the cache field.

Records following this record, and before the next SXFDB record, are omitted for brevity.

3.10.45 PivotTable: SXFDB 4

The next record in this example, <u>SXFDB</u>, specifies the UnitPrice <u>cache field</u> in the <u>PivotCache</u>. This cache field does not appear on any <u>PivotTable axis</u> in the <u>PivotTable</u>.

Size	Structure	Value
001A	SXFDB - SXFDB	
1 bit	USHORT - fAllAtoms	0x1

0002	SHORT - catm	0x0007
000C	XLUnicodeString - stFieldName	UnitPrice

Figure 175: Structure of SXFDB

fAllAtoms: 0x1 specifies that the <u>source data</u> for this cache field is cached. Though this cache field is not displayed on any areas of the PivotTable, its source data is cached because it was displayed in the PivotTable at some point.

fNumField: 0x1 specifies that the cache items in this cache field contain numeric data.

catm: 0x0007 specifies that there are seven items in the cache item collection for this cache field.

stFieldName: "UnitPrice" specifies the name of the cache field.

Records following this record, and before the next <u>SXNum</u> record, are omitted for brevity.

3.10.46 PivotTable: SXNum 1

The next record in this example, <u>SXNum</u>, specifies a **floating-point number** <u>cache item</u> in the <u>UnitPrice cache field</u> that is not in the <u>PivotTable view</u>.

Size	Structure	Value
0008	SXNum - SXNum	

Size	Structure	Value
8000	Xnum - num	0x400400000000000

Figure 176: Structure of SXNum

num: 0x4004000000000000 specifies the cache item's numeric value is 2.5.

Records following this record, and before the next SXFDB record, are omitted for brevity.

3.10.47 PivotTable: SXFDB 5

The next record in this example, <u>SXFDB</u>, specifies the Quantity <u>cache field</u> in the <u>PivotCache</u>. This cache field appears in the <u>data axis</u> of the <u>PivotTable</u>.

Size	Structure	Value
0019	SXFDB - SXFDB	
1 bit	USHORT - fAllAtoms	0x0

000B	XLUnicodeString - stFieldName	Quantity

Figure 177: Structure of SXFDB

Fields in this record that are explained in previous record descriptions in this example are omitted for brevity.

fAllAtoms: 0x0 specifies that the <u>source data</u> for this cache field is not cached. Though this cache field is displayed in the PivotTable, its source data is not cached because the cache field is displayed in the <u>data area</u>.

fNumField: 0x1 specifies that the cache items in this cache field contain numeric data.

catm: 0x0000 is 0 because fAllAtoms is 0.

stFieldName: "Quantity" specifies the name of this cache field.

Records following this record, and before the next SXDBB record, are omitted for brevity.

3.10.48 PivotTable: SXDBB 1

The next records in this example are a series of <u>SXDBB</u> and <u>SXNum</u> records that specify the <u>cache</u> records for this <u>PivotCache</u>. This first SXDBB specifies the first cache record.

Size	Structure	Value
0004	SXDBB - SXDBB	
0004	rgb - blob	
0001	BYTE - blob[0]	0x00
0001	BYTE - blob[1]	0x00
0001	BYTE - blob[2]	0x00
0001	BYTE - blob[3]	0x00

Figure 178: Structure of SXDBB

blob.blob[0]: 0x00 specifies the index of the first <u>cache item</u> (Great Lakes Food Market) within the collection of cache items of the first <u>cache field</u> (CustomerName).

blob.blob[1]: 0x00 specifies the index of the first cache item (5/6/1997) within the collection of cache items of the second cache field (OrderDate).

blob.blob[2]: 0x00 specifies the index of the first cache item (Geitost) within the collection of cache items of the third cache field (ProductName).

blob.blob[3]: 0x00 specifies the index of the first cache item (2.5) within the collection of cache items of the fourth cache field (UnitPrice).

3.10.49 PivotTable: SXNum 2

The next record in this example, <u>SXNum</u>, specifies the **floating-point number** value for the Quantity cache field in the cache record specified by the previous <u>SXDBB</u>.

Size	Structure	Value
0008	SXNum - SXNum	
0008	Xnum - num	0x4020000000000000

Figure 179: Structure of SXNum

num: 0x402000000000000 specifies that the floating-point number value of this cache item is 8.

This record is followed by 35 additional pairs of SXDBB and SXNum records that are omitted for brevity.

3.10.50 PivotTable: SXDBB 2

The next record in this example, <u>SXDBB</u>, specifies a <u>cache record</u> that is displayed within the <u>PivotTable view</u>.

Size	Structure	Value
0004	SXDBB - SXDBB	
0004	rgb - blob	
0001	BYTE - blob[0]	0x04
0001	BYTE - blob[1]	0x11
0001	BYTE - blob[2]	0x00
0001	BYTE - blob[3]	0x00

Figure 180: Structure of SXDBB

blob.blob[0]: 0x04 specifies the index of the fifth <u>cache item</u> (Königlich Essen) within the collection of cache items of the first <u>cache field</u> (CustomerName).

blob.blob[1]: 0x11 specifies the index of the eighteenth cache item (12/26/1997) within the collection of cache items of the second cache field (OrderDate).

blob.blob[2]: 0x00 specifies the index of the first cache item (Geitost) within the collection of cache items of the third cache field (ProductName).

blob.blob[3]: 0x00 specifies the index of the seventh cache item (2.5) within the collection of cache items of the fourth cache field (UnitPrice).

3.10.51 PivotTable: SXNum 3

The next record in this example, <u>SXNum</u>, specifies the **floating-point number** value for the Quantity <u>cache field</u> in the <u>cache record</u> specified by the previous <u>SXDBB</u>.

Size	Structure	Value
0008	SXNum - SXNum	
0008	Xnum - num	0x403700000000000

Figure 181: Structure of SXNum

num: 0x403700000000000 specifies that the floating-point number value of this cache item is 23.

Records following this record, and before the next <u>EOF</u> record, are omitted for brevity.

3.10.52 PivotTable: EOF

The next record in this example, <u>EOF</u>, specifies the end of the collection of records for this <u>PivotCache</u>.

Size	Structure
0000	EOF - EOF

Figure 182: Structure of EOF

4 Security Considerations

The password verifier features available in the file format (see <u>Password Verifier Algorithm</u>) are used to prevent accidental modification, rather than being used as security features. It is possible to remove the passwords by removing the records containing the verifier values.

The translation of passwords from a double-byte **Unicode** string to a new character string in the ANSI code page of the current system converts any Unicode character that cannot be mapped to the ANSI code page of the current system to the 0x3F character in that code page (as described in [ECMA-376] part 4, 3.2.29). Replacing these characters with 0x3F when the **hash** is verified will generate positive hash value matches. In certain locales this can be a significant portion of the everyday **character set**.

When a file in this format is saved with obfuscation or encryption (see Encryption), there are two primary security considerations. First, only certain storages and **streams** are encoded during encryption (see Encryption). Second, for the records that are encrypted, the record type and size are not encrypted in the **BIFF** streams. Therefore, the list of records present in the file can be read from the file without actually decrypting it. Further security considerations regarding the file encryption algorithms are described in [MS-OFFCRYPTO] section 4.1.3.

5 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Excel 97
- Microsoft Excel 2000
- Microsoft Excel 2002
- Microsoft Office Excel 2003
- Microsoft Office Excel 2007
- Microsoft Excel 2010
- Microsoft Excel 2013
- Microsoft Excel 2016
- Microsoft Excel 2019

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 2.1.7.15: Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 can write, load, and process the Signatures Stream in a file. Excel 97, Excel 2000 can load a file with a Signatures Stream but ignores it.

<2> Section 2.1.7.20.1: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.

<3> Section 2.1.7.20.2: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.

<abre>
<a>Section 2.1.7.20.2: If a **Continue** record (section $\underline{2.4.58}$) is needed in the **MSODRAWING** rule (section $\underline{2.1.7.20.2}$), Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 can write out an **MsoDrawing** record (section $\underline{2.4.170}$) instead of the first **Continue** record (section 2.4.58).

<5> Section 2.1.7.20.3: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.

<6> Section 2.1.7.20.3: If a Continue record (section 2.4.58) is needed in the MSODRAWINGGROUP rule, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 can write out an MsoDrawingGroup record (section 2.4.171) instead of the first Continue record (section 2.4.58).

- <7> Section 2.1.7.20.4: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.
- <8> Section 2.1.7.20.5: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.
- <9> Section 2.1.7.20.6: When saving unsupported **future records** (section 2.1.6), Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 will write those records at the end of the **substream** (section 2.1.3) in which they were encountered during load, in the order in which they were encountered.
- <10> Section 2.1.7.20.6: Office Excel 2007, Excel 2010, and Excel 2013 can save out a CELLTABLE without a **Row** record (section 2.4.221).
- <11> Section 2.1.7.20.6: If a **Continue** record (section 2.4.58) is needed in the **MSODRAWING** rule (section 2.1.7.20.2), Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 can write out an **MsoDrawing** record (section 2.4.170) instead of the first **Continue** record.
- <12> Section 2.1.7.21: Only Office Excel 2007 and Excel 2010 can write the XML Signatures storage. Only Office Excel 2007 and Excel 2010 can load and process a file with a XML Signatures storage; Excel 97, Excel 2000, Excel 2002, Office Excel 2003 can load a file with a XML Signatures storage but ignore it.
- <13> Section 2.2.3.11: Graph Component for Excel 97, Graph Component for Excel 2000, Graph Component for Excel 2002, Graph Component for Office Excel 2003, Graph Component for Office Excel 2007, and Graph Component for Excel 2010 can create files that do not conform to these rules.
- <14> Section 2.2.3.11: Graph Component for Excel 97, Graph Component for Excel 2000, Graph Component for Excel 2002, Graph Component for Office Excel 2003, Graph Component for Office Excel 2007, and Graph Component for Excel 2010 can create files that do not conform to these rules.
- <15> Section 2.2.3.11: Graph Component for Excel 97, Graph Component for Excel 2000, Graph Component for Excel 2002, Graph Component for Office Excel 2003, Graph Component for Office Excel 2007, and Graph Component for Excel 2010 can create files that do not conform to these rules.
- <16> Section 2.2.3.11: Graph Component for Excel 97, Graph Component for Excel 2000, Graph Component for Excel 2002, Graph Component for Office Excel 2003, Graph Component for Office Excel 2007, and Graph Component for Excel 2010 can create files that do not conform to these rules.
- <17> Section 2.2.3.11: Graph Component for Excel 97, Graph Component for Excel 2000, Graph Component for Excel 2002, Graph Component for Office Excel 2003, Graph Component for Office Excel 2007, and Graph Component for Excel 2010 can create files that do not conform to these rules.
- <18> Section 2.2.4.3: Office Excel 2007 and Excel 2010 save metadata records when cells contain formulas referencing **cube functions**. However, this metadata does not remain associated with the cells and is only recorded for the purpose of load and calculation optimization.
- <19> Section 2.2.9: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 warn the user when they enter passwords that contain characters other than alphanumeric characters or punctuation symbols.
- <20> Section 2.2.10: In Excel 97, Excel 2000, Excel 2002, and Office Excel 2003 the maximum password length is 15 characters. In Office Excel 2007 and Excel 2010 the maximum password length is 255 characters.
- <21> Section 2.2.10: Only Excel 2002 and Office Excel 2003 will save files with XOR obfuscation.

- <22> Section 2.2.10: Only Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 will load and save files with RC4 CryptoAPI encryption.
- <23> Section 2.4.3: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 write a value for this field but ignore it on load.
- <24> Section 2.4.3: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 write a value for this field but ignore it on load.
- <25> Section 2.4.9: When the base unit is not days, and the data is near the base value of the date system specified by the Date1904 record (section 2.4.77), catMin value can underflow and get saved as a large number.
- <26> Section 2.4.9: When the base unit is not days, and the data is near the maximum value of the date system specified by the **Date1904 record** (section 2.4.77), **catMax** value can overflow and get saved as a small number.
- <27> Section 2.4.21: Excel 97 writes 0x07CC for rupYear.
- <28> Section 2.4.21: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, and Excel 2013 set the value to 0 on creation, and change it to 1 in subsequent loading and saving.
- <29> Section 2.4.21: This happens only for Excel 97.
- <30> Section 2.4.21: Excel 97.
- <31> Section 2.4.21: Excel 2000.
- <32> Section 2.4.21: Excel 2002.
- <33> Section 2.4.21: Office Excel 2003.
- <34> Section 2.4.21: Office Excel 2007.
- <35> Section 2.4.21: Excel 2010
- <36> Section 2.4.21: Excel 2013
- <37> Section 2.4.21: Excel 97.
- <38> Section 2.4.21: Excel 2000.
- <39> Section 2.4.21: Excel 2002.
- <40> Section 2.4.21: Office Excel 2003.
- <41> Section 2.4.21: Office Excel 2007.
- <42> Section 2.4.21: Excel 2010.
- <43> Section 2.4.21: Excel 2013
- <44> Section 2.4.22: Office Excel 2003, Office Excel 2007, and Excel 2010 will prompt the user in this case.
- <45> Section 2.4.22: This behavior does not apply to Office Excel 2007 and Excel 2010.
- <46> Section 2.4.30: Specifies either Excel 97, Excel 2000, Excel 2002, or Office Excel 2003.
- <47> Section 2.4.30: Specifies either Office Excel 2007 or Excel 2010.

```
<48> Section 2.4.45: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save negative values, but at load time the negative values are corrected to 0.
```

- <49> Section 2.4.45: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save negative values, but at load time the negative values are corrected to 0.
- <50> Section 2.4.45: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save negative values, but at load time the negative values are corrected to 0.
- <51> Section 2.4.45: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save negative values, but at load time the negative values are corrected to 0.
- <52> Section 2.4.46: Office Excel 2007 and Excel 2010 can save values greater than or equal to 0 and less than or equal to 200. In Office Excel 2007 and Excel 2010 the view angle is determined by dividing this value by a factor of 2.
- <53> Section 2.4.46: Office Excel 2007 and Excel 2010 can save values less than 5.
- <54> Section 2.4.46: Office Excel 2007 and Excel 2010 can save values greater than 500.
- <55> Section 2.4.46: Office Excel 2007 and Excel 2010 ignores this bit and will set it back to zero if the file is resaved.
- <56> Section 2.4.49: Excel 2000
- <57> Section 2.4.49: Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, Excel 2010, or

Excel 2013

- <58> Section 2.4.49: Office Excel 2007
- <59> Section 2.4.49: Excel 97
- <60> Section 2.4.49: Excel 97
- <61> Section 2.4.49: Excel 2000
- <62> Section 2.4.49: Excel 2002, Office Excel 2003
- <63> Section 2.4.49: Office Excel 2007
- <64> Section 2.4.49: Excel 2010
- <65> Section 2.4.49: Excel 2013
- <66> Section 2.4.49: Excel 2000
- <67> Section 2.4.49: Excel 2002, Office Excel 2003
- <68> Section 2.4.49: Office Excel 2007
- <69> Section 2.4.49: Excel 2010
- <70> Section 2.4.49: Excel 2013
- <71> Section 2.4.54: Specifies Office Excel 2007, or Excel 2010.
- <72> Section 2.4.54: Specifies Office Excel 2003, Excel 2002, Excel 2000, or Excel 97.
- <73> Section 2.4.54: Specifies Office Excel 2003, Excel 2002, Excel 2000, or Excel 97.
- <74> Section 2.4.54: Specifies Office Excel 2003, Excel 2002, Excel 2000, or Excel 97.
- <75> Section 2.4.74: Office Excel 2007 and Excel 2010 can sometimes save values greater than 254.

- <76> Section 2.4.74: Though the maximum zero-based series number is 254, Office Excel 2007 and Excel 2010 sometimes save values greater than 254.
- <77> Section 2.4.91: This structure is not loaded or saved by Office Excel 2007 and Excel 2010.
- <78> Section 2.4.97: Office Excel 2003, Excel 2002, Excel 2000, and Excel 97 can save out 0 for this field. In these cases, if the **xfprops** field specifies a solid fill pattern as part of the formatting properties, the pattern's color is stored in the background color instead of the foreground color.
- <79> Section 2.4.102: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 write out this record on save.
- <80> Section 2.4.102: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 do not ignore this record.
- <81> Section 2.4.104: Specifies Excel 97.
- <82> Section 2.4.105: Specifies Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, or Excel 2010.
- <83> Section 2.4.107: Excel 97 sometimes saves out a different number of elements.
- <84> Section 2.4.109: This record is ignored in Office Excel 2007, and Excel 2010.
- <85> Section 2.4.110: This record is ignored in Office Excel 2007 and Excel 2010.
- <86> Section 2.4.117: This value is 0x0001 for files created using Office Excel 2007 and Excel 2010.
- <87> Section 2.4.122: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save out 0 for certain fonts.
- <88> Section 2.4.122: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can also write out the value 0 to specify a black font, or the value 72 to specify the automatic color for a control.
- <89> Section 2.4.122: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can also write out values 0 and 100 through 1000 (inclusive).
- <90> Section 2.4.122: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save values greater than 5.
- <91> Section 2.4.126: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save values of 383 to 392.
- <92> Section 2.4.129: Specifies Excel 2000.
- <93> Section 2.4.129: Specifies Excel 2002.
- <94> Section 2.4.131: If two consecutive GelFrame records appear, the second GelFrame is a continuation of the first.
- <95> Section 2.4.131: Excel 97 does not save OPT2.
- <96> Section 2.4.133: Office Excel 2007 and Excel 2010 uses this **GUID** to determine if the **VBA** project needs to be recompiled on load by comparing the GUID in the file to the GUID built into the application. If the value is 0x0, the VBA project needs to be recompiled on load.
- <97> Section 2.4.150: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save any value from 0 to 0xFF.
- <98> Section 2.4.154: This structure is not loaded or saved by Office Excel 2007 and Excel 2010

```
<99> Section 2.4.159: This structure is not loaded or saved by Office Excel 2007 and Excel 2010.
```

 \leq 100> Section 2.4.191: If the value of the **wPassword** field of the Password record in the Globals Substream is not 0x0000, Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 encrypt the document as specified in [MS-OFFCRYPTO], section 2.3. If an encryption password is not specified or the workbook or sheet is only protected, the document is encrypted with the default password of "\x56\x65\x6C\x76\x65\x74\x53\x77\x65\x61\x74\x73\x68\x6F\x70".

```
<101> Section 2.4.196: Excel 97 and Excel 2000 do not save this field as part of the record.
```

<102> Section 2.4.196: Excel 97 and Excel 2000 do not save this field as part of the record.

<103> Section 2.4.196: Excel 97 and Excel 2000 do not save this field as part of the record.

 \leq 104> Section 2.4.206: If the value of the **protPwdRev** field of the Prot4RevPass record is not 0x0000, Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 encrypt the document as specified in [MS-OFFCRYPTO], section 2.3. If an encryption password is not specified or the workbook or sheet is only protected, the document is encrypted with the default password of "\x56\x65\x6C\x76\x65\x74\x53\x77\x65\x61\x74\x73\x68\x6F\x70".

<105> Section 2.4.208: In the case of Excel 97 this bit specifies whether the query table adjusts column width after refresh. If this bit is set to 1 and the fPreserveFmt field in the corresponding dwQsiFuture field of the QsiSXTaq is set to 1 then the column width is not adjusted after refresh.

```
<106> Section 2.4.210: Excel 97

<107> Section 2.4.210: Excel 2000

<108> Section 2.4.210: Excel 2002

<109> Section 2.4.210: Office Excel 2003

<110> Section 2.4.210: Office Excel 2007

<111> Section 2.4.210: Excel 2010

<112> Section 2.4.210: Excel 2013

<113> Section 2.4.216: This structure is not loaded or saved by Office Excel 2007 or Excel 2010.

<114> Section 2.4.218: This record was introduced in Office Excel 2007 as a future record type. Consequently, it is preserved in **BIFF8** format, but ignored by Office Excel 2003, Excel 2002, Excel 2000, and Excel 97.

<115> Section 2.4.241: If the workbook contains more than 4112 sheets, then Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save a file in which any record that references a sheet identifier can reference the wrong sheet.

<116> Section 2.4.248: Office Excel 2007 and Excel 2010 will save at most 512 RefU in the rgref array of a Selection record. Office Excel 2003, Excel 2002, Excel 2000, and Excel 97 will save at most 1025 RefU in the rgref array of a Selection record.

<117> Section 2.4.258: This record was introduced in Office Excel 2007 as a Future Record Type. Consequently, it is preserved in BIFF8 format, but ignored by Office Excel 2003, Excel 2002, Excel 2000, and Excel 97.

<118> Section 2.4.258: This XML stream is ignored by Office Excel 2003, Excel 2002, Excel 2000, and Excel 97.

<119> Section 2.4.259: Saved only by Office Excel 2007 and Excel 2010.

- <120> Section 2.4.267: Excel 97
- <121> Section 2.4.267: Excel 2000
- <122> Section 2.4.267: Excel 2002
- <123> Section 2.4.267: Office Excel 2003
- <124> Section 2.4.267: Office Excel 2007
- <125> Section 2.4.267: Excel 2010
- <126> Section 2.4.267: Excel 2013
- <127> Section 2.4.269: Excel 2010, Office Excel 2007, Office Excel 2003, Excel 2002, Excel 2000, and Excel 97 save out an XLUnicodeString structure with 0 characters.
- <128> Section 2.4.273.9: Excel 2000 has a maximum value of 8000. Excel 2002 and Office Excel 2003 have a maximum value of 32500. Values greater than these are treated as these maximums by these applications.
- <129> Section 2.4.273.108: In certain circumstances Office Excel 2003, Excel 2002, and Excel 2000 can save out a higher value.
- <130> Section 2.4.281: Office Excel 2007 and Excel 2010 can save out wbe with a value of 0x2B
- <131> Section 2.4.310: Excel 97 does not create this field and ignores it if present.
- <132> Section 2.4.324: Excel can write numbers larger than 4000 due to rounding while editing small charts.
- <133> Section 2.4.324: Excel can write numbers larger than 4000 due to rounding while editing small charts.
- <134> Section 2.4.324: Excel can write numbers larger than 4000 due to rounding while editing small charts.
- <135> Section 2.4.324: Excel can write numbers larger than 4000 due to rounding while editing small charts.
- <136> Section 2.4.325: This record was introduced in Office Excel 2007 as a Future Record Type. Consequently, it is preserved in BIFF8 format, but ignored by Office Excel 2003, Excel 2002, Excel 2000, and Excel 97.
- <137> Section 2.4.326: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can sometimes save value 123820, which also indicates default **theme**.
- <138> Section 2.4.329: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 also use the value "2" to specify justify low alignment. Justify low occurs when Arabic kashida justification is applied to the text. Justify low lengthens kashidas slightly.
- <139> Section 2.4.329: Justified alignment is not supported in Office Excel 2007 and Excel 2010 and is treated as middle alignment.
- <140> Section 2.4.329: Excel 97 East Asian version, Excel 2000 East Asian version, Excel 2002 East Asian version, Office Excel 2003 East Asian version, or Office Excel 2007 East Asian version, or Excel 2010 East Asian version.
- <141> Section 2.4.335: Excel 97, Excel 2000, Excel 2002, and Office Excel 2003 do not set this bit to 1.

- <142> Section 2.4.337: Excel 97, Excel 2000, Excel 2002, and Office Excel 2003 can save out a value of 0x0001, indicating that natural language formulas are enabled. This feature is deprecated in Office Excel 2007 and Excel 2010.
- <143 > Section 2.4.344: Stream does not exist in Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, or Excel 2010.
- <144> Section 2.4.346: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 truncate **wScaleSLV** into a byte when saving.
- <145> Section 2.4.346: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 truncate **wScaleNormal** into a byte when saving.
- <146> Section 2.4.353: If the Transition Navigation Keys option is turned on, the set of prefix characters is single quote, double quote, caret, and backslash, which indicate left-alignment, right-alignment, center-alignment, and fill alignment, respectively. If the Transition Navigation Keys option is turned off, the only possible prefix character is single quote, which has no alignment significance but indicates (like all prefix characters) that the cell contents are to be treated as a string literal.
- <147> Section 2.4.353: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save 0 in this field when **fStyle** equals 1.
- <148> Section 2.5.4: Can sometimes be 0 if **year** is equal to 1900 and **month** is equal to 1 and the calendar is Gregorian.
- <149> Section 2.5.9: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save XL8_ITBLJAPAN2, XL8_ITBLJAPAN3, XL8_ITBLJAPAN4, and XL8_ITBLNONE_JPN as 0x0000, 0x0001, 0x0002, and 0x0003. In this case, values 0x0000 through 0x0010 are saved as 0x0004 through 0x0014.
- <150> Section 2.5.10: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save bBoolErr with an error value instead of a Boolean value when fError is 0x00.
- <151> Section 2.5.16: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 save out 0xFF.
- <152> Section 2.5.20: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 also save out 0 to specify a black background.
- <153> Section 2.5.21: The Alpha channel value in the LongRGBA structure is ignored and set to 0xFF (opaque).
- <154> Section 2.5.27: If Office Excel 2007 or Excel 2010 save different values for **cp** in the <u>CFEx</u> and <u>CF</u> records, then the value in CFEx takes precedence over the value in CF.
- <155> Section 2.5.32: Office Excel 2007 and Excel 2010 will not apply any coloring to a cell when its CFVO value falls outside of the range of the interpolation curve and **fClamp** is not set.
- <156> Section 2.5.60: Specifies Excel 97.
- <157> Section 2.5.60: Specifies Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, or Excel 2010.
- <158> Section 2.5.60: Specifies Excel 97.
- <159> Section 2.5.60: Specifies Excel 2000.
- <160> Section 2.5.63: The following table shows the maximum data functionality levels that different application versions support:

Value	Maximum data functionality level for
0	Excel 97 and Excel 2000
1	Excel 2002 and Office Excel 2003
3	Office Excel 2007
4	Excel 2010

- <161> Section 2.5.63: In Excel 97, Excel 2000, Excel 2002, and Office Excel 2003, the values of some data functionality level fields do not always reflect the correct data functionality level.
- <162> Section 2.5.65: In the 1900 date system, Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 treat the year 1900 as though it was a leap year. That is, the value 59 corresponds to February 28, and the value 61 corresponds to March 1, allowing the (non-existent) date February 29 to have the value 60.
- <163> Section 2.5.91: Office Excel 2007 and Excel 2010 sometimes saves a value greater than 15 and less than 255.
- <164> Section 2.5.113: This value is only possible in the context of a Feature12 record, and cannot be written by Office Excel 2003.
- <165> Section 2.5.113: Office Excel 2003 does not save the **totalFmla** field; **fLoadTotalFmla** is 0.
- <166> Section 2.5.118: This structure only exists in the context of a Feature12 record, and cannot be written by Office Excel 2003.
- \leq 167> Section 2.5.127: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can write out values 0x13 through 0x24.
- <168> Section 2.5.129: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can sometimes save out values 511 through 1022.
- <169> Section 2.5.129: These 4 default structures are saved out as identical Font structures. They are placeholders for their respective font formatting properties.
- <170> Section 2.5.130: This value is ignored in Office Excel 2007 and Excel 2010.
- <171> Section 2.5.134: The Feature11 and Feature12 records set the ref8.rwFirst, ref8.rwLast, ref8.colFirst, and ref8.colLast fields even if fFrtRef is 0.
- <172> Section 2.5.143: Excel 97, Excel 2000, Excel 2002, and Office Excel 2003 all write out a value of 0 for this field and ignore it on load.
- <173> Section 2.5.162: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 sometimes write out \underline{Icv} values 0x0000 and 0x0001. Office Excel 2007 and Excel 2010 sometimes also writes out \underline{Icv} values that are greater than or equal to 0x0002 and less than or equal to 0x0007.
- <174> Section 2.5.164: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 sometimes writes out Icv values greater than or equal to 0x01 and less than or equal to 0x07, or the value 0x48, which specifies the system color for text in windows.
- <175> Section 2.5.165: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can write values greater than or equal to 0x017F and less than or equal to 0x0188, but they will not be loaded.

- <176> Section 2.5.198.18: In Office Excel 2007 and Excel 2010, natural language formulas are transformed into A1 references.
- <177> Section 2.5.198.23: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can sometimes write out an rgce which contain PtgArray.
- <178> Section 2.5.198.104: Excel 97, Excel 2000, Excel 2002 and Office Excel 2003 write out these Ptgs. Office Excel 2007 and Excel 2010 convert these Ptgs to equivalent PtgAreas or PtgAreaErrs on load and never introduces these Ptgs.
- <179> Section 2.5.203: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 expect the **cbKey** field in the **PictFmlaKey** structure to be an even value.
- <180> Section 2.5.244: ItExternalData is only read and saved by Office Excel 2007 and Excel 2010.
- <181> Section 2.5.248: Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 can save out 0 for certain fonts.
- <182> Section 2.5.248: Office Excel 2003, Office Excel 2007, and Excel 2010 can also write out 0.
- <183> Section 2.5.266: Office Excel 2003 has unique table identifiers per sheet rather than per workbook. On load, Office Excel 2007 and Excel 2010 reassigns new identifiers if identical ones exist within a same workbook.
- <184> Section 2.5.266: Set to 0x1 in case of Web-based data provider list data source for worksheets created using Office Excel 2003.
- <185> Section 2.5.266: Office Excel 2007 and Excel 2010 will only write out the value of 1 for this field.
- <186> Section 2.5.266: Office Excel 2003 saves 0xB, Office Excel 2007 saves 0xC, Excel 2010 saves 0xE.
- <187> Section 2.5.266: Office Excel 2003, Office Excel 2007, and Excel 2010 do not ignore this field.
- <188> Section 2.5.272: For files last saved in East Asian versions of the application, lastRun can sometimes be a Run instead of a TxoLastRun.
- <189> Section 2.5.282: Specifies Office Excel 2007.
- <190> Section 2.5.314: Office Excel 2007 and Excel 2010 can save values larger than 500.
- <191> Section 2.5.342: Under certain circumstances, Excel 97, Excel 2000, Excel 2002, Office Excel 2003, Office Excel 2007, and Excel 2010 persist these values.
- <192> Section 2.5.344: Office Excel 2003, Office Excel 2007, and Excel 2010 can sometimes save a value of -1 on the itabLast field for either a workbook-level or a sheet-level reference to an external workbook if an Information Rights Management (IRM) authorization failure occurred during a refresh of that workbook's data.
- <193> Section 2.6.2: Web-only view is only used by Excel 97, Excel 2000, Excel 2002, and Office Excel 2003.
